Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

K15-327 was drilled to target the Santorini geophysical anomaly. Total planned depth was ~ 250 m and the hole was shut down at 221m. Hole was collared in fine grained RHYvl followed by alternation of volcanoclastic unit and mafic intrusive/sill intervals, characterized by a moderate chlorite alteration, which occurring as very fine grained bands and also pervasive, usually associated with Po/Sp/Cpy mineralization. The hole intercepted two narrows intervals of OJ (Cpy/GL/Sp rich) at 63.5m (~50cm) and 83m (~1m) hosted within volcanoclastic rhyolite, these intervals were also intensely chlorite altered and contained patchy cordierite porphyroblasts. Interestingly between 183.5 to 214.35m, we intercepted unit of oligomictic, clasts supported, pebble to cobble sized volcanic metaconglomerate. It's difficult to be totally confident for this protolith due to alteration/foliation intensity.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

6.65 10.05 RHYv Rhyolite volcaniclastic FMG

6.65 - 10.05: Light grey/greenish, fine to medium grained matrix, moderately foliated. Comprising siliceous bands, mm to cm wide, irregular and locally dismembered. Could be lapilli/clast strongly stretched/flattered, pebble size. Moderately MU/SI altered. Probably volcanoclastic interval.

<<Min: 6.65 - 7.65 2% Min: Pyrite>> Finely disseminated and also thin stringers.

<<Min: 6.65 - 9.3 4% Min: Calcite>> Associated with siliceous bands and qtz veinlets, blebs.

<<Min: 7.65 - 10.05 0.5% Min: Pyrite>>

<<Min: 9.3 - 11.2 12% Min: Calcite>> +/- pervasive/patchy

<<Alt: 6.65 - 10.05 Moderate (Alt) Silicification>> Occuring as concordant siliceous bands associated with diffuse fuschite (weak).

<<Alt: 6.65 - 10.05 Weak (Alt) Muscovite>> Weak to moderate MU alteration, fracture surface.

10.05 38.55 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green-brown FCG

10.05 - 38.55: Green to brownish, massive, coarse grained, weak/moderately foliated. Comprising BI/CL clots distributed within matrix, cm size, moderately flattered. "gabbroic" texture. CL clots Could be mafic phenocristal relics (pyroxene/amphibole?). BI occuring as small disseminated clots/flakes, more concentrate at the margins of the unit. Weakly Ca altered, occuring as blebs/patchy and locally pervasive. Trace of mineralization (PO).

<<Min: 10.05 - 38.55 0.1% Min: Pyrite>>

<<Min: 11.2 - 25.6 3% Min: Calcite>> Mainly fracture filling/thin veinlets, and also isolated blebs.

<<Min: 25.6 - 37.5 2% Min: Calcite>> Weakly calcite altered.

<<Min: 37.5 - 38.55 6% Min: Calcite>> MAFi. Blebs/veinlets

<<Alt: 10.05 - 13 Moderate (Alt) Biotite>> Small/medium sized Bi clots/flakes, distributed within the matrix.

<<Alt: 10.05 - 39 Moderate (Alt) Chlorite>> Pervasive and also occuring as altered clots.

<<Alt: 13 - 36.42 Weak (Alt) Biotite>> small/medium sized Bi clots/flakes, distributed within the matrix.

<<Alt: 36.42 - 38.55 Strong (Alt) Biotite>> small/medium sized Bi clots/flakes, distributed within the matrix.

<<Vein: 23 - 23.22 30% Calcite>> Vesicular calcite veins, 3-5 cm wide, irregular oriented.

<<Vein: 25.45 - 25.52 80% Calcite 75 deg. >> Regular calcite +/- qtz vein, 5 cm wide, discordant.

<<Struc: 32 - 32.01 Weak (Alt) Foliation>>

38.55 48.35 RHYva Coarse grained to ash tuff green FG

38.55 - 48.35: Light grey/greenish, fine grained, homogeneous, moderately foliated. <10 % of mm qtz grains distributed within MU altered fine grained matrix. Locally crosscut by deformed qtz veins. Probably fine grained ash tuff.

<<Min: 38.55 - 39.55 1% Min: Sphalerite>> Disseminated within veins.

<<Min: 38.55 - 39.55 1% Min: Pyrite>> Aggregate within Qtz veins.

<<Min: 38.55 - 39.55 2% Min: Pyrrhotite>> Aggregate within Qtz veins.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 38.55 - 48.35 3% Min: Calcite>> Blebs/fracture filling.

<<Min: 39.55 - 40.65 1% Min: Sphalerite>> Occuring as thin veinlets/stringers associated with py.

<<Min: 39.55 - 40.65 1% Min: Pyrite>> Occuring as thin veinlets/stringers associated with sp

<<Min: 40.65 - 48.35 1% Min: Pyrite>> Thin stringers.

<<Alt: 38.55 - 49.18 Moderate (Alt) Muscovite>>

<<Vein: 38.55 - 39.55 30% Quartz>> Interval comprising deformed and dismembered qtz veins, 1-10 cm wide. Associated with PO/PY/SP aggregates.

<<Vein: 44.3 - 44.35 95% Quartz 80 deg. >> Regular grey qtz vein, +/- Ca, seems "boudinaged".

<<Struc: 47 - 47.01 Moderate (Alt) Foliation>>

48.35	**62.56**	**MAFi**	**Mafic Intrusions (primarily footwall mafic intrusion)**	**green**	**FCG**	62.00	62.56	0.56	B00232803	27.8	0.051	0.58	0.19	1.42

48.35 - 62.56: Green to brownish, massive, coarse grained, weak/moderately foliated. Comprising BI/CL clots distributed within matrix, cm size, moderately flattered. . CL clots could be mafic phenocristal relics (pyroxene/amphibole?). At the top of unit, strong Si alteration interval associated with diffuse fuschite and Sp stringers. BI occuring as small disseminated clots/flakes, more concentrate at the margins of the unit. Moderately Ca altered, occuring as blebs/veinlets/patchy and locally pervasive. Trace of mineralization (PO).

<<Min: 48.35 - 49 5% Min: Sphalerite>> Occuring as thin concordant bands/stringers/fracture filling? Associated with diffuse SI/fuschite.

<<Min: 48.35 - 49 3% Min: Pyrite>> Occuring as thin concordant bands/stringers/fracture filling? Associated with diffuse SI/fuschite.

<<Min: 48.35 - 62.56 6% Min: Calcite>>

<<Min: 49 - 50.07 1% Min: Pyrite>>

<<Min: 50.07 - 50.5 0.1% Min: Pyrite>>

<<Min: 50.5 - 51.32 4% Min: Sphalerite>> Occuring as thin concordant bands/stringers/fracture filling? Associated with diffuse SI/fuschite.

<<Min: 50.5 - 51.32 1% Min: Pyrite>> Occuring as thin concordant bands/stringers/fracture filling? Associated with diffuse SI/fuschite.

<<Min: 51.32 - 54 0.5% Min: Pyrrhotite>> disseminated aggregate locally associated with Cpy.

<<Min: 51.32 - 54 0.1% Min: Chalcopyrite>> Associated with PO aggregate.

<<Min: 54 - 62.56 0.1% Min: Pyrrhotite>>

<<Alt: 48.35 - 49.18 Moderate (Alt) Silicification>> Occuring as concordant bands

		<<Min: 95 - 124.6 1% Min: Calcite>> Weak Ca altered.
		<<Min: 101.05 - 103.2 4% Min: Pyrite>> medium/coarse grained.
		<<Min: 101.05 - 103.2 1% Min: Pyrrhotite>>
		<<Alt: 91.85 - 103.2 Moderate (Alt) Muscovite>> 2-3 intensity. Original? Shiny fracture surface.
		<<Vein: 92.68 - 92.92 60% Quartz-Carbonate>> Qtz-dol- +/-Ak veins, >10 cm wide, deformed.
101.36	**102.55**	**RHYcw Curdy textured-flow banded grey CG (flows, subvolcanics)**
		101.36 - 102.55: Grey to greenish, coarse grained, heterogeneous. Moderately MU altered, "shiny" fracture surface. Weakly chlorite altered. Moderately foliated. Banded/curdy texture, marked by siliceous bands, deformed/folded and sometime dismembered, RHYcw intervals? Could be RHYvl with >40 % of clats/lapilli pebble size.
102.55	**112.77**	**RHY undifferentiated rhyolite grey-green FCG**
		102.55 - 112.77: Grey to greenish, fine to coarse grained, heterogeneous texture. Weak to moderately CL altered (Original alteration?), weakly MU altered. Locally comprising deformed/flattered fragments/clasts or lapilli? Distributed within matrix, mm to cm size, could be dismembered siliceous bands. After 107.75m, Moderate to strong CL alteration (original?) associated with weak cordierite (porphyroblast). It's difficult to determinate the protolith due to alteration intensity.
		<<Min: 103.2 - 104.3 5% Min: Pyrrhotite>> Occuring as bands/stringers with trace of Cp.
		<<Min: 103.2 - 104.3 0.1% Min: Chalcopyrite>> Associated with Po.
		<<Min: 104.3 - 104.8 2% Min: Pyrrhotite>>
		<<Min: 104.8 - 104.93 2% Min: Sphalerite>> Associated with Po band.
		<<Min: 104.8 - 104.93 7% Min: Pyrrhotite>> Occuring as semi-massive band, 2 cm wide
		<<Min: 104.8 - 104.93 4% Min: Galena>> Associated with Po band.
		<<Min: 104.93 - 105.47 1% Min: Pyrrhotite>>
		<<Min: 105.47 - 107.75 2% Min: Pyrrhotite>> Also thin veinlets
		<<Min: 105.47 - 108.15 0.1% Min: Chalcopyrite>> Associated with Po.
		<<Min: 108.15 - 109 6% Min: Sphalerite>> Occuring as thin veinlets.
		<<Min: 108.15 - 109 1% Min: Chalcopyrite>> Disseminated/patchy
		<<Min: 109 - 112.77 2% Min: Sphalerite>> Bands
		<<Min: 109 - 112.77 1% Min: Pyrrhotite>>
		<<Min: 109 - 112.77 0.5% Min: Chalcopyrite>>
		<<Alt: 103.2 - 107.75 Weak (Alt) Chlorite>> Occuring as interstitial bands.
		<<Alt: 107.75 - 112.77 Strong (Alt) Chlorite>> Occuring as pervasive bands, associated with Sp/Po stringers.

From (m)	To (m)	Rocktype & Description

<<Alt: 107.75 - 112.77 Weak (Alt) Cordierite>> Small cordierite porphyroblats distributed within matrix.

<<Alt: 109.2 - 112.77 Weak (Alt) Muscovite>> Original? Shiny on fracture surface.

<<Struc: 104 - 104.01 Moderate (Alt) Foliation>>

<<Struc: 108 - 108.01 Strong (Alt) Foliation>>

112.77 126.45 RHY undifferentiated rhyolite grey-green FCG

112.77 - 126.45: Grey to greenish, fine to coarse grained, heterogeneous texture. Weak to moderately CL altered (Original alteration?), weak/moderately MU altered. Comprising deformed fragments/clasts/lapilli or siliceous bands affected by 2 foliation, moderately crenulated, RHYc ? ~ 4-5 % of blue QE. After 119.5 m, strong original CL alteration associated with PO disseminated. It's difficult to be confident for the protolith due to alteration intensity.

<<Min: 112.77 - 119.5 0.5% Min: Pyrrhotite>>

<<Min: 119.5 - 122.15 0.5% Min: Pyrite>>

<<Min: 119.5 - 122.15 2% Min: Pyrrhotite>> Associated with chlorite interval

<<Min: 122.15 - 124.6 0.5% Min: Pyrrhotite>>

<<Min: 124.6 - 126.45 0.5% Min: Pyrite>> Associated with qtz-ca-Cl veins.

<<Min: 124.6 - 126.45 3% Min: Calcite>>

<<Min: 124.6 - 137.15 1% Min: Pyrrhotite>> Matrix disseminated and at the margins of Qtz veins.

<<Alt: 112.77 - 119.5 Moderate (Alt) Muscovite>> Original? Shiny on fracture surface.

<<Alt: 112.77 - 119.5 Weak (Alt) Chlorite>> Occuring as thin pervasive bands.

<<Alt: 119.5 - 123.9 Strong (Alt) Chlorite>> Strong pervasive chlorite associated with PO disseminated.

<<Alt: 123.9 - 135.68 Moderate (Alt) Chlorite>> Original alteration? Associated with Biotite porphyroblats.

<<Vein: 120.85 - 123 8% Quartz-Carbonate>> Interval comprising qtz-+/-dol/ca, strongly deformed/boudinaged, margins strongly chlorite altered.

<<Vein: 124.6 - 125.57 40% Quartz-Carbonate 80 deg. >> Multiple qtz-cal veins, 2-15 cm wide, strongly deformed, subconcordant, margins strongly CL altered.

126.45 127.03 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey-green FG

126.45 - 127.03: Short interval of fine grained MAFi, matrix chlorite altered comprising small biotite porphyroblasts/flakes. Sharp upper and lower contact. Strong calcite, occuring as small blebs and concordant veinlets.

<<Min: 126.45 - 127.03 5% Min: Calcite>>

<<Alt: 126.45 - 144 Weak (Alt) Biotite>> Small biotite porphyroblats/flakes, mm size, distributed within the matrix.

127.03 137.75 RHYv Rhyolite volcaniclastic green FCG

127.03 - 137.75: greenish, fine to coarse grained, massive unit. Comprising clasts/lapilli, siliceous, deformed/flattered, affected by 2 foliation, mm to cm (pebble size) size. Fine grained matrix, moderate CL altered. Characterized by ~10% of mm porphyroblasts of biotite disseminated (clots/flakes). Comprising qtz-ca-+/-Cl veins/veinlets. Could be volcanoclastic unit (Vl?) or sedimentary unit. It's difficult to be confident for the protolith due to alteration intensity.

Project: KZK **Hole Number:** K15-328

Prospect:	Santorini	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Florent Pons
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Florent Pons	Date Logging Start:	24-Nov-15
UTM Easting	414678	Core Size:	HQ3	Azimuth:	194.8	Date Logging Complete:	27-Nov-15
UTM Northing:	6815205	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1429.195	Casing Depth (m):	7	Length (m):	236	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	23-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK camp	Drill Completed:	26-Nov-15
Local Elev. (m):						Purpose:	Exploration
						Parent Hole:	

Comments:

K15-328 was drilled to target the Santorini geophysical anomaly. Total planned depth was ~ 250 m and the hole was shut down at 236m. Hole was collared in fine grained RHYvl followed by alternation of volcanoclastic unit and mafic intrusive/sill intervals, characterized by a moderate chlorite alteration, which occurring as very fine grained bands and also pervasive, usually associated with Po/Sp/Cpy mineralization. We intercepted two narrows intervals of OJ (Cpy/GL/Sp rich) at 80.75m (~15cm) and 84.67m (~85cm) hosted within volcanoclastic rhyolite, these intervals were also intensely chlorite altered and contained patchy cordierite porphyroblasts. Interestingly between 197.3 to 232.1m, we intercepted unit of oligomictic, clasts supported, pebble to cobble sized volcanic metaconglomerate. It's difficult to be totally confident for this protolith due to alteration/foliation intensity.

9.78 13.10 RHYvl Lapilli tuff beige FCG

9.78 - 13.1: Beige to light grey/greenish, fine to coarse grained matrix, moderately foliated (planar cleavage). Comprising siliceous fragment/lapilli, mm to cm size, stretched and flattered within foliation, and locally appears as dismembered bands. Could be volcanoclastic unit, lapilli tuff. Moderately MU/SI altered.
13.1-13.58m: RHYi intrusive or intense silica alteration band.

<<Min: 9.78 - 13.1 1% Min: Pyrite>>

<<Min: 9.78 - 15.5 2% Min: Calcite>>

13.10 13.58 RHYi Aphanitic Rhyolite (intrusion) grey VFG

13.1 - 13.58: Grey, aphanitic to very fine grained, homogeneous, +/- sharp upper and lower contacts. Intensively siliceous. Could be RHYi intrusive or Intense silica alteration band.

<<Alt: 13.1 - 13.58 Intense (Alt) Silicification>> Associated with RHYi intrusion?

13.58 19.80 RHYvl Lapilli tuff grey-green FCG

13.58 - 19.8: Beige to light grey/greenish, fine to coarse grained matrix, moderately foliated (planar cleavage). Comprising siliceous fragment/lapilli, mm to cm size, stretched and flattered within foliation, and locally appears as dismembered bands. Could be volcanoclastic unit, lapilli tuff. Moderately MU/SI altered.
13.1-13.58m: RHYi intrusive (clast?) or intense silica alteration band. Calcite alteration increases from 15.5m to MAFi contact.

<<Min: 13.58 - 13.9 0.5% Min: Pyrite>>

<<Min: 13.9 - 17.25 2% Min: Pyrite>>

<<Min: 15.5 - 19.8 6% Min: Calcite>> Occuring as thin veinlets and disseminated blebs.

<<Min: 17.25 - 19.8 3% Min: Pyrrhotite>> Occuring as thin stringers.

<<Alt: 14.2 - 19.8 Moderate (Alt) Muscovite>> "shiny" fracture surface.

<<Struc: 15 - 15.01 Moderate (Alt) Foliation>>

19.80 36.35 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green FCG

19.8 - 36.35: Green to brownish, massive, coarse grained, weak/moderately foliated. Comprising BI/CL clots distributed within matrix, cm size, moderately flattered. "gabbroic" texture marked by large CL clots, which could be mafic phenocristal relics (pyroxene/amphibole?). BI occuring as small disseminated clots/flakes, more concentrate at the margins of the unit. Weakly Ca altered, occuring as blebs/patchy and locally pervasive. Trace of mineralization (PO).

<<Min: 19.8 - 22.75 12% Min: Calcite>> Pervasive/blebs and associated with massive qtz-calcite veins.

<<Min: 19.8 - 36.35 0.5% Min: Pyrrhotite>> Trace of PO.

<<Min: 22.75 - 35.2 1% Min: Calcite>> Trace.

<<Min: 35.2 - 42 5% Min: Calcite>> Occuring as thin veinlets and disseminated blebs.

<<Alt: 19.8 - 23 Moderate (Alt) Biotite>> Small/medium sized Bi clots/flakes, distributed within the matrix.

<<Alt: 19.8 - 36.35 Moderate (Alt) Chlorite>> Pervasive and also occuring as altered clots.

<<Min: 133.85 - 134.5 3% Min: Pyrrhotite>>

<<Alt: 121.73 - 134.5 Strong (Alt) Chlorite>> Strong Chlorite alteration associated with mineralization.

134.50 138.12 RHYv Rhyolite volcaniclastic grey CG

134.5 - 138.12: grey, coarse grained, massive unit. Comprising clasts/lapilli, siliceous, deformed/flattered, locally affected by 2 foliation, mm to cm (pebble size) size. Moderately CL altered. Characterized by ~10% of mm porphyroblasts of biotite disseminated (clots/flakes). Comprising qtz-ca-+/-Cl veins/veinlets. Probably volcanoclastic unit (Vl?).

<<Min: 134.5 - 143.55 1% Min: Pyrite>> disseminated/wispy

<<Min: 134.5 - 143.55 0.5% Min: Pyrrhotite>> disseminated/wispy

<<Alt: 134.5 - 145 Moderate (Alt) Chlorite>> Original alt process? Weak to moderate chlorite alteration (pervasive)

<<Alt: 136 - 160 Weak (Alt) Biotite>> Small biotite porphyroblats/flakes, mm size, distributed within the matrix.

138.12 138.65 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey FMG

138.12 - 138.65: Short interval of fine grained MAFi, matrix chlorite altered comprising small biotite porphyroblasts/flakes. Diffuse upper and lower contact. Strong calcite, occuring as small blebs and concordant veinlets, also pervasive.

<<Min: 138.12 - 138.65 12% Min: Calcite>> Occuring as thin veinlets and disseminated blebs. Also pervasive

138.65 140.55 RHYv Rhyolite volcaniclastic grey CG

138.65 - 140.55: grey, coarse grained, massive unit. Comprising clasts/lapilli, siliceous, deformed/flattered, locally affected by 2 foliation, mm to cm (pebble size) size. Moderately CL altered. Characterized by ~10% of mm porphyroblasts of biotite disseminated (clots/flakes). Comprising qtz-ca-+/-Cl veins/veinlets. Probably volcanoclastic unit (Vl?).

<<Min: 138.65 - 140.55 0.5% Min: Calcite>>

140.55 141.20 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey FMG

140.55 - 141.2: Short interval of fine grained MAFi, matrix chlorite altered comprising small biotite porphyroblasts/flakes. Diffuse upper and lower contact. Strong calcite, occuring as small blebs and concordant veinlets, also pervasive.

<<Min: 140.55 - 141.2 12% Min: Calcite>> Occuring as thin veinlets and disseminated blebs. Also pervasive

141.20 150.35 RHYv Rhyolite volcaniclastic grey CG

141.2 - 150.35: grey, coarse grained, massive unit. Comprising clasts/lapilli, siliceous, deformed/flattered, locally affected by 2 foliation, mm to cm (gravel to pebble size). Moderately CL and weakly Si altered. Characterized by >10% of mm porphyroblasts of biotite disseminated (clots/flakes). Comprising qtz-ca-+/-Cl veins/veinlets.From 148.6 to 150.35m, medium grained ash? Bedding texture marked by alternation of ash tuff and lapilli sequence. Probably volcanoclastic unit (Vl?).

<<Min: 141.2 - 162.45 1% Min: Calcite>> Trace.

<<Min: 143.55 - 162.45 0.5% Min: Pyrite>>

150.35 151.90 RHYcw Curdy textured-flow banded (flows, subvolcanics) cream FG

150.35 - 151.9: Interval marked by "flow banded" texture, marked by siliceous (leucocratic) bands/clasts, concordant, locally dismembered? Seems intercaled by moderate/coarse grained tuff, bedding. Could be clasts/lapilli supported sequence (over 80 %) or Silica alteration? No sharp contacts, no strong evidence for RHYcw.

<<Alt: 150.35 - 151.9 Strong (Alt) Silicification>> Occuring as bands. Banded texture

151.90 162.45 RHYv Rhyolite volcaniclastic grey CG

151.9 - 162.45: grey, coarse grained, massive unit. Comprising clasts/lapilli, siliceous, deformed/flattered, locally affected by 2 foliation, mm to cm (gravel to pebble size) size. Moderately CL and weakly Si altered. Characterized by >10% of mm porphyroblasts of biotite disseminated (clots/flakes). Comprising qtz-ca-+/-Cl veins/veinlets.From 148.6 to 150.35m, medium grained ash? Bedding texture marked by alternation of fine/medium grained ash tuff and lapilli sequence. Probably volcanoclastic unit (Vl?).

<<Vein: 158.3 - 158.6 40% Quartz>> Irregular and deformed qtz veins, "boudinaged" texture, centimetric.

<<Struc: 152 - 152.01 Moderate (Alt) Foliation>>

<<Struc: 161.05 - 161.3 Strong (Alt) Fault>> Fault gouge

162.45 164.45 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey FMG

162.45 - 164.45: Dark grey, fine to medium grained, strongly calcite altered (pervasive). Matrix biotite altered, pervasive. Could be mafic intrusive.

<<Min: 162.45 - 164.45 3% Min: Pyrite>> Very thin wisps/stringers.

<<Min: 162.45 - 164.45 3% Min: Pyrrhotite>> Very thin wisps/stringers.

<<Min: 162.45 - 164.45 10% Min: Calcite>> MAFi associated.

164.45 168.12 RHYva Coarse grained to ash tuff grey FCG

164.45 - 168.12: Grey, fine grained, bedding texture marked by lapillitic/clastic sequence. Blue QE are distributed within matrix. Unit moderately/strobgly factured.

<<Min: 164.45 - 168.12 1% Min: Pyrrhotite>> Disseminated

<<Min: 164.45 - 168.12 2% Min: Calcite>>

<<Alt: 167.2 - 168.12 Intense (Alt) Silicification>> Pervasive. Associated with siliceous bands/lapillis?

<<Struc: 165.7 - 167.2 Moderate (Alt) Fault>> Interval comprising multiple minor fault gouge. Moderately fractured.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

168.12 170.37 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey FCG

168.12 - 170.37: Dark grey, fine to medium grained, strongly calcite altered (pervasive). Matrix biotite altered, pervasive. Could be mafic intrusive.

<<Min: 168.12 - 170.37 5% Min: Pyrrhotite>> Disseminated

<<Min: 168.12 - 170.37 10% Min: Calcite>> MAFi associated.

<<Alt: 168.12 - 170.37 Moderate (Alt) Biotite>> Pervasive and porphyroblasts/flakes. Associated with MAFi interval.

<<Vein: 168.12 - 169.2 40% Quartz-Carbonate>> Interval comprising multiple qtz-carbonate veins, strongly deformed, decimetric size, Po at the margins.

<<Struc: 170 - 170.01 Moderate (Alt) Foliation>>

170.37 176.00 RHYva Coarse grained to ash tuff grey FCG

170.37 - 176: Grey, fine grained, weak/moderately chlorite altered (pervasive). ~ 5 % of small crystals/porphyroblasts distributed with matrix, could be felspar relics. Comprising interval of lapilli/clasts, pebble size, with sorting well conserved. This intervals occuring as bands with "flow banded" texture. Blue QE disseminated.

<<Min: 170.37 - 174.33 3% Min: Pyrrhotite>>

<<Min: 170.37 - 182.48 4% Min: Calcite>> Also thin veinlets

<<Min: 174.33 - 177.65 2% Min: Pyrrhotite>> Wisps/disseminated.

<<Min: 174.33 - 182.48 1% Min: Pyrite>>

<<Alt: 172.4 - 173.1 Strong (Alt) Silicification>> Pervasive. Associated with siliceous bands/lapillis?

<<Vein: 171.3 - 173.45 5% Quartz 80 deg. >> Multiple qtz veins, associated with carbonate (weak), subconcordant, deformed, 1-5 cm wide.

176.00 182.48 RHYv Rhyolite volcaniclastic grey-brown FCG

176 - 182.48: Grey to brownish, heterogene, strongly foliated, weak to moderately altered (MU/CL/bi). This unit looks like an strongly foliated volcanic agglomerate, clasts supported, polygenetic, pebble to cobble size. The clats are strongly stretched/flattered within foliation, altered Mu and CL, marked a weak "ribbon/banded" texture. Could be alteration bands within volcanoclastic RHY. It's difficult to be confident for the protolith (agglomerate) due to alteration/foliation intensity.

<<Alt: 176 - 182.48 Weak (Alt) Chlorite>>

<<Alt: 177.6 - 182.48 Weak (Alt) Biotite>> Also occuring as bands.

182.48 183.65 RHYva Coarse grained to ash tuff brown FG

182.48 - 183.65: Brownish, fine to medium grained, bedding texture marked by thin fine grained beds. Ash tuffaceous interval. Gradual contacts.

<<Min: 182.48 - 183.65 3% Min: Pyrite>>

<<Min: 182.48 - 183.65 12% Min: Calcite>> Disseminated within fine grained RHYva,

<<Alt: 182.48 - 183.65 Moderate (Alt) Biotite>> Associated with fine grained ash tuff.

<<Vein: 182.87 - 183.15 60% Quartz>> deformed qtz-carb-Cl veins, crosscuted by tourmaline veinlet.

<<Struc: 182.5 - 182.51 >>

183.65 197.30 RHYv Rhyolite volcaniclastic grey-green FCG

183.65 - 197.3: Grey to brownish, heterogene, strongly foliated, weak to moderately altered (MU/CL/bi). This unit looks like an strongly foliated volcanoclastic unit, clasts supported, polygenetic, pebble size. The clats are strongly stretched/flattered within foliation, altered Mu and CL. Could be alteration bands within volcanoclastic RHY.

<<Min: 183.65 - 184.75 1% Min: Pyrite>>

<<Min: 183.65 - 188 4% Min: Calcite>>

<<Min: 183.65 - 222.7 1% Min: Calcite>> Locally associated with veins/veinlets

<<Min: 184.75 - 185.26 2% Min: Pyrite>> At the margins of tourmaline veins.

<<Min: 185.26 - 212.82 0.5% Min: Pyrite>>

<<Alt: 183.65 - 197.3 Moderate (Alt) Chlorite>>

<<Vein: 184.75 - 185.26 15% Tourmaline>> Multiple thin tourmaline veinlets, as bands, fracture filling. Associated with py. Discordant, irregular oriented.

<<Struc: 185.7 - 185.71 Moderate (Alt) Foliation>>

<<Struc: 192 - 192.01 Moderate (Alt) Foliation>>

197.30 222.70 RHYv Rhyolite volcaniclastic grey-green FCG

197.3 - 222.7: Grey to greenish, heterogene, strongly foliated, weak to moderately altered (MU/CL). Severals blue QE distributed within matrix. This unit looks like an strongly foliated volcanic agglomerate, clasts supported, polygenetic, mostly siliceous, pebble to cobble size. The clats are strongly stretched/flattered within foliation, altered Mu and CL, marked a weak "ribbon/banded" texture. Could be alteration bands. Locally comprising CL bands (original alt process?) associated with mineralization (mainly PO) . It's difficult to be confident for the protolith due to alteration/foliation intensity.

217.8-219.3m: "banded/curdy" texture marked by siliceous clats/lapillis.

<<Min: 206 - 212.82 0.1% Min: Pyrrhotite>>

<<Min: 212.82 - 214.6 2% Min: Pyrrhotite>> Associated with chlorite bands.

<<Min: 214.6 - 221.55 1% Min: Pyrrhotite>> Disseminated, usually associated with chlorite bands.

<<Min: 221.55 - 222.7 2% Min: Pyrrhotite>> Disseminated within matrix, small wisps.

<<Alt: 197.3 - 232.1 Weak (Alt) Chlorite>> Weak/moderate. Thin subconcordant bands, clasts altered? Locally patchy. Weak "ribbon" texture.

<<Alt: 197.3 - 236 Weak (Alt) Muscovite>> Pervasive/bands. Marked a weak "ribbon" texture with CL alteration. Shiny fracture surface.

<<Vein: 201.45 - 220.9 25% Quartz 75 deg. >> Interval comprising multiple deformed qtz veins, 2-10 cmwide.

<<Vein: 211.15 - 212.45 15% Quartz>> Group of deformed/folded qtz veiins, dismembered, 2-5 cm wide.

<<Struc: 209 - 209.01 Strong (Alt) Foliation>>

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-329

Prospect:	FCZ	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	David Nuttal
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	David Nuttal	Date Logging Start:	24-Nov-15
UTM Easting	414801	Core Size:	HQ3	Azimuth:	180.29	Date Logging Complete:	26-Nov-15
UTM Northing:	6814638	Casing Pulled?:	Yes	Dip:	-55	Drill Company:	Geotech
UTM Elev. (m):	1422.38	Casing Depth (m):	6.5	Length (m):	200	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	23-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	25-Nov-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

The objective of drill hole K15-329 (KX15-FC1) was to explore for mineralization (exploration) based on the Fault Creek VTEM anomaly south of the Fault Creek fault trace. The hole is composed of a thick package of felsic volcaniclastic rocks; dominantly RHYva/RHYvl. Narrow mafic dikes intersect the felsic volcanics between 74m to 92m depth. Moderate to intense chloritic alteration is observed from 117.73m to 162m depth and weak chloritic alteration is patchy down to 200m. Weak OJ-type mineralization (intense chlorite alteration accompanied by CP-SP-GL-PY-PO) is observed from 152.25m to 152.69m and from 158m to 161m. Muscovite mineralization is weak to moderate through to the bottom of the hole; intensity increases proximal to faults and quartz veins. Average of dominant beta angles point NNE. Average of dominant alpha angles dip 70 degrees. *NOTE WORTHY INFORMATION: intervals 117.73m - 126.58m, 152m - 153m and 158m - 161m are suspected to be failed MXSX lenses, proximal to stringer zones, distal extentions of MXSX, or indicators of proximity to strong hydrothermal activity.

Comments:

K15-330 is a geotechnical hole including packer testing in bedrock (2 tests at 10ft interval followed by tests at 20ft interval thereafter) and thermistor install. It is located 300m upstream on the East, site D abutment. The tests were conducted by Piedsold Engineering. The hole consists in graphitic mudstone and CL altered mafic tuff interbedded and fractured. The upper units shows vuggy texture, moderate oxidation, locally filled with clay/sand suggesting open fractures and surface water circulation. The hole ends at 50.95m on CL altered carbonaceous mudstone where a narrow coarse grain/pebble size clast interval, medium strained, possibly polygenic, is observed. This unit could be interpreted as a detritic sequence.

Comments:						Parent Hole:	

K15-331/KP15-I is a geotechnical hole located at the toe of the PAC waste dump, including SPT in unfrozen soil (5 ft interval) and packer test in bedrock (30 feet interval) and thermistor installation. The lithology consists in mafic tuff interbedded with carbonaceous argillite/ash units showing CA veinlets. PO/CA discontinuous veinlets are observed from 26.00m to 32.00m, few PY and CP trace. The hole ends at 32.00m on a graphitic mudstone. Nine Standard Penetration Tests were done from 0.60m to 10.95m as well as packer tests and thermistor install.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	28-Nov-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

The objective of drill hole K15-332 (KX15-FC2) was to explore for mineralization based on the Fault Creek VTEM anomaly south of the Fault Creek fault trace. The hole is composed of a thick package of felsic volcaniclastic rocks; dominantly RHYva/RHYvl. Weak OJ-type mineralization (intense chlorite alteration accompanied by weak CP-SP-GL -PO) is observed from 170m to 171.2m and from 174.15m to 174.83m. Muscovite mineralization is weak to moderate through to the bottom of the hole. After 171.2 m, remainder of hole was laminated sedimentary unit, fine to coarse grained, locally BI altered, the bedding and sorting are very well conserved. We observe similar sequences at some place in the hole. It's common to see this unit described as MAFI (biotite altered, strong calcite associated and sharp contacts).

Comments:						Parent Hole:	

K15-333/KP15-J is located on Geona Creek, downstream of the designed pit. SPT were operated (6ft interval over the unfrozen soil) as well as packer testing (in bedrock, 30ft interval). The hole is made up of mafic unit -marked by BI porphyroblasts patch-tuff or sedimentary sequence from volcanic rocks (detritic origin). The bottom shows deformations and obscured foliation witch could suggest volcanic flows. Trace of PY and PO were observed, A thermistor have been installed.

Comments:

K15-334/KP15-A is a geotechnical hole (upstream of site D creek) including SPT in unfrozen soil (interval feet), packer testing in the bedrock (10 feet interval for the two first, 20 feet thereafter). The top of the hole consists in 18.10 metres of soil and overburden followed mafic unit up to 35.50m and a mudstone. This last unit is CA veined until 41.83m then shows a vuggy texture probably due to a quasi total decalcification. From top to bottom, the rock is strongly fractured, clay and sand infilling are observed. Piedsold Engineering operated 5 SPT and 7 packer testing. They encountered issues due to artesian groundwater and subterranean pressure gas, probably carbon dioxide. Therefore the piezometer could not be installed.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	02-Dec-15
Local Northing:		Cemented?:	SP	Core Storage Loc.:	KZK Camp	Drill Completed:	03-Dec-15
Local Elev. (m):						Purpose:	Geotech
Comments:						Parent Hole:	

K15-335/KP15-H, located at the mill site, is a geotechnical hole including SPT in the unfrozen soil, packer testing in bedrock every 30 feet interval and thermistor install. The geology consists in sedimentary units, probably from volcanic origin, and rhyolitic ash tuff. Weak trace of oxidation, increasing at 26.60m, are observed in the fractures as well as a narrow CL altered zone (from 26.60m to 27.72m). The hole ends at 32.33m on a graphitic, CA veined, thinly laminated sedimentary unit.

Downhole Surveys:

Local Elev. (m):						Purpose:	Geotech
Comments:						Parent Hole:	

K15-336/KP15-B (centerline site D creek) is a geotechnical including SPT in unfrozen soil (5 feet interval) and packer testing (2 test at 10 feet interval on top, 20 feet interval thereafter) conducted by Knight Piesold Consulting as well as a thermistor install. The geology is made up of 18 m of salty alluvium followed by CL atered mafic ash tuff and graphitic mudstone interbedded showing CA veining in the foliation.Trace of decalcification are observed and tow narrow fault gouge zone. The hole ends at 50.50m on a dominant mudstone unit mixed with ash tuff.

Downhole Surveys:

Depth (m)	Dip	Measured Azimuth	Correction Factor	Corrected Azimuth	Survey Type	Survey By	Survey Date	Mag Field	Accept Values?	Comments
0	-90	0	0	0	APS	Geotech	12-Jun-15		☑	No downhole survey.

39.37 41.13 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

39.37 - 41.13: Thin foliation, CA veinlets, few PY along the foliation.

<<Struc: 39.4 - 39.41 dominant foliation>>

41.13 44.33 MAFta Coarse grained to ash tuff grey-brown

41.13 - 44.33: CA veinlets. Sharp upper contact, progressive lower contact. Feldspar clasts.

<<Alt: 41.13 - 44.33 Moderate (Alt) Chlorite>> In mafic tuff.

<<Vein: 43.8 - 50.4 Calcite>> CA veiningin foliation. Locally vuggy texture.

44.33 50.50 MDS Carbonaceous Mudstone & Tuffaceous Mudstone light grey

44.33 - 50.5: Dominantly graphitic mudstone mixed with mafic tuff, CA veined. Locally vuggy texture (decalcification). E.O.H.

<<Alt: 44.33 - 50.5 Weak (Alt) Chlorite>> In mafic tuff.

<<Struc: 48.1 - 48.3 Weak (Alt) Fault>> Sandy clay fault gouge.

<<Struc: 48.4 - 48.41 dominant foliation>>

End of Hole @ 50.5

Appendix M: Geological sections

This appendix contains 35 geological sections through the areas targeted for resource and exploration drilling during the 2015 KZK Project. Out of these 35 sections, 17 are through the ABM Zone, seven are through Krakatoa Zone, two are for Santorini, another two are for the Fault Creek Target, and seven are for the GP4F Deposit (Table M-1).

Legend - Downhole Geology

- CASN: casing
- OVBN: overburden
- no core
- FBX: fault breccia
- INT: undifferenciated granitic intrusive rock
- MAFi: mafic intrusive

Wind Lake Formation

- MAFt: mafic volcaniclastic
- MAFta: mafic volcaniclastic ash tuff
- MAFw: mafic volcanic flow
- MDU: mudstone and tuffaceous mudstone

Kudz Ze Kayah Formation

- SED: undifferentiated sedimentary rock
- SEDc: calcareous sedimentary rock
- MDS: undifferentiated mudstone
- MDSt: rhyolite tuff dominant mudstone
- MDSc: carbonaceous mudstone
- MDSw: coherent rhyolite with minor carbonaceous mudstone
- MXSX: undifferentiated massive sulphide
- OA: magnetite-bearing massive sulphide
- OB: wispy laminate, fine buckshot textured, non-magnetite bearing massive sulphide
- OC: chalcopyrite + pyrrhotite net-textured massive sulphide
- OD: brecciated sulphide
- OF: pyrrhotite-rich sulphide
- OG: chalcopyrite-rich sulphide
- OH: pyrite-rich massive sulphide
- OI: heavily disseminated sulphide in schistose host rock
- OJ: heavily disseminated sulphides in proximal altered rock

- RHY: undifferentiated rhyolite
- RHYc: coherent rhyolite
- RHYcw: coherent rhyolite, curdy-textured and/or flow-banded
- RHYcf: coherent rhyolite, feldspar ± quartz porphyry
- RHYcq: coherent rhyolite, quartz porphyry
- RHYi: aphanitic rhyolite
- RHYif: feldspar-phyric aphanitic rhyolite
- RHYv: volcaniclastic rhyolite
- RHYvl: lapilli tuff
- RHYva: coarse-grained to ash tuff
- RHYvx: quartz ± feldspar crystal tuff

- CASN: casing
- OVBN: overburden
- no core
- FBX: fault breccia
- INT: undifferentiated granitic intrusive rock
- MAFi: mafic intrusive
- MAFt: mafic volcaniclastic
- MAFta: mafic volcaniclastic ash tuff
- MAFw: mafic volcanic flow
- MDU: mudstone and tuffaceous mudstone
- MDS: undifferentiated mudstone
- MDSt: rhyolite tuff dominant mudstone
- MDSc: carbonaceous mudstone
- MDSw: coherent rhyolite with minor carbonaceous mudstone
- MXSX: undifferentiated massive sulphide
- OA: magnetite-bearing massive sulphide
- OB: wispy laminate, fine buckshot textured, non-magnetite bearing massive sulphide
- OC: chalcopyrite + pyrrhotite net-textured massive sulphide
- OD: brecciated sulphide
- OF: pyrrhotite-rich sulphide
- OG: chalcopyrite-rich sulphide
- OH: pyrite-rich massive sulphide
- OI: heavily disseminated sulphide in schistose host rock
- OJ: heavily disseminated sulphides in proximal altered rock
- RHY: undifferentiated rhyolite
- RHYc: coherent rhyolite
- RHYcw: coherent rhyolite, curdy-textured and/or flow-banded
- RHYcf: coherent rhyolite, feldspar ± quartz porphyry
- RHYcq: coherent rhyolite, quartz porphyry
- RHYi: aphanitic rhyolite
- RHYif: feldspar-phyric aphanitic rhyolite
- RHYv: volcaniclastic rhyolite
- RHYvl: lapilli tuff
- RHYva: coarse-grained to ash tuff
- RHYvx: quartz ± feldspar crystal tuff
- SED: undifferentiated sedimentary rock
- SEDc: calcareous sedimentary rock

- Copper 1cm=5 percent
- Zinc 1cm=5 percent

Appendix N: Certificates of analysis

This appendix contains all of the certificates of analysis (COA) pertaining to resource definition and exploration drilling at the 2015 KZK Project. Elements analyzed for all of these holes include Cu, Fe, Pb, Zn, Au and Ag, and many of them were also analyzed for Ba and S. A select number of intervals were also analyzed for As, Bi, Hg, Sb and Se. COAs are listed in alphanumeric order, with the first page of each COA indicated in the Page Number column in Table N-1 below.

Table N-1: Table of contents for COAs in this appendix

Certificate	Elements Assayed	Drill holes	Target	Samples (#)	Page Number
VC151957F	Ag, Au, Cu, Fe, Pb, S, Zn	K94-022, 047, K95-075, 088	ABM	106	1
VC151958F	Ag, Au, Cu, Fe, Pb, S, Zn	K94-008, 039, 040	ABM	74	10
VC151960F	Ag, Au, Cu, Fe, Pb, S, Zn	K94-014, 023, 039, 052, K95-087	ABM	104	17
VC151961F	Ag, Au, Cu, Fe, Pb, S, Zn	K94-007, 009	ABM	74	26
VC151962F	Ag, Au, Cu, Fe, Pb, S, Zn	K94-009, 049, K95-156, 157	ABM	59	33
VC151963F	Ag, Au, Cu, Fe, Pb, S, Zn	K94-020, K95-149, 150	ABM	74	39
VC151964F	Ag, Au, Cu, Fe, Pb, S, Zn	K94-010, 021, K95-081, 150	ABM	70	46
VC151965F	Ag, Au, Cu, Fe, Pb, S, Zn	K94-038, 049, K95-070	ABM	45	53
VC151966F	Ag, Au, Cu, Fe, Pb, S, Zn	K94-013, K95-071, 092	ABM	68	58
VC152112A	As, Bi, Hg, Sb, Se	K15-200, 202, 203, 204	ABM	122	65
VC152112F	Ag, Au, Cu, Fe, Pb, S, Zn	K15-200, 202, 203, 204	ABM	122	70
VC152113A	As, Bi, Hg, Sb, Se	K15-206, 207, 216, 218	ABM	101	80
VC152113F	Ag, Au, Cu, Fe, Pb, S, Zn	K15-206, 207, 216, 218	ABM	101	84
VC152205A	As, Bi, Hg, Sb, Se	K15-226, 228	ABM	40	93

Certificate of Analysis

Work Order : VC151957F

[Report File No.: 0000014314]

To: **ROBIN BLACK** Date: Dec 09, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_1/R080107-212
Project No.	:	KZK
No. Of Samples	:	106
Date Submitted	:	Dec 04, 2015
Report Comprises	:	Pages 1 to 9 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Au, Cu, Pb, and Zn values have been updated. S data has been included and is informational only.
GO_FAG313 values have been updated.
This Report cancels and supersedes the Report No. 014180
dated Dec 06, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Certificate of Analysis

Work Order : VC151958F

[Report File No.: 0000014181]

To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_1/Q311301-374
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 04, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC151958 Report No. 012697
dated Sep 11, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_1/Q311375-478
Project No.	:	KZK
No. Of Samples	:	104
Date Submitted	:	Dec 04, 2015
Report Comprises	:	Pages 1 to 9 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC151960 Report No. 012701
dated Sep 11, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Certificate of Analysis

Work Order : VC151961F

[Report File No.: 0000014183]

To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_1/Q311751-824
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 06, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb and Zn results have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC151961 Report No. 012706
dated Sep 11, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Work Order : VC151962F

[Report File No.: 0000014184]

To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_1/Q311825-883
Project No.	:	KZK
No. Of Samples	:	59
Date Submitted	:	Dec 04, 2015
Report Comprises	:	Pages 1 to 6 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC151962 Report No. 012710
dated Sep 14, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Work Order : VC151963F

[Report File No.: 0000014185]

To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_1/Q930801-874
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 04, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 and GO_FAG303 may be elevated due to reduced assay fraction size.
Au and Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC151963 Report No. 012711
dated Sep 14, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_1/Q930875-944
Project No.	:	KZK
No. Of Samples	:	70
Date Submitted	:	Dec 04, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 and GO_FAG303 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC151964 Report No. 012712
dated Sep 14, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_1/Q311885--923, R080101-106
Project No.	:	KZK
No. Of Samples	:	45
Date Submitted	:	Dec 04, 2015
Report Comprises	:	Pages 1 to 5 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC151965 Report No. 012713
dated Sep 14, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Work Order : VC151966F

[Report File No.: 0000014188]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_2/Q311924-944, Q930945-991
Project No.	:	KZK
No. Of Samples	:	68
Date Submitted	:	Dec 04, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb and Zn values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC151966 Report No. 012714
dated Sep 14, 2015 issued by SGS Canada (Production Way).

Certified By : _____

Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Project No.	:	KZK
No. Of Samples	:	101
Date Submitted	:	Oct 21, 2015
Report Comprises	:	Pages 1 to 4 (Inclusive of Cover Sheet)

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted

Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Work Order : VC152113F

[Report File No.: 0000014190]

To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_4/B00264553-596, 265001-057
Project No.	:	KZK
No. Of Samples	:	101
Date Submitted	:	Dec 04, 2015
Report Comprises	:	Pages 1 to 9 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 and GO_FAG303 may be elevated due to reduced assay fraction size.
Au and Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152113 Report No. 012788
dated Sep 18, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Work Order : VC152205F

[Report File No.: 0000014191]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_5/B00264597-664
Project No.	:	KZK
No. Of Samples	:	68
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 and GO_FAG303 may be elevated due to reduced assay fraction size.
Au and Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152205 Report No. 012784
dated Sep 18, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Certificate of Analysis

Work Order : VC152206F

[Report File No.: 0000014192]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_5/6501-54, 8501-25, 9001-33
Project No.	:	KZK
No. Of Samples	:	112
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 9 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Au and Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152206 Report No. 012808
dated Sep 22, 2015 issued by SGS Canada (Production Way).

Certified By :

Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted

Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

[Report File No.: 0000014196]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_10 B00232501-38, 267146-72
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Zn values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152425 Report No. 013115
dated Oct 14, 2015 issued by SGS Canada (Production Way).

Certified By :

Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_10 B00267173-223, 630-652
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Zn values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152426 Report No. 013137 dated Oct 15, 2015 issued by SGS Canada (Production Way).

Certified By :

Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_9 B00264761-89, 266672-716
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152431 Report No. 013242
dated Oct 22, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Work Order : VC152432F

[Report File No.: 0000014199]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_9 B00266717-269040
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 10 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
EDTA Leach results are semi-quantitative only.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152432 Report No. 13480
dated Nov 03, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Received: Oct 21, 2015
Pages: Page 1 to 4
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
41	G_LOG02	Pre-preparation processing, sorting, logging, boxing
41	GE_IC14M	Aqua Regia digestion/ICP-MS finish

Storage: Pulp & Reject

PULP STORAGE : RETURN AFTER 90 DAYS
REJECT STORAGE : STORE FOR 30 DAYS

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_13 B00264854-899/6764-774
Project No.	:	KZK
No. Of Samples	:	87
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 8 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 and GO_FAG303 may be elevated due to reduced assay fraction size.
Au and Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152566 Report No. 013533
dated Nov 05, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Samples: 102
Received: Sep 25, 2015
Pages: Page 1 to 5
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
102	G_LOG02	Pre-preparation processing, sorting, logging, boxing
102	G_WGH79	Weighing of samples and reporting of weights
97	G_PRP89	Weigh, dry,(up to3.0 kg) crush to 75% passing 2 mm, split 250 g, pulverize to
2	G_SCR34	Wet Screening 75µm, Evaluation of Prep
102	GE_FAA313	@Au, FAS, AAS, 30g-5ml(FINAL-WT)
102	GE_AAS12E	2 g, 2-Acid digest, AAS finish
102	GO_ICP90Q	Sodium Peroxide fusion/ICP-AES, single element

Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:
L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result
*INF = Composition of this sample makes detection impossible by this method
M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion
Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_11 B00232539-233013
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 08, 2015
Report Comprises	:	Pages 1 to 4 (Inclusive of Cover Sheet)

Comments:

Ag values have been updated.
This Report cancels and supersedes the VC152574 Report No. 013199 dated Oct 20, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Nov 12, 2015

P.O. No.	:	PO# BMC15-01_12 B00264809-268686
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Sep 29, 2015
Report Comprises	:	Pages 1 to 9 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

EDTA Leach results are semi-quantitative only.
% extraction for samples with feed grades near or below statistical detection limit cannot be determined.
Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.

Certified By :

Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Certificate of Analysis

Work Order : VC152579F

[Report File No.: 0000014201]

To: **ROBIN BLACK** Date: Dec 06, 2015
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.	:	PO# BMC15-01_12 B00268687-269096
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 10 (Inclusive of Cover Sheet)

Comments:

EDTA Leach results are semi-quantitative only.
% extraction for samples with feed grades near or below statistical detection limit cannot be determined.
Lower limit for GO_FAG313 and GO_FAG303 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152579 Report No. 013648
dated Nov 12, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Samples: 74
Received: Oct 21, 2015
Pages: Page 1 to 3
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
36	G_LOG02	Pre-preparation processing, sorting, logging, boxing
36	GE_IC14M	Aqua Regia digestion/ICP-MS finish

Storage: Pulp & Reject

PULP STORAGE	:	STORE FOR 90 DAYS
REJECT STORAGE	:	STORE FOR 30 DAYS

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Certificate of Analysis

Work Order : VC152613F

[Report File No.: 0000014202]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_16 B00264946-264825
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152613 Report No. 013461
dated Nov 02, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Comments:

Lower limit for GO_FAG313 and GO_FAG303 may be elevated due to reduced assay fraction size.
Ag and Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152615 Report No. 013462
dated Nov 02, 2015 issued by SGS Canada (Production Way).

Samples: 10
Received: Oct 2, 2015
Pages: Page 1 to 2
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
10	G_LOG02	Pre-preparation processing, sorting, logging, boxing
10	G_WGH79	Weighing of samples and reporting of weights
10	G_PRP89	Weigh, dry,(up to3.0 kg) crush to 75% passing 2 mm, split 250 g, pulverize to
1	G_WSH78	Barren wash between each sample - pulverizing stage
1	G_WSH79	Barren wash between each sample - crushing stage
10	GE_FAA313	@Au, FAS, AAS, 30g-5ml(FINAL-WT)
10	GE_AAS12E	2 g, 2-Acid digest, AAS finish
10	GO_ICP90Q	Sodium Peroxide fusion/ICP-AES, single element

Storage: Pulp & Reject

PULP STORAGE : STORE FOR 90 DAYS
REJECT STORAGE : STORE FOR 30 DAYS

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Certificate of Analysis

Work Order : VC152708F

[Report File No.: 0000014204]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_23 B00268303-269516
Project No.	:	KZK
No. Of Samples	:	99
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 8 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152708 Report No. 013457
dated Nov 02, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Certificate of Analysis

Work Order : VC152709F

[Report File No.: 0000014205]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_19 B00266837-268157
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Au and Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152709 Report No. 013474
dated Nov 03, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Comments:

Lower limit for GO_FAG313 and GO_FAG303 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152710 Report No. 013488
dated Nov 03, 2015 issued by SGS Canada (Production Way).

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_19 B00268232-268881
Project No.	:	KZK
No. Of Samples	:	52
Date Submitted	:	Dec 05, 2015
Report Comprises	:	Pages 1 to 5 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 and GO_FAG303 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152711 Report No. 013541
dated Nov 05, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.

Certified By : 
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted

Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

[Report File No.: 0000014210]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_24 B00266894-266967
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 06, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152897 Report No. 013838
dated Nov 20, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Work Order : VC152898F

[Report File No.: 0000014211]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 06, 2015

P.O. No.	:	PO# BMC15-01_24 B00266968-269262
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Dec 06, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Pb values have been updated. S data has been included and is informational only.
This Report cancels and supersedes the VC152898 Report No. 013650
dated Nov 12, 2015 issued by SGS Canada (Production Way).

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Certificate of Analysis
Work Order : VC152899
[Report File No.: 0000013651]

Date: November 12, 2015

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

P.O. No.: PO# BMC15-01_24 B00269263-269324
Project No.: KZK
Samples: 62
Received: Oct 19, 2015
Pages: Page 1 to 6
(Inclusive of Cover Sheet)

Methods Summary

No. Of Samples	Method Code	Description
62	G_LOG02	Pre-preparation processing, sorting, logging, boxing
62	G_WGH79	Weighing of samples and reporting of weights
58	G_PRP89	Weigh, dry,(up to3.0 kg) crush to 75% passing 2 mm, split 250 g, pulverize to
1	G_SCR34	Wet Screening 75µm, Evaluation of Prep
62	GE_FAA313	@Au, FAS, AAS, 30g-5ml(FINAL-WT)
62	GE_AAS12E	2 g, 2-Acid digest, AAS finish
62	GO_ICP90Q	Sodium Peroxide fusion/ICP-AES, single element
1	GO_FAG313	30 g, Fire assay, gravimetric finish(Ag)

Storage: Pulp & Reject

PULP STORAGE	:	STORE FOR 90 DAYS
REJECT STORAGE	:	STORE FOR 30 DAYS

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.

Certified By : 
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Nov 20, 2015

P.O. No.	:	PO# BMC15-01_25 B00265101-174
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Oct 29, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.

Certified By : Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted

Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

Certificate of Analysis

Work Order : VC153011

[Report File No.: 0000013840]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Nov 20, 2015

P.O. No.	:	PO# BMC15-01_25 B00268392-269371
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Oct 29, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.

Certified By : 
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Methods Summary

No. Of Samples	Method Code	Description
63	G_LOG02	Pre-preparation processing, sorting, logging, boxing
63	G_WGH79	Weighing of samples and reporting of weights
59	G_PRP89	Weigh, dry,(up to3.0 kg) crush to 75% passing 2 mm, split 250 g, pulverize to
1	G_SCR34	Wet Screening 75µm, Evaluation of Prep
7	G_WSH78	Barren wash between each sample - pulverizing stage
7	G_WSH79	Barren wash between each sample - crushing stage
63	GE_FAA313	@Au, FAS, AAS, 30g-5ml(Final Mode)
63	GE_AAS12E	2 g, 2-Acid digest, AAS finish
63	GO_ICP90Q	Sodium Peroxide fusion/ICP-AES, single element

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Certificate of Analysis

Work Order : VC153089

[Report File No.: 0000014115]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 03, 2015

P.O. No.	:	PO#:BMC15-01_26 B00233101-125,265202-250
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Nov 06, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
S data is informational only.

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted

Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Active files:

Comments:

Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
S data is informational only.
S data has been included.
This Report cancels and supersedes the Report No. 014120 dated Dec 03, 2015 issued by SGS Canada (Production Way).

Certified By :

Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

No. Of Samples	:	94
Date Submitted	:	Nov 23, 2015
Report Comprises	:	Pages 1 to 8 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

[Report File No.: 0000014762]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 21, 2015

P.O. No.	:	PO# BMC15-01_31 B00269913-973
Project No.	:	KZK
No. Of Samples	:	61
Date Submitted	:	Nov 23, 2015
Report Comprises	:	Pages 1 to 6 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted

Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 24, 2015

P.O. No.	:	PO# BMC15-01_32 B00269974-000,233501-533
Project No.	:	KZK
No. Of Samples	:	80
Date Submitted	:	Nov 26, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : 
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Certificate of Analysis

Work Order : VC153451

[Report File No.: 0000014642]

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 18, 2015

P.O. No.	:	PO# BMC15-01_27 B00233126-143,284-357
Project No.	:	KZK
No. Of Samples	:	74
Date Submitted	:	Nov 27, 2015
Report Comprises	:	Pages 1 to 7 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

To: **ROBIN BLACK**
BMC MINERALS (NO 1) LTD
ROBIN BLACK
530-1130 WEST PENDER ST
VANCOUVER BC V6E 4A4

Date: Dec 21, 2015

P.O. No.	:	PO# BMC15-01_27 358-367,775-760,778-850
Project No.	:	KZK
No. Of Samples	:	107
Date Submitted	:	Nov 27, 2015
Report Comprises	:	Pages 1 to 9 (Inclusive of Cover Sheet)

Distribution of unused material:
Active files:

Comments:

Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : _____
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Active files:

Comments:

Lower limit for GO_FAG303 and GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : 
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

Comments:

Lower limit for GO_FAG313 may be elevated due to reduced assay fraction size.
Ba and S data is informational only.

Certified By : 
Cam Chiang
Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R.	= Listed not received	I.S.	= Insufficient Sample
n.a.	= Not applicable	--	= No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the **@** symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Assistant Operations Manager

SGS Minerals Services Geochemistry Vancouver conforms to the requirements of ISO/IEC 17025 for specific tests as listed on their scope of accreditation which can be found at http://www.scc.ca/en/search/palcan/sgs

Report Footer:

L.N.R. = Listed not received
n.a. = Not applicable
I.S. = Insufficient Sample
-- = No result

*INF = Composition of this sample makes detection impossible by this method

M after a result denotes ppb to ppm conversion, % denotes ppm to % conversion

Methods marked with an asterisk (e.g. *NAA08V) were subcontracted
Elements marked with the @ symbol (e.g. @Cu) denote assays performed using accredited test methods

This document is issued by the Company under its General Conditions of Service accessible at http://www.sgs.com/en/Terms-and-Conditions.aspx. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was (were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativity of the goods and strictly relate to the sample (s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law .

Appendix O: QA/QC report

Review of QA/QC results for 2015 KZK Project

Release 1.0, January 22nd, 2016

Ron Voordouw

Equity Exploration Consultants Ltd.

SUMMARY

This technical document describes the quality assurance (QA) protocols used in collecting, sampling and analyzing drill core for the 2015 KZK Project, and summarizes the final, post re-assay, quality control (QC) results for certified reference materials (CRMs) and blanks. The aim of the 2015 QA/QC program was to ensure that geochemical sampling and assays met industry standards, and that the analytical results were sufficiently accurate and free of contamination to be included in a new resource estimate. Real-time monitoring of QA/QC by BMC, Equity and SGS led to mid-program modifications in QA (e.g. in the analysis of Pb and Ba) and several requests for re-assay, all of which were processed and passed QC prior to the writing of this report. Calculation of Z-scores for 363 CRM samples indicates negative analytical bias of -1 to -3% for Ag, Au and Cu, and positive bias of 1-2% for Pb and Zn. For blank materials, only two out of 1445 analyses (= 289 blank analyses each for Ag, Au, Cu, Pb, Zn) exceeded the threshold established to indicate contamination. A check assay program shows high correlation (≥0.980) between the original SGS and duplicate ALS analyses. Therefore, based on CRM, blank and check assay analyses, the 2015 KZK Project geochemical assay data appears to be sufficiently accurate and free of contamination to be included in the updated resource calculation.

KEYWORDS: KZK Project, QA/QC

INTRODUCTION

In January 2015, BMC Minerals (No. 1) Ltd. ("BMC") purchased the KZK Project from Teck Resources Ltd and subsequently embarked on a multi-faceted exploration and development program that included diamond drilling, geophysical surveys and historical drill core reclogging. Work focussed mostly on the ABM volcanogenic massive sulphide (VMS) deposit in addition to several ABM-proximal prospects and the GP4F VMS deposit, which lies 5 km southeast of ABM. The ABM deposit consists of polymetallic (Cu-Pb-Zn-Au-Ag) massive sulphide mineralization dominated by pyrite, sphalerite, pyrrhotite, galena and chalcopyrite.

The following sections describe the procedures used to sample and analyze drill core on the 2015 KZK Project, as well as the quality assurance and control (QA/QC) program that was used to monitor the accuracy and contamination of geochemical assays.

Sampling

The 2015 KZK resource drilling, exploration drilling and core re-logging programs collected 5603 samples for geochemical assay, comprising 4951 half-core samples, 289 blanks and 363 certified reference material (CRM) samples. All core samples were identified with a unique sample ID number and marked with sample tags in the core box. Core samples were taken from every mineralized intersection as well as for ~10 m into the immediate hanging wall and footwall host rock in order to characterize potential waste rock dilution. Primary core samples conformed to lithological boundaries where possible, with core loggers attempting to constrain alteration and mineralization features within the lithological boundaries as well. Sample lengths range from 0.10-3.6 m, with a median of 1.10 m and an average length of 1.16 m. Sample weights range from 0.22-8.15 kg with a median weight of 2.91 kg and average of 3.15 kg. Sample weights show a surprisingly poor correlation (ρ = 0.27) with sample length (Figure 1), most likely due to the range in rock density (2.5-4.7 g/cm^3) and the artificially long length of samples taken from intervals with significant core loss.

