Introduction

In the spring of 2005 Logan Resources Ltd. awarded McPhar Geosurveys Ltd. a contract to fly approximately 1,230 line kilometres of aeromagnetic surveying on the Shell Creek Property, Dawson Mining District, Yukon Territory.

The Shell Creek Property was explored in the late 1950's and 1960's but remained dormant until staked by Ryanwood Exploration in 2004. Logan Resources optioned the property from Ryanwood in late 2004.

The aeromagnetic survey was flown to acquire a current geophysical database that would help to establish a solid working base for future exploration and to assist with the geological and structural mapping of the property.

The aeromagnetic survey was accurately positioned using differential GPS (Global Positioning Satellite) receivers. Survey readings collected by the airborne magnetometer were precisely projected to the surface.

The local terrain is rugged so digital terrain files were purchased from the Yukon Geodetic Survey and used to produce accurate and consistent base maps.

Reconnaissance geochemical sampling and grab samples collected by Ryanwood Exploration in 2003 indicated anomalous copper and gold assays. Instead of focusing on the banded iron formation Logan Resources will use the aeromagnetic survey as a mapping base to help guide geology, soil and silt geochemistry and ground geophysics.

Shell Creek Property Location and Access

Logan Resources Ltd's. (the Company) Shell Creek Property is located in the west-central Yukon, 75 kms. (~47 miles) northwest of Dawson City, on the north side of the Yukon River. The Shell Creek property comprises 526 claim units, over an area of 110 square kilometres.