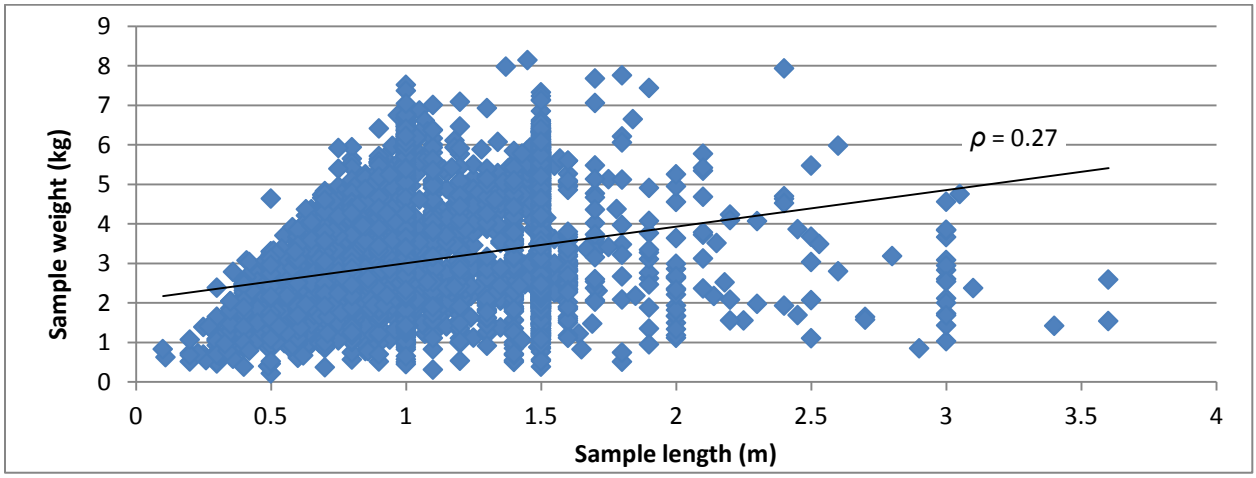

Figure 1: Length (m) against weight (kg) for all core samples collected as part of the 2015 sampling program.

Drill core samples were cut using an open circulation rock saw. Split core was consistently sampled from the same side and placed into labelled plastic sample bags that were sealed with a plastic zip tie and shipped in labelled rice bags sealed with individually numbered security tags. A list of required quartz washes was submitted to the analysis lab that would follow suspected high-grade samples in order to avoid contaminating adjacent lower grade samples. These quartz washes were completed at the crush and pulveriser stage of sample preparation.

Analytical methods

Drill core samples were sent to SGS Mineral Services Geochemistry Vancouver ("SGS Vancouver" or "SGS") for geochemical analysis of base (Cu, Pb, Zn) and precious (Ag, Au) metals for use in the resource calculation, as well as Fe and several other major and trace elements (As, Ba, Bi, Hg, S, Sb, Se). SGS Vancouver is an ISO 9001:2008 certified laboratory (accredited laboratory No. 744 – see Appendix N-A) that also conforms with the requirements of CAN-P-1579, CAN-P-1578 and CAN-P-4E (ISO/IEC 17025-2005) for the analytical methods used on the 2015 KZK Project (Table 1).

All core, CRM and blank samples submitted to SGS were analyzed for Ag, Au, Cu, Fe, Pb and Zn. Prior to analysis, samples were weighed, dried and crushed to 75% passing 2 mm, with a 250 g split pulverized to 85% passing 75 microns. Gold was analysed by 30 g fire assay with an AAS finish and silver analysed by ICP with an AAS finish on a two-gram 2-acid digest aliquot. Gold and silver over limits were triggered at Au >5 g/t and Ag >150 g/t respectively, resulting in re-analysis using a 30 g fire assay with gravimetric finish. Copper, lead, zinc and iron assays were done with sodium peroxide fusion and ICP-AES analysis. This fusion results in complete digestion of the sample and so provides a near total chemical analysis. However, the high Ba and S content of some samples promoted the precipitation $BaSO_4$ and, along with it, some of the Pb. As a result, a number of samples had to be re-analyzed for Pb at lower weight in order to prevent Ba precipitation.

Table 1: Analytical methods and range for precious and base metals analysed as part of 2015 KZK Project

Element	Analytical Method	SGS code	Analytical Range
Au	30 g fire assay/AAS finish	GE_FAA313	0.005-10 ppm
	Au over limit (>5 g/t): 30 g fire assay/gravimetric finish	GO_FAG303	0.5-3000 ppm
Ag	2 g 2-acid digest/ICP-AAS	GE_AAS12E	0.3-300 ppm
	Ag over limit (>150 ppm): 30 g fire assay/gravimetric finish	GO_FAG313	10-5000 ppm
Cu	Na peroxide fusion/ICP-AES	GO_ICP90Q	0.01-30%
Fe	Na peroxide fusion/ICP-AES	GO_ICP90Q	0.05-30%
Pb	Na peroxide fusion/ICP-AES	GO_ICP90Q	0.01-30%
Zn	Na peroxide fusion/ICP-AES	GO_ICP90Q	0.01-30%

Out of the 4951 core samples submitted for Ag-Au-Cu-Fe-Pb-Zn analysis, 3337 were also analyzed for Ba, 3286 for sulphur and 1129 for As-Bi-Hg-Sb-Se. However, no CRM were analyzed for elements besides base and precious metals. For As, Bi, Hg, S, Sb and Se the preparation methods were the same as those used for the base and precious metal assays, with analysis done by ICP-MS on a two-acid aqua regia digest of 3:1 HCl:HNO_3. For samples with relatively high Ba and S, a lower weight was used in order to prevent the precipitation of Pb along with $BaSO_4$. Samples with >5% Ba and low base metals were fused with pyrosulphate and analyzed by XRF.

QA/QC program

Quality assurance and control for Au, Ag, Cu, Fe, Pb and Zn assays was monitored through the insertion of Certified Reference Material (CRM) and blanks at alternating 20th sample intervals within the drill core sample sequence. The selection and insertion of low-, medium- or high-grade CRMs was matched to the visually estimated grade of surrounding mineralization. The selected CRM were manufactured from sulphide ore with a similar mineralogy to ABM and are generally certified for Cu, Pb, Zn and Fe at the percent level, as well as Au and Ag at the ppm level. On occasion, extra blanks were inserted after particularly high-grade samples.

Six different CRMs were utilised in the 2015 KZK Project (Table 2, Appendix N-B), with CND-ME-1311 used to match low-grade intervals, OREAS 621 and OREAS 623 used for medium grade and, lastly, OREAS 113, GBM310-16 and G312-4 used to match the highest grades. Back-to-back insertion of standards was done where intervals of moderate- to high-grade intervals were estimated as poly-metallic, Cu-rich (OREAS 113, G312-4) or Pb-rich (GBM310-16, G312-4) , respectively. A minimum weight of 100 g was used for CRM samples so that reanalyses could be completed if required. Each CRM sample is identified by its own unique sample number.

Table 2: Certified means and standard deviations (SD) for CRMs used in 2015 KZK Project

CRM Name	Threshold	Ag (ppm)		Au (ppm)		Cu (%)		Fe (%)		Pb (%)		Zn (%)	
		Mean	*SD*	*Mean*	*SD*	*Mean*	*SD*	*Mean*	*SD*	*Mean*	*SD*	*Mean*	*SD*

Notes: blank cells = not certified; *not used to monitor QA/QC on 2015 KZK Project

Blank material consisted of landscaping stone acquired from Premier Horticulture Ltd. in 18 kg bags. Ten of these blank samples were submitted to SGS on their own, to verify that the blank material does not contain any base or precious metals of interest (Table 3). Analytical results show that the 10 blank samples are below detection for Cu, Pb and Zn with one sample (B00265792) at the detection level for Ag and 0.001 ppm above the detection level for Au. Fe was slightly above the detection limit in two samples (B00265778, B00265794). The analytical results are considered acceptable for use of the landscaping stone as a blank material.

Table 3: Certified means and standard deviations (SD) for CRMs used in 2015 KZK Project

Sample ID	Ag (ppm)	Au (ppm)	Cu (%)	Fe (%)	Pb (%)	Zn (%)

Criteria for failure and re-assay

The three criteria used to flag CRM and blank samples as "QAQC failures" include:

(i) Any CRM sample with a Z-score >3 standard deviations (SD) from the mean ("3-SD failures");
(ii) Two consecutive, or two out of three consecutive, CRM samples with Z-scores between 2 and 3 SDs from the mean ("2-SD failures"); Z-scores must be of the same sign (i.e. positive or negative) and for the same element;
(iii) Any blank sample returning >10 times the analytical detection limit

When a CRM or blank exceeds one of the three failure thresholds defined above, a request for re-analysis also depends on whether it is associated with "mineralized" core samples or not. Minimum values used to define the boundary between "mineralized" and unmineralized" are in Table 1.

For failed CRMs and blanks, the "associated core samples" are the 10 sample numbers preceding the CRM/blank and the 10 sample numbers that follow it, meaning each CRM/blank is typically associated with 20 samples. A CRM/blank occurring near the beginning or end of a certificate may have a lower number of associated core samples whereas those occurring near a sequence-numbering switch may have a lower or higher number.

Table 4: Detection and mineralized limits for selected precious and base metals

Element	Detection limit (dl)	10x dl	"Mineralized"
Ag	0.3 g/t	3 g/t	20 g/t
Au	0.005 g/t	0.05 g/t	0.1 g/t
Cu	0.01%	0.10%	0.10%
Fe	0.05%	0.50%	n/a
Pb	0.01%	0.10%	0.50%
Zn	0.01%	0.10%	0.50%

Notes on finalized certificates

Several of the assay certificates finalized by SGS Vancouver were published as two or more versions differentiated from each other by a single letter suffix (Table 5). In general, those certificates that lack a suffix are either original base and precious (±Ba, S) assays, some of which were replaced by suffixed certificates and others that were not. Another set of certificates with no suffix contains only Ba ± S assays.

Certificates with the suffix "R" contain re-assays of base and precious metals that were requested by Equity, mostly to rectify the 3-SD failures. Those certificates with the suffix "U" contain re-assays of Pb that were triggered by SGS after they discovered that the presence of high Ba precipitates out some of the Pb. The suffix "A" refers to certificates with analytical results for As, Bi, Hg, Sb and Se. The "F" suffix marks a finalized integration of Ag-Au-Cu-Fe-Pb-Zn data that combined data from the original, "R" and/or "U" certificates.

Table 5: Summary of suffixes used on SGS Vancouver certificates

Suffix	Example	Description
None	VC151957	Original Ag, Au, Cu, Fe, Pb, Zn, ±Ba, ±S assays; or original Ba ± S assays
A	VC151957A	As, Bi, Hg, Sb, Se analyses
F	VC151957F	"Final" certificates comprising integrations of original, "R" and "U" certificates
R	VC151957R	Re-assays of Ag, Au, Cu, Pb and/or Zn requested by Equity
U	VC151957U	Re-assays of Pb initiated by SGS

REVIEW OF CERTIFICED REFERENCE MATERIALS (OR STANDARDS)

This section reviews the performance for each of the six certified reference materials (CRM or "standards") used on the 2015 KZK Project. A summary of standards analyzed and mean abundances for key elements is shown in Table 6 and their certificates are provided in Appendix N-B. Shewart charts for Au, Ag, Cu, Fe, Pb and Zn, along with blank charts, are shown in Appendix N-C. The total number of failures for each CRM are summarized in Table 7 and Appendix N-D.

Table 6: Mean values and % difference (relative to certified mean) for CRMs used in 2015 KZK Project

Standard	Description	N.o. Analyses	Ag (ppm)	Au (ppm)	Cu (%)	Fe (%)	Pb (%)	Zn (%)
CDN-ME-1311	Certified mean	171	44.9	0.839	0.468		0.303	1.12

Notes: "0" = no failure, "-" = CRM not certified; * = "half failures" are 2-SD failures where the two failed CRM are different types (e.g.. CDN-ME-1311 and OREAS 623).

CDN-ME-1311

This CRM is manufactured by CDN Resource Laboratories in Langley, BC, Canada, and consists of material from the Campo Morado VMS deposit in Mexico. It is certified for Ag, Au, Cu, Pb and Zn – but not for Fe – with mineralogy comprising pyrite, quartz, ankerite, sphalerite, chalcopyrite and galena, as well as trace tennanite-freibergite, arsenopyrite and pyrrhotite. Certified values are displayed in Tables 2. Pulp material is packaged in either 60 or 100 g paper envelopes that are individually vacuum-sealed and labelled with a sticker.

A total of 172 of these CRM are noted in the drill hole database and 171 analyses were returned from SGS Vancouver. The one missing standard (Q32320) appears to be a typo in the log for drill hole K94-008, and probably does not exist.

Mean concentrations of Ag, Au, Cu, Pb and Zn for all CDN-ME-1311 analyses done as part of the 2015 KZK Project lie within ±2.1% of the certified mean. The average bias for silver, gold and copper is negative and ranges from -0.6 to -2.1% whereas Pb and Zn show positive bias between +0.8 to +1.1%.

Twenty-nine and one-half quality control failures were recorded for CDN-ME-1311 comprising 17.5 3-SD failures and twelve 2-SD. The "half-failures" consist of 2-SD failures where only one of the two CRM is CDN-ME-1311 (i.e. and the second is one of the four other CRM) or where one of the CRMs is both a 2-SD and 3-SD failure. The combined 3-SD and 2-SD failure rate for CDN-ME-1311 is 3.4%, which is notably higher than the 0.5-1.4% recorded for other CRMs with >50 analyses. The most likely reason for the high failure rate of this CRM is that the ratio of certified standard deviation to mean – especially for Ag, Pb and Zn – is significantly lower for CDN-ME-1311 (1.8-2.5%) than it is for OREAS 621 (4.2-9.8%) and OREAS 623 (3.8-17.2%). The relatively narrow range of certified values for CDN-ME-1311 was therefore likely complicit in the higher number of failures.

Fifteen of the 3-SD failures and 0.5 of the 2-SD failures were re-assayed (Appendix N-D). The two-and-a-half 3-SD failures that were not re-assayed include failed Ag and Zn assays with no associated mineralized core samples, and a composite 3-SD/2-SD failure that also lacks associated mineralization. The re-assayed half 2-SD failure was requested prior to a procedural change that these failures would only be flagged for now, rather than re-assayed.

OREAS 621

OREAS 621 is manufactured by Ore Research & Exploration Pty Ltd of Bayswater North, Australia, ("Ore Research") and consist of zinc VMS ore from Gossan Hill, Western Australia, blended with barren rhyodacite that hosts and underlies the deposit. Certified elements include Ag, Au, Cu, Fe, Pb and Zn (Table 2). Ore mineralogy consists mostly of sphalerite and chalcopyrite with lesser amounts of galena, in addition to pyrite, pyrrhotite and magnetite. Pulp material is packaged in 60 g laminated foil packets with nitrogen flush to prevent oxidation, and so two packets were submitted for each OREAS 621 sample number in order to exceed the minimum 100 g threshold. The packets come pre-printed with the CRM label that can be removed with a solvent.

A total of seventy-five OREAS 621 standards occur in the drill hole database, all of which were assayed by SGS Vancouver. Mean concentrations of Ag, Au, Cu, Fe, Pb and Zn all lie within ±2.3% of the certified mean (Table 6). Silver and copper show a weak negative bias (-0.5 to -0.8%), gold is weakly positive to neutral (+0.1%) and Fe, Pb and Zn show positive bias of +1.2 to +2.3% (Table 6).

Only two QC failures were recorded for OREAS 621, with both comprising Au failures at the 3-SD level (Table 7). The total failure rate of 0.5% is the lowest for the three CRMs with >50 analyses, possibly because the standard deviation values for this CRM are high in relation to its certified mean.

Both of the 3-SD failures for gold were associated with mineralized core samples and rectified through re-assay. As such, all QAQC issues related to OREAS 621 have been resolved (Appendix N-D).

OREAS 623

OREAS 623 is also manufactured by Ore Research and, likewise, consists of zinc VMS ore from Gossan Hill that is blended with barren rhyodacite. Certified elements include Ag, Au, Cu, Fe, Pb and Zn (Table 2). Ore mineralogy consists mostly of sphalerite and chalcopyrite with lesser amounts of galena, in addition to pyrite, pyrrhotite and magnetite. Pulp material is provided in 60 g laminated foil packets with a nitrogen flush to prevent oxidation, and so,

once again, two packets were needed to exceed the minimum 100 g threshold. The packets come pre-printed with the CRM label that is removed with a solvent.

A total of 70 OREAS 623 standards were noted in the drill hole database and 70 analyses were returned from SGS Vancouver.

Mean and median abundances of Ag, Au, Cu, Fe, Pb and Zn for all OREAS 623 analyses done as part of the 2015 KZK Project lie within ±10.6% of the certified mean, reducing to ±3.7% when silver is excluded (Table 6). Silver and gold show negative bias of -10.6% and -2.8% respectively whereas assays of Cu, Fe, Pb and Zn returned an average positive bias ranging from 0.7-3.7%. For silver, the high ratio of certified standard deviation to mean (6.7:68.7 ppm) prevented QAQC failures even though the average CRM assay was 10.6% below the certified mean.

Five quality control failures were recorded for OREAS 623, four of which comprise 3-SD failures for gold and two half 2-SD failures where OREAS 623 failed together with CDN-ME-1311 for gold and Pb. The total failure rate of 1.4% is actually somewhat high given that most of these are for gold, which has a higher ratio of certified standard deviation to mean (4.9) than CDN-ME-1311 (4.0) and OREAS 621 (3.4). All four of the 3-SD failures for OREAS 623 were associated with mineralized core samples and therefore rectified with re-assay. The half 2-SD failure for gold was also rectified with re-assay whereas the half 2-SD failure for Pb was left as is (Appendix N-D).

OREAS 113

This CRM is also manufactured by Ore Research and, in North America, is distributed by Analytical Solutions Ltd of Toronto, Ontario, Canada. It is prepared from material derived from the Triton Copper Project in New South Wales, Australia. This deposit consists of massive pyrite and chalcopyrite breccias underlying oxide ores, with OREAS 113 prepared from the chalcopyrite breccia ore. Certified elements include Cu, Fe and Zn (Table 2). Pulp material is provided in 10 g heat-sealed foil packets that are nitrogen-flushed to remove oxygen. For the 2015 KZK Project, Analytical Solutions Ltd provided custom-sized 100 g packets.

Seventeen OREAS 113 standards were noted in the drill hole database and 17 were analysed by SGS Vancouver. Mean abundances of Cu, Fe and Zn all lie within ±1.7% of the certified mean (Table 6). Copper and zinc show a positive bias averaging between +1.3 to +1.7% whereas Fe shows negative bias averaging -1.7%. There were no failures for this CRM on the 2015 KZK Project.

GMB310-16

GBM310-16 was sourced from GeoStats Pty Ltd ("GeoStats") of O'Connor, Western Australia, and is prepared from zinc sulphide ore. Certified elements include Ag, Pb and Zn (Table 6). This CRM is generally available in 20 g heat-sealed plastic packets but were likewise provided in custom 100 g packets for the 2015 KZK Project.

A total of eighteen GBM310-16 standards were noted in the drill hole database and 18 analyses were returned from SGS Vancouver. Mean abundances of Ag, Pb and Zn all lie within ±4.0% of the certified mean (Table 6). Silver shows a negative average bias of -2.4% whereas Pb and Zn show positive bias that averages 0.7% (Pb) to 4.0% (Zn).

One-and-a-half quality control failures were recorded for GBM310-16, comprising a 2-SD failure for Ag (two consecutive GBM310-16) and another 2-SD failure for zinc (consecutive GBM310-16 and CDN-ME-1311). Neither of these failures were submitted for re-assay.

G312-4

This CRM is also manufactured by GeoStats and is prepared from Cu-Au sulphide ore. Certified elements consist only of gold for 50 g fire assay. GeoStats provided custom-sized 100 g to the 2015 KZK Project.

Twelve G312-4 standard are noted in the drill hole database and 24 assays were returned from SGS Vancouver, with twelve for the fire assay method and the same 12 samples also analyzed by the gravimetric technique. The mean gold abundance for the fire assay method is 5.32 g/t Au, which is just 0.4% higher than the certified mean. The gravimetric average is 5.19 g/t but this standard is not certified for this method. There were no 3-SD or 2-SD failures.

REVIEW OF BLANKS

Blank material used on the 2015 KZK Project comprised landscaping stone acquired from Premier Horticulture Ltd. ("Premier") in 18 kg bags. Two-hundred and eighty blank samples are recorded in the drill hole database whereas 289 analyses were assayed by SGS Vancouver. This discrepancy is due to batch of 10 blank samples that was sent to SGS Vancouver near the start of the 2015 KZK Project to assess the abundance of key elements within these blanks samples (Table 3), but which is not recorded in the drill hole database. An additional blank sample, Q311310_2, is recorded in the drill hole database but was never submitted to SGS, so it is most likely a data entry mistake. In consideration of this, all of the blanks sent to SGS Vancouver are accounted for.

The ten blank samples analyzed to assess the suitability of Premier landscaping stone as blank material all returned below detection for Cu, Pb and Zn with one sample (B00265792) at the detection limit (*dl*) for Ag and 0.001 ppm >*dl* for Au (Table 3). Fe was 0.04-0.05% above the detection limit in two samples (B00265778, B00265794). The analytical results were deemed acceptable for use of the Premier stone as a blank material.

On average, >80-90% of blank assays returned values for Ag, Au and Pb that were less than the detection limit (Table 8, Appendix N-C). Copper showed even less contamination, with only 2.1% of all blanks returning more than the *dl* of 0.01% Cu. Zinc and iron, on the other hand, recorded more contamination, with 27.7% and a remarkably high 71.3% of assays exceeding *dl* respectively. Maximum contamination levels of Zn were relatively low, however, with only one sample exceeding the failure threshold of 10 x *dl* (see below). The consistent Fe contamination is possibly related to the Fe-rich nature of most analyzed rocks. Whatever the case, the maximum levels of Fe contamination were insignificant compared to its abundance and irrelevant to the resource calculation.

Only five blank analyses were found to exceed the failure threshold of 10 x *dl*. Three of these analyses were for Fe and therefore required no follow-up work. The remaining two failures were for Ag (16.3 x *dl*) and Zn (12 x *dl*), both of which were associated with strongly mineralized core samples and so required no follow-up work.

Table 8: Summary statistics for blanks analyzed as part of 2015 KZK program

Statistic	Ag	Au	Cu	Fe	Pb	Zn
Detection limit	0.3 ppm	0.005 ppm	0.01%	0.05%	0.01%	0.01%
Mean (N = 289)	<dl	<dl	<dl	0.10%	<dl	0.012%
N.o. samples <*dl*	230	235	283	83	256	209
% of samples <*dl*	79.6%	81.3%	97.9%	28.7%	88.6%	72.3%
N.o. samples >10 x *dl*	1	0	0	3	0	1
% of samples >10 x *dl*	0.3%	0.0%	0.0%	1.0%	0.0%	0.3%
Maximum assay	4.9 ppm	0.029 ppm	0.03%	0.8%	0.06%	0.12%
Maximum assay/*dl*	16.3	5.8	3.0	16.0	6.0	12.0

CHECK ASSAYS

A check assay program was done by sending 150 half-core samples to ALS Minerals ("ALS") in North Vancouver, BC, Canada, for geochemical analysis of base (Cu, Pb, Zn) and precious (Ag, Au) metals, as well as Fe. The ALS lab in North Vancouver is an ISO 9001:2008 certified laboratory (accredited laboratory No. 579) that also conforms with the requirements of CAN-P-1579 and CAN-P-4E (ISO/IEC 17025-2005) for the analytical methods used (Table 9), which are analogous to those used by SGS Vancouver (Table 1).

All check assay pulp samples submitted to ALS were analyzed for Ag, Au, Cu, Fe, Pb and Zn. Gold was analysed by 30 g fire assay with an AAS finish and silver analysed by ICP with an AAS finish. The silver over limit analysis was triggered at Ag >100 g/t, resulting in re-analysis using a 30 g fire assay with gravimetric finish. Over limit analysis for Au was not requested. Copper, lead, zinc and iron assays were done with sodium peroxide fusion and ICP-AES analysis. This fusion results in complete digestion of the sample and so provides a near total chemical analysis.

Table 9: Analytical methods and range for precious and base metals analysed as part of 2015 KZK Project

Element	Analytical Method	ALS code	Analytical Range
Au	Au 30 g fire assay/AAS finish	Au-AA25	0.01-100 ppm
	Au over limit (>5 g/t): 30 g fire assay/gravimetric finish	Au-GRA21	0.05-1000 ppm
Ag	Ag by aqua regia digestion and AAS	Ag-AA45	0.2-100 ppm
	Ag over limit (>100 ppm): 30 g fire assay/gravimetric finish	Ag-GRA21	5-10000 ppm
Cu	Na peroxide fusion/ICP-AES	ME-ICP81	0.002-30%
Fe	Na peroxide fusion/ICP-AES	ME-ICP81	0.05-70%
Pb	Na peroxide fusion/ICP-AES	ME-ICP81	0.01-30%
Zn	Na peroxide fusion/ICP-AES	ME-ICP81	0.002-30%

Gold assays are, on average, 2.3% lower for the ALS check assays in comparison to the original SGS values (Table 10), which themselves were an average of -1.0% below the certified CRM values (Table 6). The Pearson correlation coefficient (ρ) for the two datasets is 0.980, which can be increased to ρ = 0.989 with removal of three outliers. Deleting these outliers also reduces the difference between ALS and SGS means to just 0.1%. Over limit assays for gold were not requested and would have been statistically irrelevant, since only one check assay returned >5 g/t Au.

Silver values determined by ALS are, on average, 2.5% lower than the SGS values, with a Pearson correlation coefficient (ρ) of 0.997 between the two data sets. Only 17 of the silver assays exceeded the over limit for both the SGS and ALS methods, with ALS assays an average of 2.0% lower than SGS and with ρ = 0.992. Like gold, the negative average bias for ALS check assays would be on top of the negative bias for SGS Ag assays indicated by the CRMs.

Copper assays are very similar for ALS and SGS assays, with the ALS check assays an average of 0.5% lower than SGS and with a perfect Pearson correlation coefficient between the two datasets of ρ = 1.000.

Iron values are an average of 2.1% lower for the ALS check assays relative to the original SGS values. This negative bias is in contrast to the 1.3% positive bias calculated for the SGS analyses relative to certified reference materials, suggesting that ALS and SGS assays show broadly similar accuracy for Fe. This is consistent with the very high Pearson correlation coefficient (ρ = 0.999) for the two datasets.

The Pb check assays are an average of 3.9% higher than the original SGS assays. This is somewhat contrary to expectation, given that SGS modified their analytical method to adjust for the Pb loss in Ba-rich samples due to the precipitation of $BaSO_4$. Unfortunately there is no Ba data for any of the 150 samples submitted for check assay. The positive check assay bias is on top of the positive bias recorded for SGS assays relative to CRM, suggesting that the SGS assays are more accurate than the ALS check assays. The Pearson correlation coefficient (ρ = 0.989) is somewhat lower than the other elements, possibly because of the Ba interference effects described earlier.

Table 10: Selected statistics for SGS original assays and ALS check assays

ol = over limit for Ag (>100 ppm for ALS, >150 ppm for SGS)

Check assays for Zn are an average of 1.3% lower than the original SGS assays, which in turn were an average of 1.5% higher than the CRM. So it follows that the ALS check assays are likely somewhat more accurate than the original SGS assays. The Pearson correlation coefficient for the two datasets is very high ($\rho = 0.999$).

DISCUSSION AND CONCLUSIONS

The quality assurance (QA) protocols used as part of the 2015 KZK geochemical assay program followed industry standard by inserting a minimum of 10% QA/QC samples within the core sample stream. This 10% includes all CRMs, blanks and check assays. It does not include the CRMs and blanks inserted by SGS Vancouver nor the duplicate analyses they completed on selected core pulps. Both the SGS and ALS lab facilities are ISO 9001:2008 certified for the analytical methods used on the 2015 KZK Project.

Quality control of CRM and blank analyses was monitored in as close to real-time as possible. CRMs that assayed more than three standard deviations (or Z-scores) away from the certified mean (i.e. "3-SD" failure) were submitted for re-assay if they were associated with mineralized core samples. These re-assays were completed prior to the writing of this report. The 2-SD failures were generally not submitted for re-assay. Only five blank analyses exceeded the failure threshold of ten times the detection limit, with each case associated with strongly mineralized core samples that rendered the magnitude of contamination negligible. As a result, QC monitoring of the 2015 KZK assay results has resolved all relevant 3-SD failures and determined that contamination levels are negligible. The bulk of 2-SD failures remain in the dataset as their related core assays were deemed suitable for inclusion in the resource estimate.

Gold assays of CRM returned an average of value -0.9% lower than the certified mean, which corresponds to an error of 10-15 ppb Au (or 0.01-0.015 g/t) at typical ABM resource grades of 1.0-1.5 g/t Au (Green, 2015) . A total of eight-and-a-half 3-SD failures and one-and-a-half 2-SD failures were recorded, for 10 failures in total. Nine of these were resolved through re-assay whereas the one remaining 2-SD failure was determined to require no follow-up work. There were no blank failures. The ALS check results show a reasonable correlation with SGS data ($\rho = 0.989$) and additional negative bias relative to SGS samples that averages -2.3%. When compared with the already negative bias of SGS relative to CRM, the check assay results suggest that the SGS analyses are more accurate than those done by ALS.

Silver assays of CRM showed an average analytical bias -2.9%, equating to an error of ~4 g/t at typically ABM resource grades of 140 g/t Ag (Green, 2015). An exceptionally high bias of -10.6% was recorded for OREAS 623 and is likely a function of its low certified grade (22.7 ppm) and the relatively high detection limit for the analytical method employed (0.3 ppm). A total of four 3-SD and four 2-SD failures were recorded for all CRM analyses of silver, with three of the 3-SD failures resolved through re-assay. The fourth 3-SD failure was not re-assayed due to lack of associated mineralization whereas the 2-SD failures were left as is. A single blank failure was also not re-assayed since it was associated with mineralized core that rendered contamination levels negligible. Check assay results shows a strong correlation between ALS and SGS datasets ($\rho = 0.997$) and additional negative bias for check assays averaging -2.5% for AAS analysis and -2.0% for gravimetric. Given that the SGS assays already showed an average -2.9% negative bias relative to the CRM, these check assay results again suggest that the SGS data is more accurate than the ALS check assays.

Copper assays of CRM returned an average analytical bias of -1.1%, as well as one 3-SD failure and two 2-SD failures. Analytical bias equates to an error of 90 ppm (or 0.009%) on typical ABM resource grades of 0.9% Cu (Green, 2015). The 3-SD failure was subsequently resolved through re-assay whereas both 2-SD failures were left as is. There were no blank failures. Check assay results showed an additional negative bias of ALS relative to SGS assays that averages -0.5%, as well as a perfect Pearson correlation coefficient of 1.000. These results indicate that the ALS and SGS data-sets are essentially identical and therefore of comparable accuracy.

Iron analyses of CRM returned an average bias of +1.3%, which is similar to the base and precious metals tracked as part of this program. CRM failures were not tracked for Fe, since this element was not included in the resource, and there were three blank failures that were also not followed up for the same reason. Check assay results showed an average negative bias of -2.1%, suggesting that the ALS check assays for Fe are of broadly similar accuracy to, or possibly slightly more accurate than, the SGS assays.

Pb assays of standards were an average of +1.7% higher than the certified mean, which equates to an error of 0.027% (or 270 ppm) for typical ABM resource grades of ~1.5% Pb (Green, 2015). A total of four 3-SD and two 2-SD failures were recorded. All four of the 3-SD failures were rectified through re-assay whereas the two 2-SD failures were left as is. There were no blank failures. Check assay results showed an average positive bias of 3.9% for ALS analyses relative to SGS that, when considered on top of the +1.8% for SGS assays relative to CRM, suggests the SGS analyses are more accurate than the ALS check assays. The better accuracy for SGS analyses is possibly related to their modification of the analytical method for Pb, which they found was being complicated through the high barium and sulphur contents of the samples.

Zn in CRM assayed an average of +1.5% higher than the certified mean, corresponding to an error of 0.08-0.09% (800-900 ppm) at typical ABM resource grades of 5.5-6.0% Zn (Green, 2015). A total of six 3-SD and five 2-SD failures were recorded. Five of the 3-SD failures were rectified through re-assay with the sixth left as is because it was not associated with mineralized core samples. Only one of the 2-SD failures was rectified through re-assay and the remaining four were left as is. A single blank failure was associated with strongly mineralized core samples and was therefore not re-assayed. Check assay results showed a negative bias averaging -1.3% of ALS relative to SGS assays, which appears to counterbalance the +1.5% positive bias recorded for SGS assays relative to certified means of CRM. These results suggest that the ALS check assay data for Zn are more accurate than the SGS assays.

In summary, the analytical biases quantified through the analyses of certified reference materials and check assays indicates that the Au, Ag, Cu, Pb and Zn assays are sufficiently accurate. Analytical results for blank samples indicate that analyses are free of contamination. For these reasons, assay data for Au, Ag, Cu, Pb and Zn is of sufficiently high quality for use in resource estimation.

PREPARED BY: CDN Resource Laboratories Ltd.
CERTIFIED BY: Duncan Sanderson, B.Sc., Licensed Assayer of British Columbia
INDEPENDENT GEOCHEMIST: Dr. Barry Smee., Ph.D., P. Geo.
DATE OF CERTIFICATION: March 20, 2014

METHOD OF PREPARATION:

Reject ore material was dried, crushed, pulverized and then passed through a 270 mesh screen. The +270 material was discarded. The -270 material was mixed for 5 days in a double-cone mixer. Splits were taken and sent to 15 laboratories for round robin assaying.

ORIGIN OF REFERENCE MATERIAL:

The ore was supplied by Farallon Resources from their Campo Morado property in Mexico. The Campo Morado precious-metal-bearing, volcanogenic massive sulphide deposits occur in a lower Cretaceous bimodal, calc-alkaline volcanic sequence. Most deposits occur in the upper part of a sequence of felsic flows and heterolithic volcanoclastic rocks or at its contact with overlying chert and argillite. Gold, silver, zinc, and lead are associated with pyrite, quartz, ankerite, sphalerite, chalcopyrite and galena, with minor tennanite-freibergite, arsenopyrite, and pyrrhotite.

Approximate chemical composition (from whole rock analysis) is as follows:

	Percent			Percent
SiO2	36.2		MgO	2.0
Al2O3	4.8		K2O	0.7
Fe2O3	28.4		TiO2	0.2
CaO	2.6		LOI	22.4
Na2O	0.1		S	17.5
C	1.3			

Statistical Procedures:

The final limits were calculated after first determining if all data was compatible within a spread normally expected for similar analytical methods done by reputable laboratories. Data from any one laboratory was removed from further calculations when the mean of all analyses from that laboratory failed a t test of the global means of the other laboratories. The means and standard deviations were calculated using all remaining data. Any analysis that fell outside of the mean ±2 standard deviations was removed from the ensuing data base. The mean and standard deviations were again calculated using the remaining data. This method is different from that used by Government agencies in that the actual "between-laboratory" standard deviation is used in the calculations. This produces upper and lower limits that reflect actual individual analyses rather than a grouped set of analyses. The limits can therefore be used to monitor accuracy from individual analyses, unlike the Confidence Limits published on other standards.

Assay Procedures:

Au: Fire assay pre-concentration, AA or ICP finish.
Ag, Cu, Pb, Zn: 4-acid digestion, AA or ICP finish.

Zn, Zinc (wt.%)	5.22	0.139	5.17	5.27	5.13	5.31

INTRODUCTION

OREAS reference materials are intended to provide a low cost method of evaluating and improving the quality of analysis of geological samples. To the geologist they provide a means of implementing quality control in analytical data sets generated in exploration from the grass roots level through to prospect evaluation, and in grade control at mining operations. To the analyst they provide an effective means of calibrating analytical equipment, assessing new techniques and routinely monitoring in-house procedures.

SOURCE MATERIALS

OREAS 621 was prepared from Zn and Cu VHMS ores sourced from the Gossan Hill deposit at Golden Grove located 338km NNE of Perth in the Murchison Province of the Archaen Yilgarn Craton, Western Australia. The VHMS deposits are hosted within and underlain by a layered rhyodacitic volcanoclastic succession. The Gossan Hill ores have been blended with fresh, barren rhyodacite material sourced from a quarry approximately 30km east of Melbourne, Australia to achieve the desired grades. The main mineralisation assemblage consists of sphalerite, chalcopyrite and lesser galena with a gangue of pyrite, pyrrhotite and magnetite. Smith *et al*. (as cited in Smith, 2003) noted the ore shoots contain many chalcophile, or partly chalchophile elements namely Fe, S, Cu, Pb, Zn, Co, As, Sb, Bi, Cd, In, Mo, Ag, Sn, Ge, Se, Te, Hg and Au. OREAS 621 is one of a suite of five CRMs ranging in grades from 0.18-3.10% Cu, 1.0-10.2% Zn, 0.25-2.21% Pb, 22-103ppm Ag and 0.68-1.85ppm Au.

COMMINUTION AND HOMOGENISATION PROCEDURES

The material constituting OREAS 621 was prepared in the following manner:

- drying of sulphide bearing ore materials to constant mass at 90°C;
- drying of rhyodacite material to constant mass at 105°C;
- crushing and milling of the ore material to 100% minus 35 microns;
- crushing and milling of the barren material to 98% minus 75 microns;
- blending in appropriate proportions to achieve the desired grades;
- packaging in 10g and 60g units sealed under nitrogen in laminated foil pouches.

ANALYTICAL PROGRAM

Twenty eight commercial analytical laboratories participated in the program to certify the 146 elements reported in Table 1. The following methods were employed:

- Gold via 20-40g* fire assay with AAS (20 labs), ICP-OES (3 labs) finish;
- Instrumental neutron activation analysis for Au on 1g subsamples to confirm homogeneity (1 laboratory);
- Sulphur by Infrared Combustion Analysis (21 labs).
- Peroxide fusion for full elemental suite ICP-OES and ICP-MS (up to 14 laboratories depending on the element).

- 4-Acid digestion (HF-HNO_3-$HClO_4$-HCl) for full elemental suite ICP-OES and ICP-MS or AAS finish (up to 22 laboratories depending on the element).
- 3-Acid digestion (HNO_3-$HClO_4$-HCl) for a limited suite by ICP-OES and AAS (up to 10 laboratories depending on the element).
- Aqua regia digestion (see note below) for full elemental suite ICP-OES and ICP-MS (up to 22 laboratories depending on the element).
- Gold via 15-50g* aqua regia digestion with ICP-MS (11 labs), AAS (5 labs) or graphite furnace AAS (1 lab) finish;

*The certified values (and 95% Confidence Interval and SD) for Au are also applicable to 50g charge weights.

It is important to note that in the analytical industry there is no standardisation of the aqua regia digestion process. Aqua regia is a partial empirical digest and differences in recoveries for various analytes are commonplace. These are caused by variations in the digest conditions which can include the ratio of nitric to hydrochloric acids, acid strength, temperatures, leach times and secondary digestions. Recoveries for sulphide-hosted base metal sulphides approach total values, however, other analytes, in particular the lithophile elements, show greater sensitivity to method parameters. This can result in lack of consensus in an inter-laboratory certification program for these elements. The approach applied here is to report certified values in those instances where reasonable agreement exists amongst a majority of participating laboratories. The results of specific laboratories may differ significantly from the certified values, but will, nonetheless, be valid and reproducible in the context of the specifics of the aqua regia method in use. Users of this reference material should, therefore, be mindful of this limitation when applying the certified values in a quality control program.

For the round robin program twenty 1kg lot samples were taken at predetermined intervals during the bagging stage, immediately following final blending and are considered representative of the entire batch. The six samples received by each laboratory were obtained by taking two 110g scoop splits from each of three separate 1kg lots. This format enabled nested ANOVA treatment of the results to evaluate homogeneity, i.e. to ascertain whether between-unit variance is greater than within-unit variance. Table 1 presents the 146 certified values together with their associated 1SD's, 95% confidence and tolerance limits and Table 2 shows 57 indicative values. Table 3 provides performance gate intervals for the certified values of each method group based on their pooled 1SD's. Tabulated results of all elements (including Au INAA analyses) together with uncorrected means, medians, standard deviations, relative standard deviations and per cent deviation of lab means from the corrected mean of means (PDM^3) are presented in the detailed certification data for this CRM (**OREAS 621 Datapack.xlsx**).

STABILITY AND STORAGE INSTRUCTIONS

OREAS 621 has been prepared from Zn and Cu VHMS ores sourced from the Gossan Hill deposit at Golden Grove and blended with argillic altered rhyodacite waste rock. It contains reactive sulphide (4.54% S) and has been packaged under a nitrogen environment (single use laminated foil pouches only). In its unopened state and under normal conditions of storage the CRM has a shelf life beyond ten years. Its stability will be monitored at regular intervals and purchasers notified if any changes are observed.

INSTRUCTIONS FOR CORRECT USE

The certified values for OREAS 621 refer to the concentration level in its packaged state. It should not be dried prior to weighing and analysis. The certified values for gold by fire assay and aqua regia digestion are applicable to charge/sample weights ranging 15-50g.

HANDLING INSTRUCTIONS

Fine powders pose a risk to eyes and lungs and therefore standard precautions such as the use of safety glasses and dust masks are advised.

LEGAL NOTICE

Ore Research & Exploration Pty Ltd has prepared and statistically evaluated the property values of this reference material to the best of its ability. The Purchaser by receipt hereof releases and indemnifies Ore Research & Exploration Pty Ltd from and against all liability and costs arising from the use of this material and information.

QMS ACCREDITED

ORE Pty Ltd is accredited to ISO 9001:2008 by Lloyd's Register Quality Assurance Ltd for its quality management system including development, manufacturing, certification and supply of CRMs.

INTRODUCTION

OREAS reference materials are intended to provide a low cost method of evaluating and improving the quality of analysis of geological samples. To the geologist they provide a means of implementing quality control in analytical data sets generated in exploration from the grass roots level through to prospect evaluation, and in grade control at mining operations. To the analyst they provide an effective means of calibrating analytical equipment, assessing new techniques and routinely monitoring in-house procedures.

SOURCE MATERIALS

OREAS 623 was prepared from Zn and Cu VHMS ores sourced from the Gossan Hill deposit at Golden Grove located 338km NNE of Perth in the Murchison Province of the Archaen Yilgarn Craton, Western Australia. The VHMS deposits are hosted within and underlain by a layered rhyodacitic volcanoclastic succession. The Gossan Hill ores have been blended with fresh, barren rhyodacite material sourced from a quarry approximately 30km east of Melbourne, Australia to achieve the desired grades. The main mineralisation assemblage consists of sphalerite, chalcopyrite and lesser galena with a gangue of pyrite, pyrrhotite and magnetite. Smith *et al*. (as cited in Smith, 2003) noted the ore shoots contain many chalcophile, or partly chalchophile elements namely Fe, S, Cu, Pb, Zn, Co, As, Sb, Bi, Cd, In, Mo, Ag, Sn, Ge, Se, Te, Hg and Au. OREAS 623 is one of a suite of five CRMs ranging in grades from 0.18-3.10% Cu, 1.0-10.2% Zn, 0.25-2.21% Pb, 22-103ppm Ag and 0.68-1.85ppm Au.

COMMINUTION AND HOMOGENISATION PROCEDURES

The material constituting OREAS 623 was prepared in the following manner:

- drying of sulphide bearing ore materials to constant mass at 90°C;
- drying of rhyodacite material to constant mass at 105°C;
- crushing and milling of the ore material to 100% minus 35 microns;
- crushing and milling of the barren material to 98% minus 75 microns;
- blending in appropriate proportions to achieve the desired grades;
- packaging in 10g and 60g units sealed under nitrogen in laminated foil pouches.

ANALYTICAL PROGRAM

Twenty eight commercial analytical laboratories participated in the program to certify the 147 elements reported in Table 1. The following methods were employed:

- Gold via 20-40g* fire assay with AAS (20 labs), ICP-OES (3 labs) finish;
- Instrumental neutron activation analysis for Au on 1g subsamples to confirm homogeneity (1 laboratory);
- Sulphur by Infrared Combustion Analysis (21 labs).
- Peroxide fusion for full elemental suite ICP-OES and ICP-MS (up to 14 laboratories depending on the element).

- 4-Acid digestion (HF-HNO_3-$HClO_4$-HCl) for full elemental suite ICP-OES and ICP-MS or AAS finish (up to 22 laboratories depending on the element).
- 3-Acid digestion (HNO_3-$HClO_4$-HCl) for a limited suite by ICP-OES and AAS (up to 10 laboratories depending on the element).
- Aqua regia digestion (see note below) for full elemental suite ICP-OES and ICP-MS (up to 22 laboratories depending on the element).
- Gold via 15-50g* aqua regia digestion with ICP-MS (11 labs), AAS (5 labs) or graphite furnace AAS (1 lab) finish;

*The certified values (and 95% Confidence Interval and SD) for Au are also applicable to 50g charge weights.

It is important to note that in the analytical industry there is no standardisation of the aqua regia digestion process. Aqua regia is a partial empirical digest and differences in recoveries for various analytes are commonplace. These are caused by variations in the digest conditions which can include the ratio of nitric to hydrochloric acids, acid strength, temperatures, leach times and secondary digestions. Recoveries for sulphide-hosted base metal sulphides approach total values, however, other analytes, in particular the lithophile elements, show greater sensitivity to method parameters. This can result in lack of consensus in an inter-laboratory certification program for these elements. The approach applied here is to report certified values in those instances where reasonable agreement exists amongst a majority of participating laboratories. The results of specific laboratories may differ significantly from the certified values, but will, nonetheless, be valid and reproducible in the context of the specifics of the aqua regia method in use. Users of this reference material should, therefore, be mindful of this limitation when applying the certified values in a quality control program.

For the round robin program twenty 1kg lot samples were taken at predetermined intervals during the bagging stage, immediately following final blending and are considered representative of the entire batch. The six samples received by each laboratory were obtained by taking two 110g scoop splits from each of three separate 1kg lots. This format enabled nested ANOVA treatment of the results to evaluate homogeneity, i.e. to ascertain whether between-unit variance is greater than within-unit variance. Table 1 presents the 147 certified values together with their associated 1SD's, 95% confidence and tolerance limits and Table 2 shows 56 indicative values. Table 3 provides performance gate intervals for the certified values of each method group based on their pooled 1SD's. Tabulated results of all elements (including Au INAA analyses) together with uncorrected means, medians, standard deviations, relative standard deviations and per cent deviation of lab means from the corrected mean of means (PDM^3) are presented in the detailed certification data for this CRM (**OREAS 623 Datapack.xlsx**).

INTENDED USE

OREAS 623 is intended for the following uses:

- for the monitoring of laboratory performance in the analysis of analytes reported in Table 1 in geological samples;
- for the verification of analytical methods for analytes reported in Table 1;
- for the calibration of instruments used in the determination of the concentration of analytes reported in Table 1.

STABILITY AND STORAGE INSTRUCTIONS

OREAS 623 has been prepared from Zn and Cu VHMS ores sourced from the Gossan Hill deposit at Golden Grove and blended with argillic altered rhyodacite waste rock. It contains reactive sulphide (9.07% S) and has been packaged under a nitrogen environment (single use laminated foil pouches only). In its unopened state and under normal conditions of storage the CRM has a shelf life beyond ten years. Its stability will be monitored at regular intervals and purchasers notified if any changes are observed.

INSTRUCTIONS FOR CORRECT USE

The certified values for OREAS 623 refer to the concentration level in its packaged state. It should not be dried prior to weighing and analysis. The certified values for gold by fire assay and aqua regia digestion are applicable to charge/sample weights ranging 15-50g.

HANDLING INSTRUCTIONS

Fine powders pose a risk to eyes and lungs and therefore standard precautions such as the use of safety glasses and dust masks are advised.

REPORT 08-724_113

INTRODUCTION

OREAS reference materials (RM) are intended to provide a low cost method of evaluating and improving the quality of precious and base metal analysis of geological samples. To the explorationist, they provide an important control in analytical data sets related to exploration from the grass roots level through to resource definition. To the analyst, they provide an effective means of calibrating analytical equipment, assessing new techniques and routinely monitoring in-house procedures.

OREAS 113 is a very high grade Cu ore certified reference material (CRM) prepared from material sourced from the Tritton Copper Project near Nyngan, New South Wales. The deposit consists of sulphide ore bodies (massive pyrite and chalcopyrite breccias) underlying oxide ores. OREAS 113 is one of a suite of five CRMs and was prepared from chalcopyrite breccia ore. All five CRMs have been characterised for Ag, As, Cd, Co, Cu, Fe, Pb, Sb and Zn by 4-acid ICP and sodium peroxide fusion ICP methods.

COMMINUTION AND HOMOGENISATION PROCEDURES

The material was prepared in the following manner:

a) drying at 65^0 C to constant mass;
b) crushing and screening;
c) multi-stage milling to 100% minus 35 microns;
d) final homogenisation;
e) packaging into 10g units sealed under nitrogen in laminated foil pouches.

ANALYSIS OF OREAS 113

Ten commercial laboratories participated in the analytical program to characterise Ag, As, Cd, Co, Cu, Fe, Pb, Sb and Zn. Their results together with uncorrected means, medians, one sigma standard deviations, relative standard deviations and percent deviation of lab means from the corrected mean of means (PDM^3) are presented in Tables A2 and A19 (Appendix). The parameter PDM^3 is a measure of laboratory accuracy while the relative standard deviation is an effective measure of analytical precision where homogeneity of the test material has been confirmed.

The analytical methods employed by each laboratory are explained, together with other abbreviations used, in Table A1 (Appendix).

Each participating laboratory received 5 samples of 30g each. Each set of subsamples submitted to each laboratory was taken at regular intervals during packaging of the standard in order to maximise their representation. All ten laboratories reported 4-acid data for the requested elements while eight included sodium peroxide fusion results. Laboratories were instructed to assay samples as received.

INSTRUCTIONS FOR THE CORRECT USE OF THE REFERENCE MATERIAL

The certified values for OREAS 113 refer to the concentration level of Ag, As, Cd, Co, Cu, Fe, Pb, Sb and Zn in its packaged state. The CRM should not be dried prior to weighing and analysis.

LEGAL NOTICE

Ore Research & Exploration Pty Ltd has prepared and statistically evaluated the property values of this reference material to the best of its ability. The Purchaser by receipt hereof releases and indemnifies Ore Research & Exploration Pty Ltd from and against all liability and costs arising from the use of this material and information.

CRM Details

Control Statistic Details

Control statistics were produced from results accumulated in the April-2010 & April-2012 round robins. The number of results used to certify each analyte is shown in the table above.

Material Description

This material is described as a Zinc Sulphide Ore .

Colour Designation (ISCC-NBS, SP440)

This material is light gray in colour.

Usage

This product is for use in the mining industry as a reference material for monitoring and testing the accuracy of laboratory assaying.

Preparation and Packaging

All CRMs are dried in an oven for a minimum of 12 hours at 110°C. The dry material is then pulverised to better than 75 micron (nominal mean of 45 micron) using an air classifier. The material is then homogenised and stored in a sealed, stable container ready for final packaging.

Materials are statistically sampled from stores, then packaged into either heat sealed, air tight, plastic pulp packets or screw top sealed plastic containers ready for distribution. All packaging has been chosen to ensure minimal contamination from outside sources during shipment, use and storage.

Assay Testwork

All standards are tested thoroughly in the Geostats bi-annual laboratory survey. This involves assaying by multiple laboratories from around the world. Results are compiled into a comprehensive report detailing statistics for each standard. Assay distributions are checked and processed statistically, producing monitoring statistics for these standards. Materials are tested regularly to ensure stability and homogeneity.

Stability

This product remains stable in its original packaging, away from direct sunlight.

Material Safety

This product is not hazardous and non-toxic.

All packaging has been chosen to ensure minimal contamination from outside sources during shipment, use and storage.

Assay Testwork

All standards are tested thoroughly in the Geostats bi-annual laboratory survey. This involves assaying by multiple laboratories from around the world. Results are compiled into a comprehensive report detailing statistics for each standard. Assay distributions are checked and processed statistically, producing monitoring statistics for these standards. Materials are tested regularly to ensure stability and homogeneity.

Stability

This product remains stable in its original packaging, away from direct sunlight.

Material Safety

This product is not hazardous and non-toxic.

Neutron Activation Analysis Results (ppm, unless otherwise noted)	
Antimony	1.5
Arsenic	15.4
Barium	420
Bromine	0.8
Cadmium	<10
Caesium	1.9
Calcium (%)	nr
Cerium	41
Chromium	90
Cobalt	41.4
Europium	1.4
Gold (ppb)	5300
Hafnium	5.8
Iridium (ppb)	<10
Iron (%)	6.2
Lanthanum	24
Lutetium	0.4
Mercury	nr
Molybdenum	35
Neodymium	nr
Nickel	350
Potassium (%)	nr
Rubidium	110
Samarium	4.7
Scandium	20.2
Selenium	<5
Silver	7
Sodium (%)	2.45
Strontium	nr
Tantalum	1
Tellurium	<10
Terbium	0.7
Thorium	13.1
Tin	<100
Tungsten	4
Uranium	7.6
Ytterbium	2.71
Zinc	1190
Zirconium	200

Major Elements by Fusion / XRF (%)	
Fe	6.04
SiO_2	59.33
Al_2O_3	14.27
TiO_2	1.182
MnO	0.12
CaO	5.65
P	0.059
S	0.671
MgO	3.06
K_2O	2.03
Na_2O	3.383
LOI1000	0.79

Neutron Activation Analyses and Fusion / XRF Analyses are single results and are indicative only. These are provided for matrix identification purposes.

G312-4

Geostats Pty Ltd, Certified Gold Reference Material, Product Code:

Appendix N-C:

Shewart and blank charts

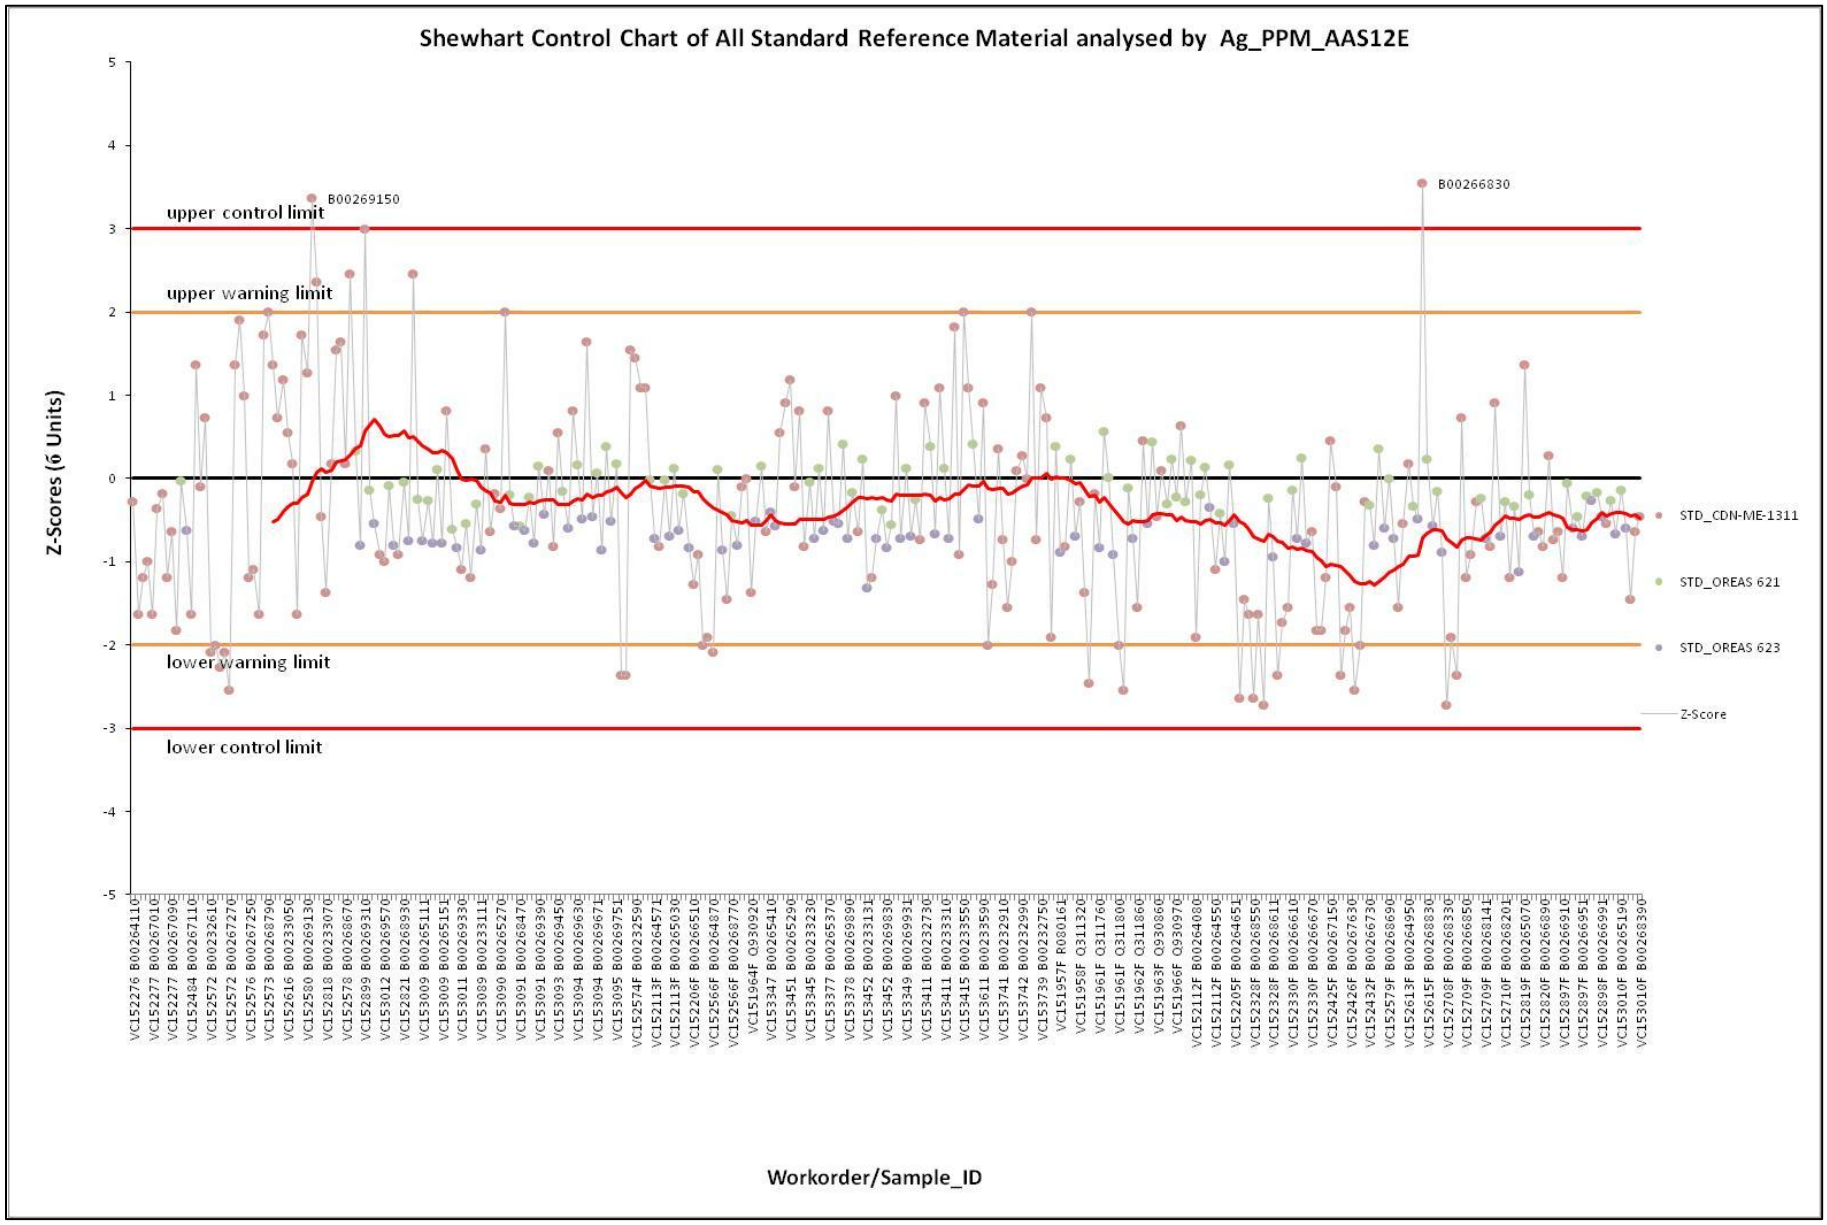

Figure 1: Shewart control chart for silver in CRMs. Red curved line is a moving average of 30 samples. The chart shows two 3-SD failures, neither of which requires follow-up work, and several 2-SD failures pegged for possible re-assay. Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

EQUITY | EXPLORATION CONSULTANTS LTD.

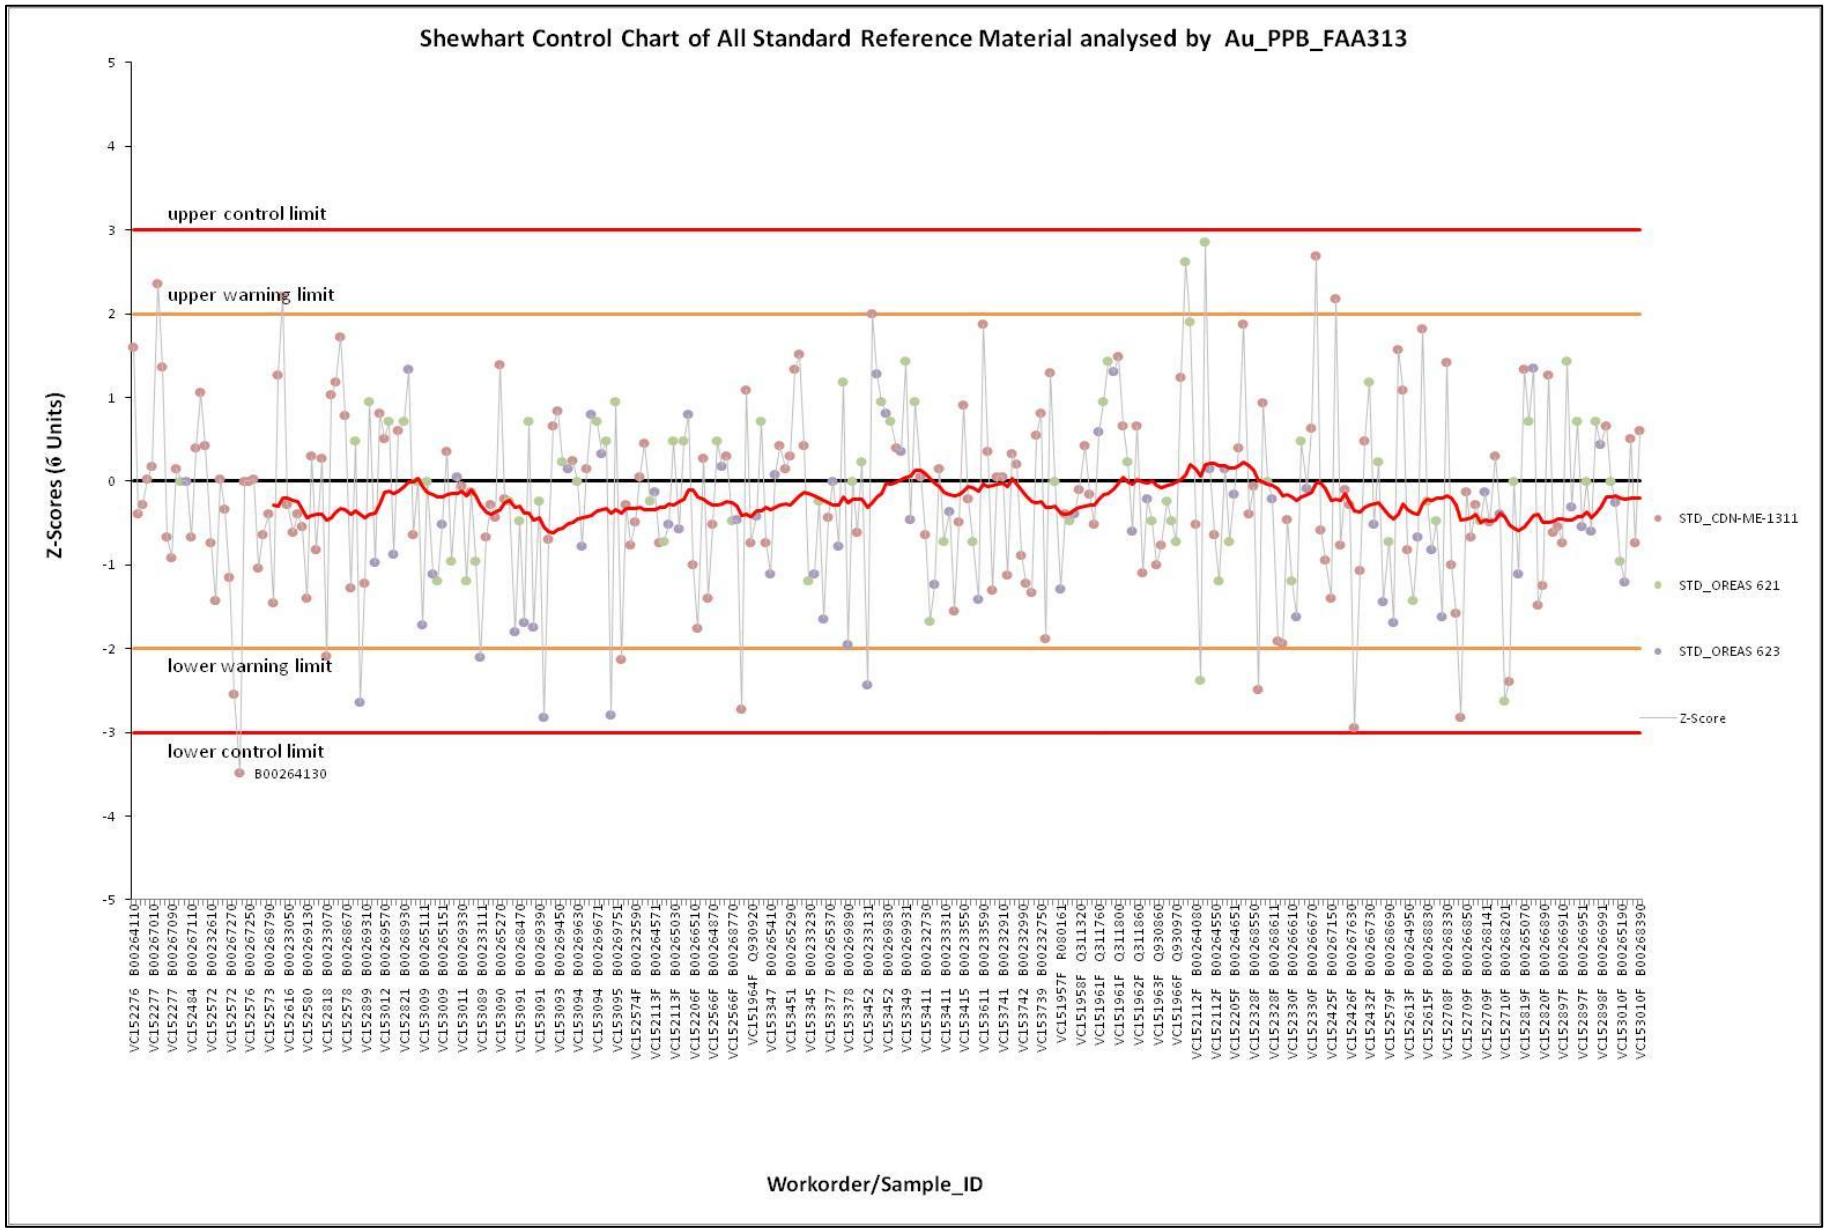

Figure 2: Shewart control chart for gold in CRMs. Red line is a moving average of 30 samples. The chart shows one 3-SD failure, which does not require follow-up work, and several 2-SD failures pegged for possible re-assay. Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

EQUITY | EXPLORATION CONSULTANTS LTD.

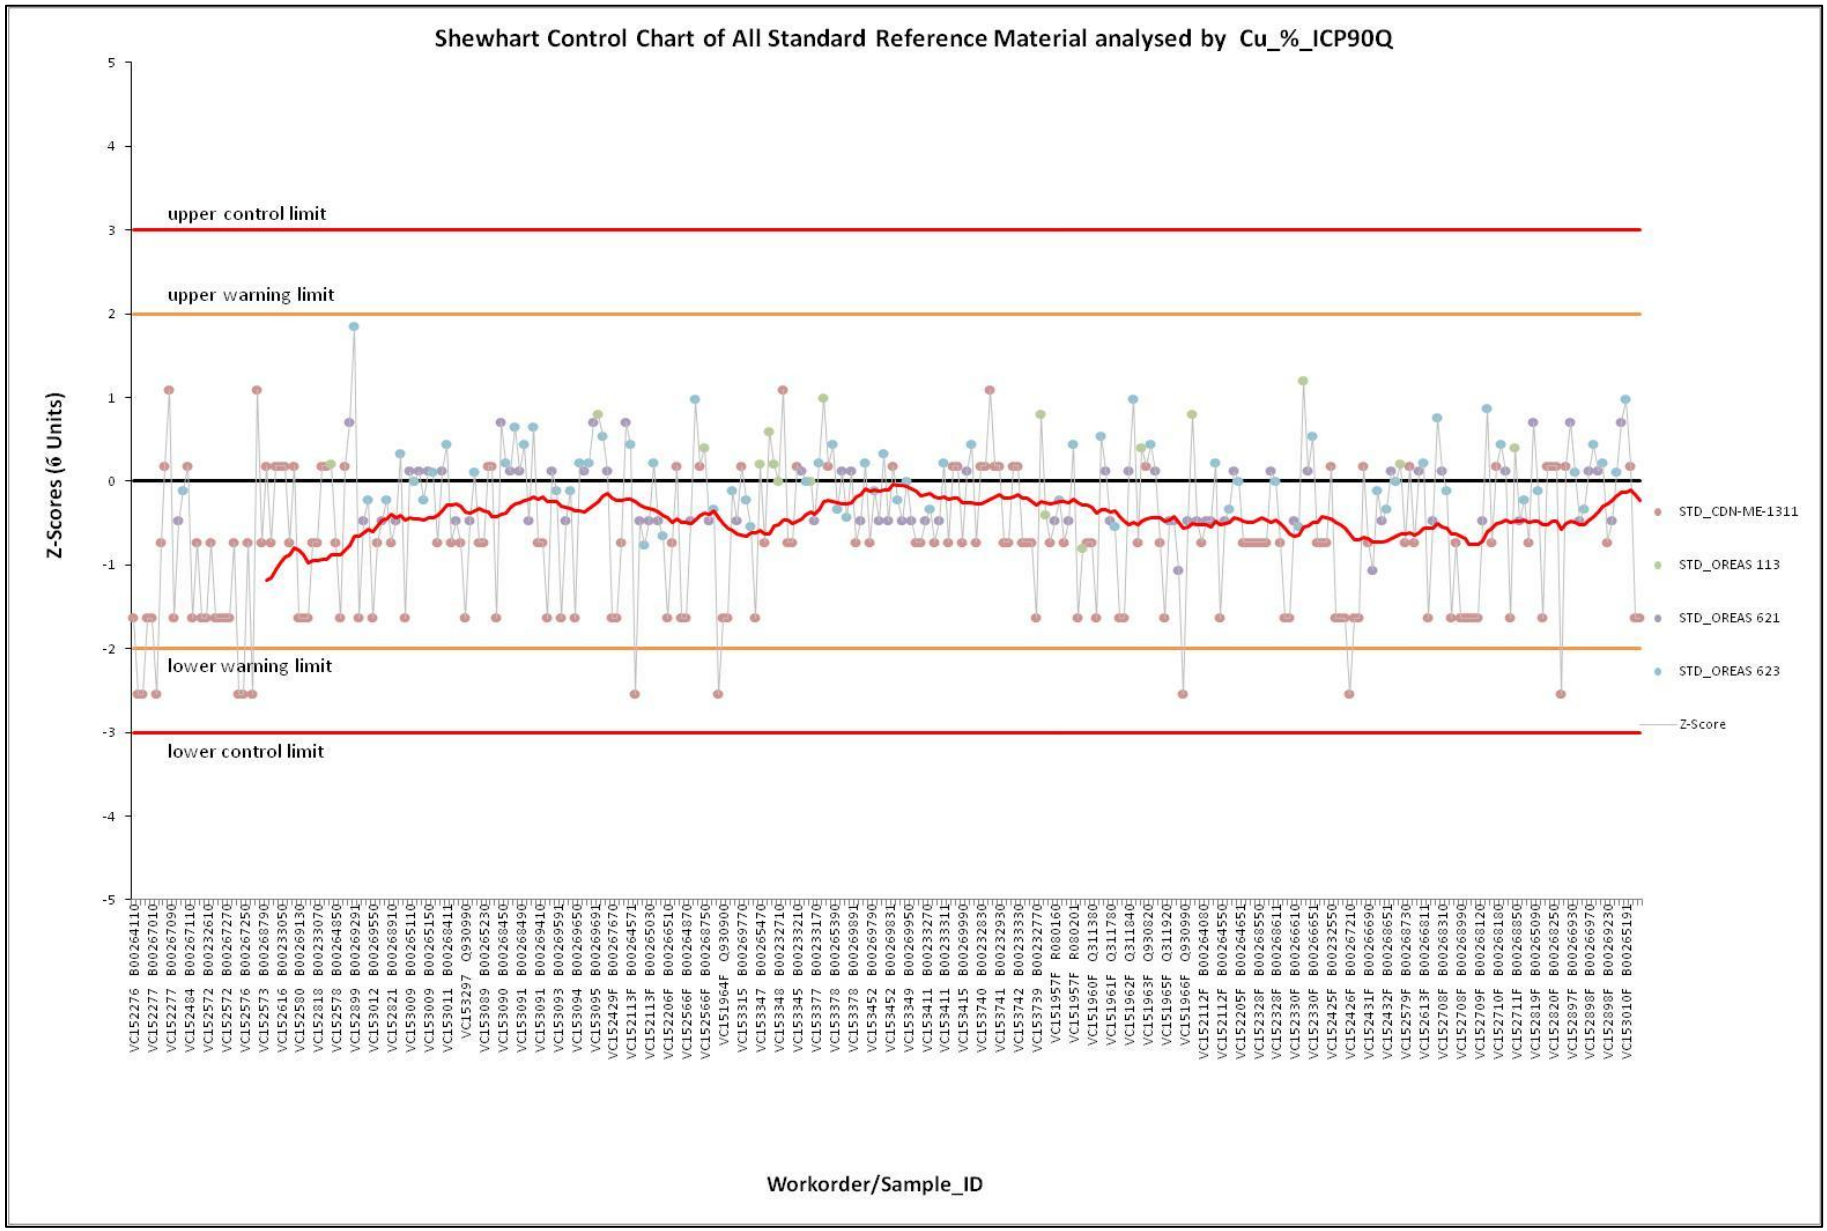

Figure 3: Shewart control chart for copper in CRMs. Red line is a moving average of 30 samples. There are no 3-SD failures and only a few 2-SD failures – mostly incurred at the start of the analytical program – pegged for possible re-assay. Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

EQUITY | EXPLORATION CONSULTANTS LTD.

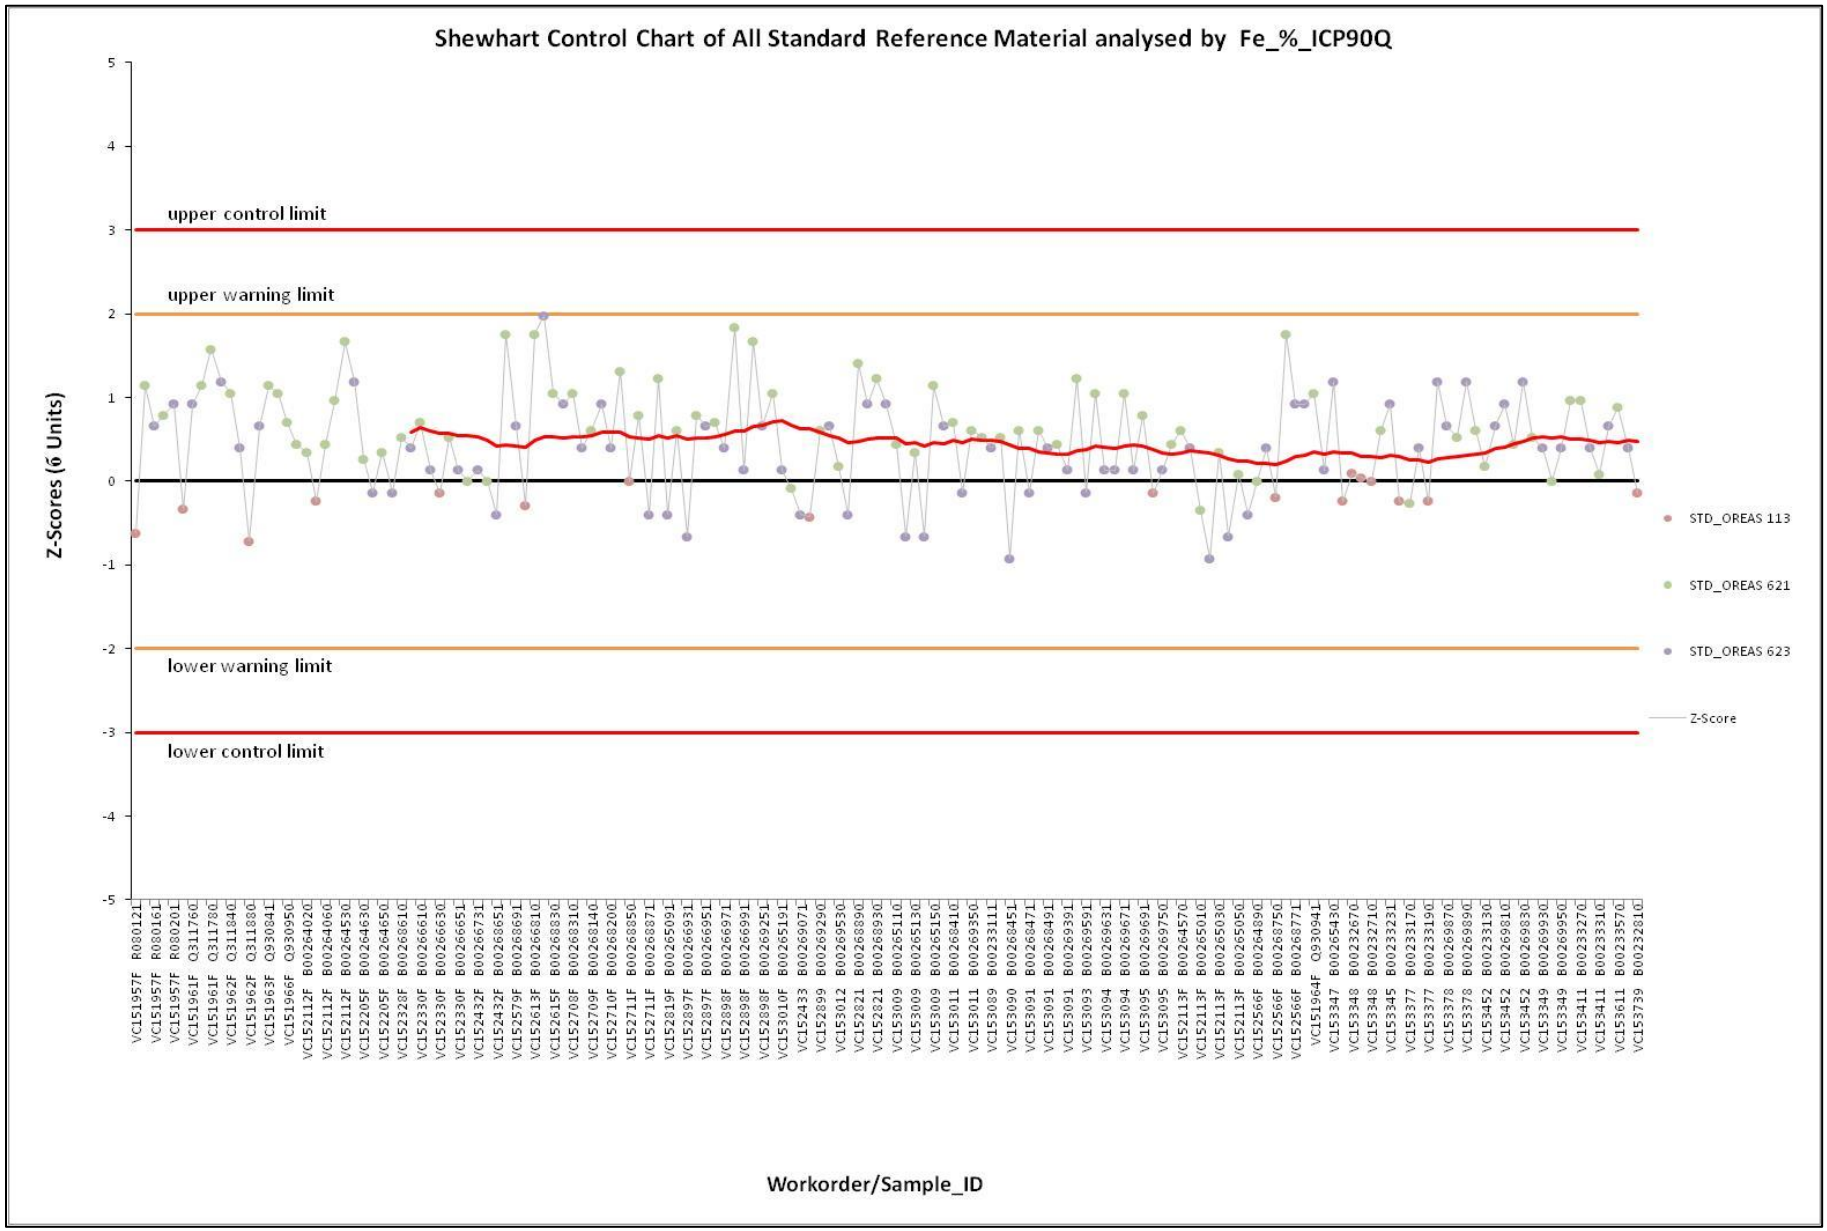

Figure 4: Shewart control chart for iron in CRMs. Red curved line is a moving average of 30 samples. There are no 3-SD or 2-SD failures. Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

EQUITY | EXPLORATION CONSULTANTS LTD.

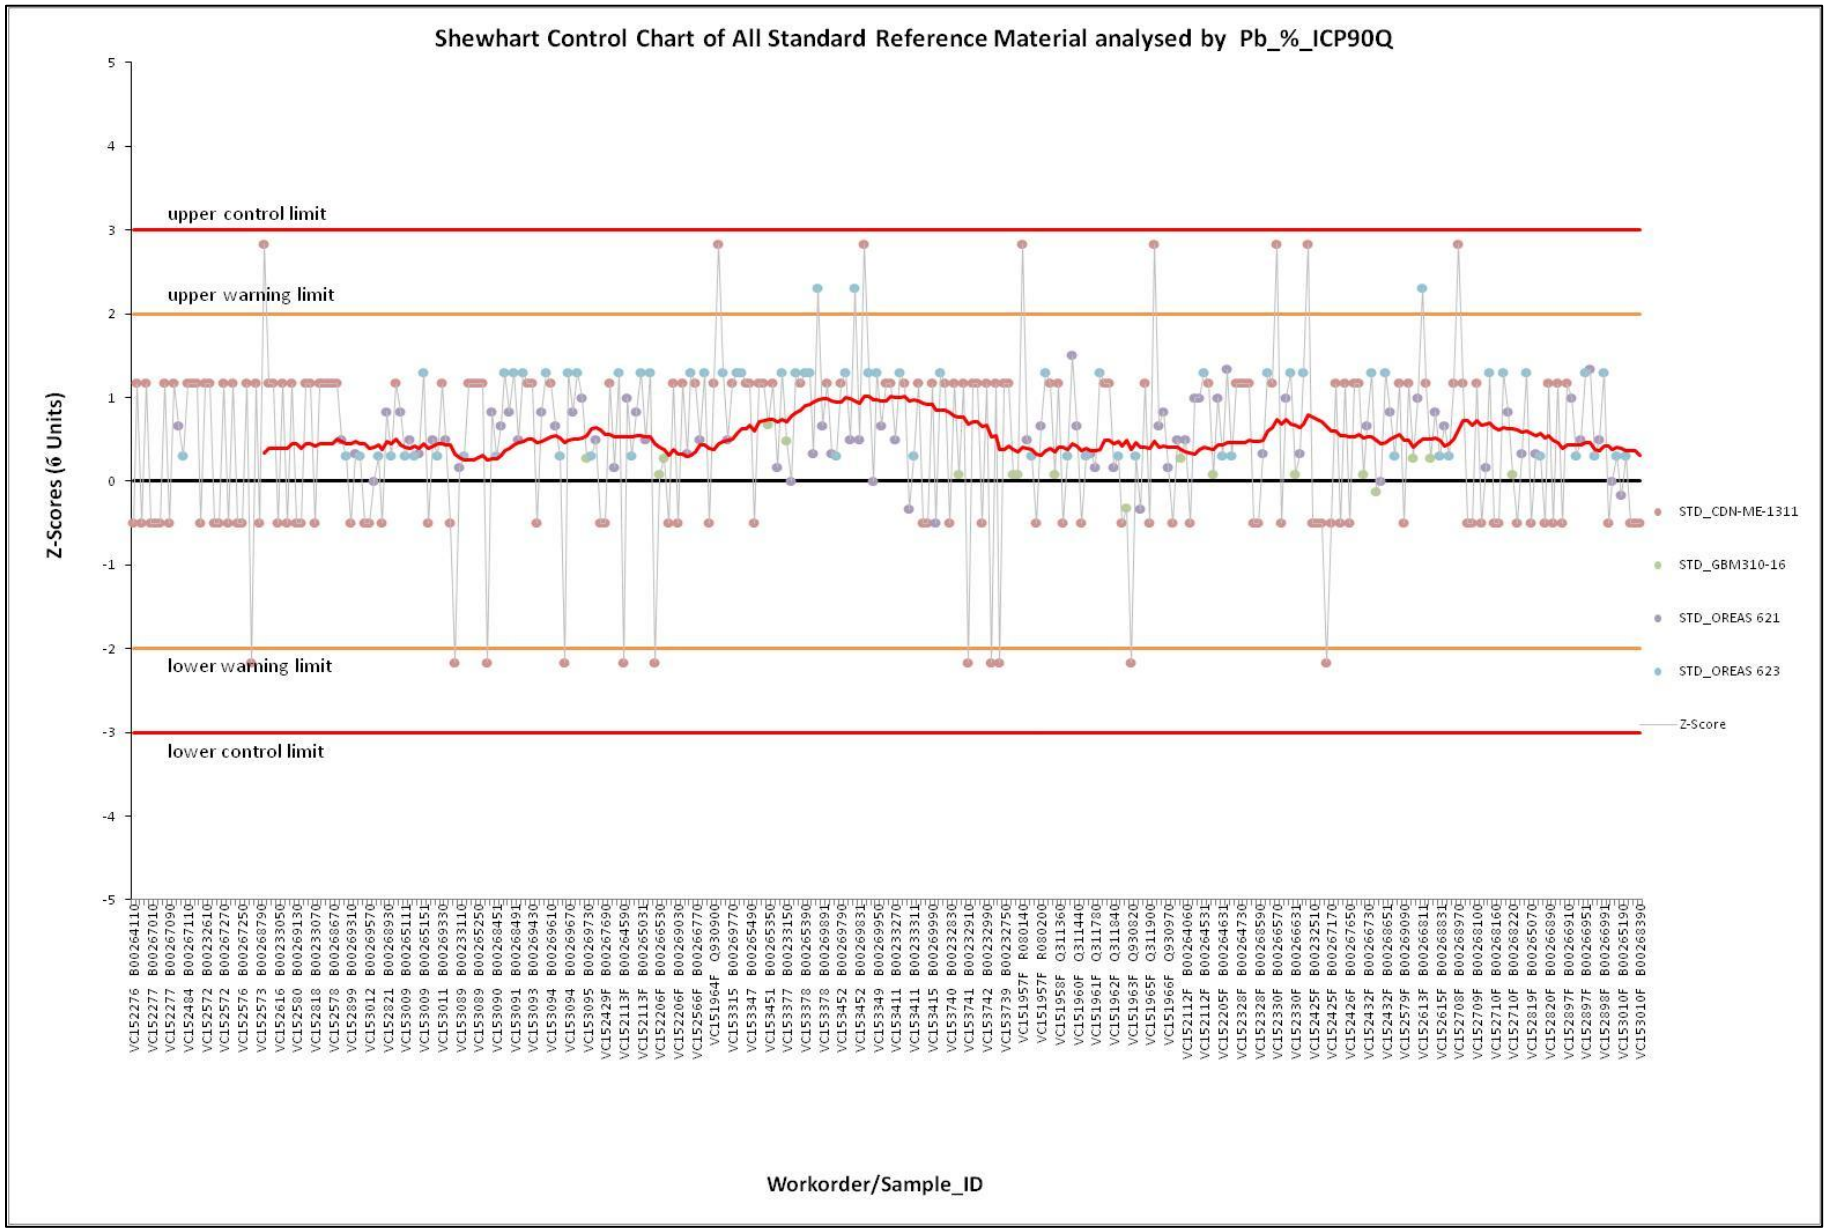

Figure 5: Shewart control chart for Pb in CRMs. Red curved line is a moving average of 30 samples. There are no 3-SD failures but there are several 2-SD failures pegged for possible follow-up work. Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

EQUITY | EXPLORATION CONSULTANTS LTD.

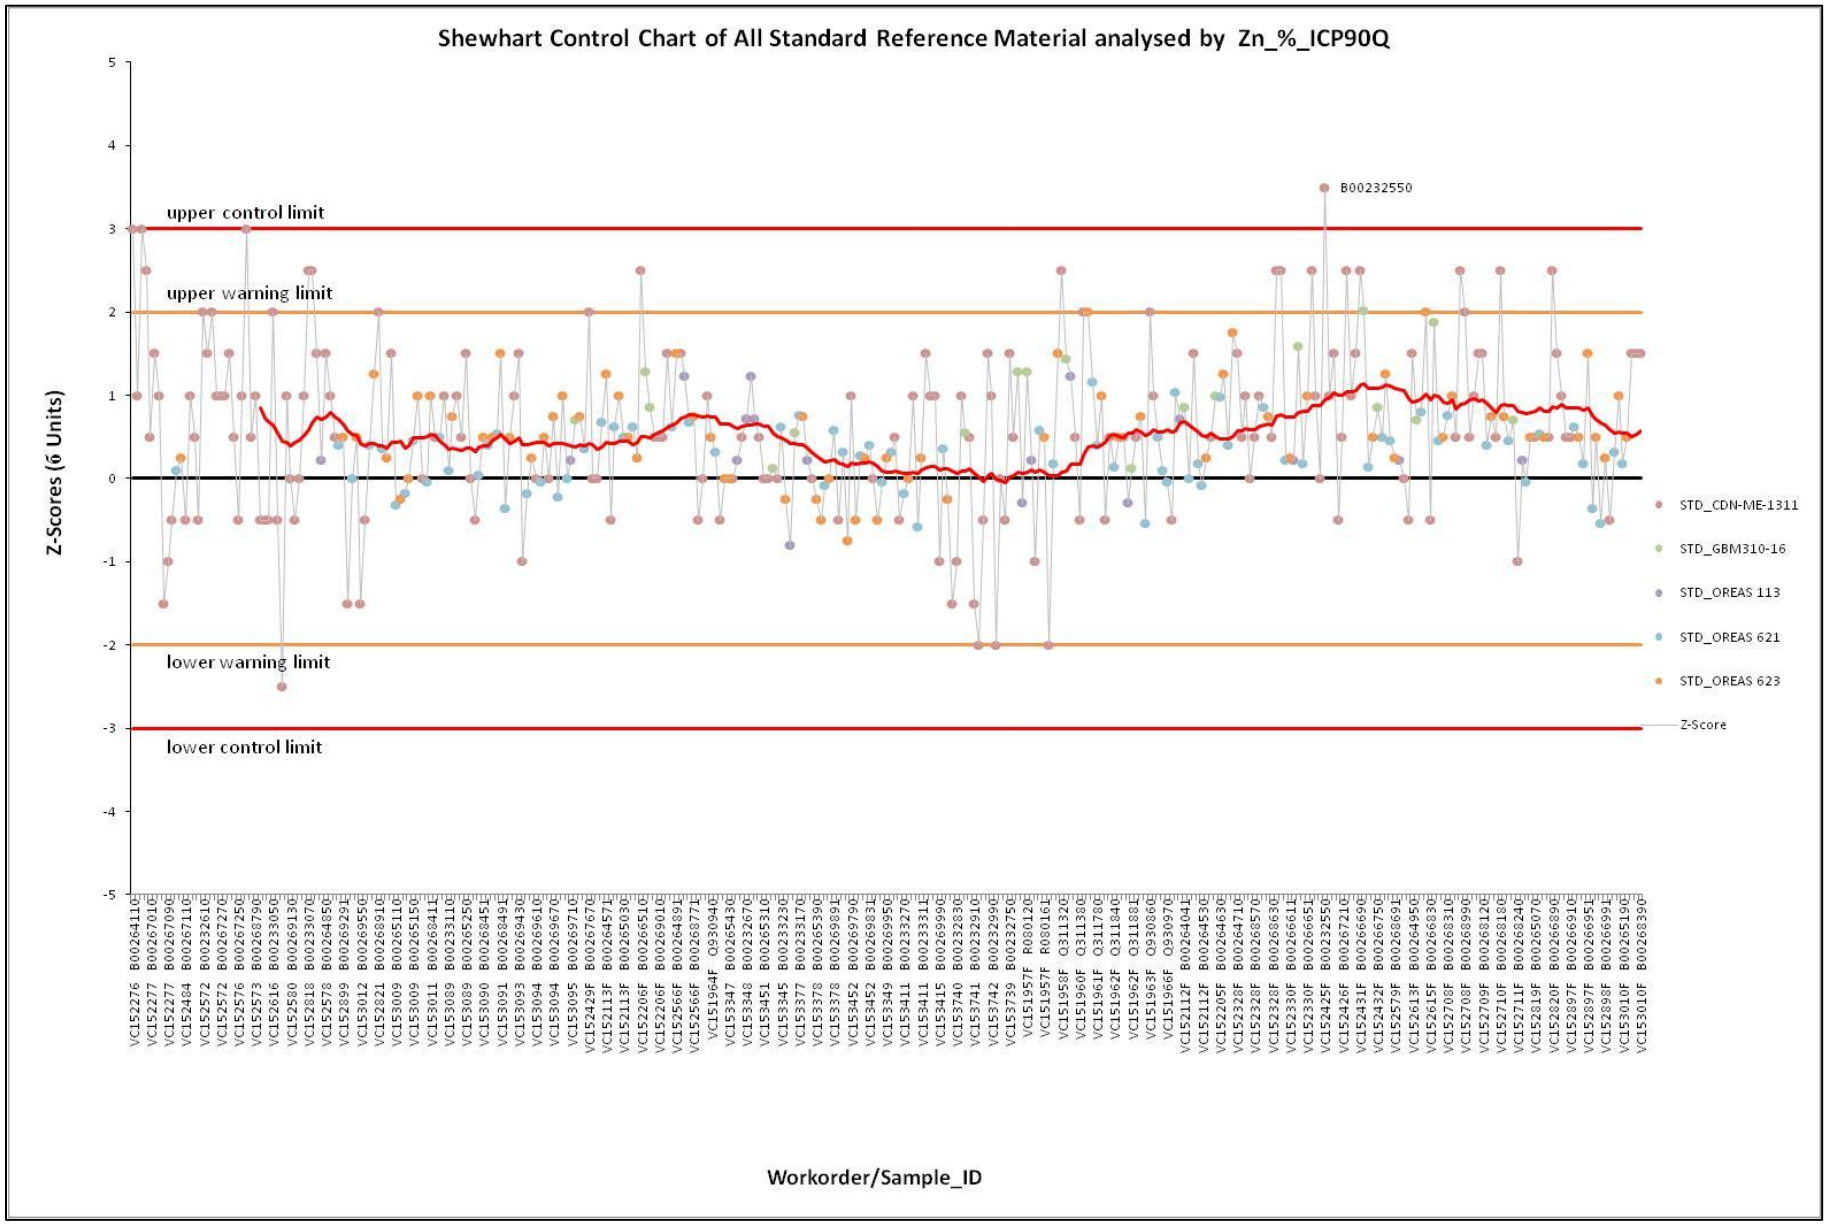

Figure 6: Shewart control chart for zinc in CRMs. Red line is a moving average of 30 samples. There is one 3-SD failure, which does not require follow-up work, and several 2-SD failures pegged for possible re-assay. Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

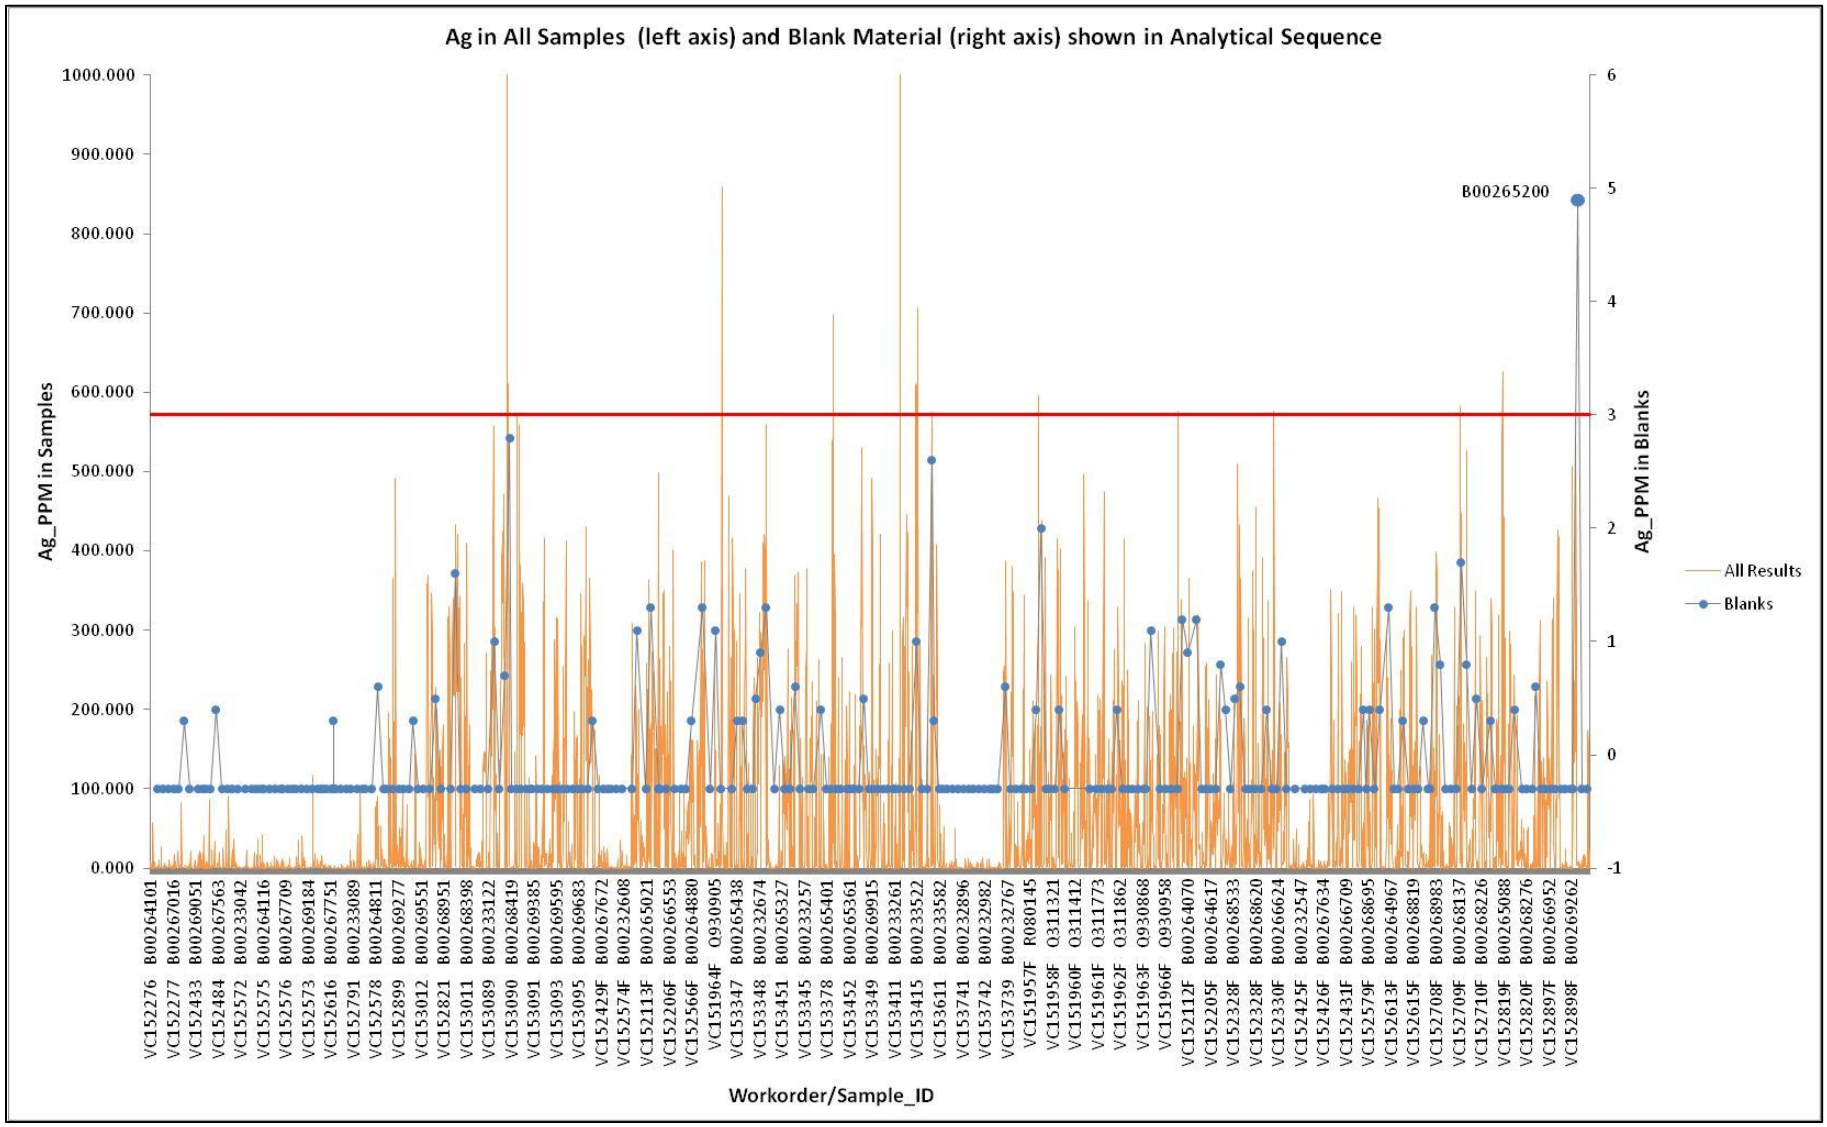

Figure 7: Silver in blanks (blue lines and dots) as well as samples (yellow line). Only one sample (B00265200) exceeds the >10 dl threshold (red horizontal line) but is associated with mineralized core samples, so re-analysis is not recommended. Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

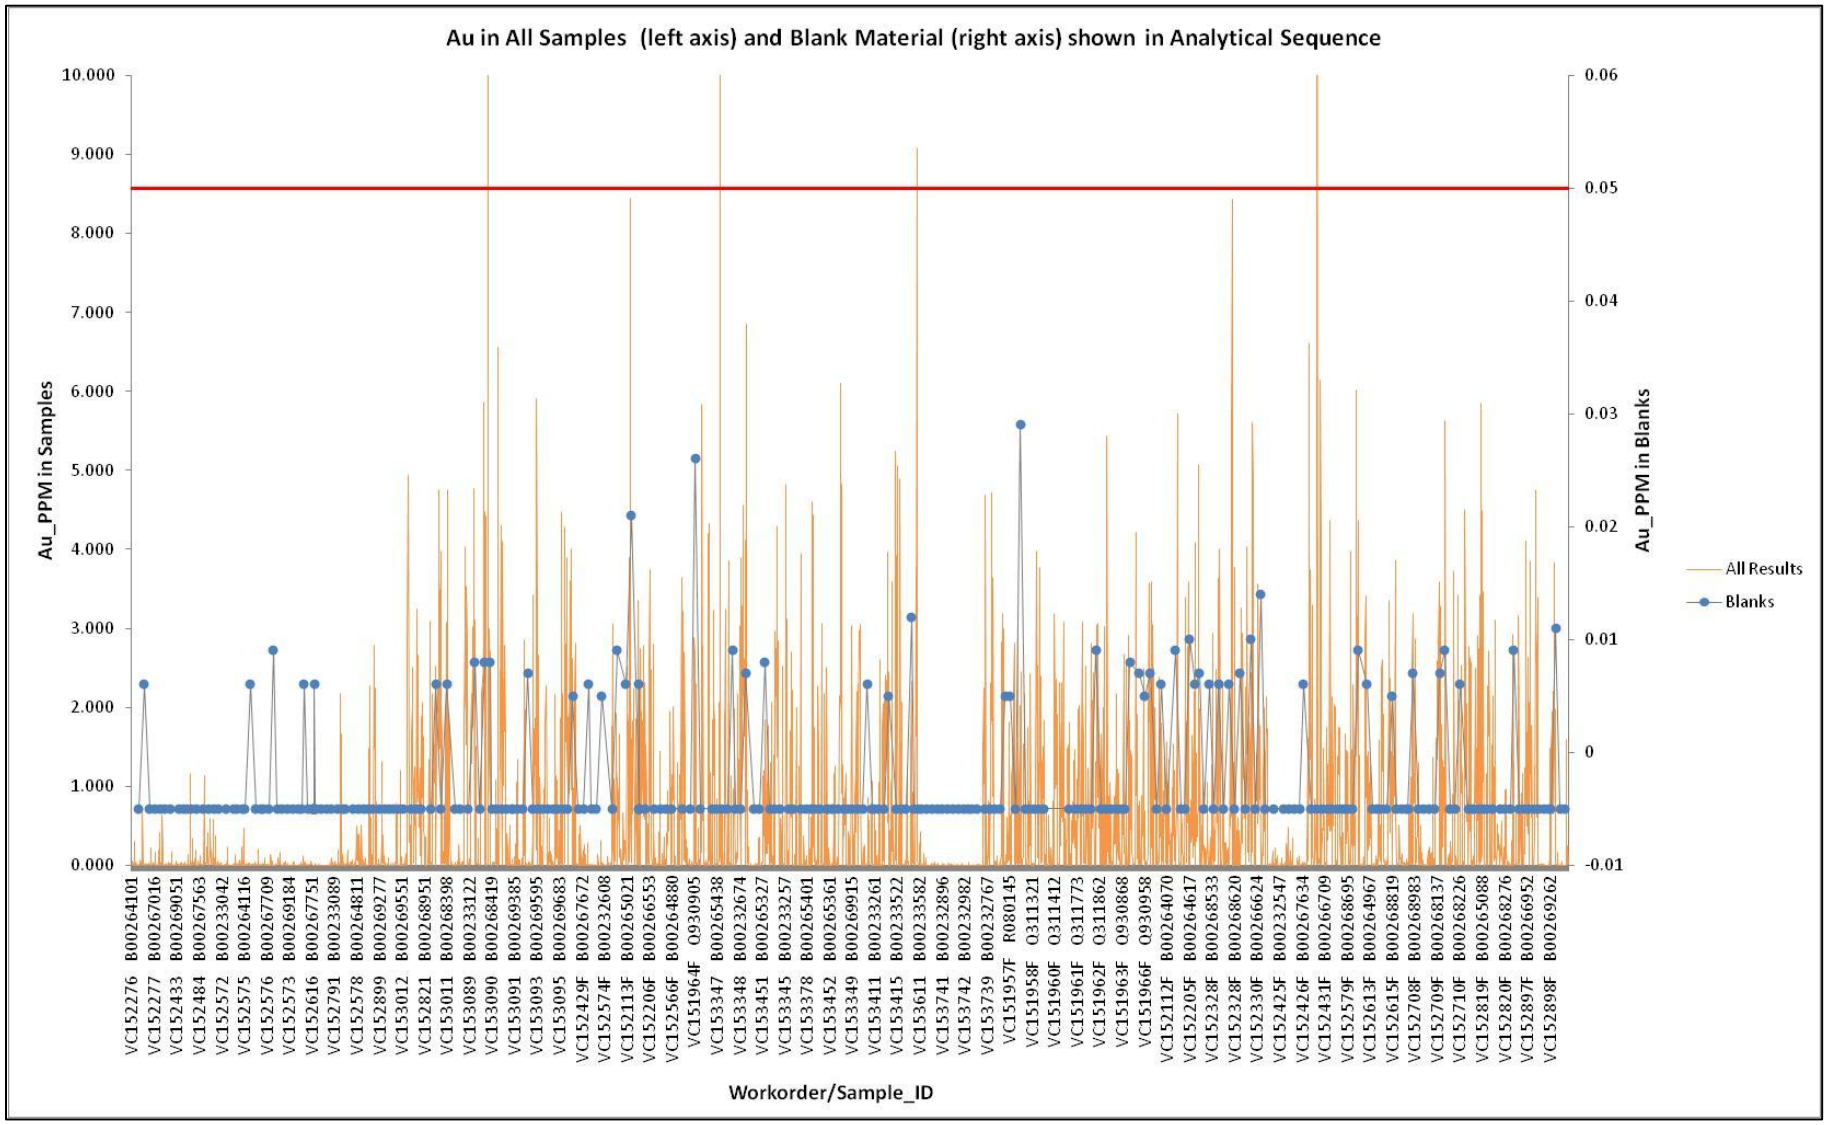

Figure 8: Gold in blanks (blue lines and dots) as well as samples (yellow line). There are no blank assays that exceed the >10 dl threshold (red horizontal line). Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

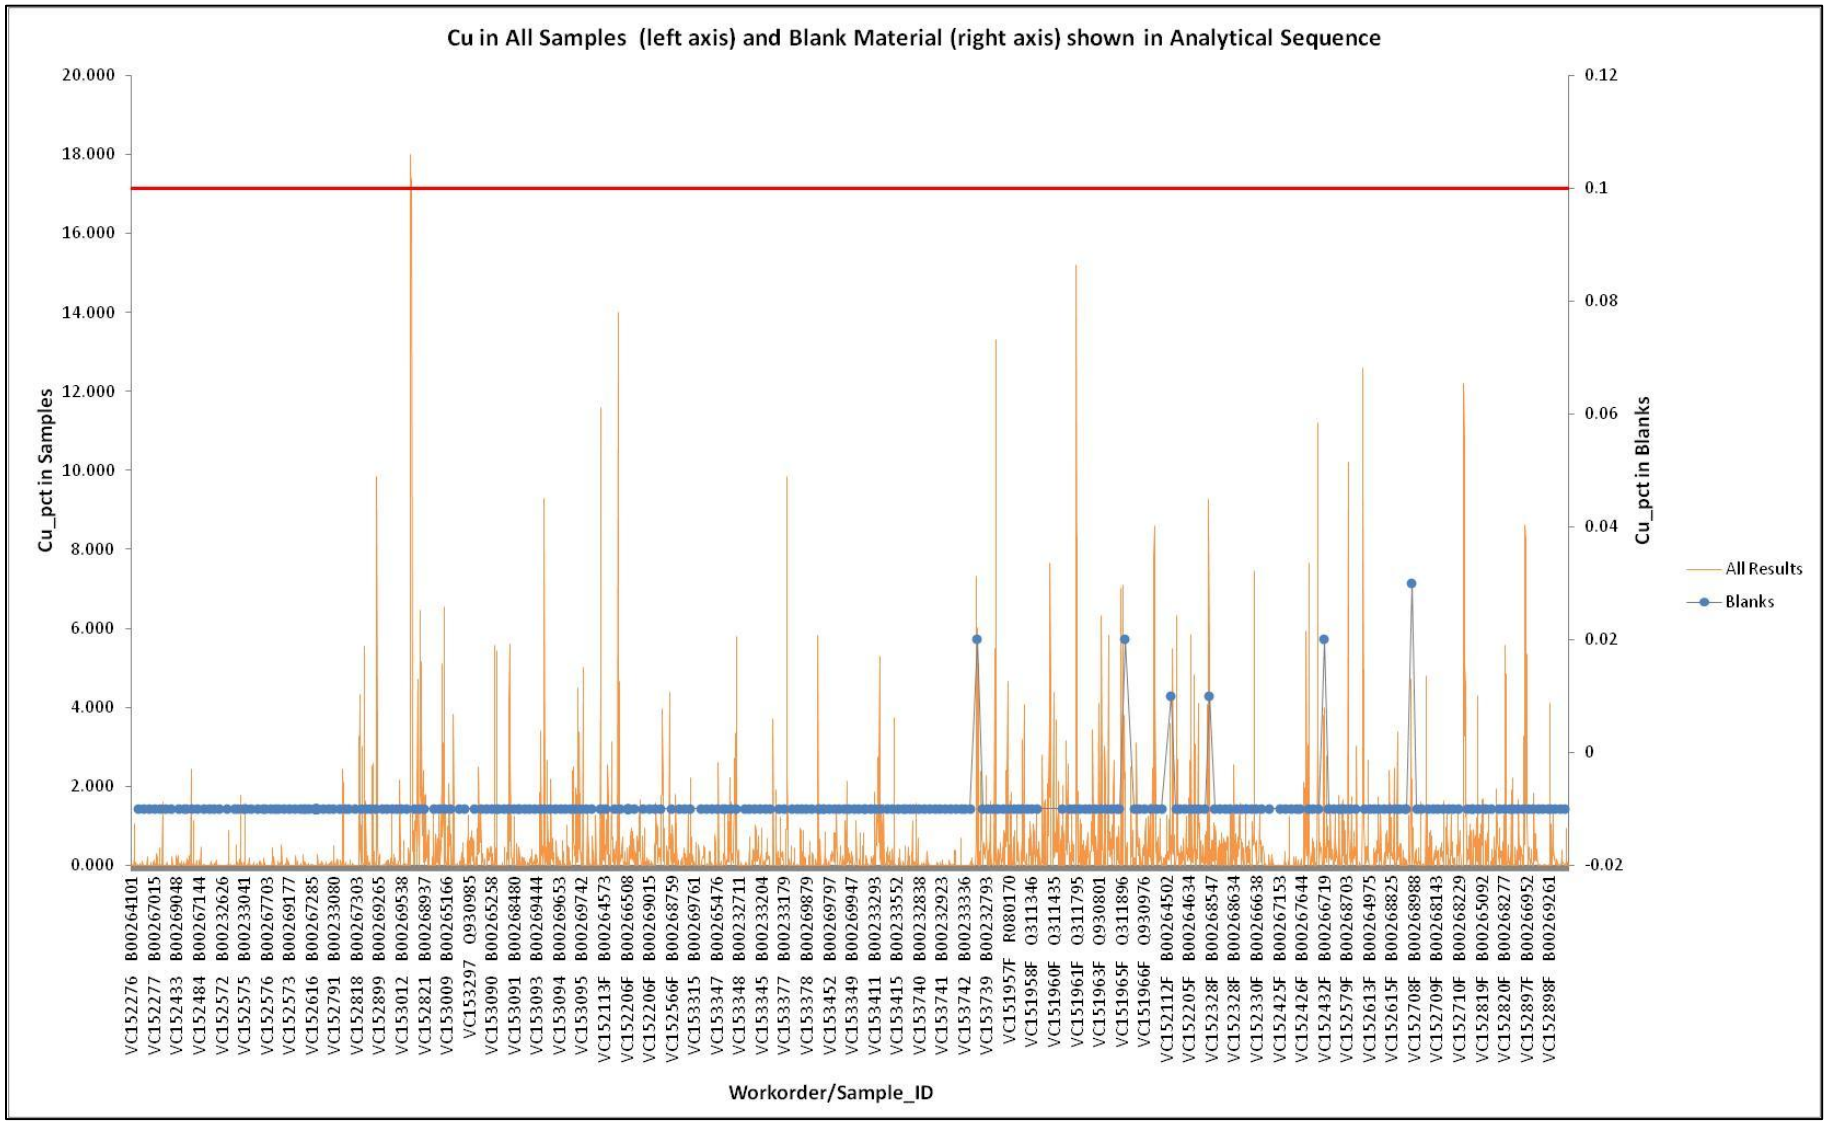

Figure 9: Copper in blanks (blue lines and dots) as well as samples (yellow line). There are no blank assays that exceed the >10 dl threshold (red horizontal line). Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

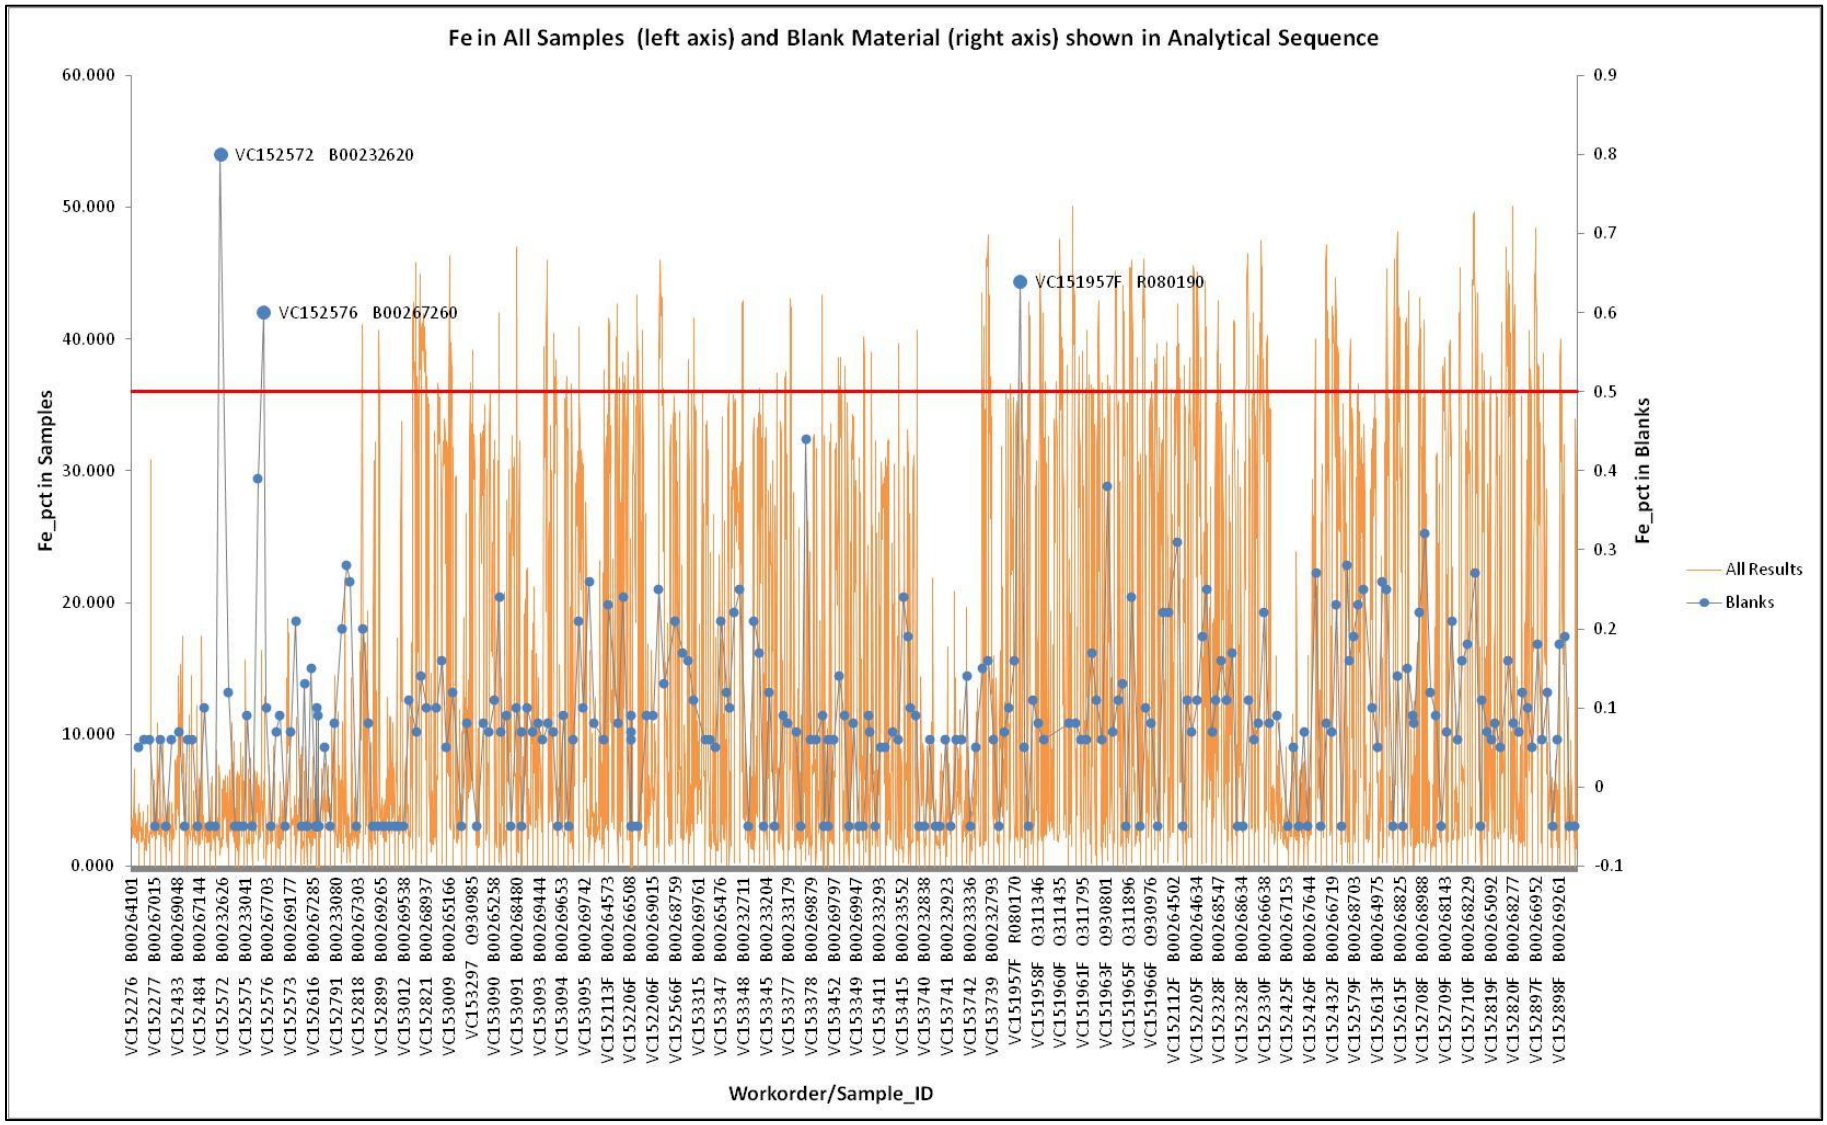

Figure 10: Iron (Fe) in blanks (blue lines and dots) as well as samples (yellow line). There are three samples that exceed the >10 dl threshold (red horizontal line) but no follow-up work is recommended because Fe is not integral to the resource. Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