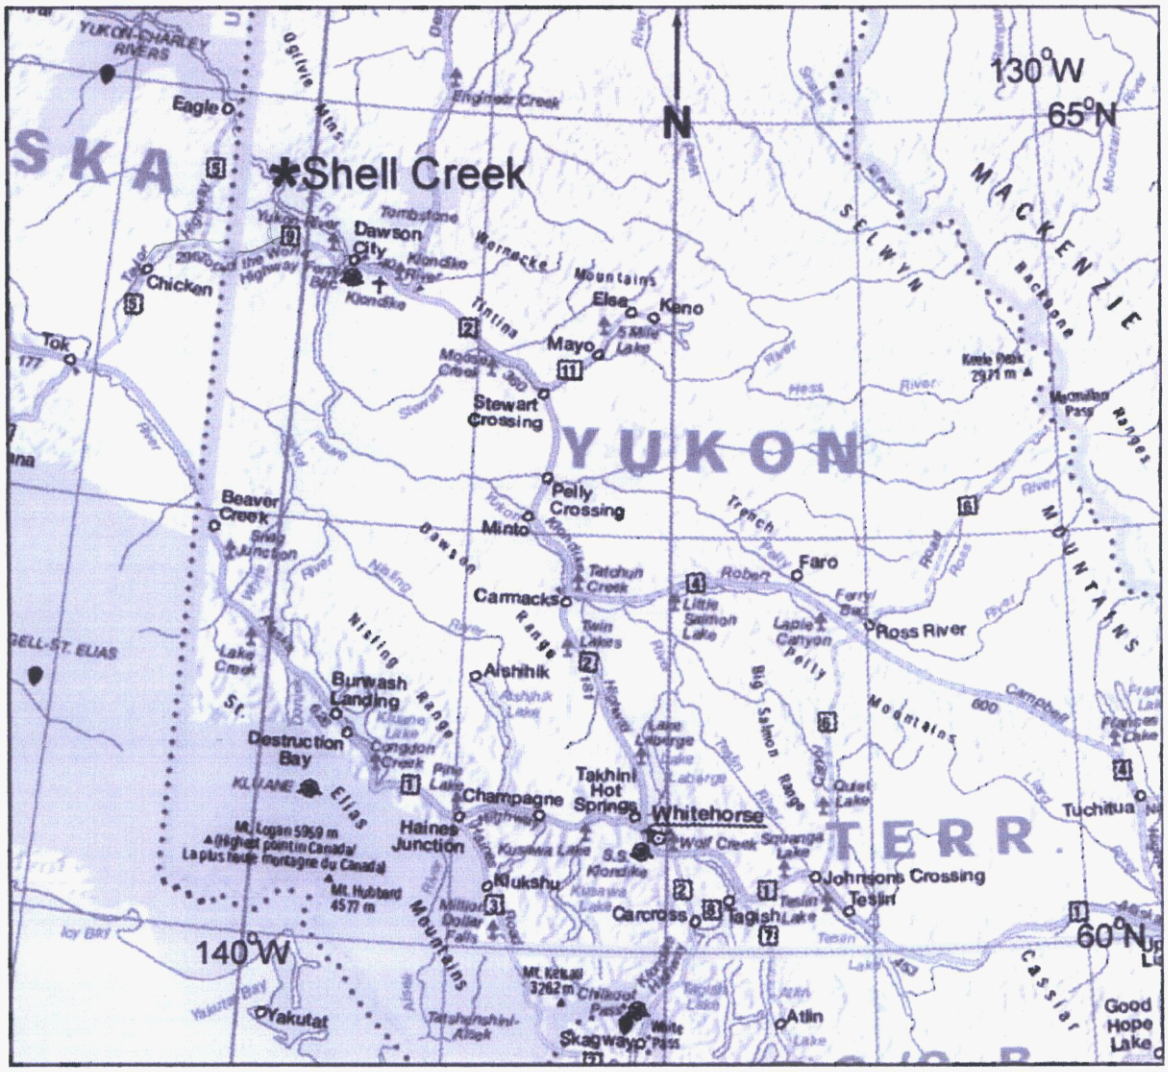

Figure 1 Shell Creek Property Location Map

Quartz Claims

The Shell Creek Property is located on the north side of the Yukon River approximately seventy kilometres by air northwest of Dawson City (Figure 1).

7540 Garfield Drive, Delta, B.C. V4C 7L4
phone: (604) 596-9707 e-mail:voxgeo@telus.net

The property straddles two 1:50,000 NTS mapsheets 116C/09, Shell Creek and 116C/10 Mount Gladman.

All claims are registered in the name of Logan Resources Ltd.

The following claims are staked on NTS mapsheet 116C/09:

N. Simba	1 – 64
Simba	1 – 214, 221 – 240, 249, 251 – 266, 277 & 279 – 488

The following claims are staked on NTS mapsheet 116C/10:

Simba	215 – 220, 241 – 248, 250, 267 – 276, 278, 489 – 536 & 551 – 578

As of August 2005 the property was comprised of 526 claims covering an area of approximately 110 square kilometres or 11,000 hectares.

Complete listings of claims showing registered owner, Mining District, claim numbers and names and expiry dates are attached in Appendix I.

Property History (extracted from Yukon Assessment Reports)

Coal was mined in the Shell Creek area at the turn of the 1900's to supply Dawson City.

"The Shell Creek Iron Formation was discovered and staked in 1956 by Hans and Werner Krause. Their claims were optioned by Asbestos Corporation (Explorations) Ltd., who obtained iron assays of between 40.8% and 48.7% over widths of 90 to 120metres (300 to 400 ft.), with a maximum width of 215 metres (700 ft.)." (Yukon assessment report 017510)

Subsequent geological mapping, dip needle surveying and hand trenching along the unfolded exposed limb of the iron formation west of Shell Creek indicated widths in excess of 120 metres (400 feet).

No structural correlation was obtained between the folded portion on the east side of Shell Creek and the straight limb trending away to the northwest on the west side of the creek.

Claims covering the property were allowed to lapse in 1962 after the Asbestos Corporation dropped its option.

In late 1966 the Geological Survey of Canada published aeromagnetic maps of the area. Although this survey was coarse and regional it was interpreted that "the higher grade folded portion is present on the west side of Shell Creek and that these folds pinch and swell, giving rise to at least two large areas where higher grade folded banded iron formation is present at relatively shallow depth."