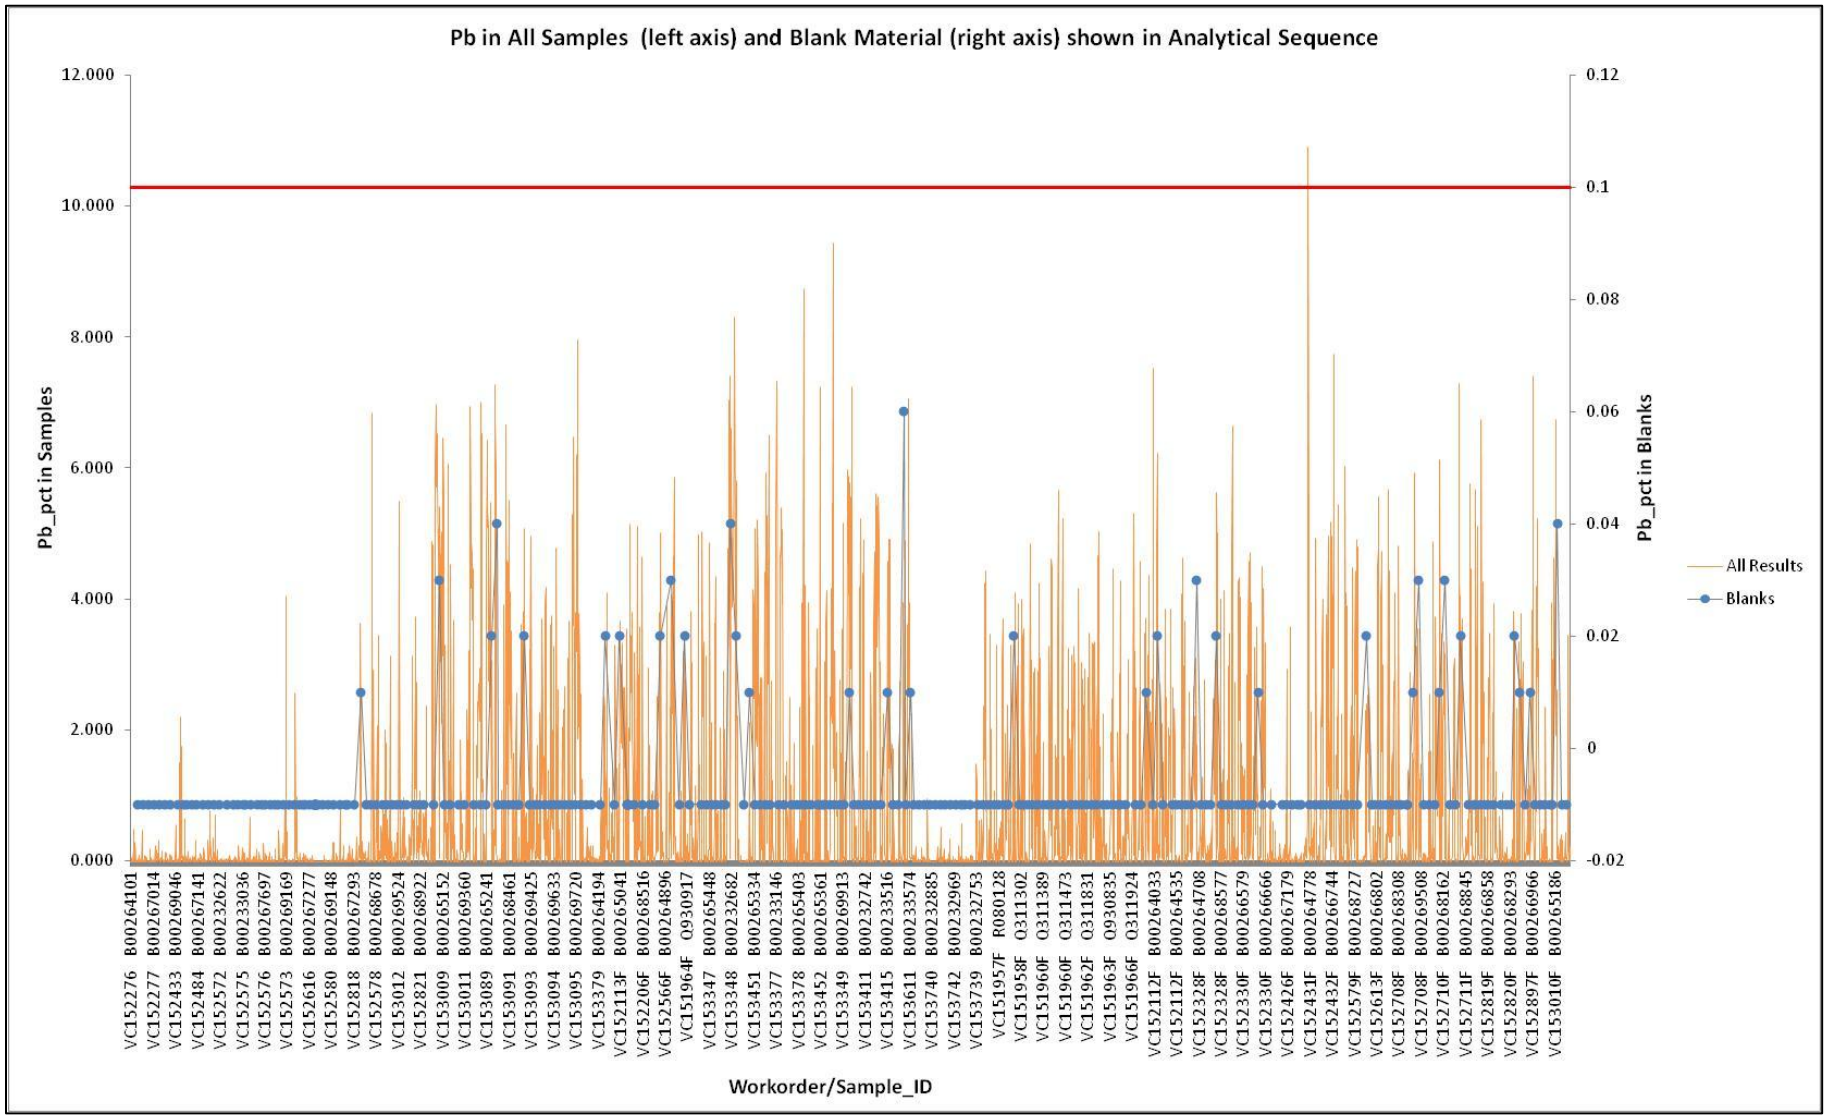

Figure 11: Lead in blanks (blue lines and dots) as well as samples (yellow line). There are no blank assays that exceed the >10 dl threshold (red horizontal line). Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

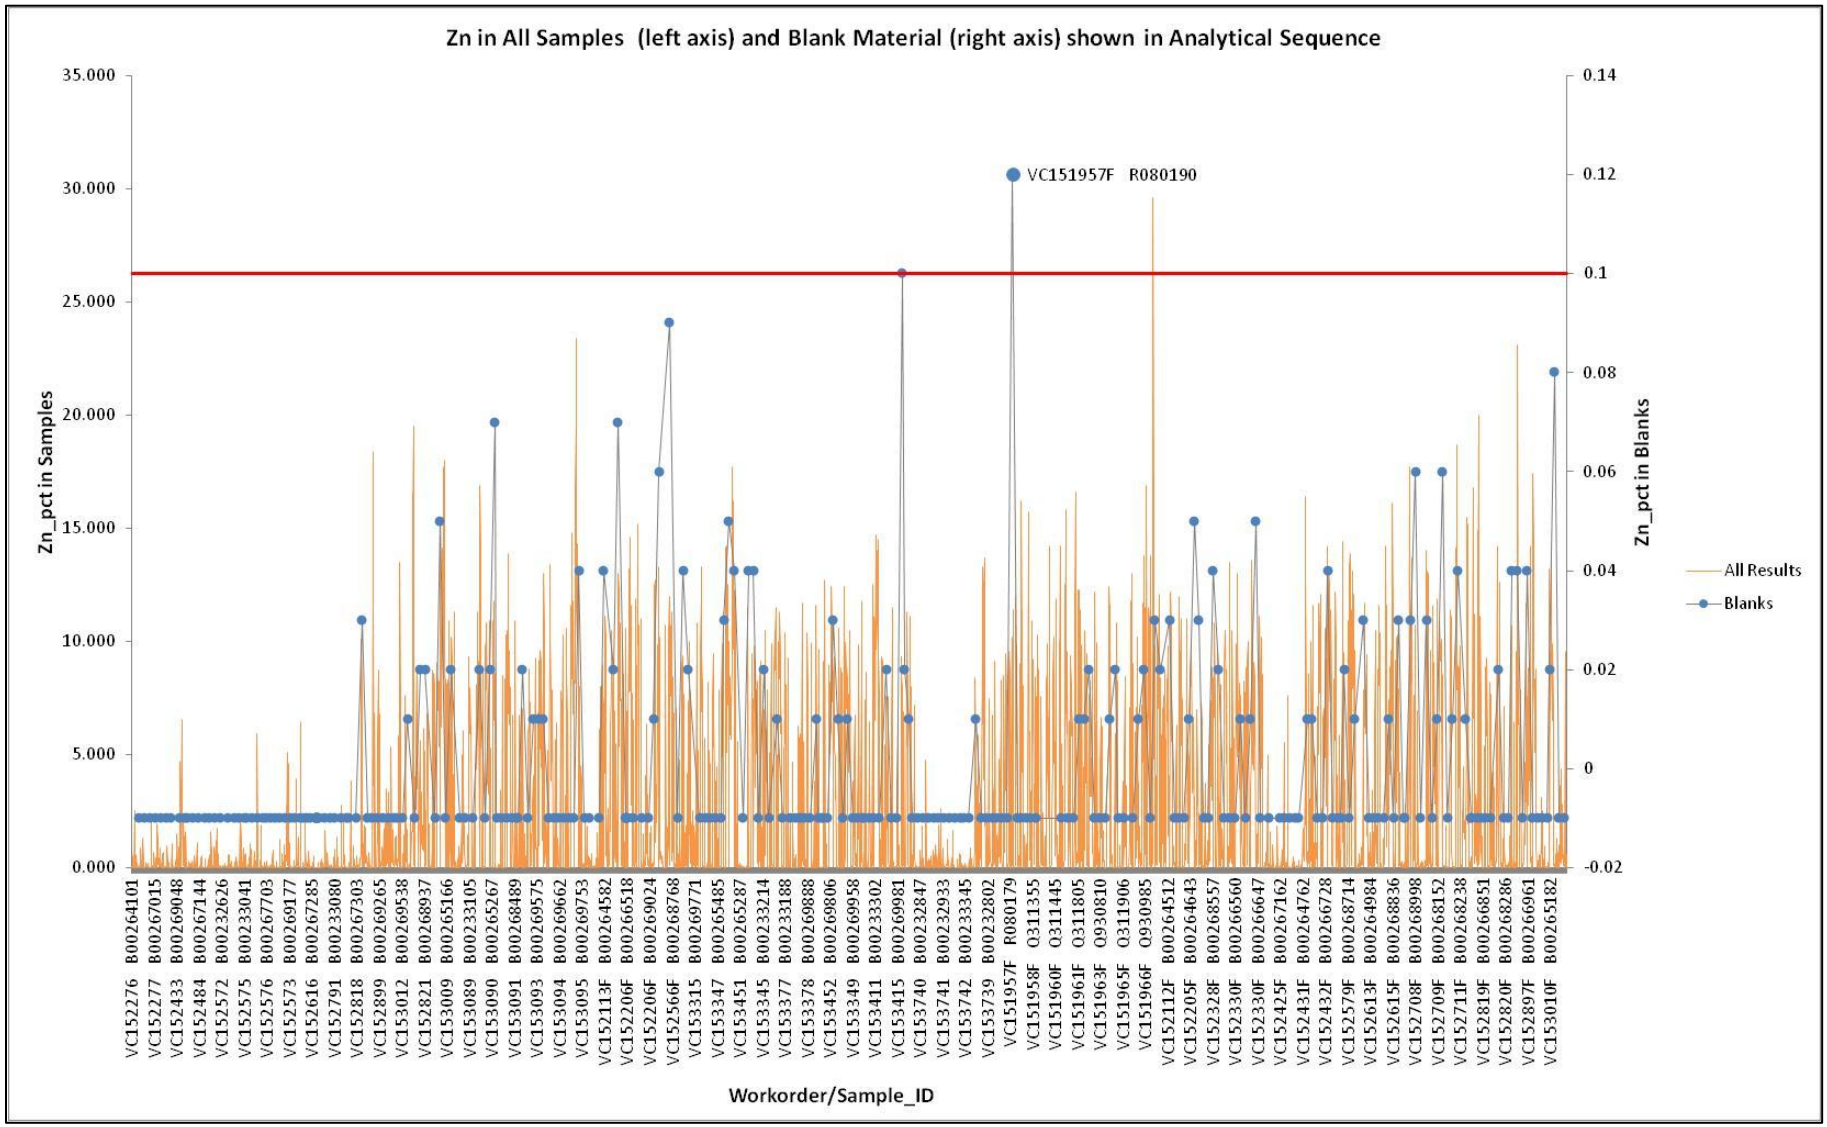

Figure 12: Zinc in blanks (blue lines and dots) as well as samples (yellow line). There is one sample (R080190) that exceeds the >10 dl threshold (red horizontal line) but is associated with mineralized core samples, so re-analysis is not recommended. Certificates finalized from Dec 23-Jan 8 plot just before the "F" certificates.

Appendix N-D:

Failure tracker

Table 5: Failure tracker for work orders related to the KZK project (white rows = QAQC issues that do not req uire follow-up; orange rows = QAQC issues that may require follow-up, red rows = QAQC issue requiring follow-up, blue rows = resolved QAQC issue).

Work Order	Finalized	Sample	Elem(s)	Failure Type	Reason for Failure	Recommended Action	Lab code	# re-assay	Action Taken	Action Result
VC151957	08-Sep-15	R080201	Au	3 SD	OREAS 623 assayed 0.659 g/t Au (Z-score -4.3)	Re-assay R080191-193, R080198-208	GE_FAA313	14	Nov 15: requested SGS to re-run GE_FAA313 (R080191-193, R080198-208)	Nov 19: Re-assay passed QAQC
VC151957	08-Sep-15	R080180	Cu, Pb	3 SD	CDN-ME-1311 assayed 0.42% Cu and 0.28% Pb (Z-scores of -4.4, -3.8 respectively)	Re-assay R080173, R080176-180, R080185-189	GO_ICP90Q	11	Nov. 14: requested SGS to R-run GO_ICP90Q (R080173, R080176-180, R080185-189)	Nov 19: Re-assay passed QAQC
VC151957	08-Sep-15	R080140	Zn	3 SD	CDN-ME-1311 assayed 1.21% Zn (Z-score 4.5)	Re-assay R080131-132, R080136-141, R080144-148	GO_ICP90Q	13	Nov. 14: requested SGS to R-run GO_ICP90Q (R080131-132, R080136-141, R080144-148)	Nov 19: Re-assay passed QAQC
VC151957	08-Sep-15	R080190	Ag, Au, Zn	Blank	Blank with 2.0 g/t Ag (6.7 x dl), 0.029 g/t Au (5.8 x dl), 0.12% Zn (12x dl)	No re-assays required				
VC151961	03-Sep-15	Q311820, Q311800	Zn	3 SD & 2 SD	Two consecutive CDN-ME-1311 with Z-scores > 2, including one that is 3.5 (Q311820)	Re-assay Q311794-823	GO_ICP90Q	30	Nov. 14: requested SGS to R-run GO_ICP90Q (Q311794-823)	Nov 18: Re-assay passed QAQC
VC151963	09-Sep-15	Q930840, Q930860	Au	2 SD	Consecutive OREAS 623 and CDN-ME-1311 with Z-scores between -2 to 3 SD	Re-assay Q930835-860, Q930868-869	GE_FAA313	28	Nov. 15: requested SGS to R-run GE_FAA313 (Q930835-860, Q930868-869)	Nov 19: Re-assay passed QAQC
VC151964	08-Sep-15	Q930910	Au	Blank	0.026 g/t Au in blank (5.2x dl)	No re-assays required				

Work Order	Finalized	Sample	Elem(s)	Failure Type	Reason for Failure	Recommended Action	Lab code	# re-assay	Action Taken	Action Result
VC151966	42255	Q930990	Zn	3 SD	CDN-ME-1311 assayed 1.19% Zn (Z-score 3.5)	Re-assay Q930981-990	GO_ICP90Q	10	Nov. 14: requested SGS to R-run GO_ICP90Q (Q930981-990); re-run failured, requested a second re-run on Nov. 21 (email to Andrew Pickering)	Nov. 20: Zn returned 1.05% Zn (SD = -3.5) so still a failure; Nov. 24, re-re-run returned 1.11% Zn (SD = -0.5) so passed.
VC152112	14-Sep-15	B00264080	Pb, Zn	3 SD	CDN-ME-1311 assayed 0.33% Pb and 1.23% Zn (Z-scores of 4.5, 5.5 respectively)	Re-assay B00264073, B00264076-082, B00264085	GO_ICP90Q	9	Nov. 14: requested SGS to R-run GO_ICP90Q (B00264073, B00264076-082, B00264085)	Nov 18: Re-assay passed QAQC
VC152113	18-Sep-15	B00265050	Au	3 SD	OREAS 621 assayed 1.05 g/t Au (Z-score -4.8)	Re-assay B00265041-054	GE_FAA313	14	Nov 15: requested SGS to re-run GE_FAA313 (B00265041-054)	Nov. 20: Re-assay passed QAQC
VC152113	18-Sep-15	B00264590	Pb	3 SD	CDN-ME-1311 assayed 0.28% Pb (Z-score -3.8)	Re-assay B00264581-587, B00264595	GO_ICP90Q	9	Nov. 14: requested SGS to R-run GO_ICP90Q (B00264581-587, B00264590, B00264595)	Nov. 20: Re-assay passed QAQC
VC152113	18-Sep-15	B00265040	Zn	Blank	0.07% Zn in blank (7x dl)	No re-assays required				
VC152205	18-Sep-15	B00264651	Au	3SD	OREAS 623 assayed 0.689 g/t Au (Z-score -3.5)	Re-assay B00264641-659	GE_FAA313	19	Nov 15: requested SGS to re-run GE_FAA313 (B00264641-659)	Nov 19: Re-assay passed QAQC
VC152206	22-Sep-15	B00268510	Au	3 SD	CDN-ME-1311 assayed 0.728 g/t Au (Z-score -3.4)	Re-assay B00268501-510; B00268517-519	GE_FAA313	13	Nov. 15: requested SGS to R-run for Au (GE_FAA313) (B00268501-510; N00268517-519)	Nov 19: Re-assay passed QAQC
VC152206	22-Sep-15	B00266530, B00266550	Ag	2 SD	Two consecutive GBM310-16 (gravimetric) with Z-scores between -2 to -3	Re-assay gravimetric Ag for B00266521, 523-524, 527-532, 534-535, 541, 548, 550	GE_AAS12E	14	To be submitted for re-assay in Jan 2016?	

Work Order	Finalized	Sample	Elem(s)	Failure Type	Reason for Failure	Recommended Action	Lab code	# re-assay	Action Taken	Action Result
VC152276		B00264110, B00267510, B00267530, B00267550	Cu, Zn	2 SD	2 consecutive Cu warning limits (Z-scores of -2.5 and -2.5) and 3 of 4 consecutive Zn warning limits (Z-scores of 3.0, 1.0, 3.0 and 2.5); all CDN-ME-1311	R-run: B00264104, B00264110, B00267501 & 502, B00267508, B00267510, B00267525, B00267530, B00267534	GO_ICP90Q	9	To be submitted for re-assay in Jan 2016?	
VC152328	06-Oct-15	B002685550, B00266550	Ag	2 SD	Two consecutive CDN-ME-1311 with Z-scores between -2 to -3	Re-assay B00268541-567, 570, 574-584, 587-595	GE_AAS12E	48	To be submitted for re-assay in Jan 2016?	
VC152330	08-Oct-15	B00266611	Au	3 SD	OREAS 623 assayed 0.698 g/t Au (Z-score -3.3)	Re-assay B00266601-615	GE_FAA313	15	Nov 15: requested SGS to re-run GE_FAA313 (B00266601-615)	Nov 19: Re-assay passed QAQC
VC152330	08-Oct-15	B00266570, B00266590	Zn	2 SD	Two consecutive CDN-ME-1311 with Z-scores between +2-3 SD	R-run: B00266563-579, B00266581-590, B00266595-599	GO_ICP90Q	33	To be submitted for re-assay in Jan 2016?	
VC152425	14-Oct-15	B00232530	Zn	3 SD	CDN-ME-1311 assayed 1.19% Zn (Z-score 3.5)	Re-assay B00232526, B00232530, B00232536	GO_ICP90Q	3	Nov. 14: requested SGS to R-run GO_ICP90Q (B00232526, B00232530, B00232536)	Nov 18: Re-assay passed QAQC
VC152425	14-Oct-15	B00232550	Zn	3 SD	CDN-ME-1311 assayed 1.19% Zn (Z-score 3.5)	No re-assays required				
VC152426	15-Oct-15	B00267190, B00267630	Zn	3 SD & 2 SD	Two of three CDN-ME-1311 with Z-scores >2, including one Z-score = 3.5 (B00267190)	Re-assay B00267190-193	GO_ICP90Q	4	Nov 15: Re-assay GO_ICP90Q (B00267190-193)	Nov 18: Re-assay passed QAQC
VC152429	20-Oct-15	B00267690	Au	3 SD	CDN-ME-1311 assayed 0.689 g/t Au (Z-score -4.6)	Re-assay B00267683, B00267687, B00267690, B00267696	GE_FAA313	4	Nov. 15: requested SGS to R-run for Au (GE_FAA313) (B00267683, B00267687, B00267690, B00267696)	Nov 19: Re-assay passed QAQC
VC152431	22-Oct-15	B00266690, B00266710	Zn	2 SD	Consecutive Z-scores between +2-3 SD for CDN-ME-1311 and GBM310-16	R-run: B00266681-684, B00266687, B00266689-690, B00266692, B00266696-699, B00266701-711	GO_ICP90Q	23	To be submitted for re-assay in Jan 2016?	
VC152566	05-Nov-15	B00268771	Au	3 SD	OREAS 623 assayed 0.644 g/t Au (Z-score -4.7)	Re-assay B00268761-775	GE_FAA313	15	Nov 15: requested SGS to re-run GE_FAA313 (B00268761-775)	Nov 19: Re-assay passed QAQC

Work Order	Finalized	Sample	Elem(s)	Failure Type	Reason for Failure	Recommended Action	Lab code	# re-assay	Action Taken	Action Result
VC152566	05-Nov-15	B00264880	Zn	Blank	0.06% Zn in blank (6x dl)	No re-assays required				
VC152566	05-Nov-15	B00268760	Zn	Blank	0.09% Zn in blank (9x dl)	No re-assays required				
VC152572	15-Oct-15	All standards on COA	Ag	2 SD	4 of 5 standards on COA have Z-scores between -2 and -3; 5th one has Z-score of -2.00	Re-assay entire work order	GE_AAS12E	76	To be submitted for re-assay in Jan 2016?	
VC152574	20-Oct-15	B00233010	Ag	3 SD	CDN-ME-1311 assayed 38.5 g/t Ag (Z-score -5.8)	Re-assay B00233013	GE_AAS12E	2	Nov. 14: requested SGS to re-run for Ag (GE_AAS12E) (B00233010, B00233013)	Nov 17: Re-assay passed QAQC
VC152575	20-Oct-15	B00233030, 00264130	Au	2 SD & 3 SD	CDN-ME-1311 assayed 0.724 g/t Au (Z-score -3.5); other standard returned Z-score of -2.5	No re-assays required for 3 SD; for 2 SD re-assays required B00233030, 037, 038, B00264115, 130	GE_FAA313	5	To be submitted for re-assay in Jan 2016?	
VC152576		B00267250, B00267730	Cu	2 SD	2 of 3 consecutive CDN-ME-1311 with Z-scores both equal -2.54 for Cu	R-run: B00267250, B00267252, B00267726, 727, 730	GO_ICP90Q	5	To be submitted for re-assay in Jan 2016?	
VC152580	26-Oct-15	B00269150	Ag	3 SD	CDN-ME-1311 assayed 48.6 g/t Ag (Z-score -3.4)	No re-assays required				
VC152615	02-Nov-15	B00266830	Ag	3 SD	CDN-ME-1311 assayed 48.8 g/t Ag (Z-score -3.6)	Re-assay B00266826-827, B00268798-799	GE_AAS12E	5	Nov. 14: requested SGS to re-run for Ag (GE_AAS12E) (B00266826-827, B00266830, B00268798-799)	Nov 17: Re-assay passed QAQC
VC152615	02-Nov-15	B00268811	Au	3 SD	G312-4 assayed 4.63 g/t Au (Z-score -3.03)	No re-assays required				
VC152708		B00268330, B00268990	Ag	2 SD	Two consecutive CDN-ME-1311 with Z-scores between -2 to -3	Re-assay B00268321-324, 330, 333, B00268961, 962, 969-971, 967-999	GE_AAS12E	44	To be submitted for re-assay in Jan 2016?	

Work Order	Finalized	Sample	Elem(s)	Failure Type	Reason for Failure	Recommended Action	Lab code	# re-assay	Action Taken	Action Result
VC152708	02-Nov-15	B00269000	Zn	Blank	0.06% Zn in blank (6x dl)	No re-assays required				
VC152710	03-Nov-15	B00268180	Pb	3 SD	CDN-ME-1311 assayed 0.33% Pb (Z-score 4.5)	Re-assay B00268171, B00268180-187	GO_ICP90Q	9	Nov. 14: requested SGS to R-run GO_ICP90Q (B00268171, B00268180-187)	Nov 18: Re-assay passed QAQC
VC152710	03-Nov-15	B00268170	Zn	Blank	0.06% Zn in blank (6x dl)	No re-assays required				
VC152818	03-Nov-15	B00267310, B00233070	Zn	2 SD	Two consecutive CDN-ME-1311 with Z-scores between +2-3 SD	R-run: B00233066, 070, 076; B00267302, 310	GO_ICP90Q	5	To be submitted for re-assay in Jan 2016?	
VC152819	12-Nov-15	B00265070	Ag	3 SD	CDN-ME-1311 assayed 48.3 g/t Ag (Z-score 3.1)	Re-assay B00265061-078	GE_AAS12E	18	Nov. 15: requested SGS to re-run GE_AAS12E (B00265061-078)	Nov 17: Re-assay passed QAQC
VC152709	03-Nov-15	B00268140	Au	3SD	OREAS 621 assayed 1.07 g/t Au (Z-score -4.3)	Re-assay B00268131-149	GE_FAA313	19	Nov 17: requested SGS to re-run GE_FAA313 (B00268131-149)	Nov 20: Re-assay passed QAQC
VC153010	20-Nov-15	B00265200	Ag	Blank	Blank with 4.8 ppm Ag (16 x dl)	No re-assays required				
VC151966F	04-Dec-15	n/a	Zn	Cert integr-ation	Not all re-assayed Zn values have been transcribed to the F certificate	Transcribe all R values and re-issue certificate	n/a	n/a	Transcription request sent to SGS	Zn values were correct and sourced from re-assay of re-assay certificate
VC152113F	05-Dec-15	n/a	Au	Cert integr-ation	One Au re-assay was not transcribed onto the F certificate	Transcribe the missing R value and re-issue certificate	n/a	n/a	Transcription request sent to SGS	New certificate issued with R value
VC152206F	05-Dec-15	n/a	Au	Cert integr-ation	One Au re-assay was not transcribed onto the F certificate	Transcribe the missing R value and re-issue certificate	n/a	n/a	Transcription request sent to SGS	New certificate issued with R value

Work Order	Finalized	Sample	Elem(s)	Failure Type	Reason for Failure	Recommended Action	Lab code	# re-assay	Action Taken	Action Result
VC152566F	05-Dec-15	n/a	Au	Cert integr-ation	One Au re-assay was not transcribed onto the F certificate	Transcribe the missing R value and re-issue certificate	n/a	n/a	Transcription request sent to SGS	New certificate issued with R value
VC153452	23-Dec-15	B00269830, 9850	Pb	2-SD	Two out of three consecutive CRMs (OREAS 623, CDN-ME-1311) with Z-scores between +2-3 SD	Re-assay B00269821-9833, B00269842-9845, B0029850	GO_ICP90Q	18	To be submitted for re-assay in Jan 2016?	
VC153742	04-Jan-16	B00233330, 3370	Pb	2-SD	Two out of three consecutive CDN-ME-1311 with Z-scores between -2 to -3 SD	Re-assay B00233328, 3330	GO_ICP90Q	2	To be submitted for re-assay in Jan 2016?	

Appendix P: Metallurgical samples

Table P-1: List of samples collected in 2015 that were used to build metallurgical composites

Hole	Sample ID	Sample type	Core Size	From (m)	To (m)	Length (m)

SUMMARY OF RESULTS

Thirty six drill core samples taken from twenty one drill holes represent a quite variable assemblage of sulphides and usually subordinate non-sulphide gangue. Thirty of the drill cores can be classified as massive sulphide and of these twenty seven contained significant mineralisation.

The ore mineralisation was dominated by sphalerite, with lesser quantities of chalcopyrite, tetrahedrite and usually accessory galena. Silver bearing gold, exceptionally reaching 40% silver (electrum) was detected in eleven cores. Silver was also present in tetrahedrite with typical values between 1 and 2% plus several examples of high silver tetrahedrite (freibergite)

Pyrite was the dominant gangue sulphide with lesser quantities of pyrrhotite, while oxides are represented by significant magnetite in one group of core. With the exception of pyrrhotite in some samples, the sulphides were fresh primary minerals. Pyrrhotite sometimes showed marked alteration to marcasite.

The very subordinate non-sulphide gangue within the massive ores was mainly carbonates, (ankerite, siderite >dolomite) and quartz with subordinate muscovite. There were three exceptional samples in which a lesser sulphide content was associated with either major barite or once the barium feldspar, celsian. There was a little silicate alteration with secondary phyllosilicates such as chlorite and kaolinite.

Textures of the massive sulphide cores usually featured a coarse banding due to variations in the percentage of the main sulphides. The textures of the main sulphides were relatively consistent with pyrite as euhedral crystals, contrasting the anhedral shape of the associated sphalerite, chalcopyrite, galena or pyrrhotite.

Probably the most dominant texture consists of major euhedral pyrite concentrations in an enclosing coarse matrix of sphalerite, plus or minus chalcopyrite. Pyrite grainsizes can vary between 50 and 500 µm but tend to be in the 100-200 µm range. Liberation sizes for sphalerite or chalcopyrite vary widely depending on the density of the pyrite concentration. In samples where pyrite becomes dominant, and semi-coalescent, the sphalerite and chalcopyrite forms very subordinate interstitial and relatively fine grains wrapped around the idiomorphic pyrite. In some cores where this occurs there is then a population of sphalerite, chalcopyrite and galena fines within the pyrite host.

Some of the sulphide bands may be deficient in pyrite and then either sphalerite or chalcopyrite is dominant with coarse liberation sizes. There are some massive samples where pyrrhotite is a major sulphide forming more complex textures with the sphalerite, chalcopyrite etc.

One group of massive sulphides, also contains major magnetite that tends to occur as subhedral grains of similar dimensions to pyrite, but within sphalerite. Uncommonly the magnetite may host fines of galena, chalcopyrite etc.

Another small group of massive sulphide contains chalcopyrite as the coarse dominant matrix with finer included pyrite, pyrrhotite and accessory sphalerite.

Three massive sulphide cores are dominated by pyrite, pyrrhotite and magnetite with low levels of sphalerite, chalcopyrite etc.

There are seven drill cores which contain minor to accessory quantities of sulphides. These are predominantly quartz muscovite chlorite schists that have vein mineralisation of base metal sulphides in siderite or dolomite. The sulphides are mainly pyrrhotite, pyrite with chalcopyrite and lesser sphalerite.

The drill cores reveal little evidence of a volcanic origin. They are essentially low grade metamorphic schists with sometimes oriented muscovite visible in massive sulphide.

One possible primary phenomena, is the presence of coarse albite in the schists and several of the massive sulphide cores. In the latter, there is a 1 cm mass of coarse polycrystalline albite i.e. albitite, in one sample (259 49.87). In another (203 101.3), numerous albites to 1.2cm, either fresh or part to completely altered, to a fine grained yellow brown phyllosilicate. Similar crystals, usually part altered at rims occur in most of the low sulphide schists. Albitites are common as wallrocks in both VMS and SEDEX deposits.

Based on mineralogy, the drill cores are classified into seven groups:

GROUP 1

160 153.3-153.6
202 11.66-11.84
226 149.45-149.55
236 99.4-99.52
267 154.74-154.86
274 85.15-85.28

Massive sulphides, dominated by euhedral pyrite, interstitial accessory sphalerite > galena, chalcopyrite, arsenopyrite, tetrahedrite. Gangue ankerite.

GROUP 2

227 34.19 -34.29
264 155.3-155.6
267 140-140.11

Massive to minor sulphides. Major euhedral pyrite, angular sphalerite, accessory tetrahedrite/ tennantite, chalcopyrite, galena and arsenopyrite. Gangue celsian or barite.

GROUP 3

240 51.35-51.48
243 176.57-176 74

Massive to major sulphides. Major euhedral pyrite, minor anhedral sphalerite tetrahedrite chalcopyrite, accessory galena arsenopyrite. Gangue ankerite, siderite, quartz and mica.

GROUP 4

284	182.35-182.48

Sulphide poor chlorite muscovite schists with sulphide bearing quartz carbonate veins.

METAL DISTRIBUTION

ZINC
Zinc is mainly present as sphalerite, with measured iron content ranging from 5 to 10%. It is also present in all the tetrahedrite tennantite grains analysed, between 3 and 5% Fe.

COPPER
Copper is present as chalcopyrite and tetrahedrite/tennantite. There was a trace as bournonite as above, and once as the copper tin sulphide, stannite (243 176.57)

LEAD/SELENIUM
Lead is present as galena plus a trace as bournonite and an unnamed lead antimony sulphide in sample 144 78. Several galenas were analysed for selenium by SEM, which found up to 9%.

SILVER
The silver detected was mainly present in the tetrahedrite/tennantite group. Most examples had between 1 and 2% silver, but there were several silver rich grains, containing between 15 and 25% silver, equivalent to freibergite.

Silver was also present in gold, and in one sample was electrum with silver content around 40%.

GOLD
Gold was found optically in eleven cores, the majority in the first priority group. It was also silver bearing and one particularly high grade sample from the third priority group was electrum.

ARSENIC ANTIMONY
Arsenic was present as accessory arsenopyrite in a number of massive sulphide samples. It also occurred as an accessory element in tetrahedrite and once was dominant over antimony (tennantite). Antimony was present mainly in tetrahedrite, with values between 15 and 26%, and once in bournonite.

BISMUTH TIN
There are two examples of fine bismuth occurrences, with galena. Tin was detected once as fine stannite.

CLASSIFIED AS A SEMI MASSIVE GALENA CHALCOPYRITE MAGNETITE PYRITE SPHALERITE ORE.

The dominant ore texture consists of a matrix of sphalerite and magnetite hosting subordinate quantities of the other sulphides. The gangue is composed of disseminated mostly oriented 100 µm muscovite, is often within massive sulphide and associated equigranular finer quartz. There is a little disseminated manganese siderite (SEM).

The sphalerite areas can exceed half a millimetre but with common fine inclusions of chalcopyrite or galena. The magnetite is less commonly hosting the sulphides but examples with chalcopyrite inclusions are present.

Pyrite varies from a major constituent as equant shaped individual grains ranging from euhedral to rather indented margins against the other sulphides, or magnetite. Pyrite dimensions are from 100 to 500 µm and the sulphide contain inclusions of galena or sphalerite rarely chalcopyrite.

Locally the chalcopyrite becomes a major component of the sphalerite, with very angular shapes to 200 µm, down to less than 10 µm. Not uncommonly it is a partial rim to pyrite. Galena also has its distribution within the dominant sphalerite, less commonly chalcopyrite but also with a regular grain shapes usually less than 100 µm.

Arsenopyrite and pyrrhotite are sporadically present in local concentrations. The arsenopyrite exceptionally exceeds 300 µm clusters, in contact with galena and chalcopyrite.

Anhedral pyrrhotite is similarly important locally within sphalerite in contact with chalcopyrite or galena.

The 6.5 cm core contains several occurrences of complex intergrowths of silver lead, copper and antimony sulphides. These included a eutectic like intergrowth of silver rich tetrahedrite (15-21% silver) and galena, and fine-grained intergrowth of bournonite and galena. There were also several examples of an unnamed lead rich antimony sulphide (no silver). White specks within the freibergite galena intergrowth could not be located by SEM.

CLASSIFIED AS A SEMI MASSIVE CARBONATE CEMENTED PYRITE ROCK WITH ACCESSORY SPHALERITE GALENA.

The drill core is dominantly composed of pyrite that ranges from the semi massive coalesced grains to more disseminated individuals within carbonate or sphalerite. Pyrite crystal shapes are subhedral when coalesced to more euhedral when disseminated.

The main gangue matrix is composed of two carbonates, ankerite and calcite (SEM). The former appears to be a more dusty finer grained component. Much occurs as an interstitial 100-300 µm matrix to the semi massive pyrite etc. There is a little sporadic quartz.

There is coarse banding emphasised by the variation in sphalerite content from locally equal to pyrite over a narrow widths to a dominant 2-3% disseminated attachment. Liberation sizes for sphalerite range from 200 µm occasionally to more common 50 µm. Where pyrites are almost coalescing, the pyrites are not normally host to sphalerite or galena inclusions.

The galena content is as marginal attachments to adjacent pyrite, with liberation sizes usually under 50 µm. Chalcopyrite is an uncommon component of the matrix around pyrites sometimes in contact with sphalerite or galena. There was a rare example of arsenopyrite composite with pyrite and once chalcopyrite.

Fine galena may occur within rare carbonate dominant bands.

GOLD

One occurrence of gold was detected optically. This was an argentian particle of 3 microns within a chalcopyrite galena? vein in coarse pyrite.

CLASSIFIED AS SEMI MASSIVE PYRITE CONTAINING ACCESSORY SPHALERITE AND GALENA.

The drill core is dominantly composed of pyrite that is most commonly massive, with coalesced grains exceeding 95%. The separate pyrite crystals were euhedral with diameters between 50 and 200 µm. Apart from the gangue content, sphalerite is the other significant mineral.

The gangue is dominantly ankerite (SEM) with local patches of quartz. The carbonate is regularly present as interstitial sub 100 µm grains.

The sphalerite content is low except for several roughly sub millimetre bands where its content equals that of the pyrite. It then forms a matrix to the euhedral iron sulphide. Normally the sphalerite occurs as 50 µm very allotriomorphic shapes to adjacent idiomorphic pyrites. Exceptionally there are millimetre dimension sphalerite masses.

The galena content is very sporadic that locally may have a similar allotriomorphic 50 µm relationship to the dominant pyrite.

Fine arsenopyrite is occasionally quite common in clusters within the pyrite and may be in contact with the sphalerite.

Pyrites may contain fines of galena and sphalerite down to a few microns. See SEM image.

There are several occurrences of magnetite clusters within the gangue.

CLASSIFIED AS A BANDED MUSCOVITE CARBONATE CEMENTED SEMI MASSIVE GALENA SPHALERITE PYRITE ORE.

The texture is dominated by pyrite that forms rough bands of concentrations of commonly subhedral to euhedral crystals from 50 to 200 µm. These may be cemented by accessory carbonate (ankerite SEM). Parts of the drill core become quite rich in oriented muscovite in several coarse bands.

The dominant texture consists of semi coalesced pyrite clusters infilled by allotriomorphic sphalerite where liberation sizes are under 50 µm. Occasionally coalescence of the pyrite results in a finer lower grade sphalerite content. Inclusions of sphalerite in pyrite are uncommon.

Galena occurs partly as allotriomorphic shaped grains separating adjacent pyrite but is much more common as irregular fine inclusions within pyrite. There is evidence of banding of this type of galena. Some pyrites contain up to 30% galena, as very irregular shapes down to 5 µm.

Within the occasional carbonate rich bands, there can be coarse sphalerite or galena, with negligible pyrite.

CLASSIFIED AS A BANDED TETRAHEDRITE SPHALERITE PYRITE IN A CALCITE BEARING COARSE-GRAINED CELSIAN ROCK

The irregular sulphide bands are hosted by either dominant very coarse-grained (to 5mm) celsian (low potash SEM) or much finer granoblastic carbonate (calcite) with accessory quartz. The slide contains a sulphide free carbonate band.

The sulphide textures and composition are quite variable across the banding. Pyrite is usually dominant but the lower termination of the slide features a semi massive band of a centimetre width of euhedral pyrite, with negligible quantities of sphalerite or tetrahedrite. This changes to a lower density sulphide of a coarser more network like texture. Pyrite distribution is erratic although present as clusters of euhedral crystals, usually in contact with tetrahedrite and lesser quantities of sphalerite, galena of chalcopyrite. Where pyrite is of low content, tetrahedrite becomes the dominant sulphide with areas in excess of a millimetre.

Further banding consists of more abundant pyrite with tetrahedrite sphalerite etc as allotriomorphic matrix to the former mineral. Sphalerite is usually finer when in contact with dominant pyrite.

Non-banded lower pyrite areas contain coarse tetrahedrite that may be rimmed by chalcopyrite. Exceptional chalcopyrite forms half millimetre masses composite with similar galena and tetrahedrite. Arsenopyrite is locally well-developed and has a vein like character partly enclosing chalcopyrite/tetrahedrite. The tetrahedrite is zincian and contains about 1% silver (SEM).

GOLD

Two occurrences of gold were detected optically. Both were argentian, with one example, containing about 15% silver (SEM).

One example was a wispy shaped 40 µm gold in celsian.

The second example was of 80 µm composite with galena on the margin of coarse arsenopyrite.

CLASSIFIED AS A QUARTZ CARBONATE PYRITE ROCK

The dominant texture consists of a coarse pyrite framework made of coalesced pyrites, that are often marginally euhedral. The pyrite is rarely present as individual crystals even within the dominant gangue areas. These were typically 100 to 200 µm.

Ankerite and lesser quartz with traces of muscovite form the dominant matrix as allotriomorphic shapes between pyrites, occasionally dominant, with rhombic habit for the carbonate. This gangue texture is interrupted by half centimetre masses of a relic nature composed of zoned siderite ankerite in a coarsely textured aluminosilicate matrix with elevated potash plus some barium, possibly ex feldspar.

Chalcopyrite is the other significant sulphide present. It occurs as very occasional coarse millimetre plus masses, that then may contain inclusions of pyrrhotite sometimes completely altered to marcasite. Otherwise the chalcopyrite occurs as very sporadic allotriomorphic masses against euhedral pyrite frequently less than 50 µm. Large areas of pyrite contain only traces of this chalcopyrite.

Sphalerite occurs as rare associates of chalcopyrite against euhedral pyrite, exceptionally reaching 150 µm. Galena occurs as very fine rare inclusions in pyrite.

GOLD

Two particles of argentian gold, measuring 3 and 5 µm occurred within a 40 µm inclusion of chalcopyrite in coarse pyrite.

CLASSIFIED AS A BANDED SEMI MASSIVE GALENA TETRAHEDRITE SPHALERITE PYRITE CARBONATE ROCK.

The carbonate texture is quite variable, and appears to contain both ankerite and calcite (SEM). Some is probably recrystallised. It is host to occasional flakes of coarse muscovite.

The sulphide texture shows considerable variation across the banding, particularly for pyrite. Much of the pyrites are part coalesced but with considerable range in grainsizes between bands from 50 to 500 µm. Some of these coalescent bands contain only low percentages of allotriomorphic interstitial sub 100 µm sphalerite. Sphalerite is also present as fines within the carbonate (ankerite). Sphalerite contains 6% iron (SEM) 51.35-51.48.

The tetrahedrite which is zincian and contains about 1% silver (SEM) is dominant in a rather coarse-grained association, to excess of a millimetre with included fine pyrite sphalerite, chalcopyrite or galena. A little tetrahedrite is present as fine blebs within the coarse pyrite. The chalcopyrite content is limited to the tetrahedrite pyrite assemblage, occurring with enclosing tetrahedrite at pyrite margins. The main galena occurrence is also present with the coarse tetrahedrite at pyrite margins. Arsenopyrite is often present in concentrations of fine rhombic crystals within coarse pyrite aggregates in several of the bands. It is also similarly concentrated in the carbonate matrix.

GOLD

Two occurrences of gold were detected optically. These appeared low in silver.

One was a 120x40 µm mass within sphalerite at a pyrite contact with associated chalcopyrite.
The second was a pair of golds, measuring 40 and 150 µm enclosed within a complex fine intergrowth of tetrahedrite chalcopyrite sphalerite and arsenopyrite.

CLASSIFIED AS A BANDED MASSIVE CHALCOPYRITE GALENA AND PYRITE SPHALERITE ORE.

The fresh sulphides form a coarsely banded series of alternating galena pyrite sphalerite and chalcopyrite, galena sphalerite associations. The sulphides form coarsely interlocking textures of euhedral pyrite and anhedral sphalerite, galena and chalcopyrite. This extends for about 5 cm, with the final 1.5 cm termination of the 6.5 cm slide having a similar mineralogy but with a high degree of fines.

The non-opaque gangue content consists of roughly equal quantities of quartz and two carbonates (siderite and ankerite SEM). These occur interstitially to the sulphides, with grainsizes ranging from 100 to 500 µm.

The galena pyrite sphalerite association consists of sphalerite matrix with grain dimensions under rarely finer than 100 µm, often exceeding 200 that is host to varying proportions of the other two major sulphides. The pyrites are present as individual often euhedral isometric shapes typically between 100 and 200 µm, sometimes coalescing. Against the galena when it is a major constituent, shapes are more irregular and inclusions are common. In places the galena dominates with subordinate included sphalerite or pyrite.

The chalcopyrite galena sphalerite association has rather complex textures due to the irregular shapes of the three sulphides. Sphalerite may be dominant, with grainsizes frequently in excess of half a millimetre and then containing fines of the other two. There may be some euhedral pyrite also present.

Where galena is in contact and often enclosing the gangue silicate carbonate, the latter then may contain fines of galena.

There are rare examples of a freibergite (confirmed by SEM, ~17% Ag) within the galena pyrite sphalerite in bands and examples to 200 µm within galena. This was also detected separately in sphalerite, partly in contact with galena. There were several occurrences of fine sub 50 µm stannite grains within sphalerite adjacent to galena and pyrite.

Arsenopyrite was present as rare fine rhombic crystals within coarse galena. There were rare examples of small relic magnetite within the gangue.

The terminal 1.5 cm piece of core is dominated by disseminated pyrite. Much of the pyrite which occurs as angular fines, down to 10 µm, in a partly fragmented sphalerite matrix, with occasional patches of irregular finer galena or chalcopyrite. There are coarse fractured pyrites veined by chalcopyrite and galena.

GOLD

One occurrence was detected optically. This was a loose cluster of sub 5 µm fines within pyrite sphalerite and galena.

CLASSIFIED AS A BANDED BARITE SPHALERITE PYRITE ORE CONTAINING LOCAL CONCENTRATIONS OF TETRAHEDRITE AND ACCESSORY GALENA.

The texture is dominated by irregular bands of pyrite concentrations with individual's subhedral or coalescing, with grainsizes commonly between 200 and 300 µm. This pyrite is flanked by anhedral sphalerite that varies from larger areas enclosing several pyrites to smaller individuals in contact with single pyrites. The latter may be sub 50 µm infill at pyrite contacts. A minor proportion of the pyrites are free of sulphides entirely within the gangue

The gangue is essentially barite forming a granoblastic allotriomorphic texture against the euhedral pyrite of similar dimensions. There is local carbonate.

Tennantite is prominent in several pyrite bands where exceptionally it may extend as a matrix of a mm to a number of fine pyrites. More commonly it forms single masses, often in contact with galena and sphalerite to 500 µm. It may contain fines of chalcopyrite. It contains about 1% silver (SEM).

Galena has a sporadic distribution as an angular marginal phase intergrown with sphalerite and pyrite with similar grainsizes. It is also found as narrow rims between pyrites often accompanied by chalcopyrite. Galena and sphalerite as inclusions in the coarse pyrites are uncommon.

CLASSIFIED AS A BANDED SPHALERITE PYRITE CARBONATE BARITE ROCK.

The dominant gangue has a consistent granoblastic texture separating the sulphides with barite or carbonate (ankerite) grainsizes varying between 200 and 300 µm normally. There is a restricted occurrence of an unusually acicular form of celsian (SEM).

The sulphides occur as a series of narrow bands that are dominated by pyrite and sphalerite and show variations in texture and presence or absence of other sulphides.

The dominant sulphide texture consists of euhedral pyrite in contact with anhedral enclosing sphalerite. The sphalerite contains about 5% iron (SEM). Uncommonly the sphalerite is dominant as areas up to 700 µm enclosing 100-200 µm pyrites. Where pyrite is dominant, clusters of euhedral crystals have very subordinate marginal sphalerite under 50 µm. Pyrite is mostly free of other sulphide inclusions.

Some pyrite sphalerite associations also contain subordinate galena. Exceptionally coarser sphalerite may also have 500 µm plus galena inclusions sometimes of vein character. Galena is also present as narrow veinlets at barite margins. Chalcopyrite occurs as fines in coarser sphalerite, some are attached.

Tetrahedrite is restricted to one band with sphalerite and galena and lower pyrite. The tetrahedrite composites with sphalerite may exceed 500 µm grainsizes. Other tetrahedrite attached to galena in barite is much finer. There are some complex sulphide intergrowths involving part corroded euhedral arsenopyrite, anhedral chalcopyrite and galena in a tetrahedrite matrix.

GOLD

Six examples of gold were detected optically. These were all argentian.

1 3 µm gold in coarse pyrite.
2 20 µm argentian gold associated with chalcopyrite, sphalerite, galena, within coarse pyrites.
3 linear argentian gold of 30 X 10 µm plus fines within the chalcopyrite margin to coarse pyrite
4 5 µm argentian gold attached to chalcopyrite/arsenopyrite inclusion in coarse tetrahedrite
5 40 X 20 µm argentian gold attached to chalcopyrite sphalerite margin with barite
6 50 µm argentian gold in core of coarse pyrite.

CLASSIFIED AS A TETRAHEDRITE PYRITE CARBONATE ROCK.

The drill core is a semi massive pyrite assemblage showing rough banding and a mostly consistent texture of part coalesced to coalesced pyrite. Much of the pyrite hosts interstitial carbonate (ankerite) and lesser quartz. There are occasional lenses of discontinuous bands dominated by carbonate quartz with fine sulphide inclusions.

Tetrahedrite is the other significant sulphide occurring partly as allotriomorphic interstitial grains between part coalesced pyrites, the former with very irregular shapes frequently under 20 µm. The tetrahedrite also occurs within carbonate and quartz as plus half millimetre almost monominerallic masses. Uncommonly where tetrahedrite is dominant over included sub 100 µm pyrites, there is also euhedral arsenopyrite and rims of chalcopyrite. Silver was not detected in the tetrahedrite (SEM).

The galena is restricted to fines in pyrite and traces internally in pyrite aggregates. Chalcopyrite occurs uncommonly within sphalerite.

GOLD

One 65 um example of silver bearing gold (16-25% silver SEM) was detected optically. This occurs at the contact between carbonate and several sulphides including arsenopyrite.

CLASSIFIED AS MASSIVE PYRRHOTITE PYRITE ORE CONTAINING CHALCOPYRITE AND LOW SPHALERITE.

This is a low grade massive sulphide sample with about 10% of interstitial rounded carbonate (siderite SEM) in a matrix of fine sericite.

Pyrite is consistent throughout as semi coalesced to massive aggregates of euhedral pyrite with grainsizes mainly between 100 and 200 µm.

Major part of this pyrite is also accompanied by coarser pyrrhotite. In parts of the slide this pyrrhotite is part altered to a fibrolamellar marcasite, or is completely replaced.

Chalcopyrite is the major valuable ore mineral, that uncommonly is the main cement to part consolidated pyrite concentrations. Liberation sizes of chalcopyrite are less than 100 µm.

Rarely sphalerite is present as a matrix to the pyrite concentrations of similar character to the chalcopyrite. Rare galena is associated with the sphalerite.

Relict habit magnetite was an uncommon component of the carbonate matrix, separate from the sulphides.

CLASSIFIED AS A SPHALERITE PYRITE ORE.

The sample is a massive association of dominant euhedral pyrite clusters and matrix sphalerite**.** The gangue consists of a disseminated interstitial quartz and carbonate (siderite SEM) with dimensions from 50 to 400 µm. At one termination, there is a little secondary? clay.

The pyrite forms a quite regular dense aggregation sometimes coalesce into massive areas of euhedral crystals mainly between 100 and 200 µm. The pyrites contain a little sphalerite as inclusions.

The sphalerite (6% iron, SEM) in much of the slide is a consistent matrix to the dominant pyrite that occasionally becomes equal in volume, with areas exceeding 400 µm across.

Galena is present as a sporadic but rare associate of the sphalerite, uncommonly locally dominating. Chalcopyrite has a similar distribution, with rare areas of major chalcopyrite matrix to pyrite. In one of these locations there was also fine tetrahedrite. Arsenopyrite was a rare but coarse composite with similar pyrite.

There was a trace of fine magnetite within the siderite.

GOLD

Two occurrences of gold were detected optically. These were argentian.

1. An 8 µm argentian gold on the margin of coarse arsenopyrite and pyrite.
2. A 50 µm argentian gold at the contact between pyrite and sphalerite.

CLASSIFIED AS A MAGNETITE SPHALERITE PYRITE ORE WITH DISSEMINATED PYRRHOTITE CHALCOPYRITE AND GALENA WITH A MINOR SIDERITE OVERPRINT

A consistent texture across the sample, consisting primarily of coalesced and subhedral to euhedral pyrite grains (~30 to ~600 µm) within varying levels (subordinate to dominant) of interstitial allotriomorphic sphalerite matrix. Sphalerite inclusions in pyrite are fairly common place (~75 µm average). Irregular allotriomorphic masses (~150 µm to ~2 mm) of magnetite are disseminated frequently throughout the sample, generally intergrown with sphalerite, and containing inclusions of several ores.

Pyrrhotite is consistently found as a minor component across the polished thin section, occurring as individual grains or coarser allotriomorphic aggregates (up to ~600 µm), usually moderately altered to marcasite.

Gangue is comprised predominantly of siderite with low levels of chlorite, quartz and rare muscovite. Siderite occurs ubiquitously across the sample as discrete grains or polycrystalline aggregates (~50 to ~500 µm) in sulphides. Chlorite was occasionally found in clusters of discrete flakes or elongate aggregates (~20 to ~500 µm) within sulphides.

Chalcopyrite is disseminated consistently throughout, as irregular to rectangular shapes and elongate/slivers forms, that are frequently rimming pyrite, along fractures within coalesced pyrite, between pyrite euhedra, inclusions or composites with sphalerite. Additionally it was found as inclusions within magnetite, adjacent to pyrrhotite, or inclusions in pyrite. Typical sizes range from ~50 to ~100 µm.

Galena generally occurs as rims on pyrite or inclusions in sphalerite, with irregular and rectangular forms, sized from ~5 to ~150 µm. Additionally, subordinate occurrences are inclusions in pyrite, associated with chalcopyrite and as inclusions in magnetite.

In several areas of the slide sphalerite occurs in large elongate to spherical monominerallic masses (veins?), sized from (6mm X 1.3mm, 3mm X 1.5 mm).

Rare arsenopyrite was found in clusters of euhedral grains (~5 to ~50 µm), in sphalerite or rimming pyrites.

GALENA	TRACE

CLASSIFIED AS A BANDED MAGNETITE SPHALERITE PYRITE ORE WITH DISSEMINATED PYRRHOTITE, CHALCOPYRITE AND GALENA.

A sample with two main bands that are characterised by particular mineral associations/ratios:

A pyrite rich band containing a relatively high level of chalcopyrite (for the sample), with moderate concentrations of sphalerite, magnetite and subordinate pyrrhotite. A dominant framework of discrete euhedral and lesser coalesced pyrites (~30 to ~700 µm) hosts mainly a subordinate interstitial matrix of sphalerite that is intergrown and consistently peppered with allotriomorphic masses (up to ~3 mm) and discrete anhedral grains of magnetite. Pyrrhotite has formed locally dominant interstitial matrixes to pyrite, rare dominant layers (up to ~1.5 mm thick) and disseminated irregular aggregates (up to ~700 µm) adjacent to pyrite and sphalerite/magnetite. Chalcopyrite is characterised by somewhat semi-continuous vein-like lineal branching patterns (matrix) through pyrite rich zones. It frequently forms rims on pyrite or local interstitial matrixes between pyrite grains, occasional inclusions within sphalerite, magnetite and pyrite, and as a rare host to several pyrite grains. Grain sizes vary from ~5 to ~550 µm.

The second band differs in that sphalerite and magnetite are the dominant accumulative host, with significant disseminated euhedral discrete pyrite (~40 to ~750 µm). Magnetite occurs as frequent small to large (~100 µm to ~2 mm) allotriomorphic masses and discrete grains intergrown with a matrix and irregular grains of sphalerite. Subordinate disseminated irregular pyrrhotite aggregates frequently rim pyrite or form composites with pyrite. Chalcopyrite content is very low, found as occasional irregularly shaped grains (~10 to ~250 µm) that primarily form rims on pyrite, or occasional inclusions within sphalerite and lesser pyrite.

Galena is a trace component that occurs more frequently within the second band. It was found as rectangular, elongate/slivers, blebs, that most commonly rim pyrite, less often found between pyrite grains or inclusions in pyrite, is occasionally associated with chalcopyrite or inclusions in sphalerite and chalcopyrite. Grain sizes vary from ~20 to ~260 µm.

Siderite and chlorite are the main gangue present. Siderite is the dominant gangue in the pyrite rich bands, whilst chlorite and subordinate siderite are found throughout the sphalerite/magnetite >> pyrite bands. Siderite occurs as fine to medium inclusions that are discrete grains or polycrystalline aggregates (~30 to ~500 µm), with SEM and XRD analyses indicate varying composition (Mg rich and poor varieties). Chlorite flakes and aggregates are up to over a millimetre, and regular pepper localized zones. Several fine to coarse quartz grains and aggregates (up to >2 mm) and rare albite were identified.

CLASSIFIED AS A CARBONATE CEMENTED BANDED MAGNETITE SPHALERITE PYRITE ORE WITH DISSEMINATED CHALCOPYRITE AND GALENA

The sample is comprised of two relatively thick bands consisting of sphalerite, pyrite and subordinate magnetite and an intervening pyrite dominant band. Pyrrhotite is regularly disseminated across the former, whilst chalcopyrite and galena occurrences are scarce. Gangue consists predominantly of carbonate (dolomite + siderite XRD), subordinate chlorite and rare quartz. Inclusions of carbonate regularly pepper the ores across all bands (~300 to ~600 µm).

The main bands comprise a dominant sphalerite host containing significant disseminated discrete grains and lesser aggregates of euhedral pyrite (~50 to ~600 µm), and frequent irregular allotriomorphic magnetite masses (up to ~900 µm). Certain areas contain significant pyrrhotite allotriomorphic masses (up to over 1 mm), which are occasionally undergoing incipient to moderate alteration to marcasite.

The pyrite dominant band is up to ~12mm thick, comprised of massive pyrite (subhedral/euhedral accumulations), with low proportions of interstitial carbonate and sphalerite. Fine galena and chalcopyrite are found in trace levels throughout.

Chalcopyrite is found sporadically across the various bands most frequently associated with pyrite and sphalerite, as slivers, rectangular, irregularly shaped grains (microns to ~200 µm). It occurs as inclusions in pyrite and sphalerite, forming composites with pyrite, occasionally hosting pyrite, and as matrix to adjacent ores with grain shapes dictated by host ores.

Galena is found in trace levels across all bands, occurring as fine irregularly shaped inclusions (microns to ~110 µm), generally within pyrite.

CLASSIFIED AS A DOLOMITE/SIDERITE CEMENTED BANDED MAGNETITE PYRRHOTITE PYRITE ORE WITH DISSEMINATED SPHALERITE, CHALCOPYRITE AND GALENA.

The sample is characterised by a wavy roughly banded texture, comprising primarily pyrite dominant bands, and intervening lenticular intermittent pyrrhotite rich and magnetite rich laminations. Sphalerite is typically an accessory component of most bands, occurring as irregularly shaped allotriomorphic grains/grains (up to ~550 µm). Large pods (up to ~2mm) of sphalerite were occasionally observed. The gangue is comprised primarily of carbonate (dolomite and siderite), found as interstitial polycrystalline inclusions (~300 µm average).

Magnetite layers are discontinuous/intermittent in nature, around ~2mm thick, characterised mainly by allotriomorphic textures and occasional subhedral grains. Magnetite is peppered with inclusions of carbonate, pyrite, pyrrhotite, subordinate chalcopyrite and sphalerite. These ores are occasionally significant.

Pyrrhotite rich layers up to ~2.5mm thick are present, roughly banded, pinching in and out with the pyrite layers. Again these layers are peppered with fine (~50 to ~250 µm) carbonate and pyrite inclusions, occasionally magnetite.

The majority of bands are pyrite rich, comprised of dominant coalesced and subordinate euhedral pyrite grains (~150 µm average), with sporadic interstitial magnetite, chalcopyrite and sphalerite, all defined by the pyrite framework (~50 to ~200 µm).

Chalcopyrite is most frequent within the pyrite bands, on occasion making up a minor/major component. Its usual texture is an interstitial matrix to the euhedral/coalesced pyrites. It forms major content in localized zones, as irregularly shaped grains/aggregates ranging from ~30 to ~500 µm. Chalcopyrite is also associated with magnetite, sphalerite, pyrrhotite and occasionally galena.

Galena is generally a trace phase, commonest occurrences include irregular fine (microns up to ~50 µm, occasionally up to ~500 µm) grains that frequently rim pyrite, as inclusions in pyrite, and associated occasionally with chalcopyrite or arsenopyrite. On rare occasions it forms localized clusters compositing with pyrite, magnetite arsenopyrite and chalcopyrite)

Arsenopyrite euhedral grains were found in clusters (~30 µm) grains as inclusions in magnetite, and occasionally in pyrite and pyrrhotite.

ARGENTIAN GOLD	TRACE

CLASSIFIED AS A BANDED QUARTZ SPHALERITE MAGNETITE PYRRHOTITE QUARTZ PYRITE ORE WITH DISSEMINATED CHALCOPYRITE AND GALENA, AND A DOLOMITE/SIDERITE OVERPRINT.

A sample characterised by alternating pyrite rich and subordinate quartz-carbonate-magnetite-sphalerite-pyrrhotite laminations, the latter form characterised by variation and accessory pyrite. Chalcopyrite and galena are found spasmodically in small clusters. A significant carbonate (dolomite) overprint is evident throughout most bands in addition to siderite veinlets orthogonal to banding. Preliminary XRD and SEM analyses confirmed siderite veins, and dolomite occurring in bands.

Bands of semi-coalesced pyrite is the dominant feature (~1 to ~5 mm thick), comprised of subhedral to euhedral pyrite crystals (~50 to ~500 µm). A ubiquitous subordinate interstitial matrix is present, varying in proportions and mineralogy – comprised of many phases usually magnetite, sphalerite and pyrrhotite, or quartz and dolomite in particular pyrite laminations. The size and shape of these interstitial phases are dictated to by the dominance of pyrite in that particular band (see photomicrographs).