7540 Garfield Drive, Delta, B.C. V4C 7L4
phone: (604) 596-9707 e-mail:voxgeo@telus.net

A field examination, by the GSC, suggested that this interpretation was correct and "much good grade iron formation was observed under a shallow cover of talus and moss well beyond the areas previously trenched."

In 1967 the property was acquired by Selwyn Explorations Ltd. (Assessment reports 019111 & 019112).

Selwyn focused on the potential of the iron formations and their development.

No additional exploration activity was located until the ground was acquired by Ryanwood Exploration in 2004.

Geological Setting

The Shell Creek iron formation occurs in late Precambrian or early Cambrian quartzites and chloritic phyllites with minor volcanics underlain by abundant limestones.

The texture and lithology of the banded iron formations (BIF) are similar to those of *magnetic iron formations in Eastern Canada.*

The property lies on the north side of the Tintina Fault.

Yukon Geology
(excerpts from The Geological Framework of the Yukon Territory by C. Hart)

"Yukon's geology divides into two essential components that are, for the most part, separated by the Tintina Trench. Rocks northeast of the Tintina Trench are old (>1000 to 300 million years), mainly sedimentary and represent the *Ancient North American* margin. Rocks southwest of the Tintina Trench are mostly young (350 to 20 million years old), mainly igneous and metamorphic, and represent numerous crustal fragments called *accreted terranes* whose place of origin is uncertain. During most of the Yukon's geological history, the terranes were not attached to North America, but were accreted to the western margin of Ancient North American between 190 and 120 million years ago. Rocks in the zone between the accreted terranes and Ancient North America have been extensively deformed and form a belt known as the *Teslin Suture Zone*. This belt has subsequently been cut by the Tintina Fault which has caused some complexity in this region.

Tintina Fault

The long, linear depression that extends northwesterly across the Yukon from Watson Lake along to Ross River, Faro and Dawson, and then into Alaska is the Tintina Trench. It is the northern continuation of the Northern Rocky Mountain Trench in British Columbia. The Tintina Trench is the physiographic expression of the Tintina Fault. Tectonic forces caused the block of rocks southwest of the fault to grind up against the

7540 Garfield Drive, Delta, B.C. V4C 7L4
phone: (604) 596-9707 e-mail:voxgeo@telus.net

stable North American block and, during a history of innumerable earthquakes, moved the southwestern block northwest towards Alaska. The grinding along the fault caused the rock to break up and become less resistant which, with erosion led to the formation of the trench. Most geological evidence suggests that there was at least 450 km of right-lateral displacement (area southwest of the fault moved northwest) along the Tintina Fault although there may have been as much as 1200 km offset. Volcanic rocks were deposited in the trench about 55 million years ago - probably at the same time as some of the motion along the Tintina Fault."

Aeromagnetic Survey

The helicopter survey was flown by McPhar Geosurveys Ltd. using a high-sensitivity caesium magnetometer. The magnetometer bird was flown at a nominal height of 45m. The survey totaled 1232.8 km on 107 flight lines (200m spacing) and 6 tie lines (2 km spacing). The flight lies were flown on an azimuth of 29° and the tie lines at 119°. The data were field processed by McPhar then forwarded to their Newmarket office for final leveling and filtering. The survey was successful in better defining the distribution, orientation and extent of the banded iron formation (BIF).

In addition to the standard colour contoured Total Magnetic Intensity (TMI) map a series of derivative maps were produced. A preliminary interpretation of the survey was presented to the Company by VOX Geoscience Ltd. on Tuesday May 31st. Included with this report (in pocket) are blackline maps of aeromagnetic contours (Plate 1) and profiles (Plate 2).

The aeromagnetic survey has accurately traced the BIF and has detected many major and minor breaks, offsets and contorted horizons on the property. Two predominate break trends are noted running southwest to northeast and north-northwest to south-southeast. The magnetic amplitude of the BIF is in excess of 6,000 nT above background.