The intervening bands are characterised by varying proportions of quartz-carbonate-magnetite-sphalerite-pyrrhotite and pyrite. Quartz rich types are defined by quartz mosaics (averaging ~300 µm) frequently overprinted by significant dolomite. Pyrrhotite varies from sporadic irregular aggregates to a major constituent of particular laminations, characterised by allotriomorphic irregular shapes (~30 µm to >1mm). Magnetite and sphalerite are frequently associated with each other in complex irregularly shaped composites peppering these bands, also commonly fringing pyrite bands, and are occasionally the dominant phases in particular bands. Both magnetite and sphalerite are allotriomorphic, sized from ~50 µm to several millimetres (including aggregates). Pyrite inclusions in magnetite and sphalerite are not uncommon, with rounded forms in magnetite and euhedral forms in sphalerite.

Chalcopyrite was observed mainly throughout the pyrite bands, frequently forming localized irregular interstitial matrix networks or a peppering of fine inclusions (slivers, interstitial forms) within pyrite bands, and occasional coarser broad equidimensional grains/aggregates (up to ~600 µm).

Galena occurs fairly regularly across the thin section, as fine (~10 to ~500 µm) inclusions in pyrite, sphalerite, magnetite, pyrrhotite and adjacent to chalcopyrite. In localized zones it is prevalent, for example numerous inclusions within a pyrite, magnetite or quartz (up to ~400 µm).

GOLD

Three occurrences of gold were detected optically. All were argentian.

1. A 6 µm particle in a chalcopyrite inclusion within coarse pyrite.

2. Three 30 X 10 µm, and 2 µm particles within pyrrhotite cementing coarse pyrite.

3. A ~22 µm particle within coarse pyrite.

CLASSIFIED AS A BANDED GALENA DOLOMITE SPHALERITE PYRITE ORE WITH A SULPHIDE DOLOMITE VEIN

A sample consisting of several pyrite/sphalerite/dolomite bands and a thick dolomite/sulphide vein.

A ~20 mm thick band is present that consists of a dominant semi-massive sphalerite matrix that hosts a minor amount of disseminated discrete euhedral pyrite grains (~50 to ~450 µm). Frequently pyrite contains sphalerite inclusions. Trace galena inclusions occur sporadically in sphalerite and pyrite, found rimming pyrite, are generally irregularly shaped, sized from ~20 to ~400 µm. Occasional magnetite subhedral grains are found sporadically hosted by sphalerite. The band is riddled with interstitial (~350 µm average) dolomite.

This grades into a band that is comprised primarily of euhedral pyrite and interstitial dolomite and muscovite, with sphalerite varying from dominant to major to an accessory constituent. Galena content increases, with localized zones up to 2 mm where it is the dominant interstitial matrix to pyrite.

Chalcopyrite is negligible in the aforementioned bands.

Half of the slide is a thick dolomite-sulphide vein that contains sporadic aggregates of chlorite, muscovite and coarse tourmaline. Dolomite is characterised by an interlocking anhedral (~500 µm average) texture. Pyrite is found in several ~1.5mm average thick layers comprised of ~300 µm euhedral grains. Additionally the dolomite vein is lined with a ~15mm thick pyrite band, comprised predominantly of very coarse subhedral pyrites (~1 to

~5mm). Coarse (~0.5 to ~4 mm) chalcopyrite, galena, sphalerite and rare magnetite, are found rimming pyrite, or forming complex composites with each other and with pyrite, or in combinations of inclusions in one another. In addition, fine to coarse composites of these aforementioned ores are found sporadically throughout the dolomite vein.

CLASSIFIED AS A BANDED MAGNETITE PYRITE ORE WITH DISSEMINATED PYRRHOTITE, SPHALERITE, RARE GALENA AND CHALCOPYRITE WITH DOLOMITE/SIDERITE OVERPRINT

A sample dominantly composed of pyrite that is primarily semi massive, characterised by coalesced grains that are discernibly euhedral (~100 to ~450 µm), with subordinate occasional roughly banded magnetite, and disseminated pyrrhotite, sphalerite, rare chalcopyrite and galena.

The gangue is primarily carbonate (dolomite and siderite (XRD)), found disseminated throughout pyrite, as several subordinate bands and rare very thin veins, averaging ~200 µm grain size.

Magnetite appears in several rough irregular discontinuous bands (up to ~2mm thick) and random equidimensional masses (up to ~1.5 mm), characterised by irregular allotriomorphic textures, and rare discrete subhedral/euhedral grains, commonly containing numerous foreign inclusions including carbonate, galena and pyrite. Frequently it is found as a composite with subordinate sphalerite.

Sphalerite is found frequently as subordinate interstitial matrix component within the coalesced semi-massive pyrite. It usually forms allotriomorphic shapes dictated to by adjacent euhedral pyrites. Localized zones of equal sphalerite and pyrite are present, the latter occurring as discrete euhedral grains. Of note is the frequent occurrences of magnetite and sphalerite together.

Galena is found disseminated right across the sample, as fine (sub 100 µm) grains that are commonly interstitial to euhedral pyrites, as irregular fine inclusions within pyrite coalesced masses, occasional inclusions in carbonate, and also adjacent to other sulphides including sphalerite and chalcopyrite. Rare coarse galena (up to ~1.5 mm) were found, characterised

by irregular shapes composite with several minerals including magnetite, pyrrhotite, pyrite and sphalerite.

Pyrrhotite is regularly disseminated within pyrite, forming interstitial allotriomorphic masses to coalesced and euhedral pyrite, ranging from ~100 µm to ~1.5 mm. Occasionally it is undergoing incipient to moderate alteration to marcasite.

Chalcopyrite occurrence is more sporadic than galena, found as irregularly shaped and rectangular forms, as inclusions within pyrite, between euhedral pyrite grains, adjacent to sphalerite, typically forming in localized clusters, ranging in size from microns to ~100 µm. Rare slivers up to ~300 µm in length in pyrite were identified.

CLASSIFIED AS A MASSIVE PYRITE ORE WITH DISSEMINATED PYRRHOTITE, MAGNETITE AND CHALCOPYRITE, WITH SIDERITE VEINS

Massive pyrite with significant ubiquitous chalcopyrite that has formed a subordinate interstitial matrix relative to the pyrite framework. Chalcopyrite varies from sporadic fine grains (sub 100 µm), through to large (over a millimetre) interstitial masses, within pyrite. Pyrrhotite and magnetite are commonly disseminated within pyrite, whilst sphalerite's presence is somewhat sporadic. Gangue is mainly chlorite, mica and siderite which erratically pepper the massive pyrite, including thin siderite veins.

Magnetite forms primarily as spherical and irregular aggregates/clusters (~500 µm to ~2 mm) of allotriomorphic grains, disseminated fairly regularly across the pyrite. Often, thin siderite veins irregular crosscut these aggregates. Pyrrhotite similarly is found regularly disseminated across the massive pyrite, occurring in irregularly shaped to occasional equidimensional and elongate aggregates (30 µm to ~1.5 mm), comprised of allotriomorphic grains.

Sphalerite content is generally low, however it forms major to dominant components of particular zones. Rare sphalerite dominant layers host subordinate to significant discrete euhedral grains and aggregates of pyrite, in addition to sporadically disseminated pyrrhotite, chalcopyrite and galena. Sphalerite also forms in localized zones, as interstitial matrix to the pyrite framework.

Galena occurs typically as randomly disseminated individual fine (microns to ~260 µm) irregular to equidimensional shaped grains, as inclusions within pyrite or subordinate sphalerite occasionally pyrrhotite, and frequently rimming pyrite, magnetite or lesser

chalcopyrite. Occasionally a cluster of galena grains occurs in particular zones, forming along boundaries of sulphides with grain shapes dictated by adjacent ores.

Gangue is comprised of siderite, chlorite and mica that occur in aggregates (50 to ~500 µm), sporadically throughout the massive pyrite. Chlorite occurs in aggregates of fine (~150 µm) flakes, whilst siderites are generally anhedral grains. A number of thin (sub ~150 µm) micritic siderite veinlets crosscut the pyrite. A very rare euhedral columnar barite aggregate (up to ~600 µm) was found within a siderite vein.

GOLD

Approximately sixty grains of argentian gold were found in one location, as inclusions within chalcopyrite and subordinate pyrrhotite. The grains are equidimensional, irregularly shaped and slivers, ranging in size from less than a micron to ~16 µm.

CLASSIFIED AS A BANDED QUARTZ PYRITE SPHALERITE ORE WITH DISSEMINATED MAGNETITE, PYRRHOTITE AND CHALCOPYRITE AND A SIDERITE OVERPRINT

A roughly banded rock with several mineral associations and varying mineral ratios. The most common bands are sphalerite rich types that form a matrix which hosts significant disseminated and partly coalesced euhedral pyrite (~20 to ~500 µm). Magnetite masses are sporadically disseminated, with low levels of pyrrhotite and chalcopyrite generally present. Occasionally, sphalerite content of these aforementioned bands rises significantly, with subordinate disseminated magnetite and low levels of disseminated ores such as pyrite, pyrrhotite etc. These bands are <2mm thick.

A relatively thick centrally located band (~5 mm) is comprised primarily of pyrite and pyrrhotite with subordinate magnetite, sphalerite and rare chalcopyrite. Primary texture is dominant euhedral and coalesced pyrite grains, with subordinate allotriomorphic interstitial pyrrhotite.

Chalcopyrite is disseminated in low amounts across the various laminations, as irregularly shaped, to rectangular grains, ranging in size from ~30 to ~200 µm. It was found as inclusions in sphalerite, occasional inclusions in pyrite and subordinate magnetite, and frequently adjacent to pyrite euhedra. Several coarse irregular chalcopyrites are present (up to ~2 mm) that form composites with pyrite and sphalerite, found associated with a siderite vein.

Several bands (up to ~2.5 mm thick), have an association of pyrite, pyrrhotite, magnetite, sphalerite and chalcopyrite. Chalcopyrite is at its highest content within these bands, occurring as branching networks/aggregates (~30 to ~300 µm) matrix interstitial to pyrite euhedra or hosted by sphalerite, or in some cases forming complex coarse (up to ~1 mm) composites with pyrite, magnetite, sphalerite and others. Pyrrhotite occurs in fine

disseminations and coarse allotriomorphic (up to ~1.5 mm) masses within these bands, occasionally incipiently altered to marcasite.

Galena is extremely rare, occurring as very fine (microns to ~50 µm) inclusions with irregular shapes and slivers, in sphalerite, and rare rims on pyrite euhedra.

The gangue is quartz and siderite, the latter found ubiquitously across the various ore bands, occurring as discrete grains or polycrystalline aggregates (~50 to ~450 µm). Thin siderite veins are occasionally present, and SEM analyses indicates varying siderite composition (CaO, MgO and MnO ratios). Quartz is mainly found as a major constituent of a ~6mm band at the top of slide, in pockets of somewhat regular mosaics (~300 µm average), with a minor siderite overprint.

CLASSIFIED AS A BANDED QUARTZ SPHALERITE MAGNETITE PYRITE ORE WITH DISSEMINATED PYRRHOTITE AND GALENA

A varied sample comprising an overall banded texture with several mineral associations. Quartz is the main gangue present, occurring in bands and frequent pockets of grains throughout the ore bands, with subordinate siderite and talc.

A ~25 mm thick band is comprised predominantly of coalesced pyrite and subordinate discernible euhedral relatively coarse pyrite (~500 µm to ~1 mm). A relatively low additional ores content is a feature, consisting of randomly disseminated irregularly shaped pyrrhotite and magnetite aggregates (~200 µm to ~2 mm). In addition, chalcopyrite occurs as fine to coarse irregularly shaped grains/aggregates ranging in size from ~40 µm to ~2 mm, generally as inclusions in coalesced pyrite, occasionally as composites/associated with pyrrhotite or at times magnetite, quartz and sphalerite.

The remaining parts of the sample are characterised by roughly banded quartz rich, magnetite rich, sphalerite/magnetite rich and pyrite/quartz bands, the latter the thickest (~6mm thick).

The quartz band is up to ~5mm thick, consisting of a regular mosaic of ~300 µm average quartz, containing sporadic subordinate additional gangue minerals. Magnetite rich laminations (up to ~4mm thick) lie below and above the quartz band. Allotriomorphic irregular shaped discontinuous magnetite masses are typical. Chalcopyrite is found as irregular aggregates (~30 µm to ~2 mm) across these magnetite and quartz laminations, characterised by irregular branching textures interstitial to quartz and magnetite.

The pyrite quartz band consists primarily of clumps and discrete euhedral pyrite grains (~300 µm to ~1 mm) with significant (but subordinate) interstitial quartz mosaics (~500 µm to ~1 mm pockets). There is a very low additional ore content, comprising the occasional random magnetite or sphalerite aggregate (typically associated with one another), ranging in size from ~300 µm to ~1.5 mm.

A magnetite/sphalerite rich lamination (up to ~4 mm thick) lies above the pyrite/quartz rich band. It is defined by intergrown sphalerite and magnetite masses, with significant disseminated euhedral pyrites, and pockets of quartz mosaics.

Galena was negligible, one very fine grain found (~20 µm).

CLASSIFIED AS A BANDED QUARTZ TALC PYRRHOTITE PYRITE MAGNETITE SPHALERITE ORE WITH DISSEMINATED GALENA AND CHALCOPYRITE

A roughly banded ore comprised of pyrite dominant, pyrrhotite dominant and sphalerite/magnetite dominant bands. Gangue makes up minor to major contents of all bands as interstitial aggregates, consisting primarily of talc aggregates, quartz mosaics (in sphalerite/magnetite bands) the occasional anhedral siderite grain, and rare chlorite flakes.

Several bands, ranging in thickness from 10 to over 20 mm, comprise a significant sphalerite and magnetite matrix that is host to minor to major sporadically disseminated discrete subhedral/euhedral pyrites (~100 to ~900 µm), and occasional irregular inclusions of galena, chalcopyrite and pyrrhotite. Magnetite is locally dominant, as large irregular aggregates or discontinuous layers (up to 5 millimetres), found containing numerous fine inclusions of galena, sphalerite and others, in particular examples. Galena is found fairly regularly rimming pyrite, as inclusions in magnetite or sphalerite, with irregularly shaped grains (~50 to ~400 µm). Chalcopyrite is scarce, found associated with galena, pyrite or sphalerite (~100 µm average). Sphalerite inclusions (~200 µm average) are frequently found in pyrites. Quartz is mainly found within these bands.

A central pyrrhotite dominant band (up to ~15mm thick) comprises irregular to elongate allotriomorphic masses of pyrrhotite, the latter parallel to banding, with a major interstitial talc component. Magnetite and subordinate sphalerite occur in elongate trains or discrete grains sporadically (~50 to ~1.5 mm). Chalcopyrite is absent, whilst trace galena occurs as irregular shaped grains rimming pyrrhotite, magnetite or sphalerite (~50 to ~450 µm.

A couple of pyrite dominant bands are present (~10 mm thick), comprising varying levels (major to accessory) of interstitial ores. Pyrite occurs as discrete and semi-coalesced euhedral forms (~100 to 600 µm), with interstitial sphalerite, chalcopyrite, galena,

magnetite and pyrrhotite. Chalcopyrite occurs typically as irregularly shaped aggregates interstitial to pyrite, rimming pyrite or intergrown with sphalerite/magnetite, a size range of ~50 to ~600 µm, occasionally over a millimetre. Galena is found as irregularly shaped inclusions in pyrite, rimming pyrite and interstitial to pyrite associated with other ores (typical ~30 to ~350 µm).

CLASSIFIED AS A BANDED CHALCOPYRITE SPHALERITE MAGNETITE PYRITE ORE

A roughly banded sample that is defined by varying concentrations of pyrite, magnetite, sphalerite and chalcopyrite. Pyrite is intermittently undergoing incipient to moderate alteration to marcasite. Most bands are riddled with gangue – chlorite and siderite mainly occurring as interstitial matrix (typically ~400 to ~1. 5mm), occasionally relatively large pockets up to ~5 mm.

Particular laminations are dominantly pyrite with only accessory levels of interstitial (sub 150 µm) sphalerite, magnetite and chalcopyrite. Pyrites are predominantly discrete euhedral and subordinate subhedral grains (~50 to ~450 µm). Chalcopyrite content is relatively high in localized zones, occurring as interstitial matrix (~50 to ~400 µm) to pyrites. Irregular allotriomorphic magnetite masses (~300 µm to ~2 mm) are found sporadically whilst sphalerite only occasionally occurs as interstitial material within pyrite.

A second band (~4.5mm) is comprised primarily of a dominant sphalerite and magnetite matrix that hosts disseminated subordinate pyrite and chalcopyrite. Sphalerite and magnetite are frequently intergrown/associated, the latter occurring in small to large irregular masses/aggregates. Discrete euhedral pyrite grains (averaging ~400 µm), and irregularly shaped chalcopyrite grains (averaging ~160 µm) are randomly disseminated. The latter commonly rims or forms composites with pyrite, and also is frequently associated with magnetite and sphalerite.

This aforementioned layer grades into a band where sphalerite/magnetite content lessens, whilst chalcopyrite increases and pyrrhotite is present, altering to marcasite. Pyrite grains form a consistent major framework of discrete euhedral grains, with interstitial complex intergrowths of chalcopyrite, sphalerite, pyrrhotite and magnetite.

The ~9mm thick area at the base of the thin section, is irregular and complex, containing large aggregates of chlorite and occasional muscovite, with haphazard layering/aggregates of euhedral pyrite, zones of intergrowths of magnetite and sphalerite, and occasional part altered pyrrhotite (to marcasite). Chalcopyrite is frequently an interstitial matrix to the pyrite.

Galena is found randomly disseminated across the entire thin section, a trace component, found mainly as irregularly shaped to rectangular fine (microns to ~200 µm) inclusions in sphalerite, pyrite and subordinate chalcopyrite.

CLASSIFIED AS A SEMI-MASSIVE MICA-CHLORITE CHALCOPYRITE ORE WITH DISSEMINATED PYRITE, SPHALERITE AND ALTERED ALBITE MACROCRYSTS

A sample that is characterised predominantly by a semi-massive chalcopyrite framework, containing significant disseminated relatively coarse (~1 to ~2mm) pyrite, subordinate pyrrhotite and scarce sphalerite. The semi-massive chalcopyrite is host to numerous partial to fully altered albite macrocrysts (~1 to ~7 mm), replaced by unidentified phyllosilicates, and secondly quite a number of moderately oriented aggregates (up to ~10mm) of muscovite, lesser biotite and chlorite (~50 to ~600 µm flakes). In addition, there are occasional occurrences of siderite aggregates found in semi-massive chalcopyrite (up to ~10 mm).

Chalcopyrite primarily forms a dominant coalesced matrix, however is occasionally present as fine (~50 to ~300 µm) disseminated irregularly shaped grains within gangue. Discrete subhedral to euhedral pyrites are disseminated regularly within the chalcopyrite, typical size range ~200 µm to ~1.5 mm, occasionally coarser aggregates. There are several zones (up to ~1 mm diameter) of massive chalcopyrite peppered with fine to very fine (~10 to ~200 µm) irregularly shaped and euhedral pyrite grains. Additional textures include pyrite aggregates that have undergone partial replacement by chalcopyrite, leaving a relic subordinate pyrite fine intricate network in dominant chalcopyrite matrix. Pyrite is occasionally moderately to significantly altered to marcasite (large zones up to ~1.5 mm), and rare relic radial pyrite growth textures observed.

Pyrrhotite (magnetic) aggregates are disseminated throughout the chalcopyrite, generally as sub-round to rectangular anhedral/subhedral aggregates (~100 to ~800 µm), frequently associated with pyrite, and intermittently incipiently altered to marcasite. In addition it occasionally forms long rims (up to ~4 mm in length) along chalcopyrite/gangue boundaries.

Sphalerite occurs sporadically across the sample, with a size range of ~40 µm to ~3 mm. It frequently is associated with pyrite, forming complex composites with chalcopyrite and pyrite. Fine (sub 200 µm) sphalerite inclusions in chalcopyrite are present, and it also occurs in a large mass (~3mm), that is host to subordinate pyrite and chalcopyrite grains.

Galena is a trace component that is found fairly often in zones (up to ~300 µm), that are complex vermicular intergrowths with pyrrhotite, tetrahedrite and native bismuth. SEM analyses indicate tetrahedrite is silver bearing, and galena is selenium bearing. Galena also occurs as fine grains (sub 120 µm, rarely up to ~400 µm) that rim pyrite, and as inclusions in sphalerite and pyrite.

CLASSIFIED AS A MASSIVE SPHALERITE ORE WITH BANDED CHALCOPYRITE, DISSEMINATED PYRITE AND PYRRHOTITE

The sample is characterised by a dominant sphalerite host matrix, containing numerous subordinate sulphides including chalcopyrite, pyrrhotite and pyrite that are somewhat banded and disseminated, plus magnetite, all defined by a variety of textures and associations. Gangue is an accessory component, occurring in random disseminated pockets (~200 to ~600 µm) of siderite, chlorite, muscovite, rare discrete albite grains, within sphalerite.

Chalcopyrite occurs in a somewhat roughly banded manner (up to ~3mm thick), where a sphalerite host contains subordinate to equal levels of interconnected irregularly shaped vein-like intermittent chalcopyrite networks. It also regularly forms composites with pyrrhotite and pyrite, often.

Pyrite's textures are varied, including clusters of discrete euhedral grains (~50 to ~250 µm) sitting in sphalerite, and occasionally in chalcopyrite. It also forms somewhat round large (~1 to ~7 mm) coalesced masses that contains a subordinate interstitial chalcopyrite component.

Pyrrhotite occurs as randomly disseminated allotriomorphic aggregates that are frequently composite with pyrite and chalcopyrite, hosted by sphalerite. Roughly banded pyrrhotite is another occurrence, ranging in thickness from ~500 µm to ~2 mm, frequently with a chalcopyrite and pyrite component.

Galena (selenium bearing) is found as a trace component generally occurring as inclusions in sphalerite and in pyrite. It frequently occurs as numerous fine (sub 50 µm) inclusions in the pyrite/chalcopyrite masses. It was observed commonly as clusters of irregularly shaped, elongate and sub-round inclusions (microns to ~200 µm) in sphalerite, where it occasionally forms composites with pyrrhotite and pyrite. Native bismuth was found associated with galena, occurring as fine inclusions and rims on galena.

Magnetite was observed as random disseminated subhedral grains and allotriomorphic masses within sphalerite (~300 µm to ~2.5 mm), occasionally forming intermittent bands in sphalerite.

CLASSIFIED AS A MUSCOVITE CHLORITE QUARTZ SCHIST/MICACEOUS QUARTZITE WITH QUARTZ-SULPHIDE VEINS

The sample is comprised of alternating bands of quartzite and chlorite-mica schist, the latter characterised by several foliations and a schistose fabric. Several minor quartz-sulphide veins cross-cut the sample.

The quartzite bands are granoblastic regular mosaics of moderately equigranular (~150 µm average), equidimensional quartz grains. There is generally an accessory component of disseminated fine (~170 µm average) simple schistose discrete/aggregates or thin layers of chlorite and mica flakes within the quartzite bands.

The muscovite-chlorite bands are defined by a strong fabric defined by two foliations, one that is almost orthogonal to the other, the latter parallel to overall rock compositional banding. Chlorite and muscovite are closely intergrown, consisting of euhedral flakes that have a typical size range of ~100 to ~300 µm. Rare occurrences of siderite are found in these bands, siderite is highly affected/displaced by the fabric, grains found parallel to both foliations, particular examples are extremely elongate grains (up to several millimetres in length). Fine (sub 250 µm) anatase are found sporadically throughout the rock, fairly regularly.

A quartz-sulphide vein crosscuts across the schist in a somewhat intermittent sporadic manner. Sulphides occur primarily in composite aggregates of the following ores: pyrite,

chalcopyrite, sphalerite, arsenopyrite/marcasite, subordinate pyrrhotite and galena. These composites are irregularly shaped, and range in size from ~100 µm to ~3 mm. There is such a variety in combinations and textures it is best to see photomicrographs which show the majority of composites present in the thin section. For example there are chalcopyrites with pyrrhotite inclusions, sphalerites with chalcopyrite rims, chalcopyrite-pyrrhotite-sphalerite composites and pyrite-pyrrhotite-chalcopyrite-galena composites, to name a few. Of note are the varied textures of the pyrite, including bunches of euhedral pyrites grains (averaging ~200 µm) that are composites with several other sulphides. Particularly interesting examples include a large chalcopyrite or sphalerite hosting many euhedral pyrite grains. Another interesting example are very finely intergrown pyrite with galena. Rare discrete grains of pyrite or chalcopyrite are occasionally present. Very rare occurrences of disseminated sulphides in quartzite of chlorite-mica bands are present.

CLASSIFIED AS A BLASTOPORPHYRITIC MICA SCHIST OVERPRINTED BY EXTENSIVE SPHALERITE-PYRRHOTITE-DOLOMITE VEINS

A chlorite-biotite-muscovite schist defined by a strong schistose fabric that has been extensively overprinted by pervasive dolomite-sulphide that has aligned with the schist fabric – giving the rock an overall roughly banded texture of alternating schist and dolomite/sulphides. Several albite macrocrysts are present, some up to ~10 mm in size.

The dolomite-sulphide overprint is comprised mainly of dolomite, pyrrhotite and subordinate sphalerite. Pyrrhotite (magnetic) and sphalerite always occur together in semi-banded/laminated composite aggregates that are highly irregularly shaped (up to ~4mm) somewhat elongate parallel to banding. Typical textures are one sulphide rimming the other, occasionally inclusions of one in the other. These ore composites frequently are intergrown or have inclusions of dolomite, which occur as discrete grains or polycrystalline mosaics (~200 µm average). The sulphides are found within muscovite, chlorite and biotite as well.

Muscovite and chlorite/biotite laminations have a strong preferentially aligned schistose texture, the former consisting of euhedral flakes (averaging ~200 µm). Intervening biotite laminations are undergoing replacement by chlorite.

Chalcopyrite occurs randomly disseminated, typically in low amounts across the thin section, as discrete grains in silicates/carbonate, as thin rims on pyrrhotite and sphalerite (generally sized from microns to ~150 µm. In one particular band it is more enriched

occurring in numerous coarser complex composites with sphalerite and pyrrhotite (up to ~500 µm) – see photomicrographs.

Galena is found sporadically disseminated across the sample, most frequently rimming sphalerite, or occurring as inclusions in the gangue. Additionally, it was found as composites with pyrrhotite, chalcopyrite or as inclusions in sphalerite. The grains are angular, irregular, elongate varying in size from microns to ~350 µm.

CLASSIFIED AS A MICA CARBONATE CEMENTED/VEINED SPHALERITE PYRRHOTITE CHALCOPYRITE PYRITE ORE WITH ALBITITE ROCK FRAGMENTS

A varied complex array of textures, consisting primarily of large masses of chalcopyrite and pyrite with disseminated pyrrhotite, lesser sphalerite and galena, cemented/veined mainly by carbonate and subordinate muscovite.

The top ~20mm of the slide is a somewhat massive chalcopyrite mass that contains numerous additional sulphide inclusions, and is veined by carbonate, muscovite and quartz. Several coarse albite polycrystalline fragments (up to ~5 mm) are hosted by chalcopyrite as well, that are commonly veined by intricate fine barite. Small (<1 mm) to large (up to ~7mm) allotriomorphic pyrrhotite inclusions are common. Frequent sphalerite inclusions were observed, ranging in size from microns to ~2 mm, and are irregularly shaped sitting mainly in chalcopyrite and the aforementioned pyrrhotite. Sub-round galena inclusions were frequently found within chalcopyrite and pyrrhotite, typical size range of ~100 µm to ~1.5 mm.

A large section of the rest of the thin section is a huge pyrite mass, incipiently altered to marcasite, with a relatively low content of additional sulphide inclusions, primarily (~100 to ~600 µm) irregular pyrrhotite grains, with frequent pockets (~400 µm) and veins of carbonate. Fine to coarse (~200 µm to ~5 mm) sphalerite grains are found rimming pyrite or occasionally included in pyrite, rare galena (~30 to ~250 µm) inclusions and rims are associated with pyrite, as are chalcopyrite (up to ~2mm) grains.

The remaining sections of the thin sections are gangue rich, consisting primarily of an interlocking/mosaic (~200 µm average) of carbonate (vein), subordinate muscovite and lesser biotite, and large fragments of coarse grained (~0.4 to ~2.5 mm) albitite rock and albite macrocrysts, showing twinning. Chalcopyrite and pyrrhotite form large irregular networks throughout these gangue dominant areas. Pyrrhotite is undergoing incipient alteration to marcasite, whilst sporadic euhedral pyrite and irregularly shaped sphalerite grains are also occasionally present (generally sub 400 µm).

CLASSIFIED AS A BANDED MUSCOVITE CHLORITE QUARTZITE WITH SPHALERITE-PYRRHOTITE-CHALCOPYRITE-SIDERITE VEINS

A quartzite that contains several thin to thick bands of foliated biotite-muscovite-chlorite, with quite large siderite-chalcopyrite-pyrrhotite veins crosscutting irregularly across the quartzite. A low content of disseminated ores are found associated with the mica-chlorite bands.

The quartzite is characterised by a somewhat regular mosaic of equi-granular (~100 to ~450 µm) equidimensional grains. Bunches of euhedral columnar tourmalines are found sporadically within the quartzites (up to ~1 mm in length), with a pleochroism from pale to dark zoned green/blue.

Several mica-chlorite bands are present, including a ~20mm example at the base of thin section, in addition to several discontinuous types (~1 to ~2mm thick) occurring randomly throughout the quartzite. These are comprised of layers of chlorite that have a strongly preferentially aligned fabric of ~200 µm flakes, with intervening laminations of muscovite (~150 µm average flakes) that also have a preferential fabric, aligned with the chlorite fabric, and in particular cases orthogonally aligned to this (two foliations). Chlorite is

generally a major component of these muscovite layers. Random clusters of biotite flakes (~100 to ~600 µm) are found sporadically, peppered with fine subhedral elongate ilmenites (~75 µm average), appearing to be undergoing chlorite alteration. Discrete grains of tourmaline were found, rarely, within chlorite.

There is a low randomly disseminated ore component in the large mica-chlorite band, consisting of chalcopyrite, subordinate pyrrhotite, galena, sphalerite and ilmenite. Frequently chalcopyrite forms composites with pyrrhotite and sphalerite, sized ~300 to ~1mm, outliers up to ~4mm.

A ~5 to ~10 mm thick siderite-chalcopyrite-pyrrhotite vein crosscuts and partially overprints the quartzite. The vein is comprised primarily of (~300 µm to ~1.3 mm) anhedral equi-dimensional siderite grains. Irregularly shaped somewhat interconnected chalcopyrite and subordinate pyrrhotite (magnetic) aggregates and composites are disseminated regularly throughout the vein, varying in size from ~100 µm through to over 3 mm, the coarser fraction generally composites of the two sulphides. Irregular grains of pyrite altering to marcasite are found composite with chalcopyrite and pyrrhotite. Rare irregularly shaped to equidimensional sphalerites are present (~100 to ~500 µm), generally found rimming chalcopyrite.

Galena was observed in trace quantities across the entire sample, as elongate and irregular forms, identified rimming pyrrhotite and chalcopyrite, rare coarse composites with pyrrhotite, and discrete grains in chlorite, ranging in size from ~20 to ~400 µm.

CLASSIFIED AS A BIOTITE-CHLORITE-MUSCOVITE SCHIST SIGNIFICANTLY OVERPRINTED BY A SIDERITE CEMENTED ELECTRUM BEARING MASSIVE CHALCOPYRITE WITH DISSEMINATED PYRITE, PYRRHOTITE AND SPHALERITE

The thin section comprises two main zones:

MICA SCHIST

A small section of the slide contains relic schist (somewhat lacking any overprint), comprised primarily of muscovite that is characterised by a strong fabric and several foliations, one almost orthogonal to the other, in addition to subordinate biotite, which is partially replaced by chlorite.

Sulphide content is low, consisting of numerous irregular composites of chalcopyrite, pyrite and subordinate pyrrhotite (~1 to ~ 4mm), in addition to numerous disseminated fine (~30 to ~300 µm) subhedral pyrite grains.

SIDERITE-SULPHIDE OVERPRINT

Approximately three quarters of the slide is semi-massive chalcopyrite containing subordinate disseminated pyrite, pyrrhotite, rare sphalerite, peppered with siderite and other gangue. Chalcopyrite is a semi-massive coalesced matrix, with monominerallic zones, that hosts sporadically disseminated euhedral pyrite discrete grains (~100 to ~800 µm, outliers up to ~2mm), and occasional semi-coalesced irregular pyrite aggregates (up to ~2

mm). Occasionally chalcopyrite occurs as crude fine networks and fine inclusions within pyrite grains/aggregates.

Pyrrhotites are ubiquitous, sporadic, fine, anhedral grains and large irregular allotriomorphic masses (~100 µm to over five millimetres), that frequently composite with pyrite. Of note is the common intricate veining of pyrite by pyrrhotite. Gangue content consists predominantly of ubiquitous peppering of polycrystalline siderite aggregates (~200 µm to ~2 mm), in addition to subordinate chlorite, aggregates of muscovite, biotite and a green mica, and rare coarse (~5mm) albite macrocrysts. These macrocrysts enclose sulphides, and are undergoing marginal replacement by green chlorite.

Sphalerite occurs as an accessory component mainly within the massive chalcopyrite zone, commonly found in complex composites with chalcopyrite and pyrite, occasionally pyrrhotite. It sometimes rims pyrite, are inclusions in chalcopyrite and pyrite, and is found on few occasions containing numerous inclusions of pyrite. Grain sizes vary from ~40 to ~400 µm generally, outliers up to ~750 µm, with broad grain shapes, elongate shapes to slivers, and irregular forms.

Galena was extremely rare, found most commonly as inclusions in sphalerite, and occasional rims on sphalerite or as discrete grains in gangue. Grain sizes vary from a few microns to 50 µm, typically as irregularly shaped forms.

GOLD

Silver rich (~40%) gold (electrum) was found regularly within the massive chalcopyrite zone, in at least ten field of views, in clusters ranging from 2 to approximately 40 grains, totaling at least 150 grains across the polished thin section. Electrum mainly occurs as inclusions in chalcopyrite and pyrrhotite, followed by inclusions in pyrite – some within fractures, occasionally as rims on pyrite and sphalerite, in addition to inclusions in sphalerite, galena and rarely in gangue. The grains range in size from a micron to ~100 µm, and grain size distribution is fairly consistent across this entire size range. The grains are irregularly shaped to elongate/slivers and blebs.

CLASSIFIED AS A MUSCOVITE SCHIST WITH LAYERED ORES AND RARE SIDERITE VEINS

A sample that is dominated by muscovite that has an extremely strong preferentially aligned fabric – a schistose texture, comprised of flakes sized generally between ~100 and ~650 µm. Lenticular pockets and discontinuous layers of polycrystalline quartz (~75 µm) are found periodically between muscovite layers. Rare subhedral elongate apatites (~750 µm) and elongate titanium oxides are sporadically present.

Within the thin section there are approximately nine layers that contain a minor to major content of disseminated ores including pyrite altering to marcasite, pyrrhotite, subordinate chalcopyrite and sphalerite. These laminations vary in thickness from ~1 to ~6mm.

The ores are comprised mainly of pyrite that are significantly altered to marcasite, often with a texture that suggests shearing – elongate and stringy aggregates parallel to the schistose fabric. Colloform siderite regularly lines these pyrite aggregates. Several thin (up to ~150 µm thick) siderite veins are also present, parallel to the fabric. Pyrrhotite is also a major ore mineral, occurring in irregularly shaped, equidimensional and elongate masses/grains (~50 µm to several millimetres), frequently composite or rimmed by other ores, with alteration to marcasite (thin rims) observed intermittently.

Sphalerite is found sporadically across the ore laminations, found mainly as rims on pyrrhotite, or composites with chalcopyrite and pyrrhotite - particular composites finely intergrown. Grain sizes vary from ~50 to ~800 µm.

Chalcopyrites are similarly sporadically found, mainly as composites with pyrrhotite, sphalerite and pyrite/marcasite (occasionally quite complex intergrowths). Discrete irregularly shaped grains and elongate forms (almost string-like), parallel to the schistose fabric, are found in muscovite. Grain sizes range in size from ~20 µm to several millimetres.

Galena occurs as rims on pyrrhotite and sphalerite, composites with pyrrhotite and pyrite, and inclusions in sphalerite, pyrite and muscovite. Grains are irregularly shaped, triangular, elongate and round, ranging in size from ~15 µm to ~450 µm.

GALENA	TRACE

CLASSIFIED AS A MASSIVE PYRITE CHALCOPYRITE ORE WITH BANDED MAGNETITE PYRRHOTITE AND DISSEMINATED SPHALERITE WITH A SIDERITE OVERPRINT

A sample that is primarily comprised of chalcopyrite and pyrite, the latter occurring mainly as subhedral discrete grains (~100 to ~300 µm) and subordinate aggregates sitting in a significant (equal to greater) interstitial host semi-massive chalcopyrite matrix.

A roughly banded texture is defined by intermittent pyrrhotite rich and magnetite rich bands. Discrete irregular aggregates of (~150 to ~850 µm) pyrrhotite are found disseminated within pyrite/chalcopyrite. Rare incipient alteration of pyrrhotite to marcasite was observed.

Similarly, particular bands contain numerous large irregular magnetite allotriomorphic masses (~300 µm to ~2.5 mm), that typically contain pyrite inclusions that have a sub-round form. Associated with these magnetite masses is generally a subordinate sphalerite component. Sphalerite also occurs in zones of up to ~3 mm, as interstitial matrix host to numerous sulphides.

Fairly often pyrite aggregates were intricately veined by pyrrhotite (single pyrrhotite grain). Occasionally large coalesced masses of pyrite are present, with subordinate fine (sub 120 µm) chalcopyrite interstitial inclusions. Most pyrites though, are free of chalcopyrite inclusions.

Galena content is almost negligible, only several grains found across the entire thin sections. These were fine (~30 µm) grains, found within pyrite and sphalerite.

The gangue component is comprised of small pockets (~100 to ~600 µm) of primarily polycrystalline siderite, and discrete grains and aggregates of talc and chlorite. XRD indicates the possibility of trace clay. In particular instances angular fine (~10 to 200 µm) chalcopyrite grains are intimately intergrown with the phyllosilicates.

CLASSIFIED AS AN ALBITITE ROCK WITH MAGNETITE, PYRRHOTITE AND PYRITE BANDS, DISSEMINATED CHALCOPYRITE PLUS PYRITIC MUSCOVITE SCHIST BANDS.

A sample comprised mainly of irregular ore bands that are hosted in a coarse grained albitite rock (~1 to ~3 mm). Irregular and discontinuous linear aggregates of chlorite and subordinate green and brown biotite, are found lying along albite grain boundaries, or crosscutting grains.

Two main ore textures exist: The first are near massive pyrite bands (~5 to ~10 mm thick) comprised mainly of coalesced pyrite, with discernible subhedral/euhedral pyrite grains. Additional ore content is low, consisting of occasional disseminated pyrrhotite grains (~200 µm), chalcopyrite (broad to slivers inclusions in coalesced pyrite and along fractures – ~15

to ~300 µm) and magnetite. A major gangue component consists mainly of aggregates of muscovite or albite and subordinate siderite, chlorite, quartz and biotite.

The second type are intervening dominant thick (~5 to ~20 mm) bands, comprised of varying (minor to major/dominant) levels of large masses and highly irregular disseminated magnetite and pyrrhotite aggregates/composites (100 µm to ~3 mm) peppered with siderite and mica, quartz mosaics (~500 µm), and coarse (~1.5 µm average) albite.

Chalcopyrite occurs sporadically throughout the two major aforementioned ore bands, mainly in a large vein up to ~2mm in length in pyrite. It was also found as discrete inclusions and slivers along fractures in pyrite, composites with pyrrhotite and pyrite, rims on pyrite, inclusions in magnetite, and discrete grains in the non-ores (gangue). Size ranges generally are from ~50 to ~700 µm. In addition it occurs in a central albite dominant band (~6mm thick) as a number of coarse linear-elongate grains that are discrete or composite with magnetite and pyrrhotite, varying in size from ~200 µm to 3.5 mm.

Sphalerite was very rarely identified, found as fine (~70 to ~150 µm) inclusions in chalcopyrite or a chalcopyrite/magnetite/pyrrhotite composite.

MUSCOVITE BANDS

Two central bands (~2 to ~10 mm thick), alternating with albite, are both somewhat discontinuous, comprised predominantly of muscovite, characterised by a moderate preferred alignment of grains. Muscovite flakes are euhedral, averaging ~250 µm. Disseminated subhedral/euhedral elongate ilmenites, and rare large (up to ~5 mm) composites of pyrite, subordinate pyrrhotite, pyrrhotite, magnetite and chalcopyrite are present.

SAMPLE K15-284 182.35-182.48

DRILL CORE

POLISHED THIN SECTION

SCHIST	**95%**
MUSCOVITE	70-80%
QUARTZ	10-20%
DOLOMITE	1-3%
ALBITE MACROCRYSTS /CLAY	**1-3%**
ORES	**5%**
PYRRHOTITE	60-70%
PYRITE	20-30%
TITANIUM OXIDES	5%
CHALCOPYRITE	5%
GALENA	<1%
MARCASITE	<1%

CLASSIFIED AS A BLASTOPORPHYRITIC QUARTZ MUSCOVITE SCHIST WITH DISSEMINATED PYRRHOTITE, PYRITE AND CHALCOPYRITE.

The sample is comprised predominantly of laminated muscovite and subordinate quartz, the former characterised by an extremely strong preferred schistose fabric. Muscovite flakes range have a typical size range of ~100 to ~500 µm. Quartz occurs in thin layers and lenses, up to ~3mm in thickness comprised of ~200 to ~400 µm mosaics. In addition, sporadic relatively coarse (up to ~3 mm) anhedral to euhedral albite macrocrysts are found sporadically and in bands across the sample, typically undergoing moderate alteration to a dark yellow/green phase (mica/clay?). Scarce sporadic dolomite grains and polycrystalline aggregates (sized from ~300 µm to ~ 1.5mm) are also present.

SULPHIDES

A relatively low ore content relative to other samples, consisting mainly of pyrrhotite and pyrite. Pyrrhotite forms elongate trains, parallel to the fabric, up to ~5mm in length, and discrete irregularly shaped to rectangular grains (~50 to ~500 µm), occasionally incipiently altered to marcasite, within dominant muscovite.

Pyrites are found primarily in layers of discrete euhedral grains (~10 to ~200 µm), sitting in dominant muscovite. Composites of pyrite and pyrrhotite are not that uncommon.

Chalcopyrite occurs mainly as composites with pyrrhotite and subordinate pyrite, rims on pyrrhotite, occasional inclusions in pyrrhotite and rare very fine (sub 10 µm) discrete grains in muscovite (sub 10 µm), sometimes associated with galena. Its typical size range is from ~50 to ~300 µm, outliers up to ~1 mm.

Galena occurrences were very rare, found as elongate and irregular rims on chalcopyrite, pyrrhotite and pyrite, inclusions in pyrrhotite and muscovite, and sitting between euhedral pyrites, sized from ~20 to ~60 µm. SEM/EDS analyses indicate galena is selenium bearing.

PETROGRAPHIC REPORT ON 17 SAMPLES OF MASSIVE SULFIDES

Report for: Murray Jones/Trevor Rabb
Equity Exploration Consultants Ltd.
1510-250 Howe Street
Vancouver, B.C. V6C 3R8 (604) 688-9806

Invoice 150864

Dec. 22, 2015.

SUMMARY:

This suite of 17 samples mostly represent crudely to locally vaguely banded/laminated, or in a few cases, relatively unbanded, massive sulfides composed mainly of euhedral pyrite, local magnetite, in a matrix of sphalerite-variable lesser galena/minor chalcopyrite-pyrrhotite-arsenopyrite-trace sulfosalt(s) with gangues of carbonate-local, variable quartz, probable barite, sericite or muscovite, chlorite or green biotite, rarely cordierite (?). These samples typically show sulfide/gangue ratios in the 65-75/35-25 range, and discontinuous banding/lamination is poorly defined by compositional variations from pyrite-rich with variable sphalerite and galena, or locally chalcopyrite and/or pyrrhotite concentrations, or gangue-rich, particularly carbonate- or sericite-rich, locally barite?-rich (the latter typically associated with sphalerite and especially galena-rich zones, suggestive of the approach to the upper portions of a volcanogenic massive sulfide deposit). Sphalerite varies from pale orange-brown (Fe-poor) to more common dark orange-brown or intense red-brown (Fe-rich), sometimes even only a few meters apart. Locally, chalcopyrite, pyrrhotite, coarser sphalerite, galena and sulfosalts, appear to be associated with coarser-grained, possibly remobilized, carbonate ±quartz bearing bands/veins that could represent remobilization of more volatile portions of the deposit during metamorphism/deformation (alternatively, some might represent former stringers?). In general, deformation seems likely to have caused the softer sulfides (galena, sphalerite, pyrrhotite, chalcopyrite) to recrystallize or "flow" to form the matrix to the much harder, ubiquitous euhedral pyrite (and local subhedral magnetite, which has fractured and been partly altered to carbonate, chlorite or sericite, local sphene). Carbonate varies from calcite (typically in bands/veins or distinctly later planar veinlets, or in places in the matrix) to mostly dolomite (gangue matrix) to locally ankerite or even rarely siderite (?). In a few samples, the Fe-carbonate appears to rim or enclose the calcite or dolomite. Chlorite or green (possibly ferriferous?) biotite appears likely to have replaced former biotite.

Sulfosalts appear to be mainly of two types, mainly within or closely associated with galena, particularly where in contact with sphalerite, chalcopyrite or pyrrhotite: first, one which is anisotropic under crossed polars but with only barely detectable, slightly lower reflectance and olive-grey colour compared to galena (could be any one of numerous Pb-Sb-As±Ag sulfosalts?), and second, grey, apparently isotropic (likely tennantite-tetrahedrite, could be Ag-bearing?). SEM analysis is recommended to identify these sulfosalts and their possible Ag contents. No gold was seen, in spite of detailed search at high magnification; again, SEM analysis might reveal gold particles.

In two samples (K15-224 196 and K98-197 133.9) sulfides are lesser/relatively minor, and include much more abundant quartz, local alkali feldspar (Kspar), mica (sericite/muscovite, biotite or green biotite, chlorite), plus epidote, tourmaline and Fe-carbonate. Tourmaline appears on the basis of dark bluish green colour to be Fe-rich, schorl, not suggestive of Mg-rich dravite commonly considered to be of exhalative origin in VMS deposits. Epidote is relatively colourless, possibly Fe-poor (clinozoisite). These samples appear to represent meta-volcanic rocks (one possibly felsic since it contains what appear to be relict alkali feldspar and possible quartz phenocrysts, somewhat elongated and flattened in the plane of banding/foliation).

Capsule descriptions are as follows:

K15-282 302.56-302.69m: fine-grained, crudely banded/laminated, semi-massive sulfides (pyrite-sphalerite-minor chalcopyrite-galena-trace sulfosalt) in carbonate-minor quartz-accessory chlorite gangue)

K15-282 311.32-311.45m: massive, vaguely banded fine-grained pyrite-sphalerite-minor magnetite-trace galena with carbonate-very minor quartz gangue, cut by a central band/vein of coarser carbonate containing significant chalcopyrite, sphalerite, galena but only minor pyrite and magnetite, local pyrrhotite; trace sulfosalt (tetrahedrite?) is rarely included in galena.

K15-315 102.69-102.79m: massive, only faintly banded, pyrite-sphalerite-minor galena intergrown with mixed gangues of carbonate (calcite?)-chlorite or green biotite (rarely containing euhedral marcasite)-lesser quartz.

K15-314 27.5-27.63m: banded/laminated, weakly foliated, fine-grained semi-massive pyrite-minor sphalerite-arsenopyrite-galena-trace chalcopyrite-rare sulfosalt (tennantite?) in sericite-very minor quartz gangue.

K15-314 70.92-71m: crudely banded, pyrite-lesser sphalerite- minor galena in carbonate gangue, with local coarser-grained bands of carbonate-significant chalcopyrite-sphalerite but only minor pyrite, rare galena, possible tetrahedrite, pyrrhotite, cut by late veins of calcite.

K15-297 293.1-293.22m: semi-massive pyrite-sphalerite-minor galena-magnetite-trace chalcopyrite (rare sulfosalts, tetrahedrite and unidentified?) in gangue of carbonate-local quartz-minor chlorite. Chalcopyrite and sulfosalts are mostly in a coarser, carbonate-quartz rich band.

K15-297 296.66-296.8m: massive pyrite-sphalerite-minor chalcopyrite-galena-arsenopyrite-trace pyrrhotite-magnetite (rare sulfosalt, tetrahedrite?) in gangue of carbonate-quartz-minor chlorite-sericite. Arsenopyrite and sulfosalt may be mostly in remobilized carbonate-quartz rich bands.

K15-304 166.21-166.33: massive pyrite-sphalerite-minor arsenopyrite-galena-chalcopyrite trace sulfosalts (unidentified, and tennantite?) in gangue of carbonate-barite?-minor quartz. Arsenopyrite may replace pyrite, and sulfosalt may be mostly in remobilized coarse chalcopyrite-sphalerite-galena-carbonate-barite? rich bands.

K15-224 196-199: weakly foliated massive sulfide (pyrite subhedra in matrix of pyrrhotite-sphalerite-minor galena-trace chalcopyrite ±sulfosalt, likely tetrahedrite?) intercalated with gangue-rich bands of sericite (muscovite)-quartz-biotite ±chlorite, epidote, sphene and schorlitic tourmaline; trace carbonate occurs only in late thin veinlets.

K15-315 134.6-134.71: massive, crudely banded, fine-grained pyrite-sphalerite-minor magnetite-pyrrhotite-galena-arsenopyrite-chalcopyrite with carbonate-sericite (local blastic, partly chloritized cordierite?) gangue. Pyrrhotite (partly replaced by marcasite) is closely associated with chalcopyrite; arsenopyrite appears to largely replace pyrite.

K15-315 135.21-135.3: massive pyrite-sphalerite-galena-arsenopyrite-minor chalcopyrite-trace sulfosalt (tennantite?) inter-banded with gangues of carbonate-lesser barite?, presumably from the upper zones of a volcanogenic massive sulfide deposit.

K15-307 188.09-188.19: finer-grained pyrite-minor sphalerite-galena-trace chalcopyrite in contact with coarser, more massive pyrite-sphalerite-galena-trace arsenopyrite-magnetite-sulfosalts; gangues vary from carbonate-quartz-minor barite in the first type to quartz-carbonate in the second.

K98-197 133.9-134.08: altered, felsic meta-volcanic (?) schist/gneiss with minor sulfides consisting mainly of weakly foliated, vaguely banded/laminated quartz-alkali feldspar or micas (muscovite, biotite, chlorite)-epidote-minor tourmaline-accessory monazite, in places with discontinuous sulfide bands or laminae composed of pyrite-sphalerite-pyrrhotite-galena-minor magnetite-chalcopyrite.

K98-193 176.78-176.96: medium-grained massive sulfide in which euhedral pyrite is enclosed in a matrix of abundant, Fe-rich sphalerite and significant galena with local concentrations of pyrrhotite but only trace chalcopyrite-arsenopyrite, with gangue inclusions of carbonate-chlorite/green biotite, minor barite?

K98-188 79.39-79.5: medium-grained massive sulfide in which euhedral pyrite is enclosed in a matrix of abundant, Fe-rich sphalerite, local pyrrhotite, significant galena, local relict magnetite, trace arsenopyrite, chalcopyrite, gangue inclusions of carbonate-quartz-chlorite/green biotite, rare schorlitic tourmaline.

K15-292 221.18-221.37: fine-grained, faintly banded massive sulfide in which euhedral pyrite and minor magnetite are enclosed in a matrix of sphalerite, lesser galena, minor chalcopyrite and sulfosalt (likely tetrahedrite?), lensy gangues are carbonate-quartz-local barite (?).

K15-292 234.13-234.31: massive, vaguely banded fine-grained pyrite-sphalerite-minor chalcopyrite – galena-pyrrhotite-arsenopyrite with carbonate-sericite-minor quartz gangue, cut by bands/veins of coarser carbonate locally with significant chalcopyrite, sphalerite, galena, pyrrhotite; trace sulfosalts (unidentified, tetrahedrite?) are rare in galena. Late carbonate veins are associated with fracturing.

Detailed petrographic descriptions and photomicrographs are appended (by CD/email attachment). If you have any questions regarding the petrography, please do not hesitate to contact me.

Craig H.B. Leitch, Ph.D., P. Eng. (250) 653-9158 dromore61@gmail.com
492 Isabella Point Road, Salt Spring Island, B.C. Canada V8K 1V4

K15-282 302.56-302.69m: FINE-GRAINED, CRUDELY BANDED/LAMINATED, SEMI-MASSIVE SULFIDES (PYRITE-SPHALERITE-MINOR CHALCOPYRITE-GALENA-TRACE SULFOSALT) IN CARBONATE-MINOR QUARTZ-ACCESSORY CHLORITE GANGUE)

Hand sample not supplied; etched offcut shows fine-grained, dark grey, crudely banded/laminated semi-massive sulfide composed mainly of pyrite and sphalerite, with carbonate gangue. The rock shows trace magnetism, widespread but slow reaction to cold dilute HCl, and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (50%)

Carbonate (mainly calcite/dolomite?)	90%
Quartz	7%
Chlorite	3%

Ore (50%)

Pyrite	60%
Sphalerite	30%
Chalcopyrite	5%
Galena	5%
Sulfosalt (Pb-Sb, Bi or Ag sulfosalt?)	<1%
Pyrrhotite	trace

Gangue minerals are dominated by carbonate, forming sub- to rarely euhedral crystals mainly in the 0.5 mm (locally <0.1, or less commonly up to almost 1 mm) range. The carbonate species is difficult to be sure of due to the HF attack (for Kspar staining) damaging the surface and making it less reactive; it may be calcite and/or dolomite (?). Minor quartz forms subhedral, mostly <0.5 mm crystals to irregular anhedra up to almost 2 mm across; most crystals are apparently relatively unstrained, but the larger ones show mild undulose extinction with no sub-grain development or suturing of grain boundaries. Scattered flakes of chlorite are mostly euhedral, randomly oriented, up to about 1 mm in diameter, with pale green pleochroism and distinctly length-fast, weakly anomalous greenish birefringence suggestive of Fe:Fe+Mg, or F:M, ratio slightly less than 0.5 (?). Rarely, it is intergrown with (likely replacing) relict biotite with pale yellow-brownish or distinctly green pleochroism and length-slow, significantly higher birefringence.

Ore minerals are crudely arranged in bands or laminations mostly <1 mm thick but aggregating to about 0.5 cm thick, highlighted by compositional variation (pyrite-rich, sphalerite-chalcopyrite or sphalerite-galena-rich). Galena rarely contains or is intergrown with very minor sulfosalt of uncertain identity, and chalcopyrite very rarely contains trace inclusions of pyrrhotite (that probably account for the trace magnetism detected in hand specimen). Almost all sulfides contain inclusions of each other, e.g. pyrite within a matrix of sphalerite and/or galena, pyrite within chalcopyrite, and to a lesser degree sphalerite or galena, but not chalcopyrite, within pyrite.

Pyrite forms generally cubic euhedra up to about 1 mm in diameter. Arsenopyrite was not detected. Sphalerite forms somewhat rounded sub- to rarely euhedral crystals mostly <0.75 mm in diameter but commonly in aggregates up to 2 mm thick, elongated in the plane of banding and intergrown with galena as irregular masses up to 2 mm long by 1 mm thick. Sphalerite shows medium red-brown colour suggestive of moderate Fe content, and is generally devoid of fine chalcopyrite inclusions. Chalcopyrite occurs as irregular-shaped masses generally <1 mm across intergrown with sphalerite and wrapped around pyrite. Sulfosalt included within galena is difficult to identify. It forms stubby to elongate sub/euhedral crystals <0.5 mm long and shows reflectance very similar to that of galena, in fact it is only really distinguishable by its distinct (but not strong) anisotropism from dark grey to medium grey under crossed polars. In plane light, it is slightly darker than and shows slightly olive-greenish tints compared to adjacent galena. It could be any one of a wide variety of Pb-Sb, Bi or Ag-bearing sulfosalts, only determinable by SEM (scanning electron microscope) or possibly microprobe studies. Very rare pyrrhotite detected within chalcopyrite forms rounded subhedra <0.1 mm in size.

K15-282 311.32-311.45m: MASSIVE, VAGUELY BANDED FINE-GRAINED PYRITE-SPHALERITE-MINOR MAGNETITE-TRACE GALENACARBONATE-VERY MINOR QUARTZ GANGUE, CUT BY A CENTRAL BAND/VEIN OF COARSER CARBONATE-CHALCOPYRITE, SPHALERITE, GALENA-MINOR PYRITE-MAGNETITE-PYRRHOTITE-TRACE SULFOSALT

Hand sample not supplied; etched offcut shows fine-grained, grey, crudely banded/ laminated massive sulfide composed mainly of pyrite and lesser sphalerite, with mainly carbonate gangue. There is a central ~1cm band of coarser, carbonate-chalcopyrite rich rock. The rock is strongly magnetic, shows widespread but slow reaction to cold dilute HCl, and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (35%)

Carbonate (mainly dolomite?)	97%
Quartz	3%
Sericite	<1%

Ore (65%)

Pyrite	70%
Sphalerite	15%
Magnetite	5%
Chalcopyrite	5%
Galena	3%
Pyrrhotite	1%
Sulfosalt (tetrahedrite-tennantite?)	<1%

Gangue minerals are almost entirely carbonate, forming sub- to anhedral crystals mainly in the 0.5 to <0.1 mm size range where intermixed with the massive sulfides, or up to almost 1 mm within the central band or vein-like area. The carbonate species is difficult to be sure of but in areas of the side of the offcut where the HF attack is not as effective, reaction is still slow; suggesting it may be mostly dolomite (?). Very minor quartz forms subhedra or irregular anhedra mostly <0.5 mm across; most crystals are apparently relatively unstrained. Quartz is almost completely absent from the central band or vein, except near its margins. In places the massive sulfides are cut by narrow veinlets <0.1 mm thick in which shattered pyrite is accompanied by what appears to be minor sericite (?) as randomly oriented subhedral flakes<30 μm in diameter, although it is difficult to distinguish from very fine-grained carbonate of similar size it is intimately mixed with.

In the fine-grained massive sulfides, ore minerals are crudely arranged in poorly defined bands or laminations mostly <1 mm thick but aggregating to about 0.5 cm thick, highlighted by compositional variation (pyrite-minor magnetite rich, or sphalerite-carbonate rich). Pyrite forms generally cubic euhedra mainly in the 0.1-0.5 mm range (arsenopyrite not detected). Sphalerite forms somewhat rounded sub- to rarely euhedral crystals mostly <0.65 mm long but locally in aggregates to 2 mm long, elongated in the plane of banding and intergrown with galena as subhedra <0.4 mm. Sphalerite shows dark red-brown colour suggestive of high Fe content. In general, galena is very minor, mainly <0.1 mm and interstitial to the other sulfides and magnetite, which forms sub/euhedra mainly <0.5 mm (local aggregates to ~1 mm, distinguished by minute inclusions of pyrite or galena <50 μm). Chalcopyrite occurs only as rare subhedra <35 μm within carbonate.

In the central band or vein, chalcopyrite is common and coarse-grained (ragged anhedral aggregates to almost 2 mm), containing or intergrown in places with minor pyrrhotite as subhedra <0.6 mm. Sphalerite occurs as irregular subhedra to ~1 mm, galena as irregular subhedra to 1.5 mm; local pyrite forms sub/euhedra <0.4 mm, in places included within galena or chalcopyrite. Magnetite is uncommon, forming subhedra mainly <0.2 mm. Galena rarely contains symplectic intergrowths of trace grey, apparently isotropic sulfosalt (tetrahedrite-tennantite?) <50 μm, that might be Ag-bearing.

In summary, this is massive, vaguely banded fine-grained pyrite-sphalerite-minor magnetite-trace galena with carbonate-very minor quartz gangue, cut by a central band/vein of coarser carbonate

containing significant chalcopyrite, sphalerite, galena but only minor pyrite and magnetite, local pyrrhotite; trace sulfosalt (tetrahedrite?) is rarely included in galena.

K15-315 102.69-102.79m: MASSIVE, ONLY FAINTLY BANDED, PYRITE-SPHALERITE-MINOR GALENA INTERGROWN WITH MIXED GANGUES OF CARBONATE (CALCITE?)-CHLORITE OR GREEN BIOTITE (RARELY CONTAINING EUHEDRAL MARCASITE)-LESSER QUARTZ

Hand sample not supplied; etched offcut shows fine-grained, grey, only faintly banded massive sulfide composed mainly of pyrite and lesser sphalerite, with relatively minor gangue. The rock is not magnetic, shows local, rapid reaction to cold dilute HCl, and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (25%)

Carbonate (mainly calcite?)	55%
Chlorite/green biotite	30%
Quartz	15%

Ore (75%)

Pyrite	65%
Sphalerite	30%
Galena	~5%
Marcasite	<1%

Gangue minerals include carbonate, lesser chlorite or green biotite, and quartz. Carbonate forms sub- to irregular anhedral crystals optically continuous for up to ~1 mm, with a slight tendency to elongation (length:width up to 1.5:10 in the plane of banding, sub-parallel to common alignment of mica flakes. The carbonate is likely mainly calcite to judge by the strong reaction to cold dilute HCl in the offcut. The mica, which forms mainly euhedral flakes up to about 1 mm in diameter, shows pale green pleochroism typical of a chlorite but has length-slow, moderate birefringence suggestive of green biotite (typically, green biotite is ferriferous, or Fe-rich, but the pleochroism in this case is relatively weak, leaving the identity of this mineral phase uncertain). In places the pale green mica is associated with patches of pale yellowish-green, much finer-grained (10-20 μm) mica in patches to ~1 mm across that are partly rimmed by carbonate and may contain quartz. Quartz is less common than the other gangues minerals, typically forming subhedra to irregular/locally skeletal anhedra mostly <0.5, rarely to ~1 mm in diameter that show only mild strain (weak undulose extinction).

Ore minerals are mainly pyrite in a matrix of sphalerite and minor galena, with rare marcasite included in chlorite/green biotite. Vague banding is caused by irregular variation from pyrite-sphalerite-minor galena rich to gangue-rich zones mostly <2 mm thick, sub-parallel to crude alignment of chlorite/green biotite flakes.

Pyrite forms almost universally euhedral cubic crystals in the 0.5-1.0 mm size range, or locally in poorly-defined bands <1 mm thick of cubic crystals in the 0.1-0.4 mm range. Inclusions of sphalerite or galena are uncommon, mainly <50 μm in diameter. Sphalerite typically forms a matrix to the pyrite, where it occurs as somewhat rounded, sub- to locally euhedral crystals mostly <1 mm in diameter with medium orange-brown colour suggestive of moderate Fe content. Galena is typically interstitial to both sphalerite and galena, forming irregular an- to subhedra <0.5 mm but in places wispy aggregating to ~1 mm across. Sulfosalt was not detected in the galena, and chalcopyrite was not seen in the section. Rarely, bladed euhedral marcasite up to 0.6 mm long occurs included within (and parallel to the foliation in) chlorite/green biotite.

In summary, this is massive, only faintly banded, pyrite-sphalerite-minor galena intergrown with mixed gangues of carbonate (calcite?)-chlorite or green biotite (rarely containing euhedral marcasite)-quartz.

K15-314 27.5-27.63m: BANDED/LAMINATED, WEAKLY FOLIATED, FINE-GRAINED SEMI-MASSIVE PYRITE-MINOR SPHALERITE-ARSENOPYRITE-GALENA-TRACE CHALCOPYRITE-RARE SULFOSALT (TENNANTITE?) IN SERICITE-VERY MINOR QUARTZ GANGUE

Hand sample not supplied; etched offcut shows fine-grained, grey, finely banded/laminated semi-massive sulfide composed mainly of pyrite and sphalerite, with carbonate gangue. The rock shows trace magnetism, widespread but slow reaction to cold dilute HCl, and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (45%)	
Sericite/muscovite	99%
Quartz	1%
Ore (55%)	
Pyrite	80%
Sphalerite	10%
Arsenopyrite	~5%
Galena	3-5%
Chalcopyrite	<1%
Sulfosalt (tennantite-tetrahedrite?)	trace

This sample consists of alternating bands or laminae rich in pyrite-minor sphalerite-interstitial galena-arsenopyrite-trace chalcopyrite, or rich in sericite (very minor quartz) gangue. The bands or laminae are lensy and discontinuous but range from about 1 mm up to 5 mm, especially for the sulfide-rich ones.

Sericite or muscovite-rich laminae consist of matted, mainly euhedral flakes in the <0.1-0.5 mm size range, typically either randomly oriented (within the center of the laminae) or more or less aligned sub-parallel to the compositional lamination, particularly at the margins, imparting a weak foliation to the rock. Quartz is widely scattered, forming subhedra mainly <0.5 but rarely to 0.75 mm, mostly mixed with sulfides at the margins of or around the sericite-rich laminae. The quartz locally shows moderate undulose extinction, but no sub-grain development or suturing of grain boundaries, indicating weak strain.

Pyrite forms sub- to euhedral cubic or rectangular crystals mostly in the 0.5-1.0 mm size range, somewhat flattened with a slight tendency to elongation (length:width up to 2:1) in the poorly defined plane of foliation. In some laminae, arsenopyrite is found as clusters <0.5 mm across of bladed/radiating euhedral rhomb-shaped crystals mainly <0.1 mm long, with random orientations, typically contained within the pyrite. Sphalerite is much subordinate to and typically interstitial to pyrite, forming subhedra rarely more than 0.4 mm in diameter with deep red-brown colour suggestive of high Fe content, generally closely associated with minor galena that occurs interstitial to pyrite and sphalerite as sub/anhedra mostly < Chalcopyrite is relatively uncommon, generally found only in certain laminations, forming subhedra <0.2 mm (local aggregates to ~0.5 mm) interstitial to pyrite, rarely intergrown or associated with traces of grey, apparently isotropic possible sulfosalt (tennantite-tetrahedrite?) as subhedra <50 μm. The chalcopyrite typically occurs intergrown with sphalerite or galena, and associated with arsenopyrite-rich zones.

In summary, this is banded/laminated, weakly foliated, fine-grained semi-massive pyrite-minor sphalerite-arsenopyrite-galena-trace chalcopyrite-rare sulfosalt (tennantite?) in sericite-very minor quartz gangue.

K15-314 70.92-71m: CRUDELY BANDED, PYRITE-LESSER SPHALERITE- MINOR GALENA IN CARBONATE GANGUE, WITH LOCAL COARSER-GRAINED BANDS OF CARBONATE-SIGNIFICANT CHALCOPYRITE-SPHALERITE BUT ONLY MINOR PYRITE, RARE GALENA, TETRAHEDRITE?, PYRRHOTITE, CUT BY LATE VEINS OF CALCITE

Hand sample not supplied; etched offcut shows fine-grained, dark grey, crudely banded massive sulfide composed mainly of pyrite and sphalerite, with carbonate gangue (especially notable in banding-parallel coarser-grained zones), and cut by white carbonate veins sub-perpendicular to banding. The rock is not magnetic, shows widespread but slow reaction to cold dilute HCl (except rapid in carbonate veins), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (40%)

Carbonate (calcite veins, wallrock mainly dolomite?)	100%

Ore (60%)

Pyrite	75%
Sphalerite	20%
Galena	3%
Chalcopyrite	1-2%
Sulfosalt (argentian tetrahedrite?)	trace
Pyrrhotite	trace

Gangue appears to be entirely carbonate, forming sub- to rarely euhedral crystals mainly in the 0.5 mm (locally <0.1, or less commonly up to almost 1 mm) range. The carbonate species intergrown with sulfides in wallrock or in the coarser-grained carbonate-rich bands is difficult to be sure of due to the HF attack making the offcut less reactive; it may be calcite and/or dolomite (?). However, carbonate in the veins is calcite, forming much coarser (up to 3 mm long) subhedra somewhat aligned subparallel to the vein wals.

Ore minerals are very crudely arranged in bands or laminations ranging from <1 to almost 2 cm thick, defined by compositional variation (pyrite-rich, pyrite-sphalerite-minor galena rich, or coarse carbonate-chalcopyrite-sphalerite). Pyrite is commonly included within a matrix of sphalerite and minor galena or less commonly within chalcopyrite; inclusions of sphalerite or galena, but not chalcopyrite, are small and not common within pyrite.

Pyrite forms generally cubic euhedra up to about 1 mm in diameter, but in massive finer-grained bands, crystals are generally subhedral and in the 0.1-0.5 mm size range. Sphalerite forms somewhat rounded sub- to rarely euhedral crystals mostly <0.75 mm in diameter but commonly it forms a matrix to pyrite as aggregates up to almost 1 cm thick (somewhat elongated in the plane of banding) and variably intergrown with galena as irregular masses up to 1 mm long. Sphalerite shows medium red/orange-brown colour suggestive of moderate Fe content, and lacks fine chalcopyrite inclusions.

Chalcopyrite is virtually absent from the vaguely banded sulfides, but occurs commonly in the coarser-grained, carbonate rich band/vein sub-parallel to banding as irregular-shaped masses generally <1 mm across intergrown with sphalerite and wrapped around or including pyrite; only very minor galena occurs in this band. Only trace rare sulfosalt (greenish-grey, apparently isotropic, possibly argentian tetrahedrite?) occurs as minute subhedra mainly <15 μm included within sphalerite, although associated with galena that contains traces of chalcopyrite. Very rare pyrrhotite detected within chalcopyrite forms rounded subhedra <25 μm in size.

In summary, this is crudely banded, pyrite-lesser sphalerite- minor galena in carbonate gangue, with local coarser-grained bands of carbonate-significant chalcopyrite-sphalerite but only minor pyrite, rare galena, possible tetrahedrite, pyrrhotite, cut by late veins of calcite.

K15-297 293.1-293.22m: SEMI-MASSIVE PYRITE-SPHALERITE-MINOR GALENA-MAGNETITE-TRACE CHALCOPYRITE (RARE SULFOSALTS, TETRAHEDRITE AND UNIDENTIFIED?) IN GANGUE OF CARBONATE-LOCAL QUARTZ-MINOR CHLORITE

Hand sample not supplied; etched offcut shows fine-grained, grey, crudely banded/laminated semi-massive sulfide composed mainly of pyrite and sphalerite in abundant carbonate gangue. The rock is distinctly magnetic, shows widespread but slow reaction to cold dilute HCl (except veins), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is roughly:

Gangue (60%)

Carbonate (mainly calcite/dolomite?)	85%
Quartz (mainly in central band/vein)	13%
Chlorite	2%

Ore (40%)

Pyrite	75%
Sphalerite	20%
Galena	2%
Magnetite	2%
Chalcopyrite	<1%
Sulfosalt1 (Pb-Sb, Bi or Ag?)	<1%
Sulfosalt2 (tetrahedrite?)	<1%

Gangue minerals are dominated by carbonate, forming sub- to rarely euhedral crystals mainly in the 0.5 mm (locally <0.1, or less commonly up to almost 1 mm) range. The carbonate species is difficult to be sure of due to the HF attack damaging the surface and making it less reactive; it may include calcite and dolomite (?). Minor quartz forms subhedral, mostly <0.5 mm crystals except in a central band/vein with irregular anhedra up to 1 mm, in aggregates to ~3 mm long. Most crystals are apparently relatively unstrained; even the larger ones show only mild undulose extinction with no sub-grain development or suturing of grain boundaries, but are locally cut by hairline fractures of chlorite (minute flakes <15 μm). Scattered coarse euhedral flakes of chlorite are randomly oriented, up to about 1 mm, with pale green pleochroism and length-slow, low to moderate birefringence suggestive of F:M slightly more than 0.5 (or it may replace relict biotite) There are also patches of the very fine-grained chlorite (minute flakes <15 μm) with pale yellow-brownish/greenish pleochroism and length-slow, but low, birefringence; similar material replaces magnetite along fractures.

Ore minerals are crudely arranged in bands or laminations mostly <2 mm thick but loosely aggregating to about 0.5 cm thick, highlighted by compositional variation (pyrite-rich, sphalerite-galena rich, or rarely carbonate-rich, minor chalcopyrite-sulfosalts bearing). Magnetite is widely scattered as subhedra <0.5 mm, mainly in sulfide-rich bands. Much pyrite occurs within what is almost a matrix of sphalerite and minor galena, and locally, fine sphalerite or galena is included in pyrite.

Pyrite forms generally cubic euhedra up to about 1 mm in diameter, locally aggregating to 2 mm. Sphalerite forms somewhat rounded sub- to rarely euhedral crystals mostly <0.75 mm in diameter but commonly in aggregates up to several mm thick, elongated in the plane of banding and intergrown with galena as irregular masses mostly <0.5 mm. Sphalerite shows medium red-brown colour suggestive of moderate Fe content, and only rarely contains chalcopyrite <50 μm. Most chalcopyrite occurs as subhedra <0.3 mm intergrown with sphalerite in the carbonate-rich band/vein. Sulfosalt forming stubby to elongate sub/euhedral crystals <0.5 mm long shows reflectance somewhat less than that of galena, with weak but distinct anisotropism from dark grey to medium grey under crossed polars. In plane light, it shows slightly olive-greenish tints compared to galena, and could be any one of a wide variety of Pb-Sb, Bi or Ag-bearing sulfosalts, only determinable by SEM or microprobe studies. A different sulfosalt (grey, apparently isotropic) forming subhedra <0.1 mm characteristically intergrown with chalcopyrite is likely tetrahedrite (?).

In summary, this is semi-massive pyrite-sphalerite-minor galena-magnetite-trace chalcopyrite (rare sulfosalts, tetrahedrite and unidentified?) in gangue of carbonate-local quartz-minor chlorite. Chalcopyrite and sulfosalts are mostly in a coarser, carbonate-quartz rich band.

K15-297 296.66-296.8m: MASSIVE PYRITE-SPHALERITE-MINOR CHALCOPYRITE-GALENA-ARSENOPYRITE-TRACE PYRRHOTITE-MAGNETITE (RARE SULFOSALT, TETRAHEDRITE?) IN GANGUE OF CARBONATE-QUARTZ-MINOR CHLORITE-SERICITE

Hand sample not supplied; etched offcut shows fine-grained, grey, crudely banded/laminated massive sulfide composed mainly of pyrite and sphalerite in abundant carbonate gangue. The rock is locally magnetic, shows widespread slow reaction to cold dilute HCl (where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is roughly:

Gangue (40%)

Carbonate (mainly dolomite?)	50%
Quartz (most abundant in remobilized band/veins)	47%
Chlorite	2%
Sericite/muscovite	1%

Ore (60%)

Pyrite	70%
Sphalerite	15%
Chalcopyrite	~5%
Galena	~5%
Arsenopyrite	3-5%
Pyrrhotite (locally partly altered to marcasite)	~1%
Magnetite (relict, partly altered to sphene?)	<1%
Sulfosalt (tetrahedrite?)	<1%

Gangue minerals are roughly equal proportions of carbonate (subhedral to ragged anhedral crystals mainly in the 0.5 to almost 1 mm range, likely mainly dolomite?) and quartz (subhedra to anhedra to 1.2 mm, aggregates to 2 mm). Most quartz crystals show only mild strain (indicated by only mild undulose extinction with no sub-grain development or suturing of grain boundaries) but locally show triple junctions indicative of annealing post-deformation. Scattered euhedral flakes of chlorite are randomly oriented, up to about 1 mm, with pale brownish green pleochroism and length-slow, low to moderate birefringence suggestive of F:M slightly more than 0.5 (may replace relict biotite?). There are also scattered flakes of sericite/muscovite (euhedral, <0.5 mm).

Ore minerals are crudely arranged in bands or laminations mostly <2 mm thick but loosely aggregating to about 0.7 cm thick, highlighted by compositional variation (pyrite-rich, commonly with a chalcopyrite matrix, or sphalerite-galena rich, alternating with gangue-rich bands). The latter have the appearance of remobilized sulfides/gangue, with coarser chalcopyrite (associated with pyrrhotite), sphalerite, and very minor sulfosalt intergrown with galena, plus local arsenopyrite. Magnetite (relict, apparently partly replaced by sphene?) is rare as subhedra <0.5 mm. Much pyrite occurs within a semi-matrix of sphalerite and minor galena or of chalcopyrite; locally, fine sphalerite or galena is included in pyrite. Pyrite forms generally cubic euhedra up to about 1 mm, but there are bands in which they average <0.1 mm (in a matrix of galena, sphalerite or chalcopyrite; these could represent relict primary sea-floor sulfides?). Sphalerite forms somewhat rounded sub- to rarely euhedral crystals mostly <0.75 mm but commonly in aggregates up to several mm long, elongated in the plane of banding and intergrown with galena as irregular masses mostly <0.5 mm. Sphalerite shows medium red-brown colour suggestive of moderate Fe content, and only rarely contains chalcopyrite <50 μm. Most chalcopyrite occurs as subhedra <0.3 mm (matrix to pyrite) or as masses to 0.75 mm containing pyrrhotite to 0.35 mm, intergrown with sphalerite in the remobilized bands/veins. Arsenopyrite occurs as either clusters of minute (<0.1 mm) euhedra or subhedra to 0.4 mm replacing margins of adjacent pyrite, apparently also associated with the margins of the remobilized band/vein. Sulfosalt forming sub/euhedra <0.15 mm is grey, apparently isotropic (likely tetrahedrite?) and intergrown with galena and sphalerite, also possibly associated with the remobilized band/veins.

In summary, this is massive pyrite-sphalerite-minor chalcopyrite-galena-arsenopyrite-trace pyrrhotite-magnetite (rare sulfosalt, tetrahedrite?) in gangue of carbonate-quartz-minor chlorite-sericite. Arsenopyrite and sulfosalt may be mostly in remobilized carbonate-quartz rich bands.

K15-304 166.21-166.33: MASSIVE PYRITE-SPHALERITE-MINOR ARSENOPYRITE-GALENA-CHALCOPYRITE TRACE SULFOSALTS (UNIDENTIFIED, AND TENNANTITE?) IN GANGUE OF CARBONATE-BARITE?-MINOR QUARTZ. ARSENOPYRITE MAY REPLACE PYRITE, AND SULFOSALT MAY BE MOSTLY IN REMOBILIZED, COARSE CHALCOPYRITE-SPHALERITE-GALENA-CARBONATE-BARITE? RICH BANDS

Hand sample not supplied; etched offcut shows fine-grained, grey, crudely banded/laminated pyrite-sphalerite rich massive sulfide with lensy or augen-like carbonate gangue. The rock is locally very slightly magnetic, shows widespread slow reaction to cold dilute HCl (only where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is roughly:

Gangue (35%)

Carbonate (mainly dolomite?)	60%
Sulfate (likely barite?)	37%
Quartz (mainly in central band/vein)	3%

Ore (65%)

Pyrite	65%
Sphalerite	15%
Arsenopyrite	10%
Galena	~5%
Chalcopyrite	~3%
Sulfosalt 1 (Pb-As, Bi or Ag?)	<1%
Sulfosalt 2 (tennantite-tetrahedrite?)	<1%

This section is over-thinned, making identifications of gangues difficult, but they seem to be sub-equal proportions of carbonate (subhedral to ragged anhedral crystals mainly in the 0.5 to almost 1 mm range, likely mainly dolomite?) and probable sulfate, most likely barite to judge by the relief only slightly negative compared to carbonate, although cleavage is not well developed/interference figures are difficult to obtain (similar sized, rounded sub/anhedral crystals), plus very minor quartz (subhedra mostly <0.5 mm). Most quartz crystals show only mild undulose extinction. The gangue minerals are typically concentrated in lensy bands or augen<2 mm thick by up to 2 cm long.

Ore minerals are crudely arranged in bands or laminations mostly <2 mm thick but loosely aggregating to about 1cm thick, highlighted by compositional variation (pyrite ±arsenopyrite-rich, commonly with a sphalerite ±galena rich matrix, alternating with gangue-rich bands). The latter have the appearance of remobilized sulfides/gangue, with coarser chalcopyrite, sphalerite, galena and minor sulfosalts. Most pyrite occurs within a semi-matrix of sphalerite and minor galena but not chalcopyrite, suggesting this sample comes from an upper level of volcanogenic massive sulfide (Pb-Zn zone), supported by the presence of possible barite. Pyrite forms generally cubic euhedra in the 0.1-0.5 mm range, commonly mixed with (partly replaced by?) arsenopyrite as euhedra that average <0.1 mm (locally in a matrix of sphalerite or galena, but only rare chalcopyrite). Sphalerite forms sub- to rarely euhedral, somewhat rounded crystals mostly <0.5 mm intergrown with galena as irregular masses mostly <0.5 mm. Sphalerite shows pale orange-brown colour suggestive of low Fe content, and only rarely contains chalcopyrite <50 μm. Chalcopyrite (subhedra <0.3 mm) is relatively rare in the banded sulfides; most chalcopyrite occurs as masses to 3.5 mm long, intergrown with sphalerite and galena in what appear to be remobilized bands/veins that also appear to contain most of the sulfosalts. Sulfosalts include one with nearly the same colour/reflectance as galena but weak anisotropism under crossed polars (possibly Pb-Sb like bournonite, or Pb-As?) forming sub/euhedra similar in size to galena, and a second one (grey, apparently isotropic, likely tetrahedrite?) forming symplectic intergrowths with galena, mostly <0.25 mm long.

In summary, this is massive pyrite-sphalerite-minor arsenopyrite-galena-chalcopyrite trace sulfosalts (unidentified, and tennantite?) in gangue of carbonate-barite?-minor quartz. Arsenopyrite may replace pyrite, and sulfosalt may be mostly in remobilized coarse chalcopyrite-sphalerite-galena-carbonate-barite rich bands.

K15-224 196-199: WEAKLY FOLIATED MASSIVE SULFIDE (PYRITE SUBHEDRA IN MATRIX OF PYRRHOTITE-SPHALERITE-MINOR GALENA-TRACE CHALCOPYRITE ±SULFOSALT, LIKELY TETRAHEDRITE?) INTERCALATED WITH GANGUE-RICH BANDS OF SERICITE (MUSCOVITE)-QUARTZ-BIOTITE ±CHLORITE, EPIDOTE, SPHENE AND TOURMALINE; TRACE CARBONATE OCCURS ONLY IN LATE THIN VEINLETS

Hand sample not supplied; etched offcut shows fine-grained, dark grey/black, crudely banded massive sulfide and gangue each up to several cm thick. The rock is strongly magnetic, shows no reaction to cold dilute HCl (even where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (35%)

Muscovite, sericite	60%
Quartz	15%
Biotite	15%
Epidote	5%
Chlorite (after biotite?)	3%
Sphene (accessory, in "augen" with quartz)	<1%
Tourmaline (schorl)	<1%
Carbonate (late veinlets only)	<1%

Ore (65%)

Pyrite	35%
Pyrrhotite	30%
Sphalerite	30%
Galena	3-5%
Chalcopyrite	<1%
Sulfosalt 2 (tetrahedrite?)	<1%

This sample is significantly different from the preceding 8 samples, consisting of massive sulfide (pyrite in matrix of pyrrhotite-sphalerite-galena-minor chalcopyrite-trace sulfosalt) alternating with gangue-rich bands.

Gangue-rich bands up to 1.5 cm thick consist mainly of muscovite or sericite (mostly euhedral flakes up to almost 1 mm in diameter, more or less aligned to impart a foliation to the rock) and lesser, variable quartz (rounded sub/anhedra mainly <0.5 mm commonly in "augen" up to 2.5 mm in size that also contain sphene as blastic-looking euhedra up to almost 2 mm), commonly mixed with biotite (sub/euhedral flakes to 0.75 mm with pale brown pleochroism, locally apparently partly replaced by chlorite as subhedral flakes <0.1 mm with brownish-green colour). The quartz shows only mild undulose extinction (local triple junctions); sphene shows pale reddish-brown pleochroism. Epidote forms mostly euhedral, lath-like crystals up to 1 mm long with faint yellow pleochroism (low Fe content). Rarely, dark green pleochroic tourmaline (stubby euhedral prisms to 0.2 mm, likely schorl with F:M ~0.7-0.8?) occurs. Carbonate is confined to rare thin late veinlets <0.1 mm thick.

Massive sulfide bands up to 2.5 cm thick consist of sub- to locally euhedral pyrite (cubic crystals up to 15 mm) generally contained in a matrix composed of variable proportions of subhedral pyrrhotite (ragged, irregular crystals mostly <0.7 mm, weakly elongated in the plane of foliation and banding), sphalerite (mostly <1 mm, locally semi-continuous for up to several mm along foliation, with dark red-brown colour indicative of high Fe content), lesser galena (wispy, irregular, interstitial, mostly <0.5 mm) plus only rare chalcopyrite (ragged, irregular subhedra <0.2 mm) that is rarely associated with traces of pale grey, apparently isotropic sulfosalt (tetrahedrite, could be Ag-rich?) <0.1 mm in size. Similar sulfosalt also occurs rarely as inclusions <50 μm in galena, typically where associated/intergrown with the minor chalcopyrite.

In summary, this is weakly foliated massive sulfide (pyrite subhedra in matrix of pyrrhotite-sphalerite-minor galena-trace chalcopyrite ±sulfosalt, likely tetrahedrite?) intercalated with gangue-rich bands of sericite (muscovite)-quartz-biotite ±chlorite, epidote, sphene and schorlitic tourmaline; trace carbonate occurs only in late thin veinlets.

K15-315 134.6-134.71: MASSIVE, CRUDELY BANDED, FINE-GRAINED PYRITE-SPHALERITE-MINOR MAGNETITE-PYRRHOTITE-GALENA-ARSENOPYRITE-CHALCOPYRITE WITH CARBONATE-SERICITE (LOCAL BLASTIC, PARTLY CHLORITIZED CORDIERITE?) GANGUE. PYRRHOTITE (PARTLY REPLACED BY MARCASITE) IS CLOSELY ASSOCIATED WITH CHALCOPYRITE; ARSENOPYRITE APPEARS TO LARGELY REPLACE PYRITE

Hand sample not supplied; etched offcut shows fine-grained, dark grey, crudely banded/ laminated massive sulfide composed mainly of pyrite and lesser sphalerite and magnetite, with only minor gangue. The rock is strongly magnetic, but shows no reaction to cold dilute HCl, and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (25%)

Carbonate (dolomite or ankerite?)	60%
Sericite	35%
Cordierite (?) (one large porphyroblast, altered to chlorite)	5%

Ore (75%)

Pyrite	60%
Sphalerite	20%
Magnetite	7%
Pyrrhotite (partly altered to marcasite)	5%
Galena	3%
Arsenopyrite	3%
Chalcopyrite	2%

Gangue minerals consist of carbonate, forming sub- to anhedral crystals mainly in the 0.1 to 0.5 mm size range where intergrown with the massive sulfides, and sericite (muscovite) as sub- to euhedral flakes up to ~1 mm in diameter, typically somewhat aligned with the banding to impart a weak foliation. The carbonate species is difficult to be sure of due to the HF attack; lack of reaction suggests it may be dolomite or ankerite (?). Quartz is not identified, but widely scattered, large blastic crystals of possible cordierite (?) with subhedral outlines up to 3.5 mm are altered at margins and along fractures to chlorite (matted subhedral flakes mainly <0.1 mm) and carbonate.

In the fine-grained massive sulfides, ore minerals are crudely arranged in poorly defined bands or laminations mostly <1 mm thick but aggregating to about 4 mm thick, highlighted by slight compositional variation (pyrite-lesser magnetite rich, or sphalerite-pyrrhotite/marcasite-minor galena, chalcopyrite rich; arsenopyrite distribution is variable). Pyrite forms generally cubic euhedra mainly in the 0.1-0.5 mm range, locally intergrown with fine-grained arsenopyrite (euhedra <0.1 mm) or replaced by euhedra up to 0.4 mm. Sphalerite (dark red-brown colour suggestive of high Fe content) forms somewhat rounded sub- to rarely euhedral crystals mostly <0.5 mm but locally in aggregates to 1 mm long in the plane of banding, and intergrown with galena as skeletal subhedra <0.6 mm. Magnetite forms rounded sub/euhedral, typically strongly fractured crystals up to almost 1mm in diameter, immersed in the matrix of sphalerite-gangues. Pyrrhotite forms sub- to anhedral crystals mostly <0.4 mm, commonly partly replaced by very fine-grained (<25 μm) marcasite that locally pseudomorphs it. In general, chalcopyrite is minor, mainly <0.1 mm and interstitial to the other sulfides and closely associated with chalcopyrite that occurs as ragged, irregular subhedra mostly < 0.5 mm with local inclusions of pyrrhotite or galena. Sulfosalt(s) were searched for but not found in this sample.

In summary, this is massive, crudely banded, fine-grained pyrite-sphalerite-minor magnetite-pyrrhotite-galena-arsenopyrite-chalcopyrite with carbonate-sericite (local blastic, partly chloritized cordierite?) gangue. Pyrrhotite (partly replaced by marcasite) is closely associated with chalcopyrite; arsenopyrite appears to largely replace pyrite.

K15-315 135.21-135.3: MASSIVE PYRITE-SPHALERITE-GALENA-ARSENOPYRITE-MINOR CHALCOPYRITE-TRACE SULFOSALT (TENNANTITE?) INTER-BANDED WITH GANGUES OF CARBONATE-LESSER BARITE?

Hand sample not supplied; etched offcut shows fine-grained, dark grey, crudely banded/ laminated massive sulfide composed mainly of pyrite and lesser sphalerite, with only minor gangue. The rock is locally slightly magnetic, but shows no reaction to cold dilute HCl (even where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (35%)

Carbonate (dolomite or ankerite?)	65%
Sulfate (likely barite?)	35%

Ore (65%)

Pyrite	55%
Sphalerite	25%
Galena	10%
Arsenopyrite	7-8%
Chalcopyrite	1-2%
Sulfosalt 2 (tennantite-tetrahedrite?)	<1%

This sample consists mainly of crudely banded massive sulfides, dominated by pyrite-lesser sphalerite-significant galena-arsenopyrite-very minor chalcopyrite-trace sulfosalt, alternating with poorly defined, discontinuous bands of gangues (mainly carbonate, lesser barite?).

Gangue minerals are locally concentrated into bands up to about 0.5 cm thick, parallel to the poorly defined banding in the sulfides. Carbonate forming the bulk of the gangues occurs as tightly interlocking, sub- to anhedral crystals mostly <0.5 mm, but in places mostly <0.1 mm where intergrown with fine sulfides of similar size. The complete lack of reaction to cold dilute HCl, even where powdered, suggests it may be ankerite (?). It is intergrown with lesser amounts of what is tentatively identified as barite, forming mostly rounded sub- to anhedral crystals <0.75 mm in size, locally in aggregates to about 2 mm across. The barite (?) is identified on the basis of relief close to that of carbonate, small positive 2V, and poorly developed cleavage at right angles.

Ore minerals are concentrated in poorly defined, thin bands or discontinuous laminae mostly <2 mm thick, but coalescing in places to almost 2 cm. They vary from pyrite (±arsenopyrite) rich to sphalerite (±galena) rich, the latter more commonly associated with gangues of barite (?) and carbonate. Pyrite typically occurs as euhedral cubic crystals ranging from 0.1 to 1.0 mm, but is locally partly to strongly replaced at the margins, or set in a matrix of, fine- to very fine-grained arsenopyrite forming mainly euhedral crystals <0.1 mm (commonly <50 μm; only rarely to 0.25 mm). The distribution of the arsenopyrite replacements, however, is commonly sub-parallel to the banding. Sphalerite forms sub- to locally euhedral crystals mostly in the 0.5-1.0 mm range, with medium orange-brown colour suggestive of moderate Fe content, and commonly intergrown with or containing inclusions of galena (only rare chalcopyrite). Galena occurs as 1) very fine-grained inclusions in or matrix to pyrite, locally accompanied by arsenopyrite, 2) subhedral, interstitial crystals rarely over 0.6 mm across, or 3) coarser-grained aggregates up to 5 mm long; again, the concentrations tend to follow the banding, and to follow the concentrations of sphalerite. Chalcopyrite is relatively uncommon, mostly confined to the gangue-rich bands (or relict veins?) where it occurs as irregular masses up to 3 mm long, again distributed along the banding, and mixed with galena or sphalerite as a matrix to pyrite. Occurrences of the grey, apparently isotropic sulfosalt (tennantite-tetrahedrite?) are relatively rare, confined to sub/euhedral crystals rarely over 75 μm typically located at the margins of galena where associated with chalcopyrite.

In summary, this is massive pyrite-sphalerite-galena-arsenopyrite-minor chalcopyrite-trace sulfosalt (tennantite?) inter-banded with gangues of carbonate-lesser barite?, presumably from the upper zones of a volcanogenic massive sulfide deposit.

K15-307 188.09-188.19: FINE-GRAINED PYRITE-MINOR SPHALERITE-GALENA-TRACE CHALCOPYRITE/COARSER, MORE MASSIVE PYRITE-SPHALERITE-GALENA-TRACE ARSENOPYRITE-MAGNETITE-SULFOSALTS; GANGUES CARBONATE-QUARTZ-BARITE

Etched offcut shows fine-grained, dark grey, crudely banded massive sulfide (pyrite with lesser sphalerite, minor gangue), in contact with more massive, pyrite-sphalerite-galena rich sulfides. The latter is weakly magnetic, but shows no reaction to cold dilute HCl (even where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is roughly:

Gangue (50%)

Carbonate (dolomite/ankerite?)	60%
Quartz	25%
Barite (?)	15%
Chlorite	<1%

Ore (50%)

Pyrite	55%
Sphalerite	35%
Galena	13%
Arsenopyrite (typically as inclusions within galena)	<1%
Magnetite (partly altered to carbonate)	<1%
Chalcopyrite	<1%
Sulfosalt 2 (tennantite-tetrahedrite?)	<1%
Sulfosalt (Pb-Sb, Bi or Ag sulfosalt?)	<1%

Approximately one-half of this slide consists of relatively fine-grained, pyrite-dominated massive sulfides (minor sphalerite, galena as matrix to pyrite; gangues of carbonate, barite and quartz, locally in augen-like concentrations that may contain sphalerite at the core, plus traces of chlorite). The other half, across a short transition, is more massive, with coarser-grained pyrite in a matrix of major sphalerite, lesser galena (locally containing arsenopyrite, or rarely sulfosalts), rare chalcopyrite and relict magnetite, also containing "augen" composed mainly of carbonate (lesser quartz).

In the first type, pyrite forms mostly cubic euhedra in the <0.1-0.25 mm size range (rarely to 0.5 mm, typically where adjacent to linear, <1 mm thick, quartz-barite-carbonate gangue zones sub-parallel to the contact and serving to define the crude banding. Minor sphalerite, forming sub- to anhedral crystals mostly <0.25 mm but aggregating to 0.5 mm, forms a matrix to pyrite, typically containing minor, interstitial galena as wispy anhedra <0.2 mm. Chalcopyrite is very rare, forming wispy interstitial anhedra <0.1 mm. Sulfosalts are not seen. Augen-like gangue concentrations have rounded to oval outlines up to ~4 mm across, composed of interlocking carbonate as sub/anhedra to about 1 mm size (possibly dolomite or even ankerite to judge by the lack of reaction to HCl in the offcut), or in places quartz and barite (?) of similar size (both rounded anhedra <1 mm).

In the second type, pyrite forms coarser, again mostly cubic euhedra up to about 1 mm in diameter, in a matrix of sphalerite (subhedra of similar size, but commonly aggregating to several mm across, with pale orange-brown colour suggestive of relatively low Fe content) and lesser galena (wispy sub/anhedra also mainly <1 mm long, distinctly interstitial to sphalerite and pyrite). Gangues are mostly quartz (rounded sub/anhedra to almost 1 mm) or, in "augen", mainly carbonate (subhedra to 1.25 mm); barite is not seen. In places, especially near the contact, galena occurs as fine-grained masses to 2.5 mm across with myriads of arsenopyrite inclusions as minute euhedra mostly <25 μm long, with random orientations. Magnetite occurs in the matrix of sphalerite as widely scattered, euhedra <0.25 mm, typically strongly fractured and partly replaced by what appears to be very fine-grained (<20 μm) carbonate. Rarely, near carbonate "augen", galena contains inclusions of both sulfosalts (one only slightly darker than galena, weakly anisotropic; the second grey, apparently isotropic, likely tennantite-tetrahedrite?) as subhedra <0.25 and 0.5 mm respectively.

In summary, this is finer-grained pyrite-minor sphalerite-galena-trace chalcopyrite in contact with coarser, more massive pyrite-sphalerite-galena-trace arsenopyrite-magnetite-sulfosalts; gangues vary from carbonate-quartz-minor barite in the first type to quartz-carbonate in the second.

K98-197 133.9-134.08:PYRITE-SPHALEITE-PYRRHOTTIE-GALENA±MAGNETITE-CHALCO-BANDS IN QUARZ-KSPAR-SERICITE-BIOTITE-CHLORITE-EPIDOTE-TOURMALINE ROCK

Etched offcut shows fine-grained, pale grey-white, crudely banded/laminated minor to locally semi-massive sulfides (major gangues intercalated with the sulfides). The rock is distinctly magnetic, shows no reaction to cold dilute HCl, and minor yellow stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (85%)

Quartz	30%
Alkali feldspar (mainly Kspar?)	15%
Muscovite, sericite	15%
Biotite	15%
Chlorite/green biotite (after biotite?)	15%
Epidote	7-8%
Tourmaline (schorl)	1-2%
Fe-carbonate, minor monazite (?)	<1%

Ore (15%)

Pyrite (partly secondary, after pyrrhotite?)	50%
Sphalerite	30%
Pyrrhotite	10%
Galena	7%
Magnetite	2%
Chalcopyrite	~1%

This sample is more of an altered, felsic meta-volcanic (?) schist or gneiss with minor sulfides than massive sulfide; it consists mainly of weakly foliated, vaguely banded/laminated (1-5 mm) quartz-alkali feldspar or micas (muscovite, biotite, chlorite)-epidote-minor tourmaline-accessory monazite rich bands, in places with poorly defined or discontinuous sulfide bands or laminae composed of pyrite-sphalerite-pyrrhotite-galena-minor magnetite-chalcopyrite.

In wallrock, scattered, somewhat flattened relict feldspar and possible quartz crystals (former phenocrysts?), and the mineral composition, suggests a felsic volcanic protolith. The relict feldspar crystals have rounded subhedral outlines mostly <1.25 mm but locally aggregate to ~2 mm, and appear to be mainly Kspar to judge by the negative relief compared t adjacent quartz, and yellow stain in etched offcut. Possible relict quartz "eyes" have lens-like outlines up to 3.5 mm long (elongated in the plane of foliation; could represent metamorphic "sweat" veinlets) composed of interlocking sub/anhedra <1 mm. The groundmass consists of finer-grained, interlocking quartz sub/anhedra mainly <0.2 mm with interstitial lath-like alkali feldspar of similar size, mostly partly altered to minute flakes of sericite. Alternating with these felsic laminae are bands rich in micas and epidote or locally tourmaline, suggestive of more mafic protolith. Muscovite forming mainly euhedral flakes <0.5 mm in size, typically strongly aligned to define the foliation, are mixed with variable biotite (similar sized, less well aligned sub/euhedral flakes showing variable, pale brown, greenish brown, almost black, or distinctly green pleochroism implying a variable F:M ratio from normal to ferriferous) or chlorite (similar sized euhedral flakes, pale green pleochroism but length-slow birefringence suggestive of having replaced biotite). Epidote occurs as fractured, ragged euhedral crystals to 0.7 mm, somewhat aligned in the foliation, with no yellow colour, implying low Fe content (clinozoisite?). Tourmaline forms stubby sub/euhedra up to 1.5 mm long, more or less aligned in the foliation, with dark green colour (F:M ~0.7-0.8?), and there are races of Fe-carbonate <0.3 mm and monazite (?) as euhedra <0.15 mm surrounded by radiation damaged haloes in biotite.

Pyrite-rich laminae consist of either subhedra to 2 mm (aligned in the foliation, with included pyrrhotite) or wispy anhedra <0.2 mm (likely after pyrrhotite, which nearby forms subhedra to 0.4 mm). Both are locally intergrown with sphalerite (dark red-brown, Fe-rich subhedra <1 mm long), galena (wispy anhedra to 1.2 mm long), local magnetite (highly fractured subhedra <0.5 mm) and traces of chalcopyrite (subhedra <0.5 mm). Sulfosalts were searched for but not observed.

K98-193 176.78-176.96: MEDIUM-GRAINED MASSIVE SULFIDE (EUHEDRAL PYRITE ENCLOSED IN MATRIX OF ABUNDANT, FE-RICH SPHALERITE AND SIGNIFICANT GALENA WITH LOCAL CONCENTRATIONS OF PYRRHOTITE BUT ONLY TRACE CHALCOPYRITE-ARSENOPYRITE; GANGUE INCLUSIONS OF CARBONATE-CHLORITE/GREEN BIOTITE, MINOR BARITE?

Etched offcut shows medium-grained, grey, massive sulfide composed mainly of pyrite and sphalerite, with only minor, likely mostly carbonate gangue. The rock is weakly magnetic, shows spotty reaction to cold dilute HCl (even where not scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (15%)

Carbonate (mainly calcite?)	85%
Chlorite/green biotite	12%
Barite (?)	~3%

Ore (85%)

Pyrite	55%
Sphalerite	30%
Galena	12%
Pyrrhotite	~2%
Chalcopyrite	~1%
Arsenopyrite	<1%

This is medium-grained massive sulfide composed mainly of abundant pyrite in a matrix of almost as abundant sphalerite, lesser galena, minor pyrrhotite and trace chalcopyrite-arsenopyrite; poikilitically included gangues are mostly carbonate and lesser chlorite/green biotite, rare possible barite (?). Banding is essentially absent, although there is some tendency to galena-rich and pyrrhotite-rich zones, sub-parallel to each other.

Pyrite forms euhedral cubic crystals up to about 1.5 mm in diameter, locally aggregating to 2.5 mm. They contain minor inclusions of rounded subhedral sphalerite <0.15 mm, or rarely bleb-like galena <0.1 mm. Sphalerite forming the bulk of the matrix occurs as interlocking, sub- to euhedral crystals to 1.5 mm diameter, with deep red colour indicative of high Fe content. Galena making up most of the rest of the matrix occurs as irregular, interstitial sub/anhedral crystals up to almost 2 mm across. Pyrrhotite shows a much more limited distribution, occurring only in certain zones in aggregates up to 1.5 mm long composed of interlocking subhedra mainly <0.75 mm. Some pyrrhotite may locally replace the margins of pyrite crystals. Chalcopyrite is very minor, occurring as elongated, subhedral crystals <0.5 mm interstitial to the other sulfides, intergrown with galena and associated with pyrrhotite; arsenopyrite occurs rarely apparently replacing the cores of pyrite crystals. Sulfosalts were searched for but not found in the section.

Gangue inclusions in the massive sulfides are mostly irregular in outline, up to about 3 mm across, and consist mainly of carbonate (interlocking sub- to anhedral crystals mostly <1 mm in diameter, possibly mostly calcite to judge by the reaction in offcut) and lesser chlorite or green biotite (pale green or locally yellowish-brownish green pleochroism, but generally length-slow, low to moderate birefringence) that may be intimately intergrown with (altered to?) carbonate, where it may be associated with traces of minute galena <25 μm in size. Minor barite (?) is as described for previous samples, forming rounded anhedra mostly lacking cleavage, identified mainly on the lack of strong relief against carbonate, and poorly seen small positive 2V.

In summary, this is medium-grained massive sulfide in which euhedral pyrite is enclosed in a matrix of abundant, Fe-rich sphalerite and significant galena with local concentrations of pyrrhotite but only trace chalcopyrite-arsenopyrite, with gangue inclusions of carbonate-chlorite/green biotite, minor barite?

K98-188 79.39-79.5: MEDIUM-GRAINED MASSIVE SULFIDE (EUHEDRAL PYRITE IN MATRIX OF ABUNDANT, FE-RICH SPHALERITE, LOCAL PYRRHOTITE, SIGNIFICANT GALENA, LOCAL RELICT MAGNETITE, TRACE CHALCOPYRITE, GANGUE INCLUSIONS OF CARBONATE-QUARTZ-CHLORITE/GREEN BIOTITE, RARE TOURMALINE

Etched offcut shows medium-grained, grey, massive sulfide composed mainly of pyrite and sphalerite, with only minor, likely mostly carbonate gangue. The rock is weakly magnetic, shows spotty reaction to cold dilute HCl (even where not scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (20%)

Carbonate (mainly calcite?)	75%
Quartz	20%
Chlorite/green biotite	1-2%
Sericite/muscovite	1-2%
Tourmaline (schorlitic)	1%

Ore (80%)

Pyrite	50%
Sphalerite	30%
Pyrrhotite	10%
Galena	8-10%
Magnetite (relict, altered to pyrrhotite-chlorite-sericite)	~1%
Arsenopyrite	<1%
Chalcopyrite	trace

This is medium-grained massive sulfide composed mainly of abundant pyrite in a matrix of almost as abundant sphalerite, lesser pyrrhotite and galena, trace magnetite (relict) and very rare chalcopyrite; poikilitic included gangues are mostly carbonate and lesser quartz, minor chlorite/green biotite and sericite, rare tourmaline. Banding is essentially absent, although there is some tendency to pyrrhotite-rich or lesser galena-rich zones up to ~2 mm thick sub-parallel to each other.

Pyrite forms euhedral cubic crystals up to about 1.5 mm in diameter, locally aggregating to 3.5 mm. They contain minor inclusions of rounded subhedral sphalerite to 0.25 mm, or lesser bleb-like galena <0.2 mm. Sphalerite forming the bulk of the matrix occurs as interlocking, sub- to euhedral crystals to 1.5 mm diameter, with deep red colour indicative of high Fe content. Pyrrhotite shows a much more limited distribution, occurring only in certain zones in aggregates up to 1.5 mm long composed of interlocking subhedra up to 1.5 mm. Some pyrrhotite may locally replace the margins of pyrite crystals. Galena making up portions of the rest of the matrix occurs as irregular, interstitial sub/anhedral crystals up to almost 2 mm across. Magnetite occurs as widely scattered sub- to euhedral relicts, partly altered to variable mixtures of fine-grained chlorite, sericite and pyrrhotite. Chalcopyrite is very rare, occurring as elongated, subhedral crystals <0.3 mm interstitial to the other sulfides, intergrown with galena and associated with pyrrhotite; arsenopyrite occurs rarely apparently replacing the cores of pyrite crystals Sulfosalts were searched for but not found in the section.

Gangue inclusions in the massive sulfides are mostly irregular in outline, up to about 2 mm across, and consist mainly of carbonate (interlocking sub- to anhedral crystals mostly <1 mm in diameter, possibly mostly calcite to judge by the reaction in offcut) and lesser quartz as rounded sub/anhedra up to about 1.25 mm in diameter, with relatively little strain (very mild undulose extinction), chlorite or green biotite (pale green or locally yellowish-brownish green pleochroism, but generally length-slow, low to moderate birefringence suggestive of being after biotite) that may be intimately intergrown with (altered to?) carbonate, or sericite/muscovite as euhedral flakes <0.5 mm. Relatively rare tourmaline forms stubby euhedral prisms to 0.7 mm long with dark green colour indicative of F:M around 0.7-0.8 (?).

In summary, this is medium-grained massive sulfide in which euhedral pyrite is enclosed in a matrix of abundant, Fe-rich sphalerite, pyrrhotite, galena, relict magnetite, trace arsenopyrite, chalcopyrite, gangue inclusions of carbonate-quartz-chlorite/green biotite, rare schorlitic tourmaline.

K15-292 221.18-221.37: FINE-GRAINED, FAINTLY BANDED MASSIVE SULFIDE (EUHEDRAL PYRITE/MINOR MAGNETITE ENCLOSED IN MATRIX OF SPHALERITE, LESSER GALENA, MINOR CHALCOPYRITE AND SULFOSALT, LIKELY TETRAHEDRITE?), LENSY GANGUES ARE CARBONATE-QUARTZ-LOCAL BARITE (?)

Etched offcut shows fine-grained, dark grey, crudely banded massive sulfide (pyrite with lesser sphalerite, galena, minor gangue). The rock is strongly magnetic, shows minor, but rapid reaction to cold dilute HCl (mainly where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is roughly:

Gangue (30%)

Carbonate (calcite, ankerite/siderite?)	60%
Quartz	25%
Barite (?)	15%

Ore (70%)

Pyrite	60%
Sphalerite	25%
Galena	10%
Magnetite (partly altered to carbonate)	3-5%
Chalcopyrite	1%
Sulfosalt 2 (tennantite-tetrahedrite?)	<1%

This is fine-grained, faintly banded massive sulfide composed mainly of pyrite and minor magnetite in a matrix of sphalerite, lesser galena, and minor chalcopyrite; lensy included gangues are mostly carbonate, lesser quartz, minor barite (?). Banding is poorly defined by a tendency to sphalerite-rich or lesser galena (±local chalcopyrite)-rich zones up to ~6 mm thick sub-parallel to each other.

Pyrite forms euhedral cubic crystals mostly < 1 mm in diameter, locally aggregating to ~2mm. They contain minor inclusions of rounded subhedral sphalerite to 0.2 mm, or lesser bleb-like galena <0.1 mm. Sphalerite forming the bulk of the matrix occurs as interlocking, sub- to euhedral crystals mainly <0.75 mm, with orange-brown colour indicative of moderate Fe content. Galena making up portions of the rest of the matrix occurs as irregular, interstitial sub/anhedral crystals/aggregates up to 2.5 mm across; galena and sphalerite locally have the appearance of having been remobilized or recrystallized into interstitial position around the pyrite and magnetite during deformation. Magnetite occurs as commonly fractured sub/euhedra, partly altered at margins to minor fine-grained carbonate, embedded in sphalerite or galena, and with inclusions as for pyrite. Chalcopyrite is minor, occurring in certain 2-3 mm thick zones as subhedra <0.5 mm interstitial to the other sulfides, intergrown with galena and sphalerite. Grey, isotropic sulfosalt (tennantite-tetrahedrite?) is relatively abundant in this sample compared to others, occurring included in/mixed with galena as subhedra up to about 1 mm across

Gangue inclusions in the massive sulfides are mostly lens-like or discontinuous bands, up to about 2 mm thick, and consist mainly of carbonate (interlocking sub- to anhedral crystals mostly <015 mm in diameter (including calcite to judge by the reaction in offcut and significant Fe-carbonate with strong positive relief against calcite, minute inclusions, suggestive of ankerite or siderite?), plus lesser quartz (rounded sub/anhedra mostly <0.75 mm, with relatively little strain/mild undulose extinction), and local probable barite (?) as rounded anhedra <0.6 mm long that are distinguished from quartz only by “mottled” extinction and positive relief (cleavage not visible).

In summary, this is fine-grained, faintly banded massive sulfide in which euhedral pyrite and minor magnetite are enclosed in a matrix of sphalerite, lesser galena, minor chalcopyrite and sulfosalt (likely tetrahedrite?), lensy gangues are carbonate-quartz-local barite (?).

K15-292 234.13-234.31: MASSIVE, VAGUELY BANDED FINE-GRAINED PYRITE-SPHALERITE-MINOR CHALCOPYRITE –GALENA-PYRRHOTITE-ARSENOPYRITE WITH CARBONATE-SERICITE-MINOR QUARTZ GANGUE, CUT BY BANDS/VEINS OF COARSER CARBONATE LOCALLY WITH SIGNIFICANT CHALCOPYRITE, SPHALERITE, GALENA, PYRRHOTITE; TRACE SULFOSALTS (UNIDENTIFIED, TETRAHEDRITE?) IN GALENA

Etched offcut shows fine-grained, dark grey, crudely banded massive sulfide (pyrite with lesser sphalerite, galena, minor gangue), cut by local veinlets sub-parallel or oblique to banding. The rock is locally weakly magnetic, shows minor, slow reaction to cold dilute HCl (where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is roughly:

Gangue (30%)

Carbonate (dolomite, ankerite?)	75%
Sericite/muscovite	20%
Quartz	5%

Ore (70%)

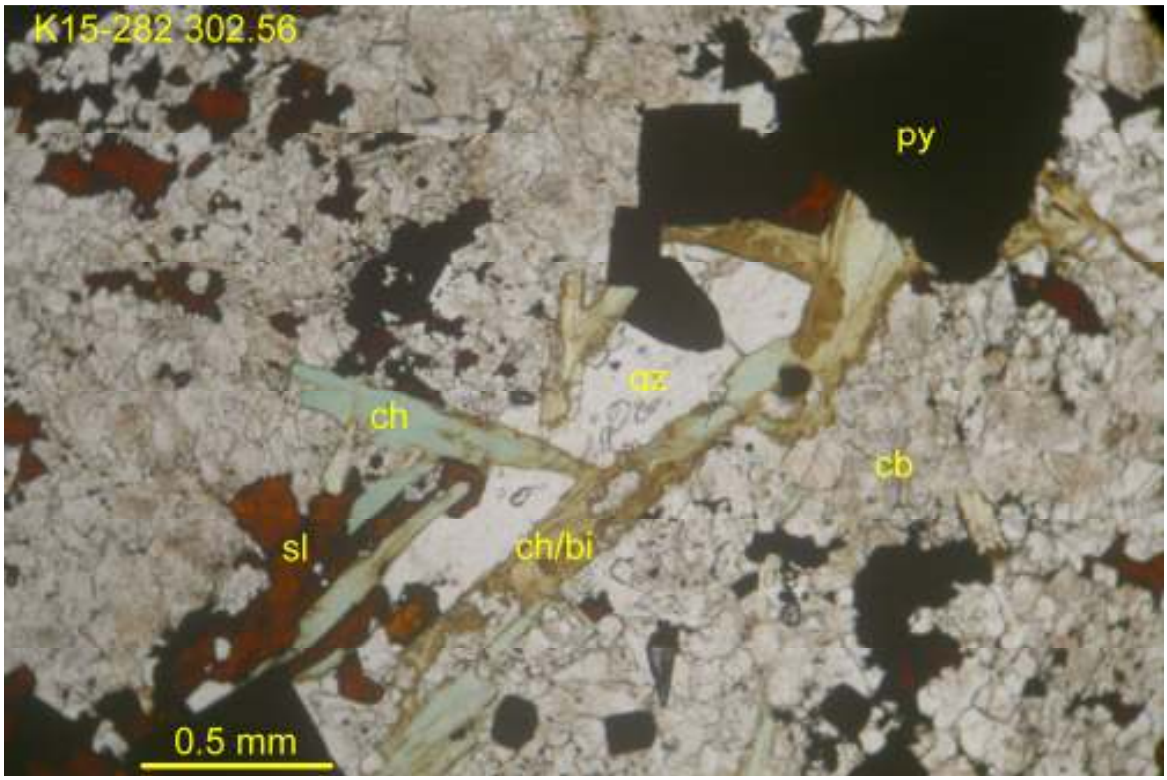
Pyrite	70%
Sphalerite (Fe-rich)	20%
Chalcopyrite	5%
Galena	3%
Pyrrhotite (slightly altered to marcasite)	~1%
Arsenopyrite (interstitial, with chalcopyrite, pyrrhotite)	~1%
Sulfosalts (1, Pb-As-Sb?, 2, tennantite-tetrahedrite?)	<1%

Gangue minerals are mainly carbonate, forming sub- to anhedral crystals mainly in the 0.1 to 0.5 mm size range where intermixed with the massive sulfides, or up to about 3 mm within the irregular band or vein-like areas. The carbonate species is difficult to be sure of but in areas of the side of the offcut where the HF attack was not so effective, reaction is slow even where scratched; suggesting it may be dolomite and ankerite (?). Locally, especially near and along the veins, there is significant muscovite as euhedral flakes to ~1 mm, with mostly random orientations. Minor quartz forms subhedra or irregular anhedra mostly <0.75 mm long, locally in aggregates up to 1.2 mm along the banding; most crystals are apparently relatively unstrained. In places the massive sulfides are cut by distinctive narrow planar veinlets <1 mm thick sub-parallel to banding, in which carbonate subhedra to 1.5mm long are accompanied by margins of shattered pyrite and sphalerite <30 μm in diameter.

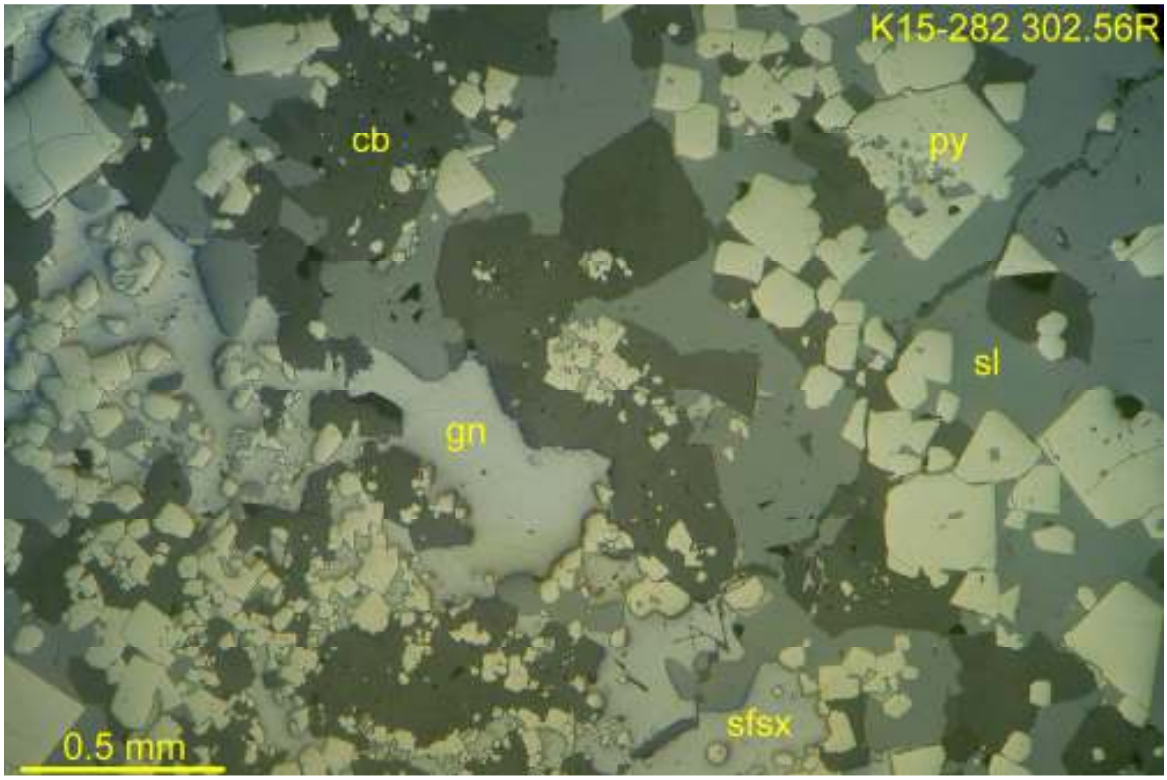
In the fine-grained massive sulfides, ore minerals are crudely arranged in vaguely defined bands or laminations mostly <1 mm thick but aggregating to about 0.5 cm thick, highlighted by compositional variation (pyrite-rich, sphalerite-minor galena, or locally chalcopyrite- rich). Pyrite forms generally cubic euhedra mainly in the 0.1-0.5 mm range (arsenopyrite detected locally as minute euhedra <0.1 mm long with random orientations, mixed with chalcopyrite and pyrrhotite). Sphalerite forms somewhat rounded sub- to rarely euhedral crystals mostly <0.5 mm long but locally in aggregates to 3 mm long, elongated in the plane of banding and intergrown with chalcopyrite or galena as subhedra <0.4 mm. Sphalerite shows dark red-brown colour suggestive of high Fe content, and is locally intimately intergrown with the muscovite. In general, galena is very minor, mainly <0.2 mm and interstitial to or included in sphalerite or chalcopyrite. Chalcopyrite forms sub/euhedra mainly <0.5 mm (local aggregates to ~1 mm, distinguished by minute inclusions of pyrite or galena <50 μm), is commonly closely associated with or includes pyrrhotite (subhedra <0.25 mm). Galena rarely contains symplectic intergrowths <50 μm of grey, apparently isotropic sulfosalt 2 (tetrahedrite-tennantite?) or lesser, pale greenish grey anisotropic sulfosalt 1 (Pb-As-Sb?) as subhedra <0.2 mm.

In the irregular bands/veins, chalcopyrite is more common and coarse-grained (ragged anhedral aggregates to 1 mm), containing or intergrown in places with minor pyrrhotite as subhedra <0.3 mm. Sphalerite occurs as irregular subhedra to ~1 mm, galena as irregular subhedra to 0.5 mm; local pyrite forms sub/euhedra <0.4 mm, in places included within galena or chalcopyrite.

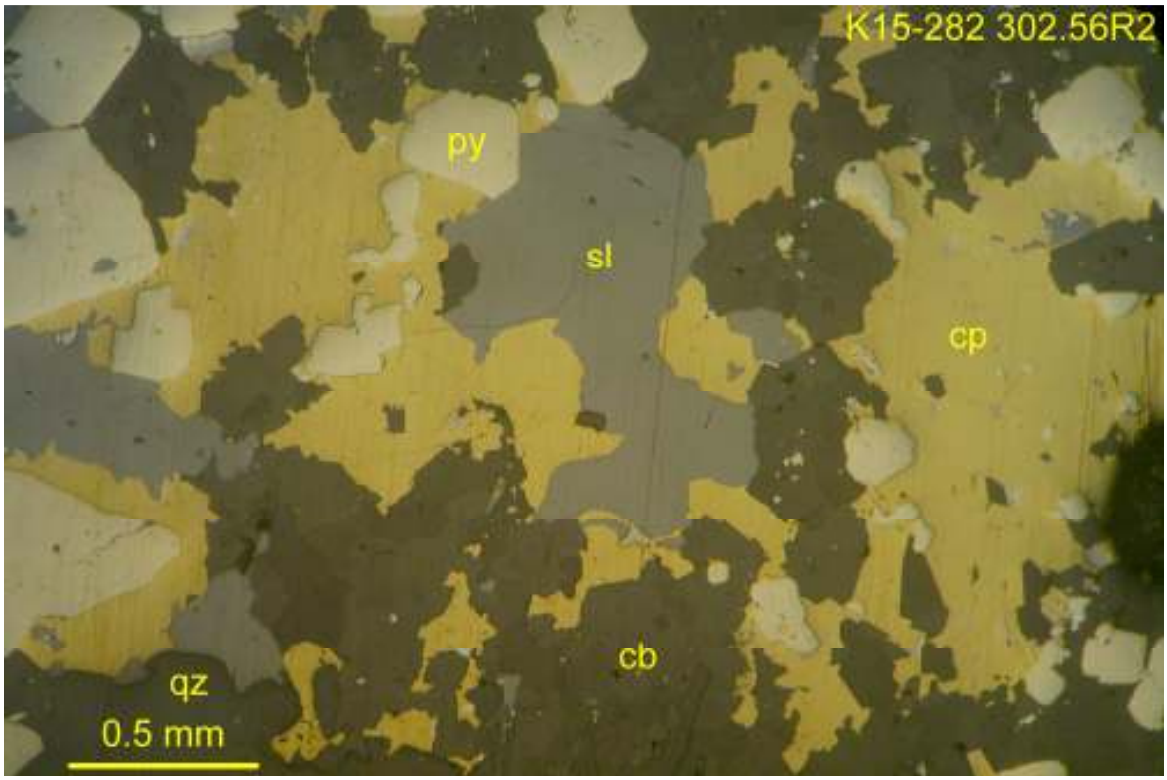
In summary, this is massive, vaguely banded fine-grained pyrite-sphalerite-minor chalcopyrite –galena-pyrrhotite-arsenopyrite with carbonate-sericite-minor quartz gangue, cut by bands/veins of coarser carbonate locally with significant chalcopyrite, sphalerite, galena, pyrrhotite; trace sulfosalts (unidentified, tetrahedrite?) are rare in galena. Late carbonate veins are associated with fracturing.