An interpretation of the magnetic data indicates that the two well defined banded iron formation (BIF) horizons are likely the north and south limbs of a slightly deformed syncline that dips towards the south and plunges at a shallow angle towards the east. The axis is parallel to the Tintina Fault. The north limb generally dips to the south at between 45 and 70° while the south limb dips steeply to the south between 70 and 90°. A very pronounced fault is coincident with the valley of Shell Creek. East of the fault the nose of the syncline appears to be compressed and consequently is tightly folded and convoluted.

On the north side of the northern limb of the BIF several discontinuous high magnetic susceptibility features were detected. Discontinuous horizons of lower magnetic susceptibility hint towards additional folding of horizons north of the main syncline.

The aeromagnetic survey also mapped a broad deep-seated magnetic high in the northwest portion of the survey block. This magnetic high could represent a deeper-seated intrusive body that may have influenced the mineralization.

7540 Garfield Drive, Delta, B.C. V4C 7L4
phone: (604) 596-9707 e-mail:voxgeo@telus.net

The property is crisscrossed by many prominent southwest-northeast trending breaks that may represent important structural controls. Ground evaluation is required.

To the west and east of the Shell Creek Property the Tintina Fault is quite evident. Regional aeromagnetic results and topography show that the Tintina Fault lies immediately to the south of the Shell Creek Property.

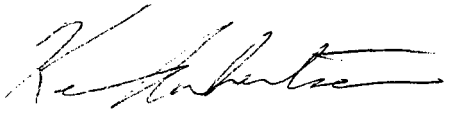
Conclusions and Recommendations

The aeromagnetic survey, flown over the Shell Creek Property, successfully and precisely mapped the banded iron formation horizons.

Windowing a portion of the survey for 3D geophysical inversion could help with the interpretation of the aeromagnetic results and associated structures.

The destruction of some of the magnetic horizons could be evidence of hydrothermal alteration and might point towards areas for detailed ground follow-up. This interpretation will be reinforced if anomalous geochemical assays are obtained in the immediate vicinity of the magnetic lows.

Respectfully submitted,



Ken Robertson, P.Geo.

Survey Progress and Flight Logs

7540 Garfield Drive, Delta, B.C. V4C 7L4
phone: (604) 596-9707 e-mail:voxgeo@telus.net

Daily survey progress and flight logs

April 20, 2005

- Syed Shaw arrived in Whitehorse the evening of April 19th, 2005
- Installation of survey equipment in helicopter started today at the hanger of Trans North Helicopters in Whitehorse
- Syed drove to Dawson City with remaining equipment in the afternoon, helicopter to follow

April 21, 2005

- Installation of equipment finished in the Dawson City hanger.
- Magnetometer and GPS base station setup and running for 24 hours to collect background data

April 22, 2005
Flt # 001

- Flew instrument checks and calibrations.
- Could not fly production lines in Shell Creek survey area because of strong winds.

April 23, 2005
Flt #'s 002 & 003

- Flew survey lines 10 -140 in the Shell Creek survey

April 24, 2005
Flt # 004

- Flew two lines in Shell Creek (lines 150 and 160). Flight was aborted due to strong winds and low visibility.

April 25, 2005
Flt #'s 005 & 006

- Flew lines 170 - 400

April 26, 2005
Flt #'s 007 & 008

- flew lines 410 - 540
- flew lines 550 - 670

April 27, 2005
Flt #'s 009, 010 & 011

- Flew lines 680 - 1020

April 28, 2005
Flt #'s 012 & 013

- Finished flying all the survey lines and tie lines in Shell Creek.

Accumulated kilometres (April 20 to April 28, 2005): 1232.8
Accumulated hours flown: 34.9

SURVEY HELICOPTER

It is understood that Logan Resources Ltd. will, at its expense, provide a suitable helicopter, its fuel and flight crew.