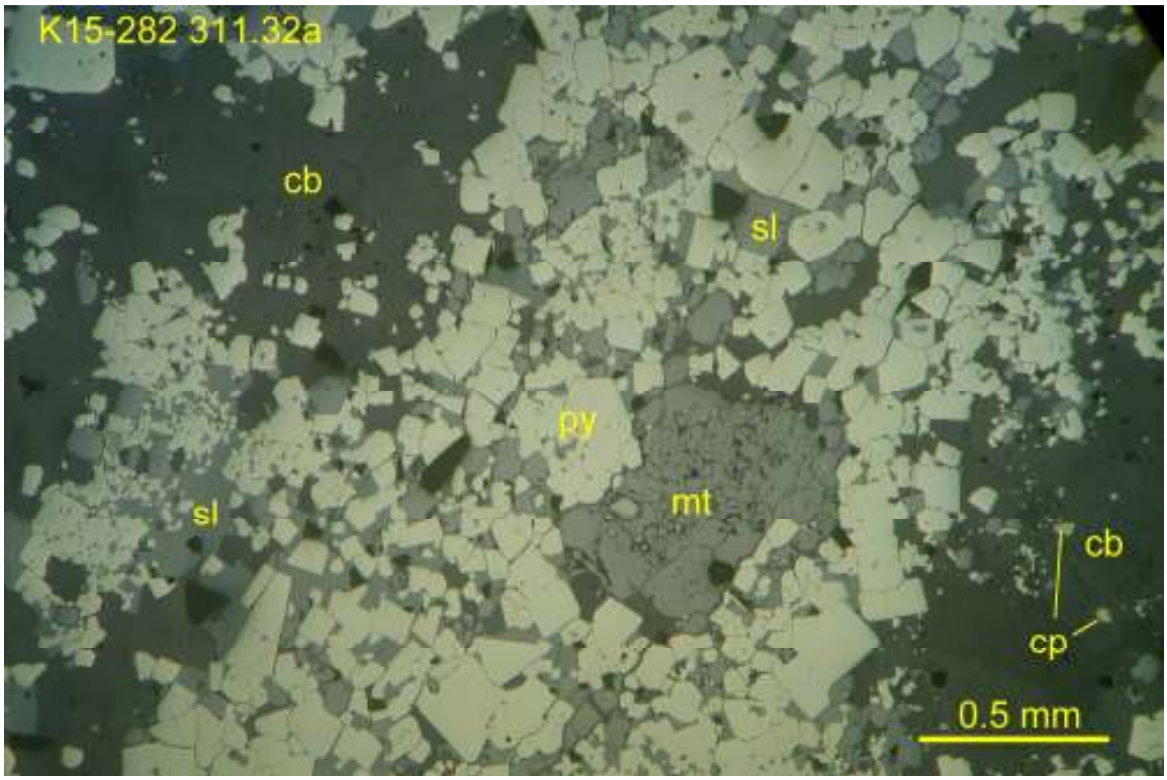
K15-282 302.56-302.69: carbonate gangue containing minor quartz (qz) and pale green chlorite (ch) or chloritized biotite (ch/bi). Sulfides are mostly euhedral pyrite (py) or red-brown sphalerite (sl). Transmitted plane light, field of view ~3 mm wide.



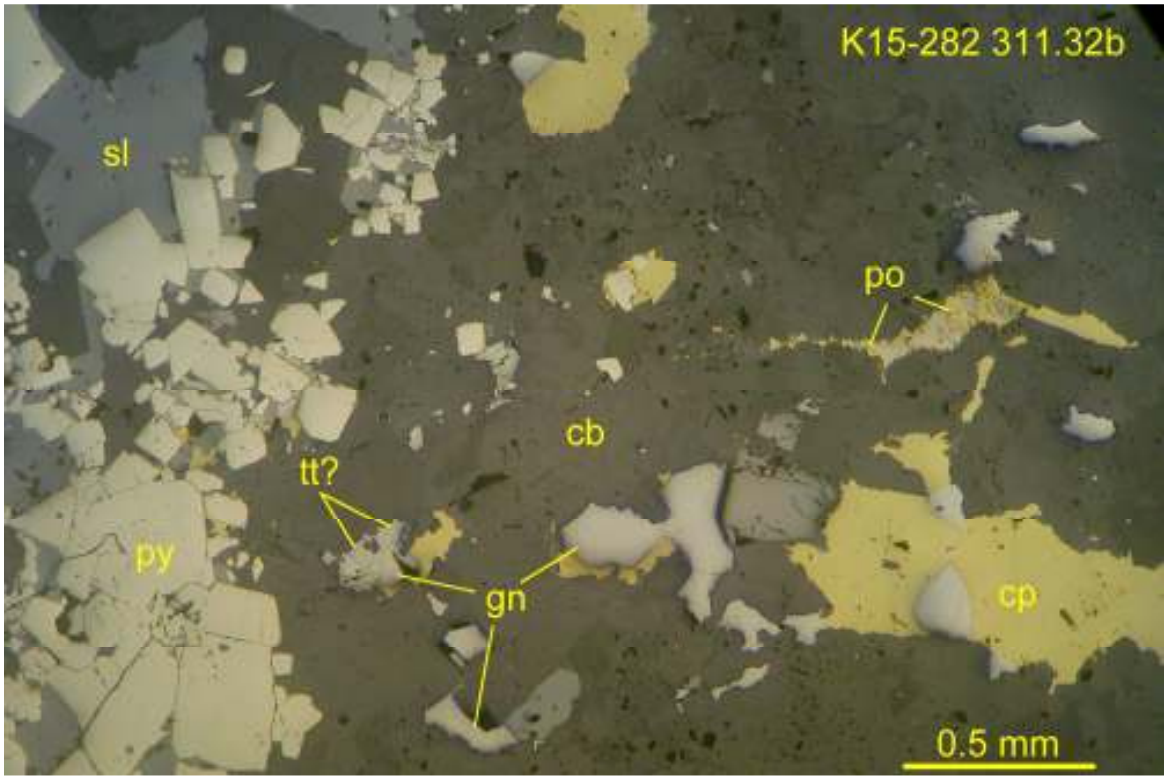
K15-282 302.56-302.69R: typical sphalerite (sl)-galena (gn) rich band with euhedral pyrite (some of which contain minute inclusions of sphalerite or galena). One crystal of sulfosalt (sfsx) is intergrown with and almost impossible to distinguish from host galena. Reflected light, uncrossed polars, field of view ~3 mm wide.



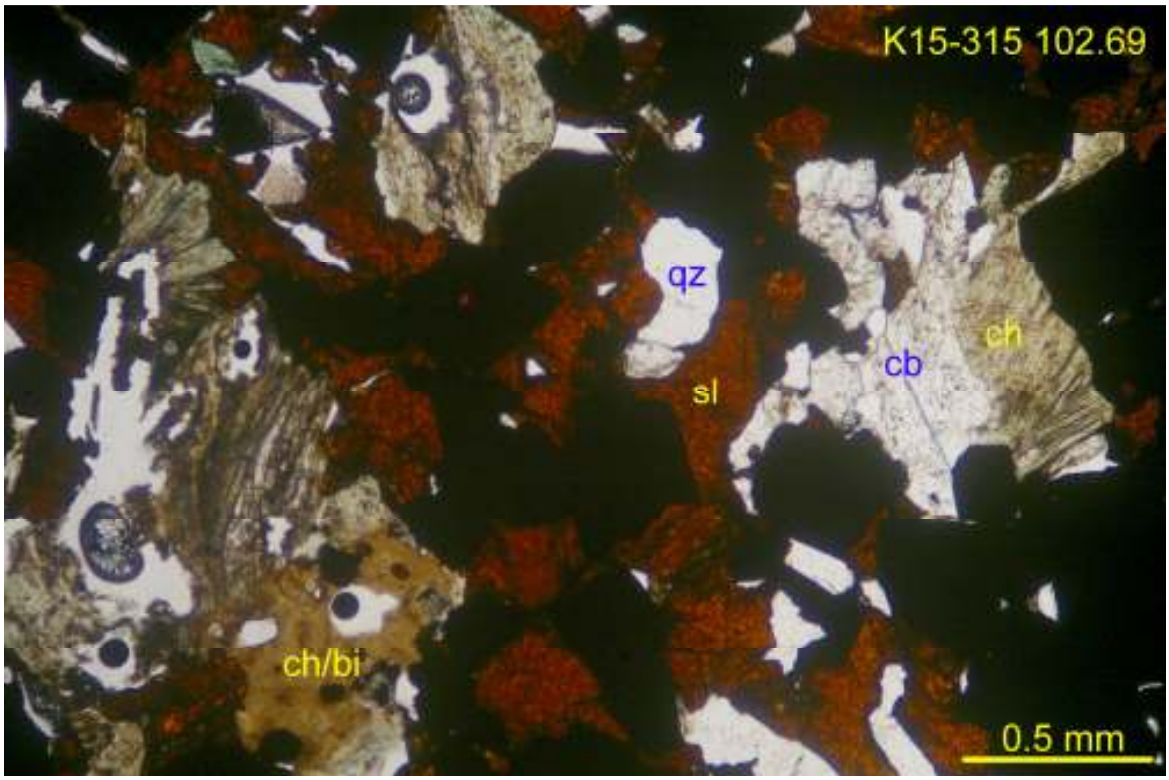
K15-282 302.56-302.69R2: typical intergrowth of chalcopyrite (cp) with sphalerite and euhedral pyrite; galena is rare. Gangues are mostly carbonate (cb) but carbonate is locally intergrown with larger, irregular crystals of quartz (qz). Reflected light, uncrossed polars, field of view ~3 mm wide.



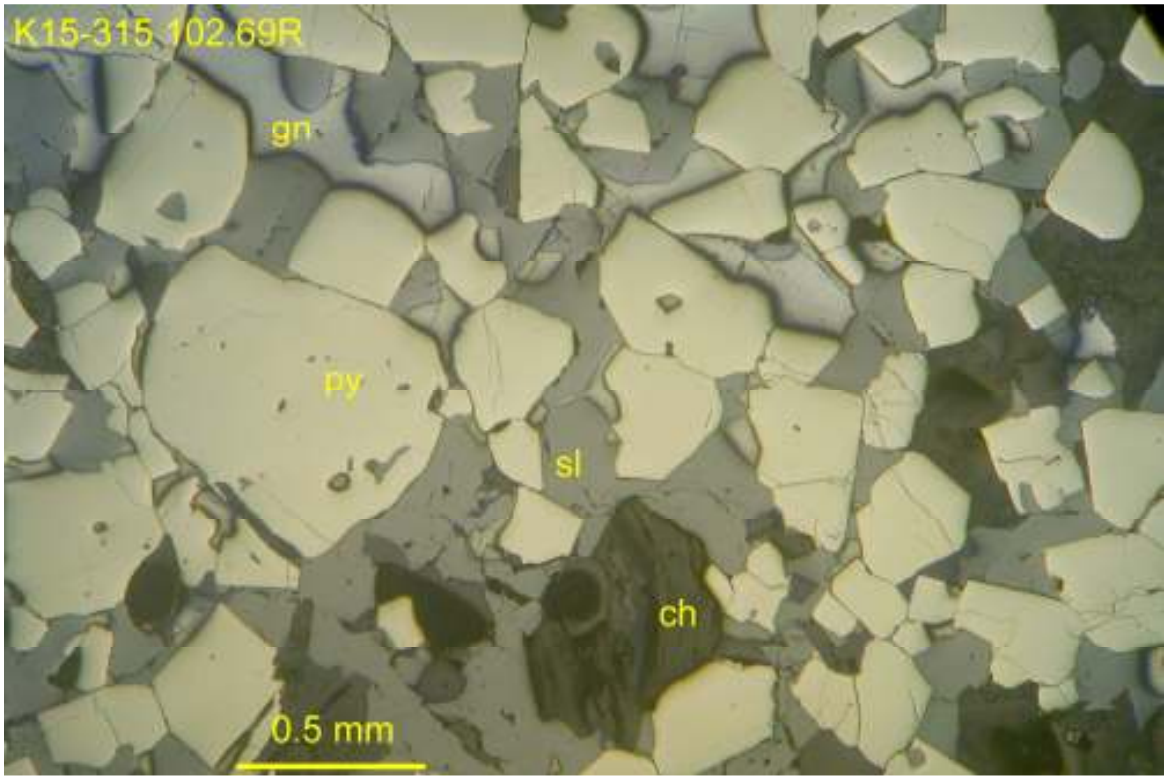
K15-282 311.32-311.45a: typical massive sulfides composed of euhedral pyrite, lesser sphalerite (difficult to distinguish from local magnetite, mt, forming subhedral blastic aggregates) and trace galena (interstitial to pyritel, or as inclusions in magnetite). Chalcopyrite occurs only in carbonate gangue. Reflected light, uncrossed polars, field of view ~3 mm wide.



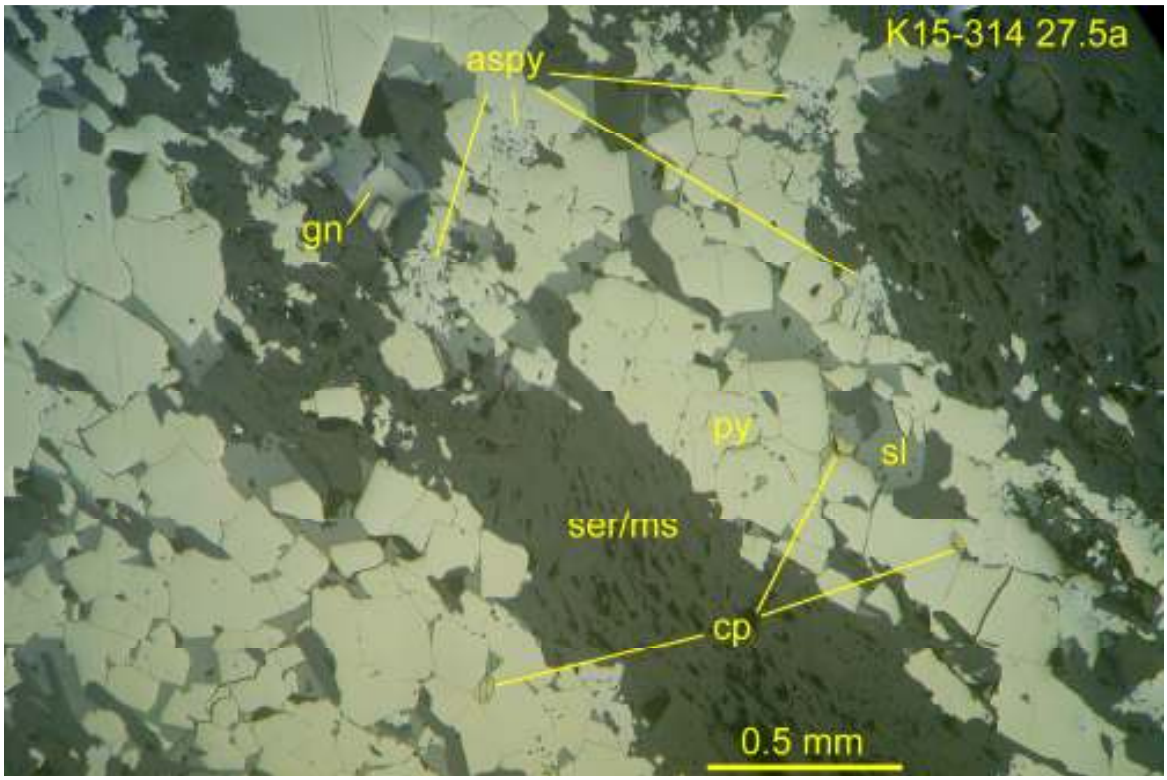
K15-282 311.32-311.45b: margin of central band/vein of coarser carbonate with significant chalcopyrite (containing local pyrrhotite, po), sphalerite (intergrown with cubic pyrite along the margin; difficult to distinguish from euhedral magnetite) and galena (rarely containing inclusions of grey isotropic sulfosalt, possibly tetrahedrite, tt?). Reflected light, uncrossed polars, field of view ~3 mm wide.



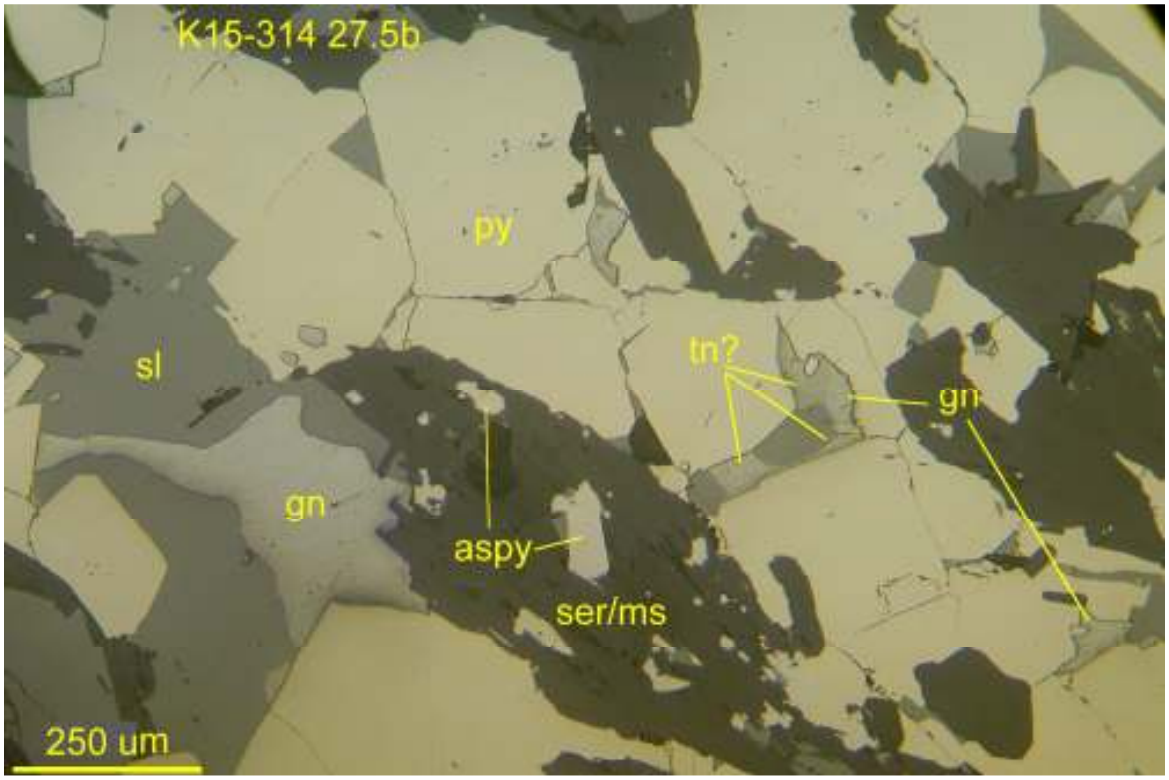
K15-315 102.69-102.79: gangue assemblage of carbonate (likely mainly calcite), pale green chlorite/green biotite (locally in patches that may represent pseudomorphs of some other former mafic mineral) and quartz, hosting subequal proportions of orange-brown sphalerite and pyrite (opaque). Transmitted plane light, field of view~3 mm wide.



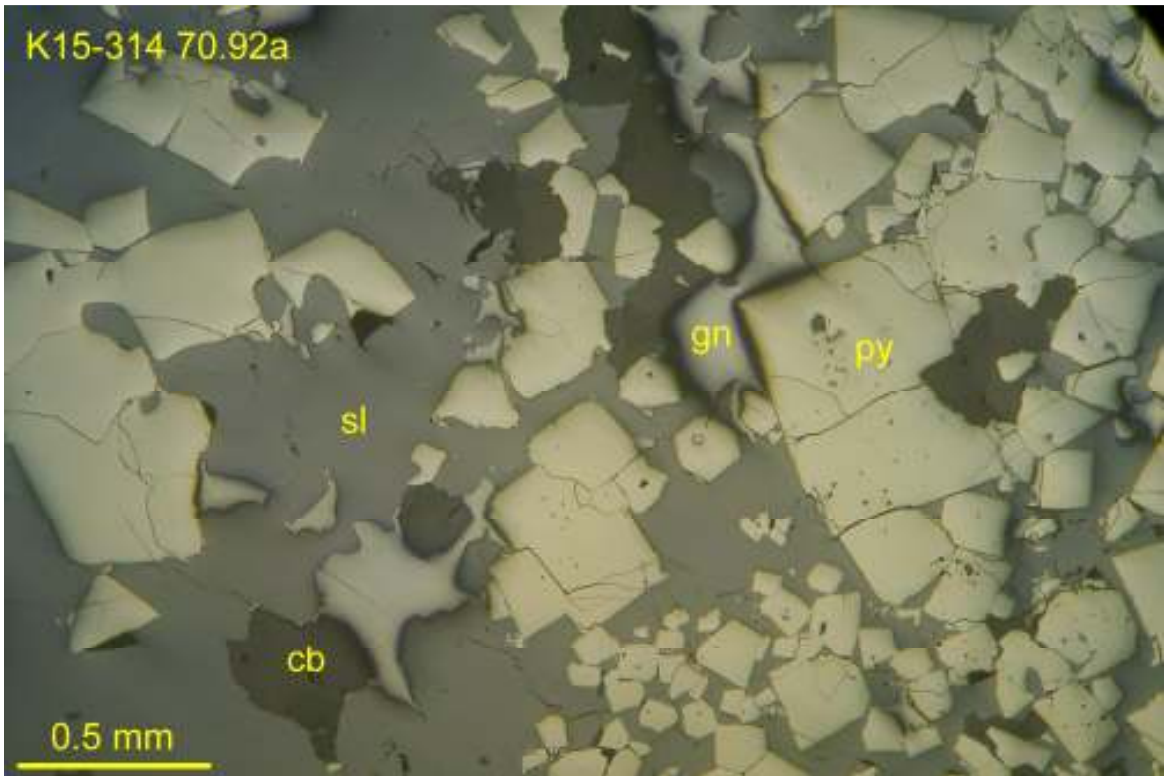
K15-315 102.6-102.79R: almost same area to show cubic pyrite in matrix of subhedral sphalerite and minor interstitial, anhedral galena. Reflected light, uncrossed polars, field of view ~3 mm wide.



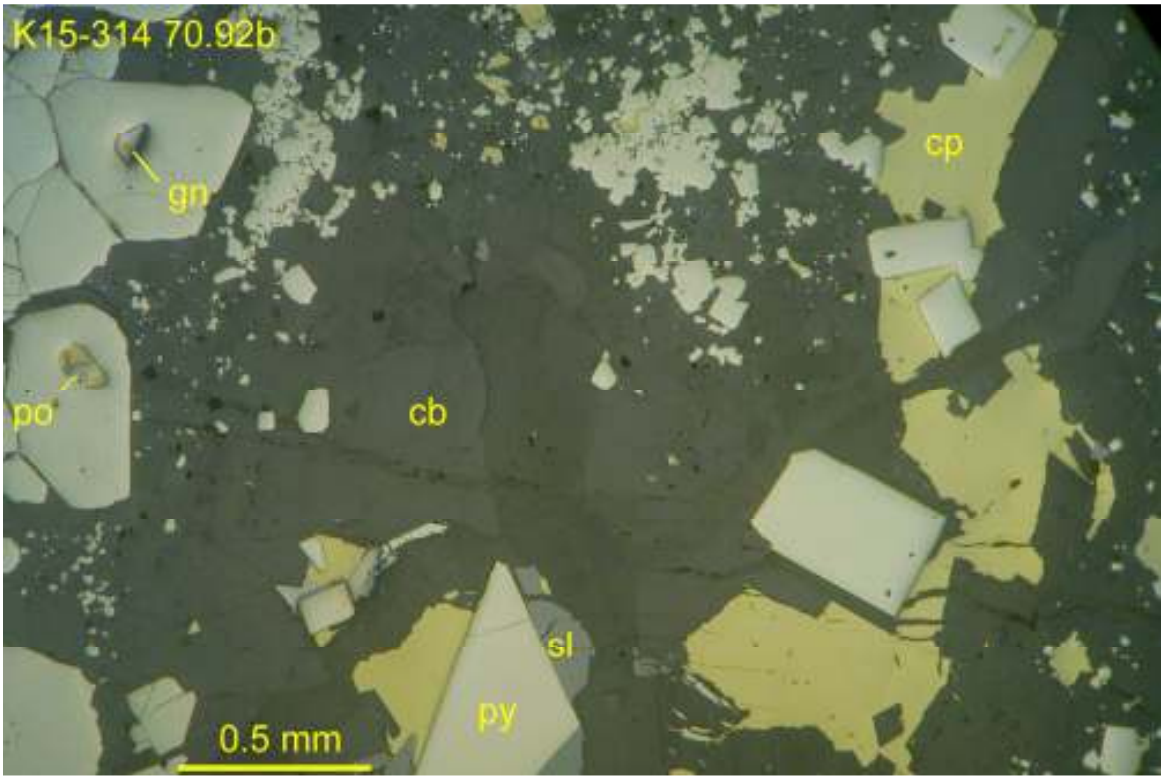
K15-314 27.5-27.63a: alternating bands/laminae of pyrite-minor arsenopyrite (aspy, difficult to distinguish from pyrite)-sphalerite-galena-rare chalcopyrite, or sericite/muscovite (dark grey, flakes somewhat aligned to impart a weak foliation parallel to banding/laminae). Reflected light, uncrossed polars, field of view ~3 mm wide.



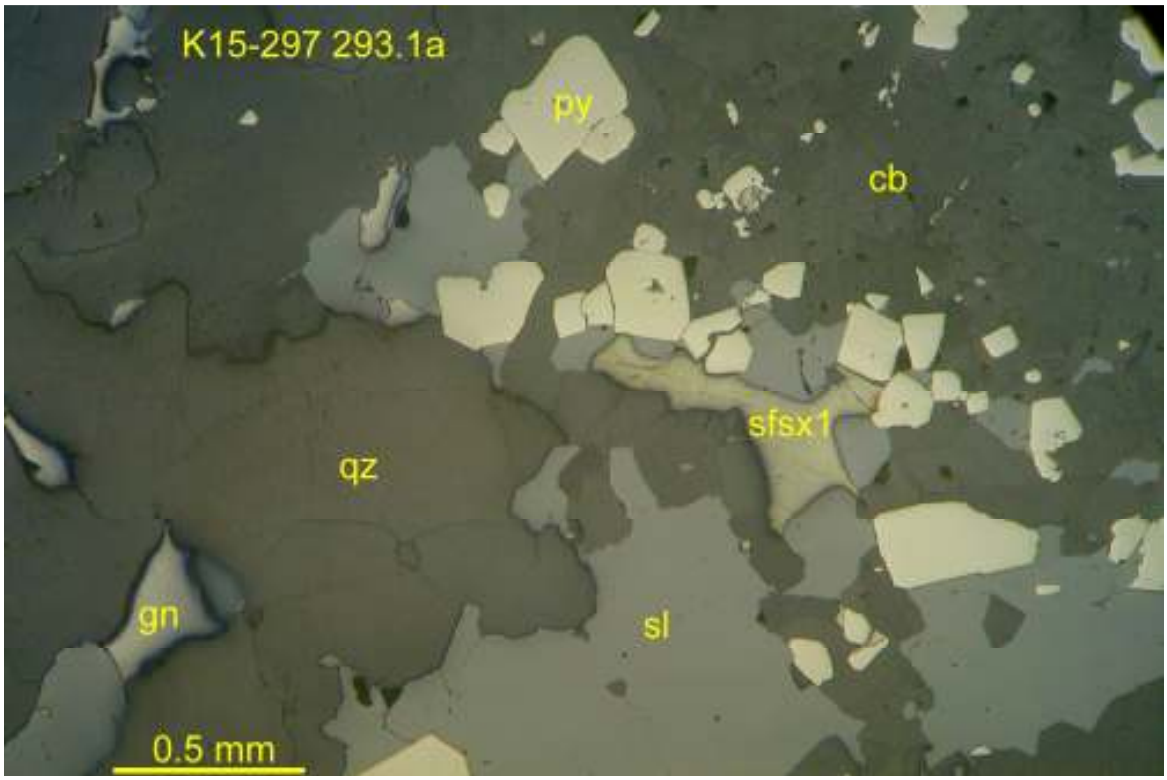
K15-314 27.5-27.63b: detailed view to show subhedral grey sulfosalt (tennantite, tn?) intergrown with galena, sphalerite and trace chalcopyrite, interstitial to pyrite (note minor arsenopyrite at margins of pyrite, near and within sericite gangues). Reflected light, uncrossed polars, field of view ~1.5 mm wide.



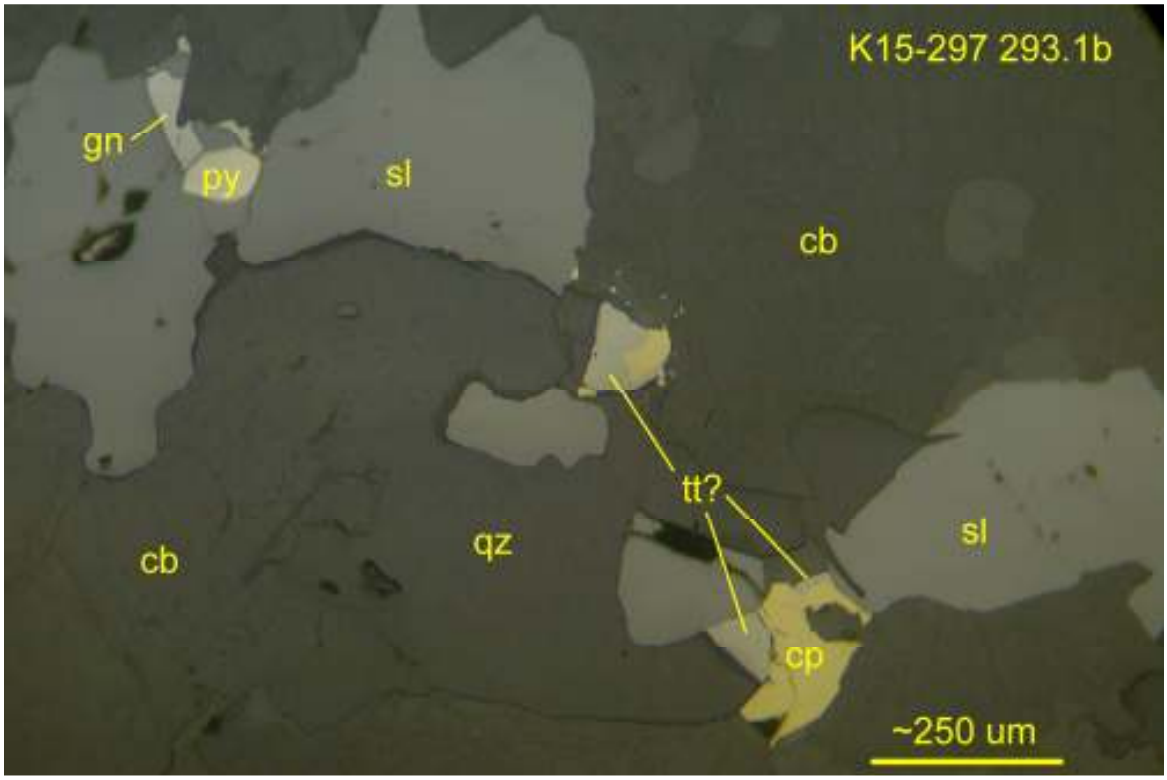
K15-314 70.92-71a: boundary between sphalerite-lesser pyrite-minor galena rich band (on left) and pyrite-lesser sphalerite-trace galena rich band, in crudely banded massive sulfides. Gangue (dark grey) is entirely carbonate, possibly mostly dolomite. Reflected light, uncrossed polars, field of view ~3 mm wide.



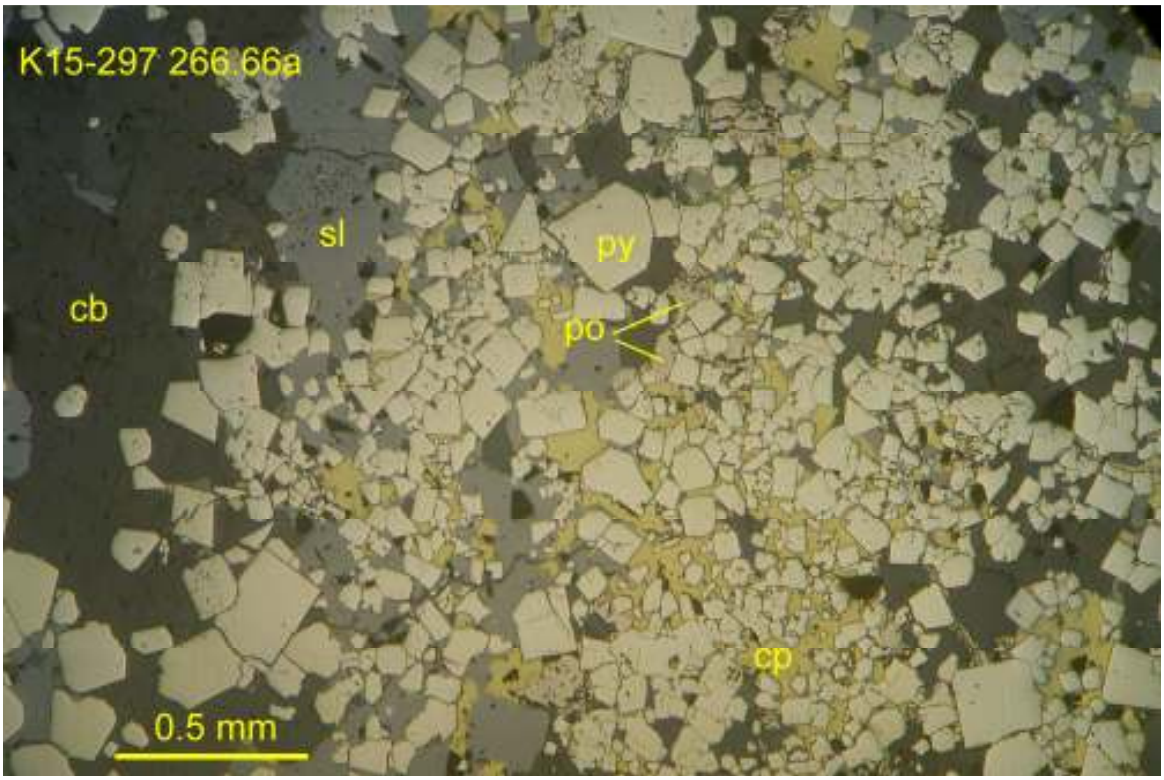
K15-314 70.92-71b: view across coarser-grained band/vein of carbonate containing significant chalcopyrite and sphalerite but lesser pyrite; note inclusions of galena and chalcopyrite (the latter containing minor pyrrhotite) in pyrite at margin of band/vein. Reflected light, uncrossed polars, field of view ~3 mm wide.



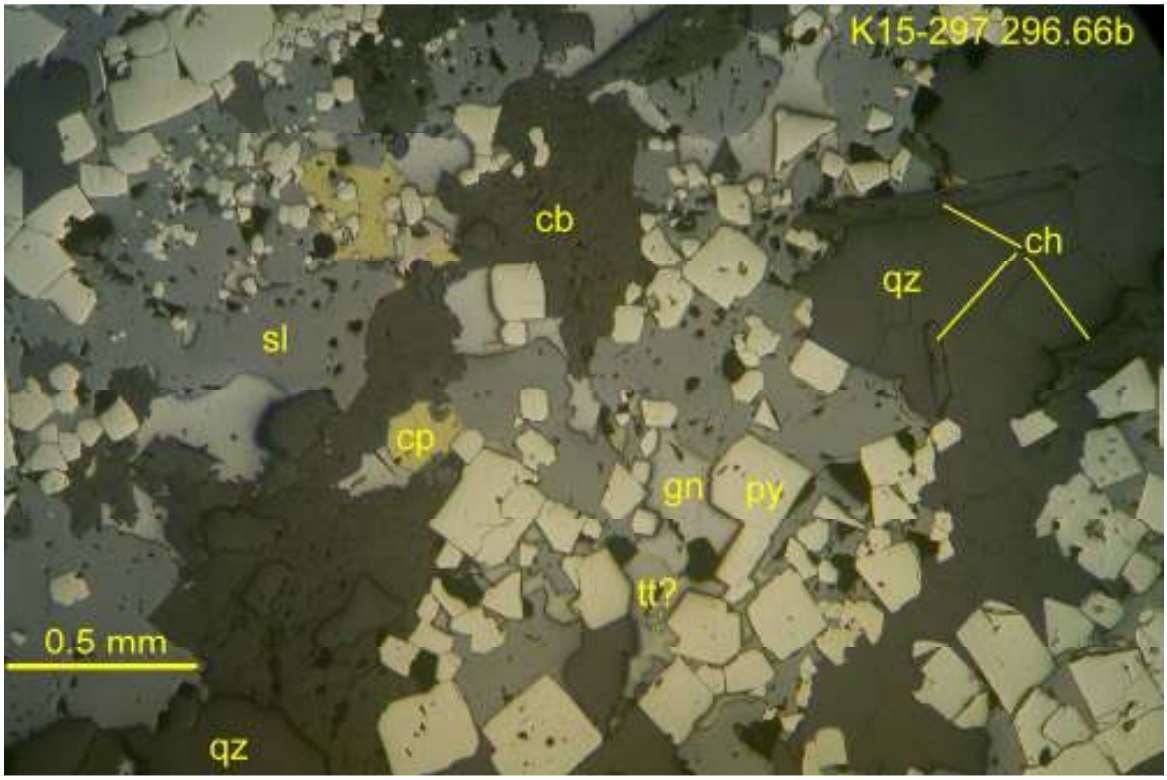
K15-297 293.1-293.22a: overview of coarse carbonate-rich band containing sphalerite, pyrite, minor galena and local sulfosalt 1 (slightly darker, with olive tint compared to galena) in gangues of carbonate and significant quartz. Reflected light, uncrossed polars, field of view ~3 mm wide.



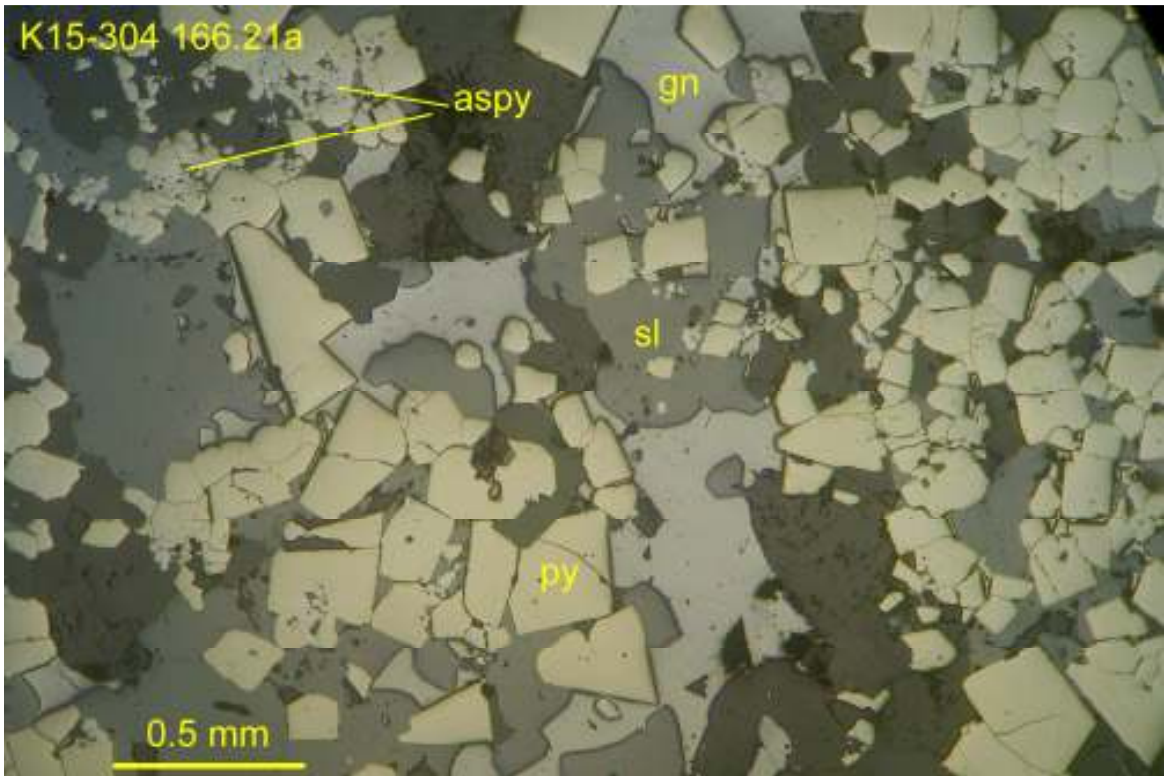
K15-297 293.1-293.22b: detailed view to show grey, apparently isotropic sulfosalt 2 (possibly tetrahedrite?) intergrown with chalcopyrite associated with sphalerite, minor galena and pyrite, also closely associated with quartz in otherwise carbonate-rich gangue. Reflected light, uncrossed polars, field of view ~1.5 mm wide.



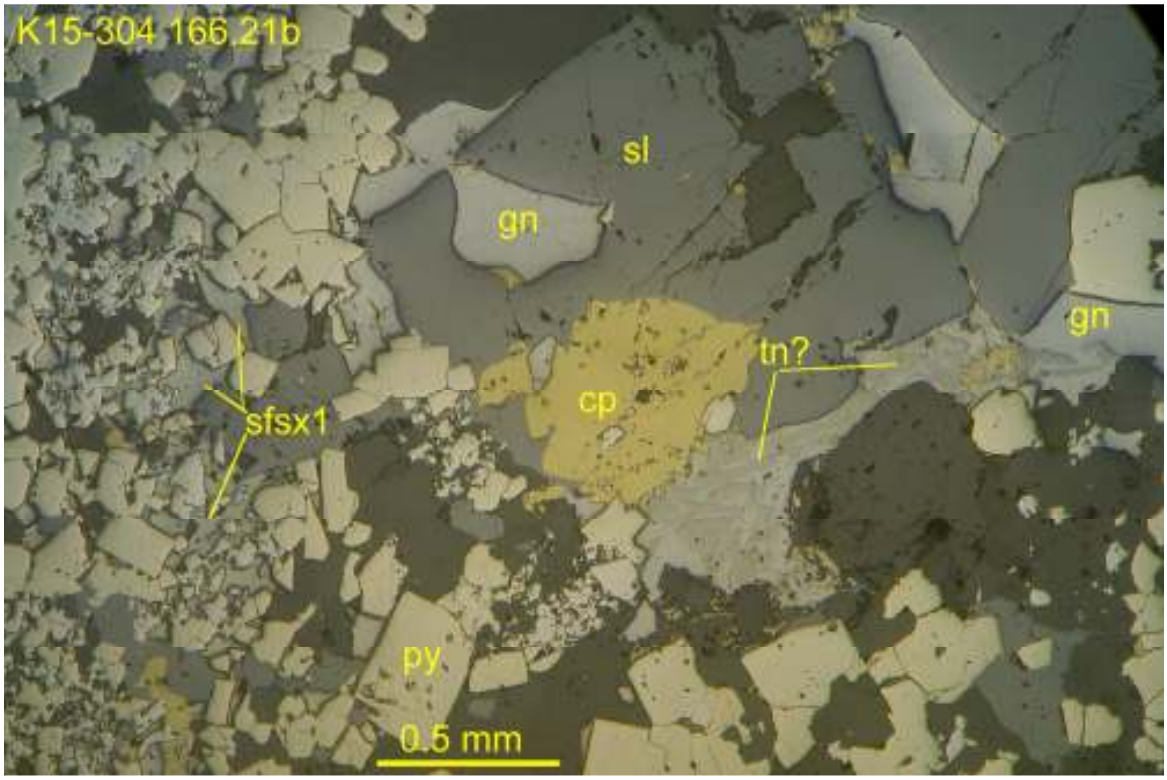
K15-297 296.66-296.8a: alternating pyrite-chalcopyrite or pyrite-sphalerite rich bands with gangue-rich (mainly carbonate) bands in fine-grained massive sulfides. Note minor pyrrhotite associated with chalcopyrite. Reflected light, uncrossed polars, field of view ~3 mm wide.



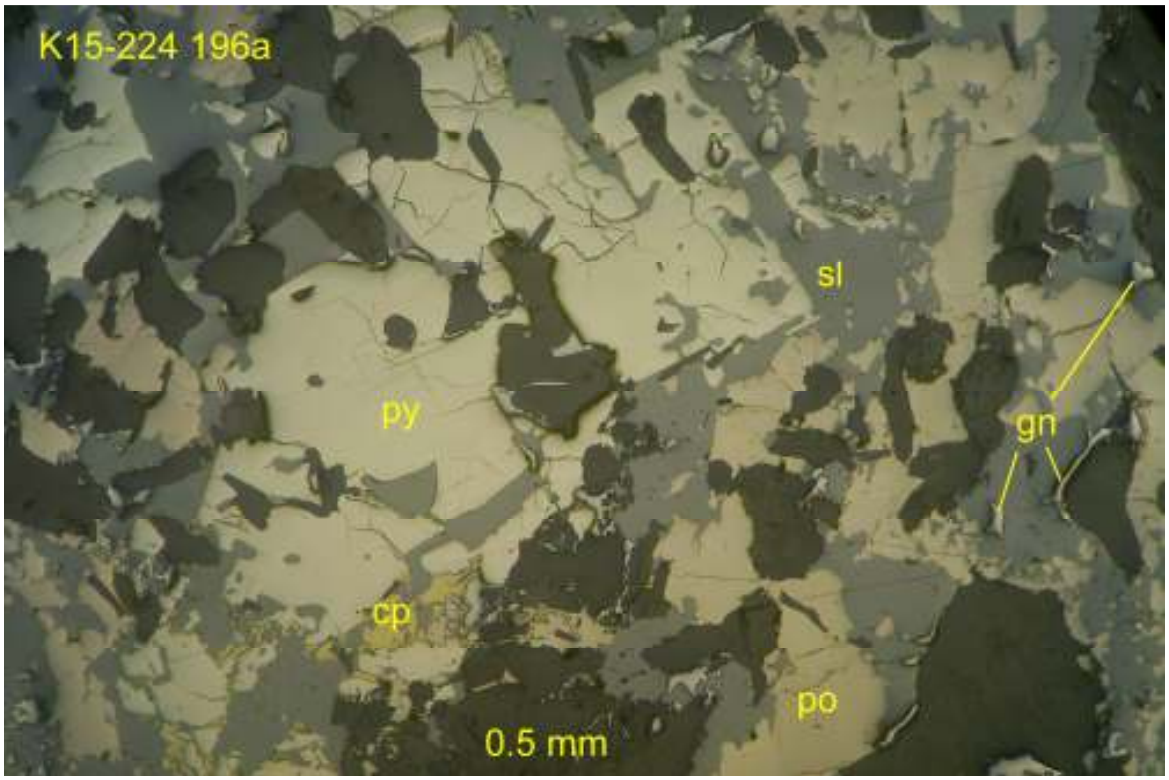
K15-297 296.66-296.8b: margin of possibly remobilized band with coarser chalcopyrite (±minor pyrrhotite), sphalerite, and galena (locally containing minor grey sulfosalt, possibly tetrahedrite, tt?), associated with coarser quartz, carbonate, and minor chlorite (ch) as euhedral flakes. Reflected light, uncrossed polars, field of view ~3 mm wide.



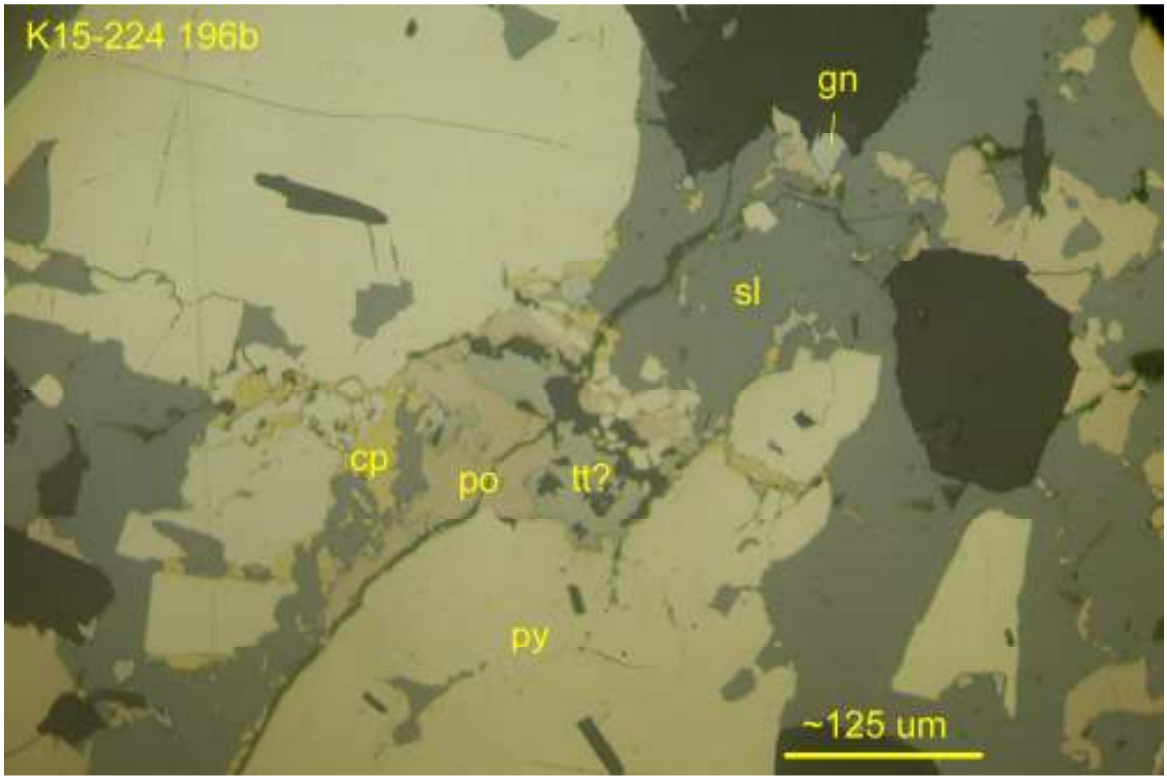
K15-304 166.21-166.33a: overview of massive sulfides showing crudely defined alternating pyrite (±fine-grained arsenopyrite), sphalerite-galena rich or carbonate-barite (?) bands. Reflected light, uncrossed polars, field of view ~3 mm wide.



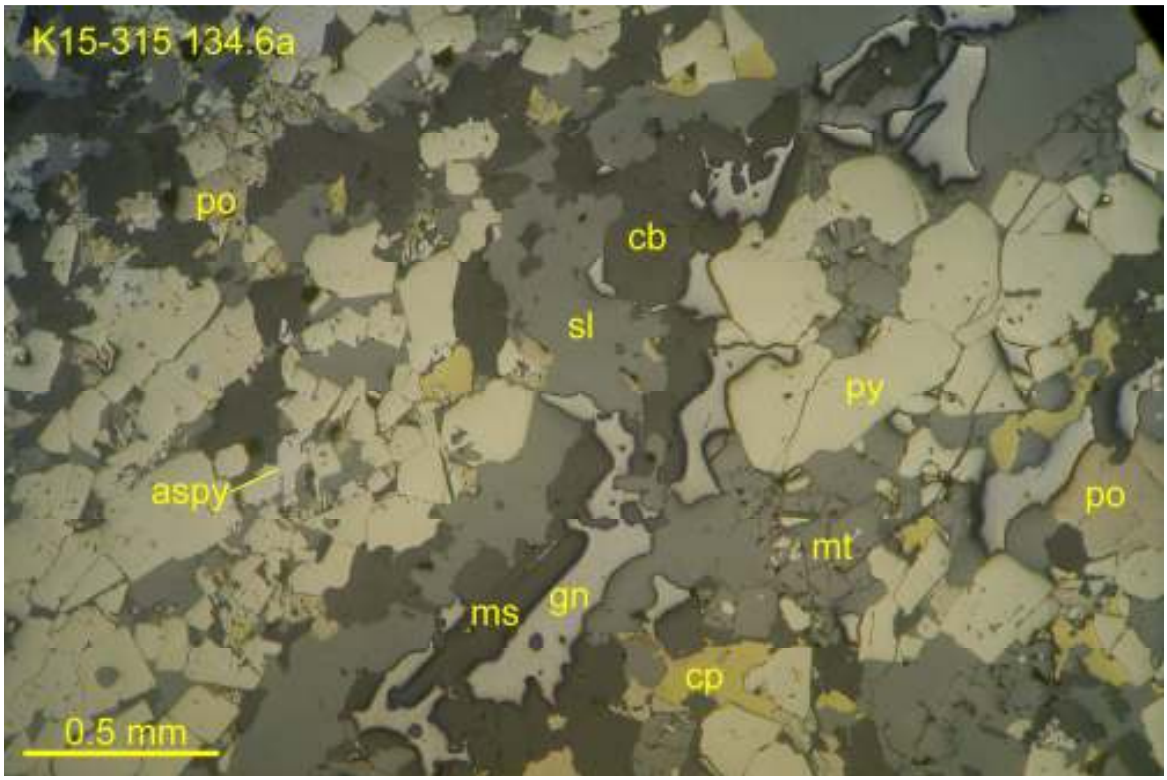
K15-304 166.21-166.33b: overview of coarser, possibly remobilized, chalcopyrite-sphalerite-galena band with sulfosalt 1 (Pb-Sb-As?) separate but difficult to distinguish from galena, and sulfosalt 2 (tennantite, tn?) as symplectic intergrowth within galena; gangues include carbonate and probable barite. Reflected light, uncrossed polars, field of view ~3 mm.



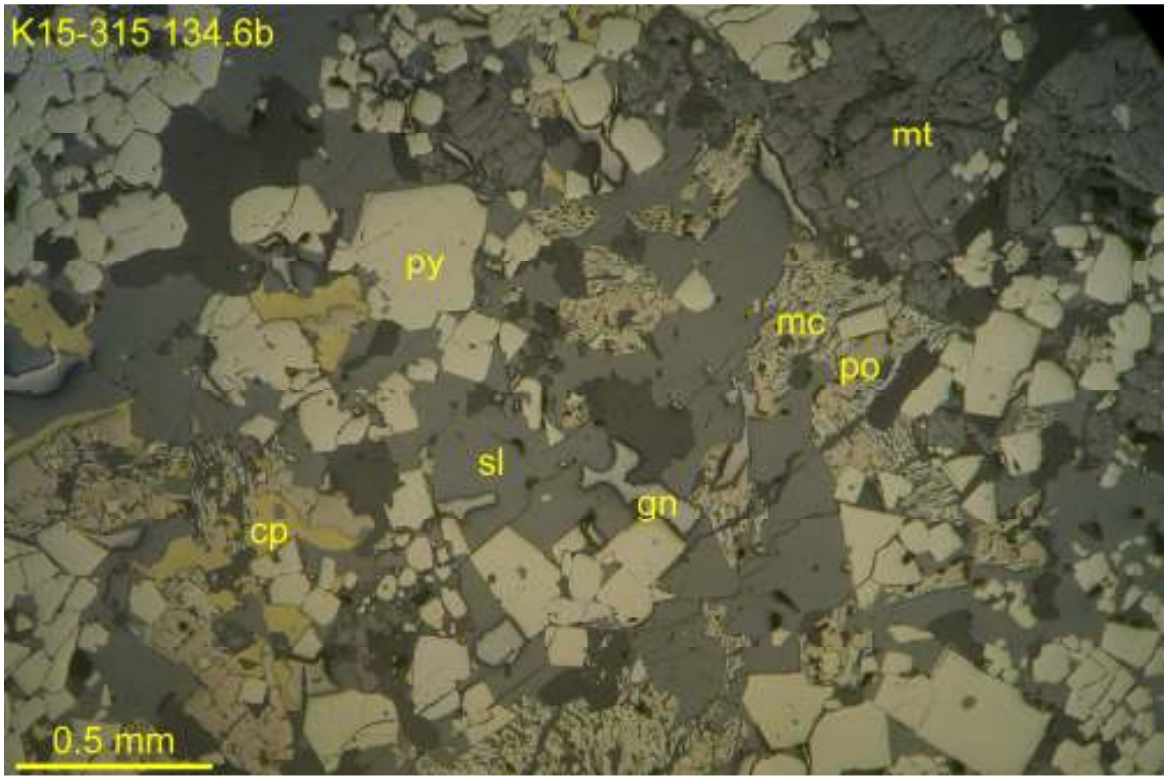
K15-224 196-199a: typical massive sulfides composed of subhedral, locally skeletal pyrite crystals in a weakly foliated matrix of intergrown pyrrhotite, sphalerite, lesser galena and relatively rare chalcopyrite; gangues are mainly sericite, biotite, quartz and local epidote. Reflected light, uncrossed polars, field of view ~3 mm wide.



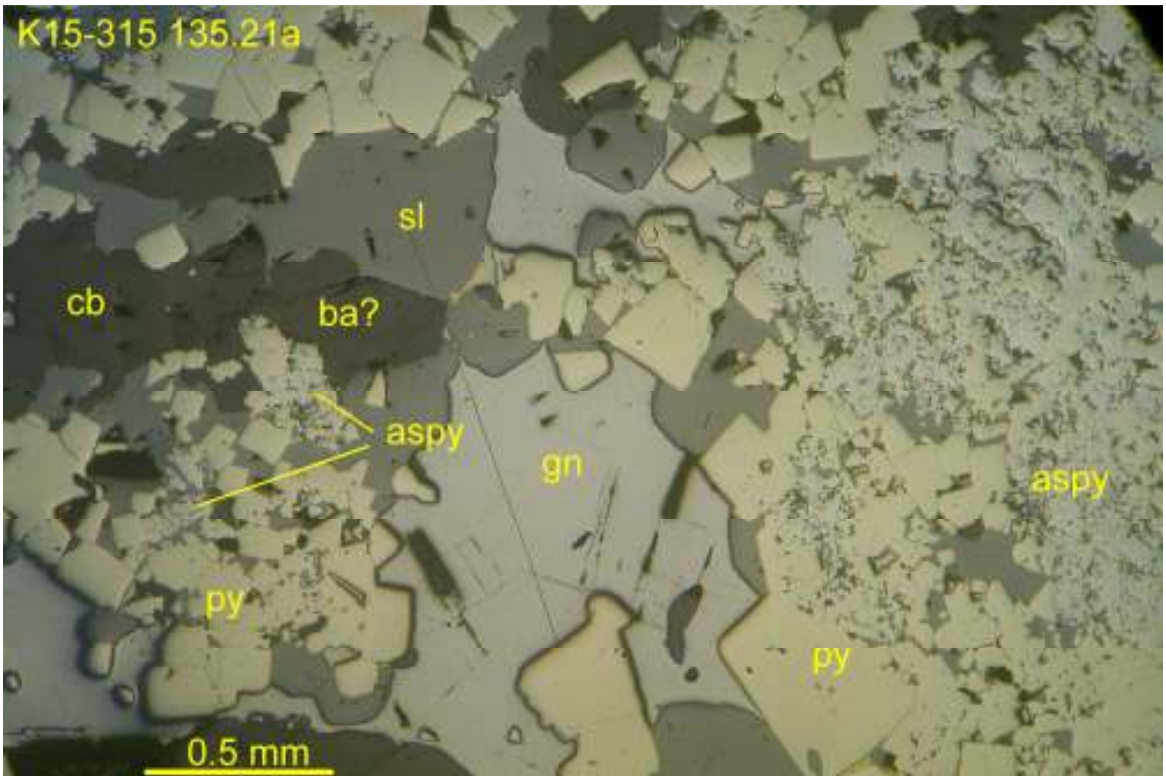
K15-224 196-199b: very detailed view to show fine-grained, grey, apparently isotropic sulfosalt (tetrahedrite, tt?) intergrown with pyrrhotite and chalcopyrite, in sphalerite matrix to pyrite crystals. Reflected light, uncrossed polars, field of view ~0.75 mm wide.



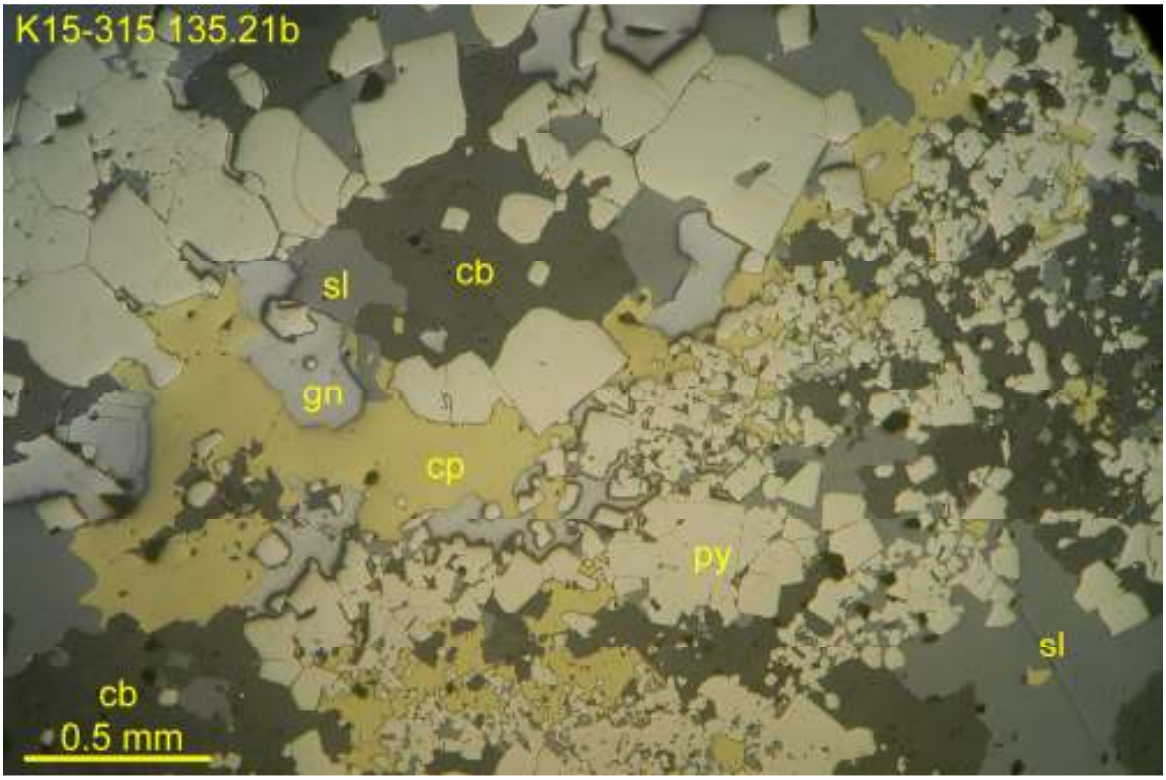
K15-315 134.6-134.71a: massive sulfides crudely segregated into bands of pyrite (partly replaced by arsenopyrite)-blastic magnetite-lesser pyrrhotite (partly replaced by very fine-grained marcasite) with variable sphalerite-lesser galena-local chalcopyrite matrix; gangues are carbonate and local muscovite. Reflected light, uncrossed polars, field of view ~3 mm.