SURVEY INSTRUMENTS

A HeliMAG system, complete with the following instruments will be utilized:

- A Scintrex CS-3 high-sensitivity cesium magnetometer installed in a towed-bird airfoil, 0.001 nT/10 Hz resolution
- A GPS Navigation System, comprising a NovAtel PowerPAK GPS receiver, and a GPS computer and pilot steering indicator (PSI)
- A Terra TRA-3000/TRI-30 Radar Altimeter
- A PC-based Data Acquisition System
- A Magnetometer Base Station, comprising a KMAG4 Magnetometer Base Station, comprising a Scintrex CS-3 Cesium Magnetometer and accessories. Synchronization of the system with the airborne system will be via GPS time.
- A complement of spare parts will be maintained at the survey site.

1. Airborne High Sensitivity Magnetometer

A Scintrex CS-3 high-sensitivity, optically pumped airborne cesium magnetometer, with a sensitivity of 0.001 nT will be utilized. This high-sensitivity magnetometer will be installed in a towed-bird airfoil. The magnetometer will perform continuously in areas of high magnetic gradient with the ambient range of the sensor approximately 20,000-100,000 nT. Aerodynamic magnetometer noise will not exceed 0.5 nT.

Sampling rate of the magnetometer will be 10 times per second (10Hz).

The CS-3 is described in Appendix.

2. GPS Satellite Navigation System

A GPS navigation system will be used to provide in-flight navigation control. This GPS navigation system will operate on 12-channels. The receiver to be used on the helicopter will be a NovAtel ProPak GPS model. A pilot steering indicator and a Navigation Computer will provide steering and horizontal track guidance to the pilot. Another NovAtel ProPak GPS system will used as a base station.

Post survey differential corrections will be performed by means of a program called C3NAV.

7540 Garfield Drive, Delta, B.C. V4C 7L4
phone: (604) 596-9707 e-mail:voxgeo@telus.net

3. Radar Altimeter

A Terra TRA3000 radar altimeter system will record the ground clearance to an accuracy of about 30 cm (1 foot), over a range of 12 to 762 metres (40ft to 2,500ft).

The altimeter will be interfaced to the data acquisition system with an output repetition rate of 1 second, and will be digitally recorded.

4. Data Acquisition/Recording System

Survey data will be digitally recorded on a PC-based Data Acquisition System (DAS). The DAS is not only a powerful data acquisition system; it is also a fully PC-compatible microcomputer, built around a PENTIUM CPU board. All data collection routines, checking, buffering, recording and verification are software controlled for maximum flexibility. A modular concept has been used for both the software and the hardware to allow for future expandability. The five main functions fulfilled by the DAS are: 1) system control and monitoring, 2) data acquisition, 3) real-time data processing, 4) navigation, and 5) data playback and analysis. The DAS is controlled and operated by a standard keyboard, and is supplied with a number of expansion slots, into which may be installed various processor modules, such as a cesium magnetometer processor; an Analog/Digital converter; etc.

In this system, survey data is digitally recorded directly onto the DAS' internal hard disk. On completion of the days flying, the survey data which has been stored on the hard disk is backed-up to FLASH card and then copied to the Field Workstation.

5. Magnetometer Base Station

The Magnetometer Base Station will comprise a KMAG processor/datalogger and another Scintrex CS-3 cesium magnetometer.

The base-station magnetometer, with digital recording, will be operated continuously throughout the airborne data acquisition work with a sensitivity of 0.01 nT at one second intervals. The ground and airborne system clocks will be synchronised using GPS time, to an accuracy of 1 second or better. At the end of the day's work, the digital data will be transferred from the base station's data-logger to CD-ROM.

This base station will be located at the base camp in reasonable proximity to the survey area, in a region of low magnetic gradient (less than 2nT/m). The base station will be sited away from moving steel objects, vehicles or power transmission lines to ensure minimum interference and noise levels.

6. Spares

A normal compliment of spare parts will be available in the field.

7540 Garfield Drive, Delta, B.C. V4C 7L4
phone: (604) 596-9707 e-mail:voxgeo@telus.net

INSTRUMENT CHECKS AND CALIBRATIONS

a. Magnetic Heading Effect

The magnetic heading effect will be determined by flying a cloverleaf pattern oriented in the same direction as the survey lines and tie lines. At least two passes in each direction will be flown over a recognizable feature on the ground in order to obtain sufficient statistical information to estimate the heading error. The heading error will be determined before and after the survey.

b. Lag Test

A Lag Test will be performed to ascertain the time difference between the magnetometer readings and the operation of the GPS System. Test flights will be flown in two directions at survey altitude across distinct anomalies.

These lag tests will be carried out before the start of survey production flights, and after any major survey equipment alteration or replacement has been made. Results of lag tests will be submitted in the final report.

c. Altimeter Calibration Checks

Checks of the radar altimeter calibration will be undertaken before and after the survey. The calibration will be determined by comparing the radar altitude with a suitable reading from the GPS system during a radar "stack" over the landing pad or a suitable level area where the height above sea-level (ASL) is accurately known.

SAFETY AND ENVIRONMENTAL PROCEDURES

The geophysical system to be used on this survey will weigh approximately 60 kg including the towed-bird. This weight, together with a pilot and an operator, emergency gear and full fuel means that most small to mid-size helicopters should perform very well at the expected survey altitudes.

For the duration of the work, McPhar will require that the work is carried out with the utmost regard for safety, and that all personnel are fully conversant with the safety standards considered normal in the helicopter aviation industry and more importantly, of IAGSA (International Airborne Geophysics Safety Association). Our technician will review and establish safety procedures with the helicopter pilot and will specifically ensure that he is aware of emergency and radio communications procedures.

7540 Garfield Drive, Delta, B.C. V4C 7L4
phone: (604) 596-9707 e-mail:voxgeo@telus.net

FIELD PERSONNEL

McPhar will provide an experienced technician/operator to maintain and operate the survey equipment.

QUALITY CONTROL

Basic quality control of newly acquired airborne data would be undertaken in the field by McPhar's technician, on a daily basis, and then passed on to the client's representative in the field.

DATA PROCESSING

Preliminary and final data processing will be undertaken for the Client by McPhar.

DELIVERABLE PRODUCTS

It is understood that there are no Deliverable Products to be prepared for this survey. McPhar's technician in the field will provide the Client's representative with survey data on a regular basis as digital files in ASCII format on CD-ROM.

Appendix VI

Statement of Material Fact

7540 Garfield Drive, Delta, B.C. V4C 7L4
phone: (604) 596-9707 e-mail:voxgeo@telus.net

CERTIFICATE of AUTHOR

Kenneth A. Robertson, P.Geo.
Telephone: (604) 596-9707
Email: voxgeo@telus.net

I, Kenneth A. Robertson, P.Geo. do hereby certify that:

1. I am president of:

   VOX Geoscience Ltd.,
   7540 Garfield Drive,
   Delta, B.C., Canada,
   V4C 7L4

2. I graduated with a degree in Geology and Physics (H.B.Sc.) from the University of Toronto in 1977.

3. I am a member of the Association of Professional Engineers and Geoscientists of the Province of British Columbia (registration number 20630).

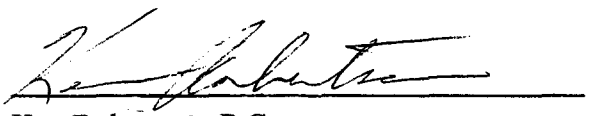
4. I have worked as a geophysicist/geologist for a total of twenty-seven years since my graduation from university.

5. I have read the definition of "qualified person" set out in National Instrument 43-101 ("NI 43-101") and certify that by reason of my education, affiliation with a professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements to be a "qualified person" for the purpose of NI 43-101.

6. I am responsible for the preparation of the assessment report titled "Report of Aeromagnetic Geophysical Survey Conducted on the Shell Creek Property".

7. I have not had prior involvement with the property that is the subject of this Report.

8. I am not aware of any material fact or material change with respect to the subject matter of the Report that is not reflected in the Report, the omission to disclose which makes the Report misleading.



Ken Robertson, P.Geo.