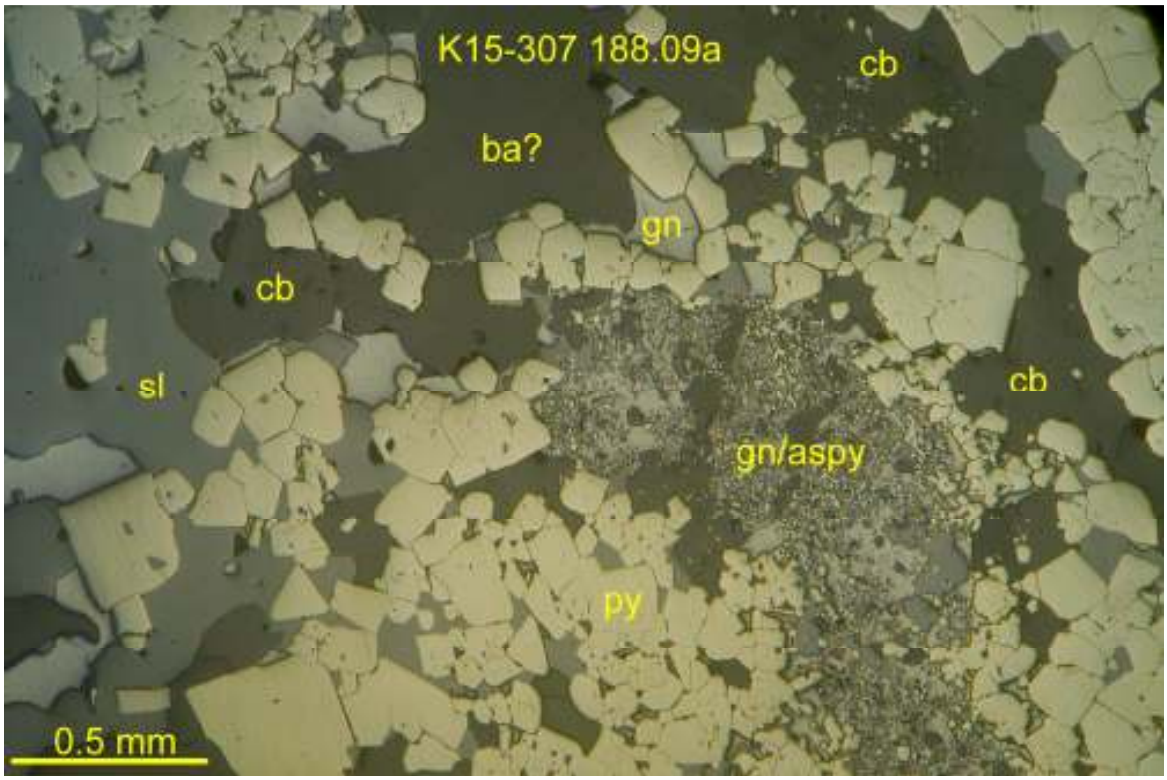
K15-315 134.6-134.71b: lamellar textured marcasite locally pseudomorphing pyrrhotite, intergrown with pyrite, blastic magnetite, in matrix of sphalerite, minor chalcopyrite and galena; gangue is mostly carbonate, local muscovite. Reflected light, uncrossed polars, field of view ~3 mm wide.



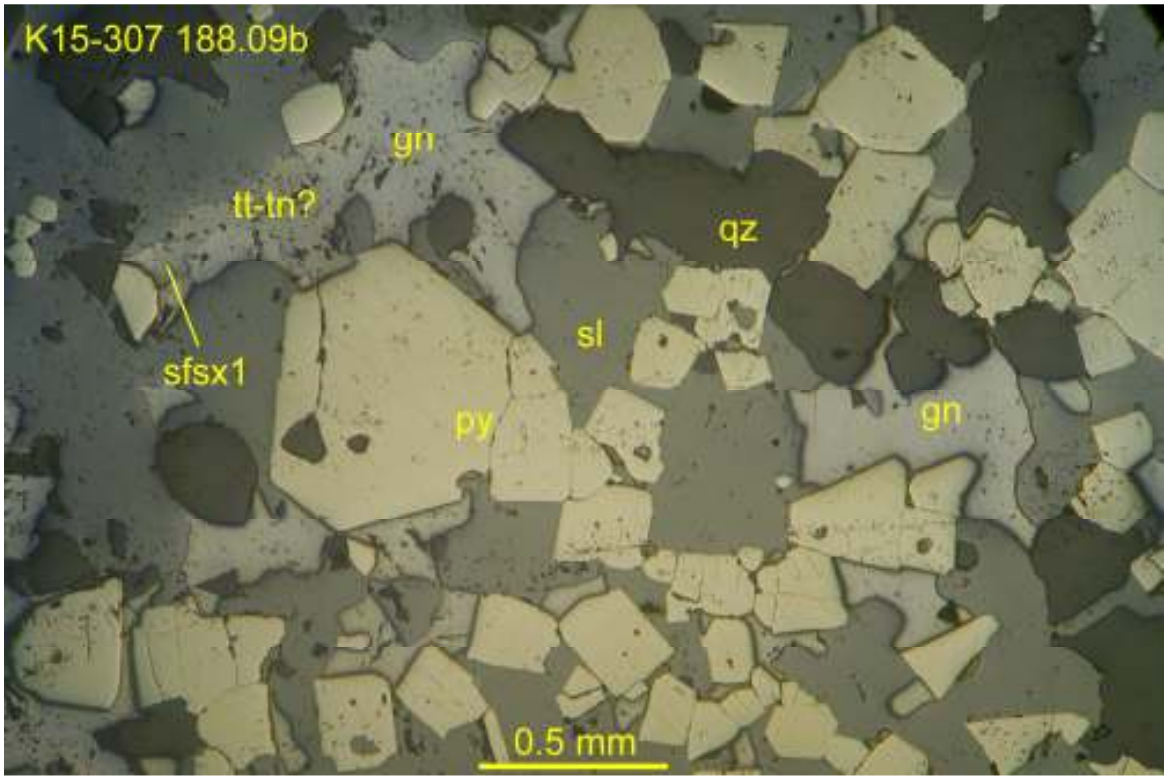
K15-315 135.21-135.3a: view along east-west, Pb-Zn rich band composed of sphalerite, galena, pyrite (the latter locally partly replaced by swarms of fine arsenopyrite crystals and with myriads of galena inclusions), associated with gangues of barite (ba?) and carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



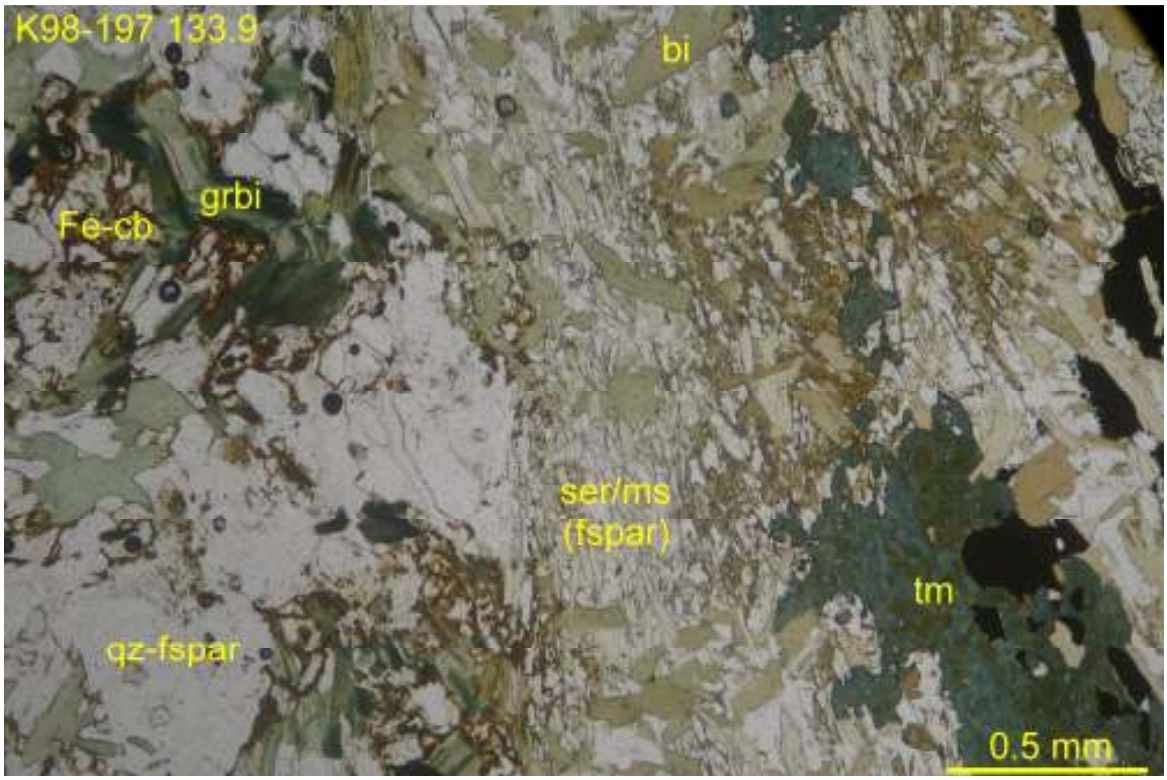
K15-315 135.21-135.3b: crudely banded, coarse pyrite-sphalerite-galena or chalcopyrite-fine pyrite rich massive sulfides; gangues are mostly carbonate in this exposure. Minute, trace sulfosalt (tennantite?) occurs to the NE of this view, along strike. Reflected light, uncrossed polars, field of view ~3 mm wide.



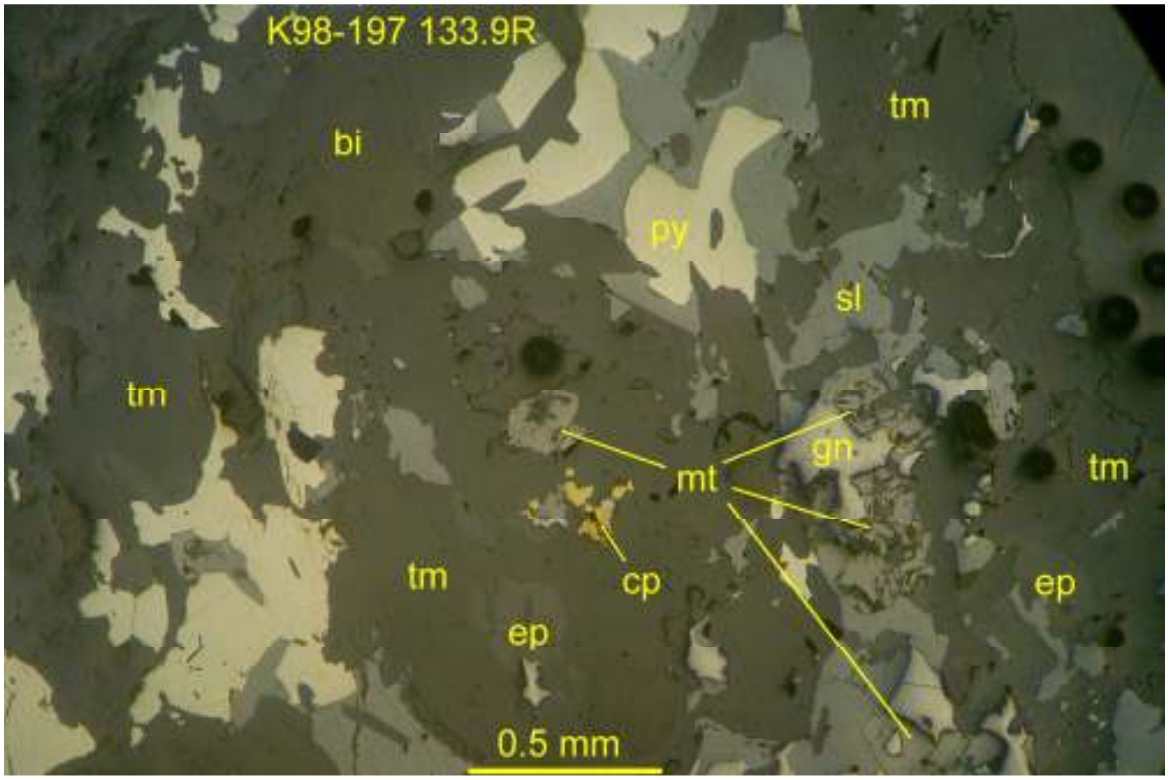
K15-307 188.09-188.19a: contact between fine-grained, pyrite-rich massive sulfide and coarser-grained, sphalerite-galena rich matrix massive sulfides; note patch of galena with minute arsenopyrite inclusions near/along contact, gangues of carbonate and probable barite (ba?). Reflected light, uncrossed polars, field of view ~3 mm wide.



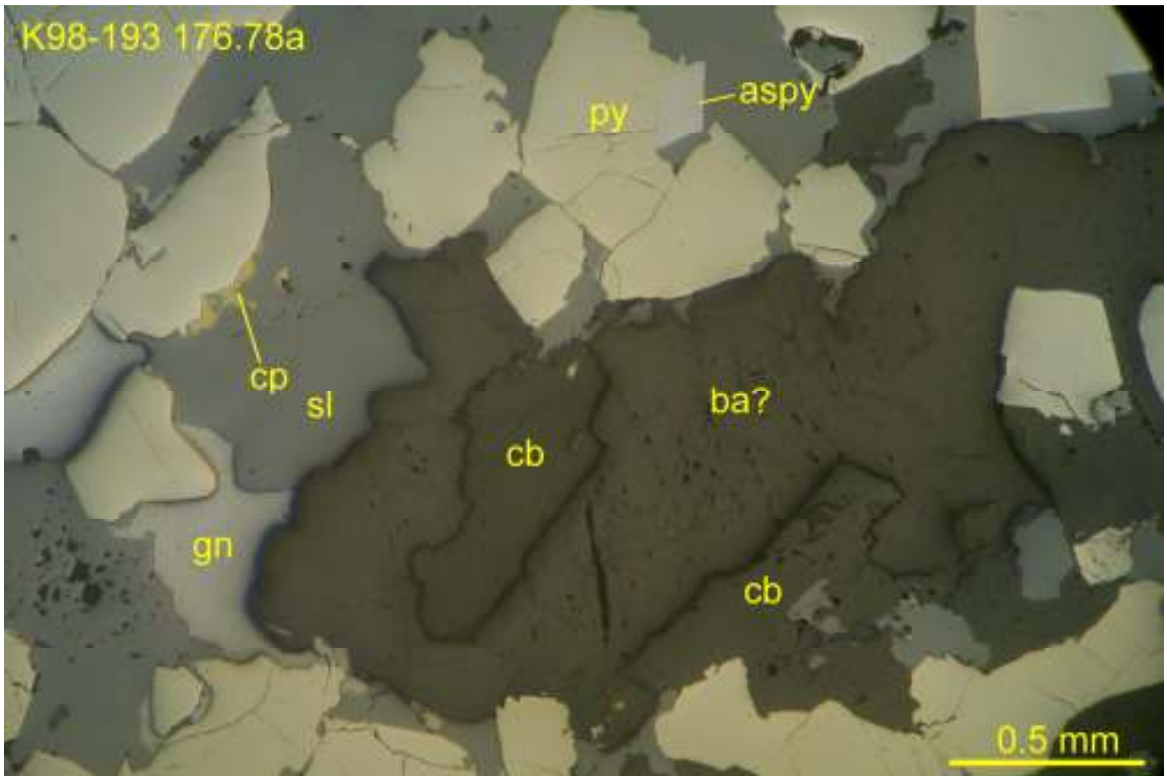
K15-307 188.09-188.19b: coarser-grained massive sulfides composed of sphalerite-galena rich matrix to pyrite crystals, gangue is quartz except carbonate-rich "augen" to N; note two sulfosalts included in galena (first is difficult to see, sfsx; second is grey, possible tennantite-tetrahedrite, tn-tt?) Reflected light, uncrossed polars, field of view ~3 mm wide.



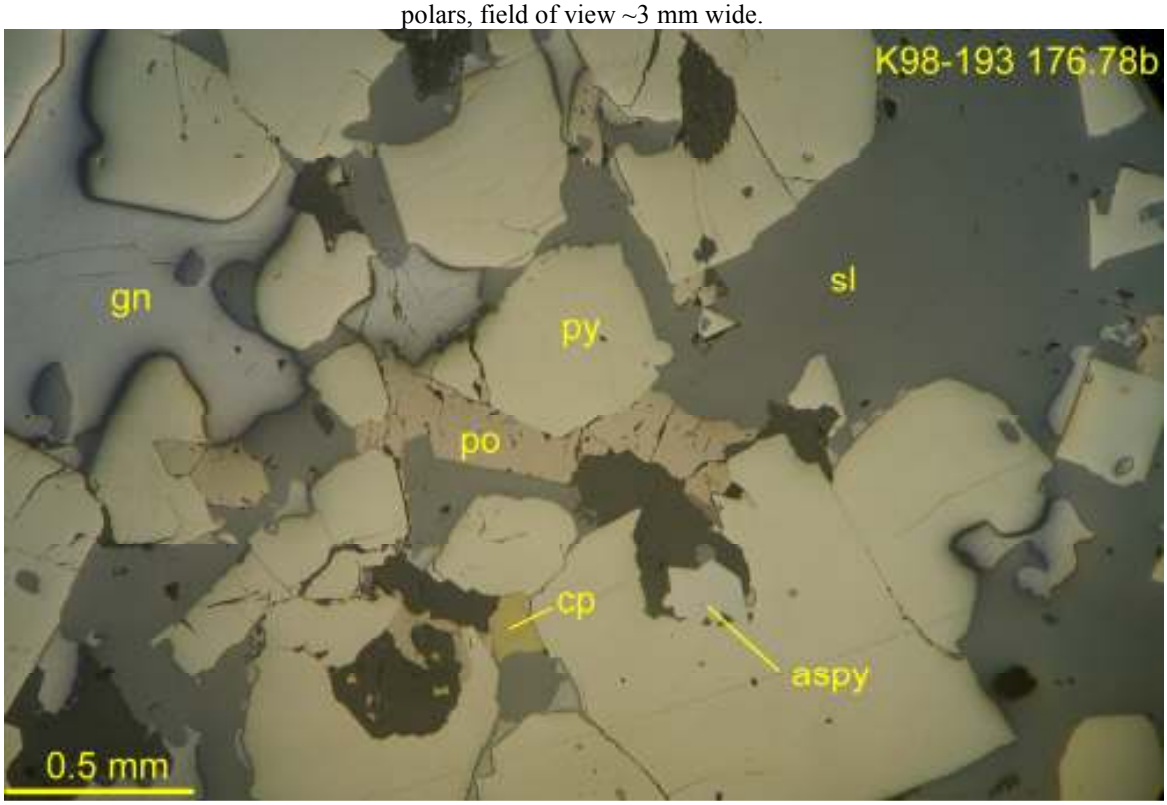
K98-197 133.9-134.08: boundary between quartz-feldspar-minor dark green biotite-local Fe-carbonate (?) and muscovite-pale greenish brown biotite-local dark green (schorlitic) tourmaline bands in weakly foliated, possible meta-volcanic rock. Transmitted plane light, field of view ~3 mm wide.



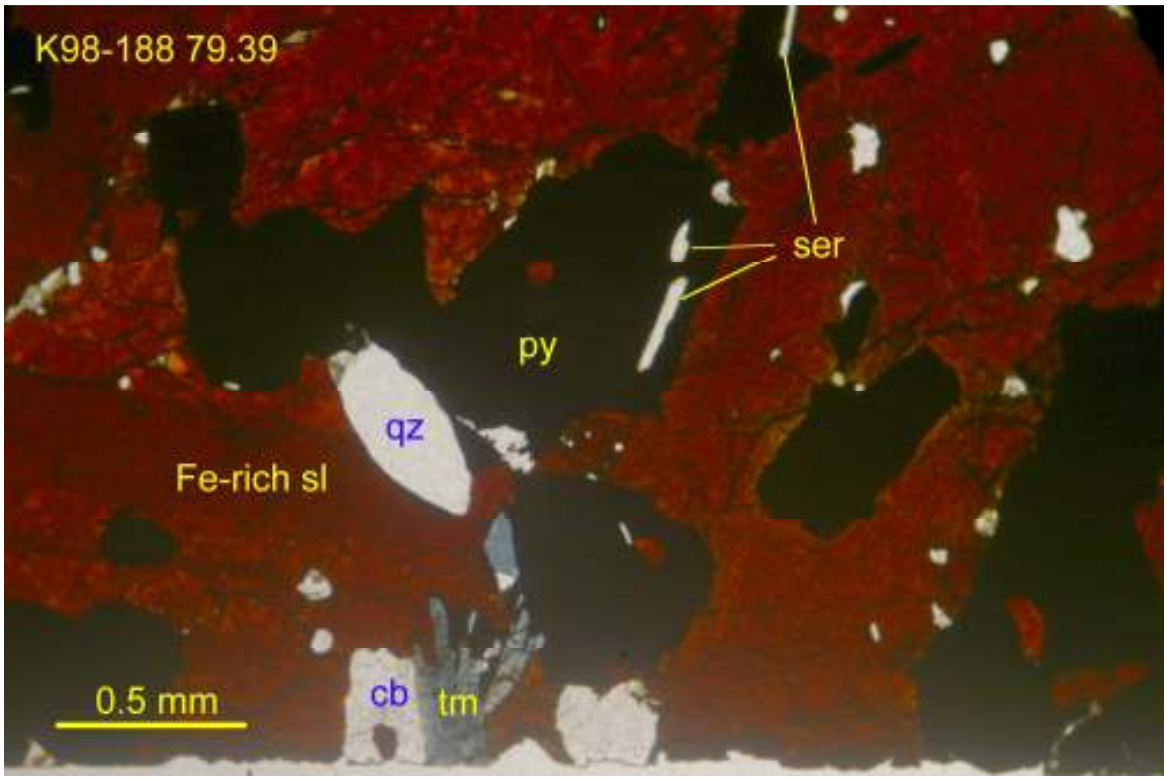
K98-197 133.9-134.08R: poorly defined sulfide band composed of pyrite (coarse, subhedral, or finer, possibly after pyrrhotite?), lesser sphalerite, galena, minor blastic magnetite and trace chalcopyrite, the latter closely associated with rounded blastic tourmaline (tm) aggregate. Reflected light, uncrossed polars, field of view ~3 mm wide.



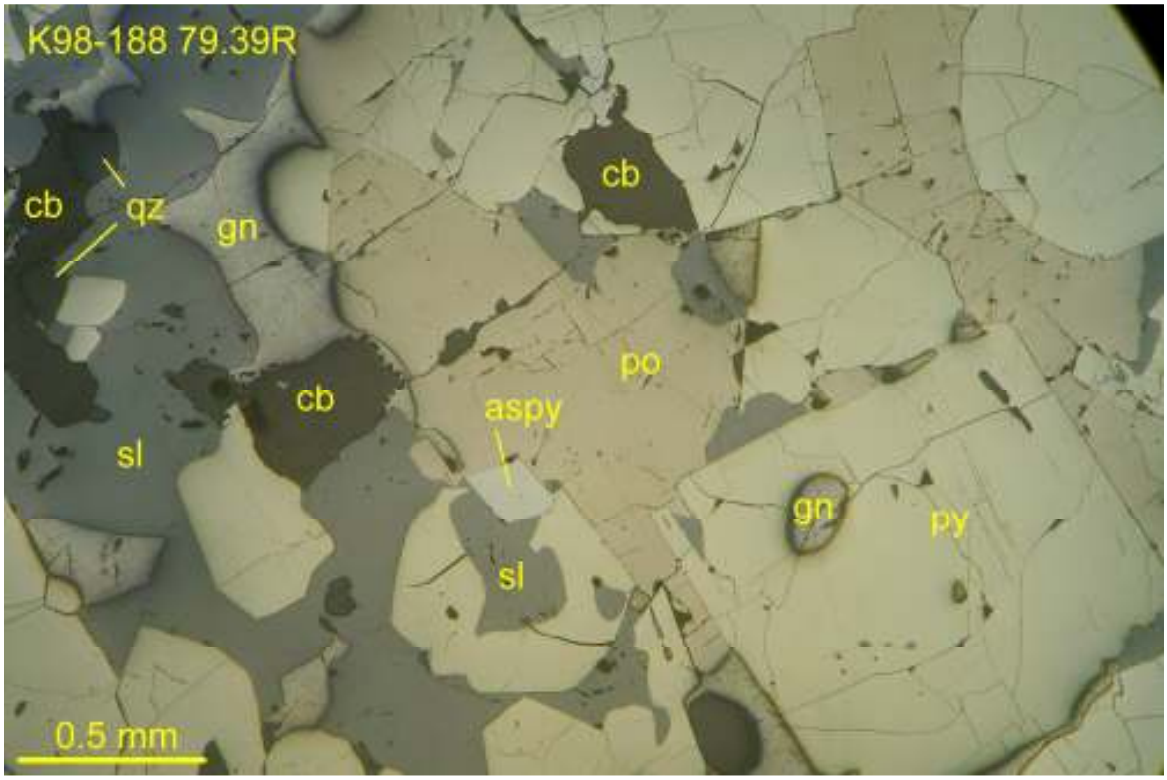
K98-193 176.78-176.96a: gangue inclusions of carbonate (cb) and probable barite (ba?) poikilitically enclosed in massive sulfides comprising pyrite in a matrix of sphalerite, lesser galena and trace chalcopyrite. Reflected light, uncrossed polars, field of view ~3 mm wide.



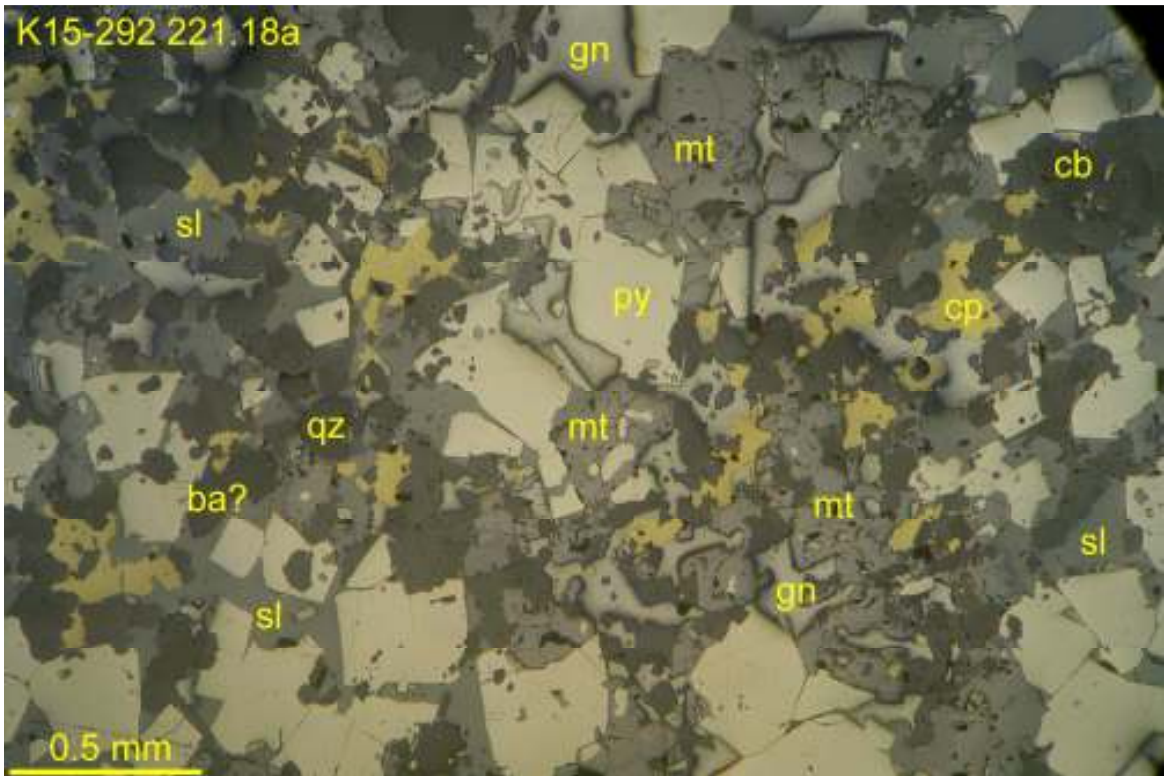
K98-193 176.78-176.96: boundary between sphalerite-rich and galena-rich matrix to euhedral pyrite cubes; note local pyrrhotite and trace chalcopyrite associated with sphalerite matrix, and rare arsenopyrite found in core of pyrite crystal. Reflected light, uncrossed polars, field of view ~3 mm wide.



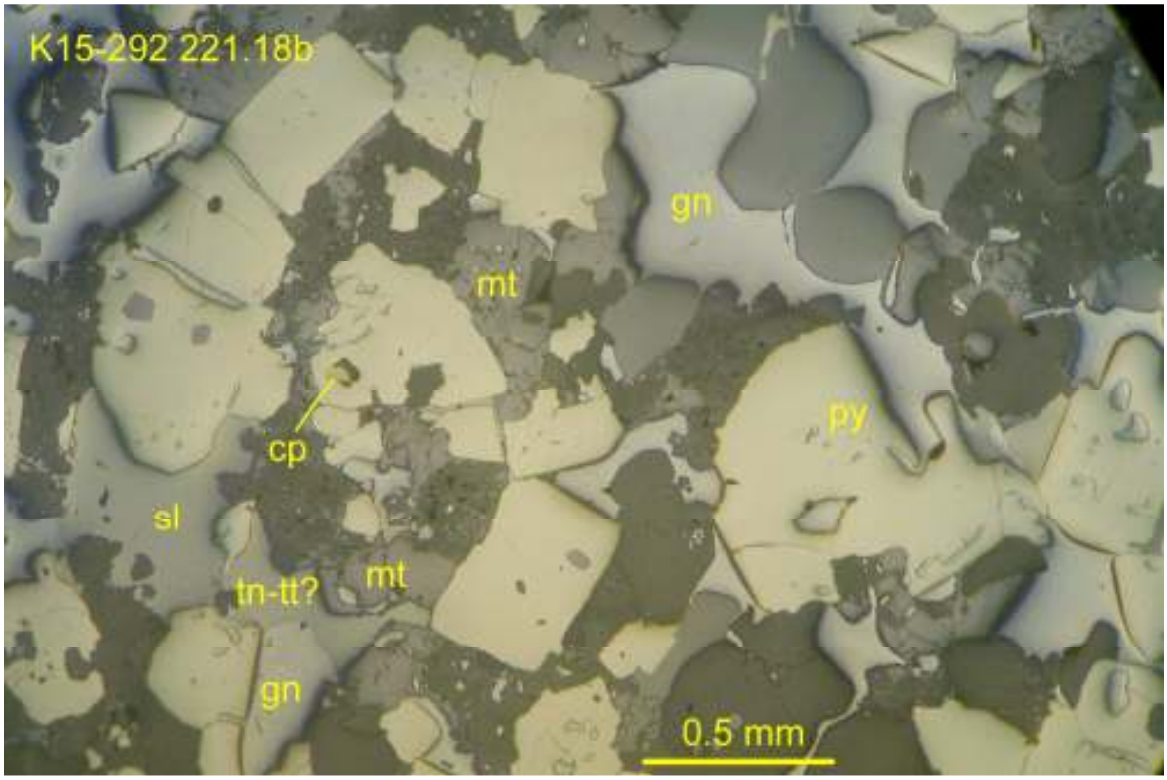
K98-188 79.39-79.5: deep red, Fe-rich sphalerite matrix to cubic pyrite crystals; gangues included in the massive sulfides include subhedral quartz, carbonate, local euhedral dark green tourmaline, and sericite/muscovite. Transmitted plane light, field of view ~3 mm wide.



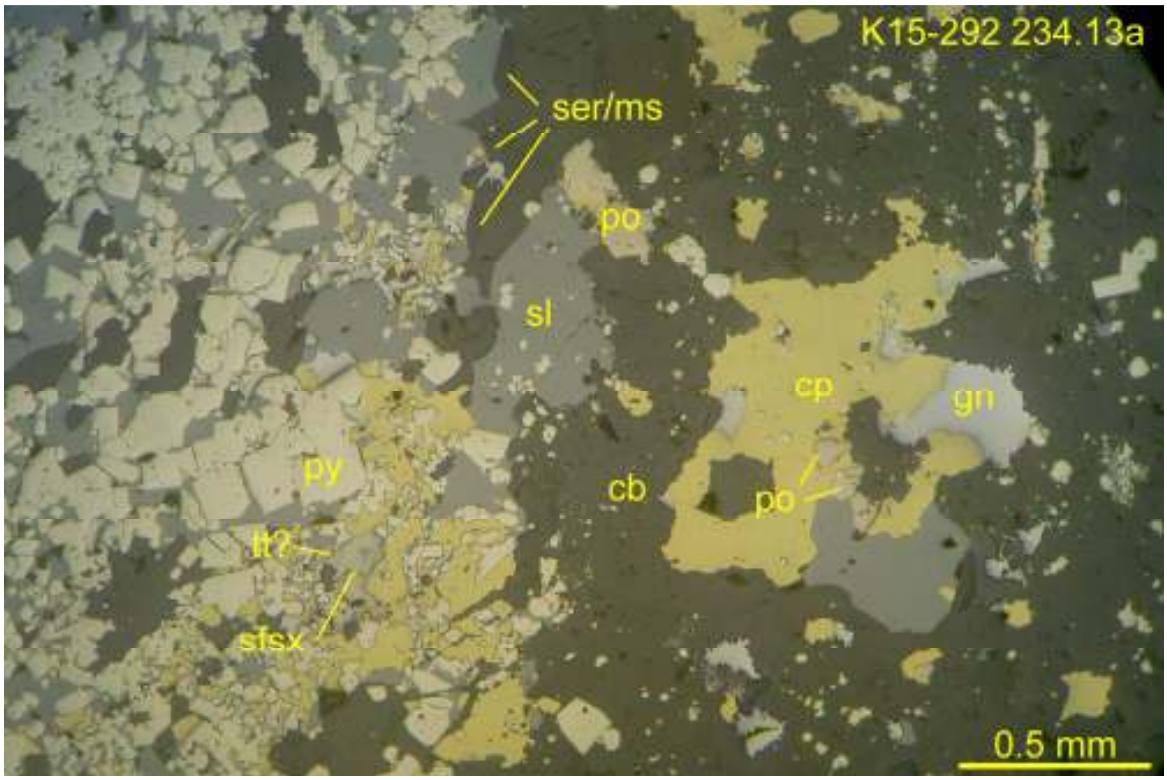
K98-188 79.39-79.5R: matrix of sphalerite, pyrrhotite, and galena to cubic pyrite crystals (rare arsenopyrite may partly replace pyrite?). Reflected light, uncrossed polars, field of view ~3 mm wide.



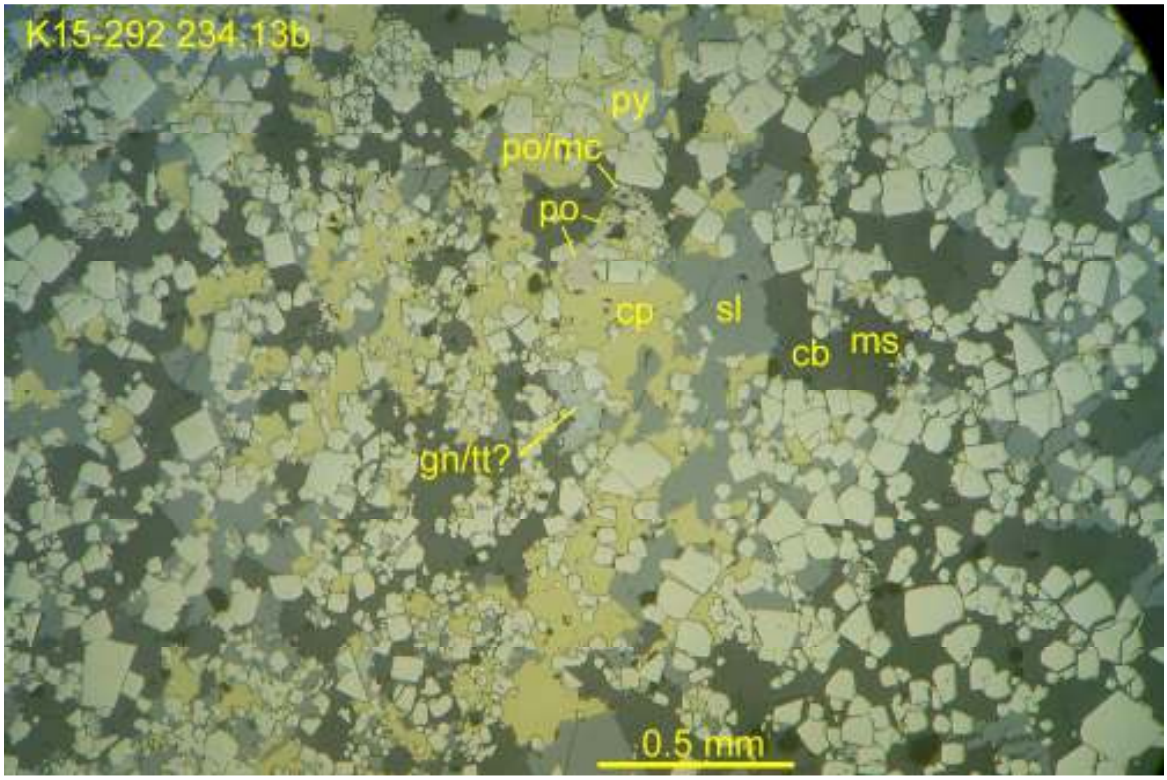
K15-292 221.18-221.37a: poorly defined, sphalerite-galena and locally chalcopyrite-rich band of massive sulfides in which the base-metal sulfides form a matrix (with gangues of carbonate, quartz, local barite?) to cubic euhedra of pyrite and significant fractured subhedra of magnetite. Reflected light, uncrossed polars, field of view ~3 mm wide.



K15-292 221.18-221.37b: euhedral pyrite, lesser fractured subhedral magnetite contained within sphalerite-galena rich matrix that here contains significant, relatively coarse-grained grey isotropic sulfosalt (possibly tennantite-tetrahedrite, tn-tt?) up to almost 1 mm across, within galena. Reflected light, uncrossed polars, field of view ~3 mm wide.



K15-292 234.13-234.31a: margin of carbonate band/vein in which chalcopyrite, sphalerite and galena are associated with pyrrhotite; note euhedral flakes of muscovite along margin, and traces of sulfosalts (sfsx, and tt?) in galena of sphalerite matrix to euhedral pyrite in wallrock massive sulfides. Reflected light, uncrossed polars, field of view ~3 mm wide.



K15-292 234.13-234.31b: massive sulfides of euhedral pyrite in matrix of sphalerite-minor galena with faint compositional banding highlighted by chalcopyrite-rich zone; galena rarely contains symplectic intergrowths of sulfosalt2 (tennantite-tetrahedrite, tn?). Reflected light, uncrossed polars, field of view ~3 mm wide.

Overviews of thin sections and offcuts (blue semi-circles mark photomicrograph locations).

PETROGRAPHIC REPORT ON 11 SAMPLES OF MASSIVE SULFIDES

Report for: Murray Jones/Trevor Rabb
Equity Exploration Consultants Ltd.
1510-250 Howe Street
Vancouver, B.C. V6C 3R8 (604) 688-9806

Invoice 150890

Jan. 4, 2016.

SUMMARY:

This suite of 11 samples mostly represent crudely to locally vaguely banded/laminated, or in a few cases, relatively unbanded, massive sulfides composed mainly of euhedral pyrite, local magnetite, in a matrix of sphalerite-variable lesser galena-minor chalcopyrite-local pyrrhotite (largely altered to pyrite/marcasite)-arsenopyrite-trace sulfosalt(s) with gangues of carbonate-local, variable quartz, probable barite, sericite/muscovite, chlorite or rare biotite. The massive sulfide samples typically show sulfide/gangue ratios in the 70-80/30-20 range, with semi-massive sulfide samples in the 30-50/70-50 range. In both types, discontinuous banding/lamination is poorly defined by compositional/grain size variation from pyrite-rich with variable sphalerite and galena or locally chalcopyrite and/or (relict) pyrrhotite concentrations, to gangue-rich, particularly carbonate- or sericite-, locally barite?-rich (the latter typically associated with sphalerite and especially galena-rich zones, suggestive of the approach to the upper portions of a volcanogenic massive sulfide deposit). Weak foliation is locally defined by aligned mica flakes, sub-parallel to elongation of quartz or carbonate crystals/aggregates.

Pyrite is typically euhedral, rarely replaced at cores by arsenopyrite, and set (as is sporadic magnetite) in a variable matrix of the base-metal sulfides. Sphalerite varies from pale yellow-brown (Fe-poor) to more common dark orange-brown or intense red-brown (Fe-rich), sometimes even only a few meters apart. Locally, chalcopyrite, pyrrhotite, coarser sphalerite, galena and sulfosalts, appear to be associated with coarser-grained, possibly remobilized, carbonate ±quartz or barite bearing bands/veins that could represent remobilization of more volatile portions of the deposit during metamorphism/deformation (or might represent former stringers?). In general, deformation seems likely to have caused the softer sulfides (galena, sphalerite, pyrrhotite, chalcopyrite) to recrystallize or "flow" to form the matrix to the much harder, ubiquitous euhedral pyrite (and local subhedral magnetite, which has fractured and been partly altered to carbonate). Carbonate varies from calcite (typically in bands/veins or distinctly later planar veinlets) to mostly dolomite (gangue matrix) or locally ankerite (?). In some samples, the Fe-carbonate appears to rim or enclose the calcite/dolomite; in others, it may form the core. Chlorite may have replaced former pale brown biotite.

Sulfosalts appear to be mainly of two types, mostly within or closely associated with galena, particularly where in contact with sphalerite, chalcopyrite or pyrrhotite: first, one which is anisotropic under crossed polars but with only barely detectable, slightly lower reflectance and olive-grey colour compared to galena (could be any one of numerous Pb-Sb-As±Ag sulfosalts?), and second, grey, apparently isotropic (likely tennantite-tetrahedrite, could be Ag-bearing?). SEM analysis is recommended to identify these sulfosalts and their possible Ag contents. No gold was seen, in spite of detailed search at high magnification; again, SEM analysis might reveal gold particles.

Capsule descriptions are as follows:

K15-317 87.29-87.44: semi-massive pyrite-sphalerite-arsenopyrite- minor galena-trace sulfosalts (tennantite?/ unidentified)-chalcopyrite in gangue of barite?-minor carbonate-trace biotite, quartz. Arsenopyrite may replace pyrite, and sulfosalt may be mostly in barite-rich (±sphalerite-galena-carbonate) bands.

K15-319 168.68-168.83: semi-massive, disrupted-looking pyrite-sphalerite-chalcopyrite (local pyrrhotite inclusions)-minor galena (trace included sulfosalt, tetrahedrite?) with mainly carbonate gangue; a band/vein of coarser carbonate-minor quartz-sericite contains significant chalcopyrite, sphalerite, minor galena. There are late carbonate (possibly calcite) veinlets.

K15-209 22.37-22.5: massive pyrite-sphalerite-galena-chalcopyrite-significant sulfosalt (tetrahedrite?)-trace arsenopyrite, inter-banded with gangues of barite?-lesser carbonate, presumably from the upper zones of a volcanogenic massive sulfide deposit.

K15-209 25.5-25.63: vaguely banded/ contorted massive pyrite-sphalerite-chalcopyrite-magnetite-arsenopyrite-pyrrhotite/marcasite-sulfosalts (boulangerite?/tennantite?)-galena, with carbonate ± quartz, sericite gangue.

K15-209 36.8-36.9: semi-massive pyrite (in part after pyrrhotite, with marcasite)-sphalerite-chalcopyrite-minor magnetite in gangue of carbonate-sericite/muscovite-minor chlorite. Chalcopyrite and sphalerite are mostly concentrated in thin bands that alternate with pyrite or gangue-rich bands.

K15-223 10.88-11.01: massive pyrite-sphalerite-magnetite-minor galena-chalcopyrite-trace sulfosalts (Pb-Sb-As?, tetrahedrite?), inter-banded with gangues of barite?-lesser carbonate, presumably from the upper zones of a volcanogenic massive sulfide deposit.

K15-228 23.66-23.77: relatively unbanded massive pyrite-sphalerite-galena-arsenopyrite-minor sulfosalts (boulangerite?/unidentified?/tennantite?)-trace chalcopyrite-pyrrhotite, with quartz-carbonate-minor barite? ± possible limonite/sericite gangue.

K15-296 19.66-19.79: massive pyrite-minor sphalerite-chalcopyrite-magnetite-relict pyrrhotite (altered to marcasite)-galena/sulfosalt (mainly Pb-Sb-As?, trace tetrahedrite?), inter-banded with gangues of carbonate, minor quartz.

K15-296 23.8-23.93: massive pyrite-lesser sphalerite-minor galena-magnetite (altered to carbonate)-trace chalcopyrite-rare sulfosalt (tetrahedrite?), inter-banded with gangues of quartz-carbonate-minor sericite, possibly from the upper zones of a volcanogenic massive sulfide deposit.

K15-312 62.4-62.5: relatively un- or crudely banded massive pyrite-sphalerite-galena-trace sulfosalts (unidentified/tennantite?)-trace chalcopyrite, with carbonate-barite?-minor quartz ± possible apatite gangue.

K15-314 135.82-135.93: semi-massive pyrite (in part after pyrrhotite?)-sphalerite-galena-minor arsenopyrite-chalcopyrite±tetrahedrite? in gangues of quartz-carbonate-sericite/muscovite. Sphalerite and galena are mostly concentrated in thin bands with pyrite that alternate with gangue-rich bands.

Detailed petrographic descriptions and photomicrographs are appended (by email attachment). If you have any questions regarding the petrography, please do not hesitate to contact me.

Craig H.B. Leitch, Ph.D., P. Eng. (250) 653-9158 dromore61@gmail.com
492 Isabella Point Road, Salt Spring Island, B.C. Canada V8K 1V4

K15-317 87.29-87.44: SEMI-MASSIVE PYRITE-SPHALERITE-ARSENOPYRITE- MINOR GALENA-TRACE SULFOSALTS (TENNANTITE?, UNIDENTIFIED)-CHALCOPYRITE IN GANGUE OF BARITE?-MINOR CARBONATE-TRACE BIOTITE, QUARTZ; ARSENOPYRITE MAY REPLACE PYRITE, AND SULFOSALT MAY BE MOSTLY IN BARITE-RICH (±SPHALERITE-GALENA-CARBONATE) BANDS

Hand sample not supplied; etched offcut shows fine-grained, grey, crudely banded/laminated pyrite-sphalerite rich semi-massive sulfide with significant lensy gangue inclusions. The rock is not magnetic, shows no reaction to cold dilute HCl (even where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is roughly:

Gangue (50%)

Sulfate (likely barite?)	90%
Carbonate (mainly dolomite/ankerite?)	10%
Biotite	<<1%
Quartz (mainly in central band/vein)	<<1%

Ore (50%)

Pyrite	65%
Sphalerite	15%
Arsenopyrite	12%
Galena	~7%
Sulfosalt 2 (tennantite-tetrahedrite?)	~1%
Chalcopyrite	<1%
Sulfosalt 1 (Pb-As, Bi or Ag?)	<<1%

Gangues appears to consist mainly of probable sulfate, most likely barite to judge by the relief only slightly negative compared to carbonate, although cleavage is not well developed/interference figures are difficult to obtain (rounded sub/anhedral crystals mainly 0.5-1 mm), minor carbonate (smaller subhedral/ragged anhedral crystals mainly 0.1-0.5 mm, likely dolomite or ankerite?), plus traces of biotite (pale brown pleochroic, euhedral flakes <0.2 mm typically aligned with the banding, only in certain bands) and rare quartz (subhedra mostly <0.15 mm with only mild undulose extinction. The gangue minerals are typically concentrated in lensy bands <2 mm thick by up to 2.5 cm long.

Ore minerals are crudely arranged in bands or laminations mostly <2 mm thick but loosely aggregating to about 1cm thick, highlighted by compositional variation (pyrite ±arsenopyrite-rich, commonly with discontinuous sphalerite ±galena rich matrix, alternating with gangue-rich bands). The latter typically contain most of the sulfosalts, intimately intergrown with sphalerite, galena, and contain the traces of biotite and quartz. Most pyrite occurs with sphalerite and minor galena but there is no chalcopyrite, suggesting this sample comes from an upper level of volcanogenic massive sulfide (Pb-Zn zone), supported by the presence of abundant barite (?). Pyrite forms generally cubic euhedra in the 0.1-0.5 mm range, commonly mixed with (partly replaced by?) arsenopyrite as euhedra that average <0.1 mm (rarely to 0.2 mm, locally in irregular patches up t ~1 mm across). Sphalerite forms sub- to rarely euhedral, somewhat rounded crystals mostly <1 mm intergrown with galena as irregular masses mostly <0.65 mm. Sphalerite shows pale orange-brown colour suggestive of low Fe content; no chalcopyrite inclusions were noted. Rare chalcopyrite occurs as anhedra <0.1 mm between pyrite and sphalerite. Sulfosalts are mostly grey, apparently isotropic (likely tennantite-tetrahedrite given the abundance of arsenopyrite in the sample) forming symplectic intergrowths with galena, mostly <0.35 mm long, but include traces of one with nearly the same colour/reflectance as galena but weak anisotropism under crossed polars (possibly Pb-Sb-rich like bournonite, or Pb-As?) forming sub/euhedra mostly <50 µm.

In summary, this is semi-massive pyrite-sphalerite-arsenopyrite- minor galena-trace sulfosalts (tennantite?, unidentified)-chalcopyrite in gangue of barite?-minor carbonate-trace biotite, quartz. Arsenopyrite may replace pyrite, and sulfosalt may be mostly in barite-rich (±sphalerite-galena-carbonate) bands.

K15-319 168.68-168.83: SEMI-MASSIVE, DISRUPTED-LOOKING PYRITE-SPHALERITE-CHALCOPYRITE (LOCAL PYRRHOTITE INCLUSIONS)-MINOR GALENA (TRACE INCLUDED SULFOSALT, TETRAHEDRITE?) WITH MAINLY CARBONATE GANGUE; A BAND/VEIN OF COARSER CARBONATE-MINOR QUARTZ-SERICITE CONTAINS SIGNIFICANT CHALCOPYRITE, SPHALERITE, MINOR GALENA

Hand sample not supplied; etched offcut shows fine/medium-grained, grey, disrupted-looking semi-massive sulfide composed mainly of pyrite, lesser sphalerite, chalcopyrite, in carbonate gangue somewhat segregated into ~2 cm bands of coarser, carbonate ±chalcopyrite rich rock. The rock is locally magnetic, shows widespread but very slow reaction to cold dilute HCl (mainly only where scratched) and no stain for K-feldspar. Modal mineralogy in polished thin section is approximately:

Gangue (50%)

Carbonate (mainly dolomite?)	95%
Quartz	3-5%
Sericite	1-2%

Ore (50%)

Pyrite	70%
Sphalerite	15%
Chalcopyrite	10%
Galena	3-5%
Pyrrhotite	<1%
Sulfosalt (tetrahedrite?)	<1%

Gangue minerals are almost entirely carbonate, forming sub- to anhedral crystals mainly in the 0.5 to 1.0 mm range where intermixed with the massive sulfides, or up to almost 2 mm within the coarser band or vein-like area. The carbonate species is difficult to be sure of but reaction is very slow; suggesting it may be dolomite or even ankerite (?), except in distinct later veinlets up to ~1 mm thick where reaction is stronger, suggestive of calcite. The late calcite veins are locally accompanied by narrow veinlets <0.15 mm thick along which pyrite is shattered. Local minor quartz forms subhedra or locally zoned euhedra mostly <0.5 but up to almost 1mm long, especially in the coarse band or vein; most quartz crystals are apparently relatively unstrained. Locally there is also minor sericite (?) as randomly oriented subhedral flakes<1 mm in diameter.

In the gangue-rich band or vein, chalcopyrite is common, forming ragged sub/anhedral aggregates to almost 2 mm, containing traces of pyrrhotite (subhedra <0.1 mm), and intergrown with sphalerite as irregular subhedra to ~2 mm, galena as irregular subhedra to 0.5 mm; pyrite forms mostly euhedra to 1.5 mm. Galena does not appear to contain sulfosalt.

In the somewhat finer-grained semi-massive sulfide portion of the sample, ore minerals are not obviously banded but aggregate to about 2 cm thick; as in the carbonate rich portion, some areas are rich in coarse chalcopyrite. Pyrite forms generally cubic euhedra in the 0.5-1.0 mm range, but locally super-crystals up to 3 mm across contain inclusions of sphalerite and galena mainly <0.5 mm; rare chalcopyrite inclusions are <0.2 mm. Arsenopyrite is not detected in the sample. Sphalerite forms sub- to rarely euhedral crystals mostly <1 mm long but locally in aggregates to 2 mm long, associated or intergrown with the coarsest pyrite and chalcopyrite, local galena crystals. Sphalerite shows dark red-brown colour suggestive of high Fe content. Chalcopyrite forms ragged subhedra up to 3 mm across, locally containing inclusions of pyrrhotite as clusters of subhedra <0.5 mm across, or as thin veinlets <0.1 mm within sphalerite. In general, galena is minor, mainly <0.5 mm, intergrown with or included in sphalerite (local aggregates to ~1 mm). Galena contains most of the minor grey, apparently isotropic sulfosalt (tetrahedrite-tennantite?) as symplectic intergrowths <0.5 mm,

In summary, this is semi-massive, disrupted-looking pyrite-sphalerite-chalcopyrite (local pyrrhotite inclusions)-minor galena (trace included sulfosalt, tetrahedrite?) with mainly carbonate gangue; a band/vein of coarser carbonate-minor quartz-sericite contains significant chalcopyrite, sphalerite, minor galena. There are late carbonate, possibly calcite, veinlets.

K15-209 22.37-22.5: MASSIVE PYRITE-SPHALERITE-GALENA-CHALCOPYRITE-SIGNIFICANT SULFOSALT (TETRAHEDRITE?)-TRACE ARSENOPYRITE, INTER-BANDED WITH GANGUES OF BARITE?-LESSER CARBONATE, PRESUMABLY FROM THE UPPER ZONES OF A VOLCANOGENIC MASSIVE SULFIDE DEPOSIT

Hand sample not supplied; etched offcut shows mainly fine-grained, dark grey, crudely banded/laminated massive sulfide composed mainly of pyrite and sphalerite, with only minor gangue. The rock is locally slightly magnetic, but shows no reaction to cold dilute HCl (even where scratched), and no stain for K-feldspar. Modal mineralogy in polished thin section is approximately:

Gangue (25%)

Sulfate (likely barite?)	65%
Carbonate (dolomite or ankerite?)	35%

Ore (75%)

Pyrite	60%
Sphalerite	30%
Galena	5%
Chalcopyrite	3-5%
Sulfosalt 2 (tennantite-tetrahedrite?)	~1%
Arsenopyrite (only with chalcopyrite/sulfosalt)	trace

This sample consists mainly of crudely banded massive sulfides, dominated by pyrite-lesser sphalerite-significant galena-chalcopyrite-minor sulfosalt, alternating with poorly defined, discontinuous bands of gangues (mainly barite, lesser carbonate).

Gangue minerals are locally concentrated into discontinuous bands up to about 2 mm thick, parallel to the poorly defined banding in the sulfides. Barite (?) forming the bulk of the gangues occurs as sub- to anhedral, irregular crystals mostly <1.2 mm long, commonly more or less aligned (length:width up to 3:1) in the plane of banding. Carbonate crystals typically intergrown with the barite (?) occur as ragged, irregular to skeletal anhedra mostly <0.6 mm that lack elongation in the plane of banding. The complete lack of reaction to cold dilute HCl, even where powdered, suggests it may be ankerite (?). If quartz is present it is not readily detectable.

Ore minerals are concentrated in poorly defined, thin bands or discontinuous laminae mostly <1 mm thick, but coalescing in places to almost 0.5 cm. They vary from pyrite rich (±chalcopyrite, sulfosalt, trace arsenopyrite) to sphalerite (±galena) rich, the latter more commonly associated with gangues of barite (?) and carbonate. Pyrite typically occurs as euhedral cubic crystals ranging from 0.1 to 1.0 mm; the coarser crystals are somewhat blastic, set in a background of the finer crystals, in a matrix of sphalerite-galena-minor local chalcopyrite. Sphalerite forms sub- to locally euhedral crystals mostly in the 0.5-1.0 mm range, with pale yellow-brown colour suggestive of low Fe content, and commonly intergrown with or containing inclusions of galena (anhedral, <1 mm) or locally chalcopyrite (fine-grained, <0.1 mm). Galena also occurs as 1) fine-grained inclusions in or matrix to pyrite, or 2) subhedral, interstitial crystals rarely over 0.4 mm across; the concentrations tend to follow the banding, and to follow the concentrations of sphalerite. Chalcopyrite is much less common, mostly as irregular masses up to 3 mm long, distributed along the banding, mixed with sphalerite or galena as a matrix to pyrite, and with significant amounts of the grey, apparently isotropic sulfosalt (tennantite-tetrahedrite?) forming irregular masses also up to ~3 mm long typically located at the margins of chalcopyrite where associated with sphalerite or galena.

In summary, this is massive pyrite-sphalerite-galena-chalcopyrite-significant sulfosalt (tetrahedrite?)-trace arsenopyrite, inter-banded with gangues of barite?-lesser carbonate, presumably from the upper zones of a volcanogenic massive sulfide deposit.

K15-209 25.5-25.63: VAGUELY BANDED/ CONTORTED MASSIVE PYRITE-SPHALERITE-CHALCOPYRITE-MAGNETITE-ARSENOPYRITE-PYRRHOTITE/MARCASITE-SULFOSALTS (BOULANGERITE?/TENNANTITE?)-GALENA, WITH CARBONATE ± QUARTZ, SERICITE

Hand sample not supplied; etched offcut shows fine/medium-grained, grey, disrupted-looking massive sulfide composed mainly of pyrite-lesser sphalerite-magnetite in carbonate gangue (partly segregated into contorted, <2 cm bands of coarser, carbonate ±chalcopyrite, local arsenopyrite, pyrrhotite). The rock is strongly magnetic, shows very slow reaction to cold dilute HCl (mostly where scratched) and no stain for K-feldspar. Modal mineralogy in polished thin section is approximately:

Gangue (25%)

Carbonate (mainly dolomite or ankerite?)	98%
Quartz	~1%
Sericite	~1%

Ore (75%)

Pyrite	65%
Sphalerite	15%
Chalcopyrite	10%
Magnetite	3%
Arsenopyrite	2%
Pyrrhotite (partly altered to marcasite)	2%
Marcasite (likely after pyrrhotite)	2%
Sulfosalt 1 (Pb-As-Sb?)	<1%
Sulfosalt 2 (tetrahedrite?)	<1%
Galena	<1%

This sample consists of possibly formerly crudely banded, but now contorted/crenulated, massive sulfides (mainly pyrite; matrix of sphalerite-local chalcopyrite-magnetite-arsenopyrite-pyrrhotite (partly/largely replaced by marcasite)-minor sulfosalts (one of which may be mixed with trace galena?). The massive sulfide "bands" appear to be <1 cm thick (except where apparently thickened in the hinges of folds to ~2 cm), crudely alternating with thinner, poorly defined, discontinuous or disrupted "bands" richer in gangues (mainly carbonate, with only traces of quartz and sericite).

The bulk of the sulfide bands consists of pyrite, forming either tightly interlocking, 0.1-0.5 mm sub/anhedra, or 0.5-1.0 mm sub/euhedra, set in a matrix of variable sphalerite, chalcopyrite, carbonate and magnetite. Carbonate forms tightly interlocking, sub- to locally euhedral crystals mainly <0.5, but up to 1.25 mm in size; it could be dolomite or possibly ankerite to judge by lack of reaction to HCl in the offcut. Magnetite occurs as scattered, fractured subhedra mostly <0.35 mm. Rare quartz (irregular sub/anhedra <0.35 mm) and sericite (sub/euhedral flakes to 0.5 mm, locally with pale green/brownish colour suggestive of being after former biotite?) occur in carbonate.

The sphalerite typically forms interlocking, subhedral crystals <1.5 mm but locally aggregating to ~6 mm, with deep, dark red colour indicative of high Fe content, and is intergrown with or contains inclusions of, chalcopyrite as sub/anhedra <1 mm (but aggregating in places to ~3 mm), closely associated with pyrrhotite (irregular masses to 3 mm of subhedra mostly <0.8 mm) and arsenopyrite as partly fractured euhedra up to ~1 mm. The pyrrhotite is commonly partly, to locally completely, replaced by lamellar-textured marcasite as fine, needle-like subhedra mainly <20 μm thick by up to 0.2 mm long, probably aligned with the axis of the original pyrrhotite crystals. In places, sulfosalt is relatively common, forming skeletal-shaped masses up to almost 0.5 cm across composed mainly of subhedra <0.5 mm that are slightly darker than the galena it is mixed with, with a faintly olive-green tint, and distinctly to strongly anisotropic in shades of grey under crossed polars (likely Pb-As/Sb sulfosalt such as boulangerite?). Galena is relatively rare, forming subhedra <0.5 mm; there is also very minor sulfosalt 2 (grey, isotropic, likely tennantite-tetrahedrite?) as subhedral inclusions <0.15 mm, mostly around the margins of sulfosalt 1. In summary, this is vaguely banded/ contorted massive pyrite-sphalerite-chalcopyrite-magnetite-arsenopyrite-pyrrhotite/marcasite-sulfosalts (boulangerite?/tennantite?)-galena, with carbonate ± quartz, sericite gangue.

K15-209 36.8-36.9: SEMI-MASSIVE PYRITE (IN PART AFTER PYRRHOTITE, WITH MARCASITE)-SPHALERITE-CHALCOPYRITE-MINOR MAGNETITE IN GANGUE OF CARBONATE-SERICITE/MUSCOVITE-MINOR CHLORITE. CHALCOPYRITE AND SPHALERITE ARE MOSTLY CONCENTRATED IN THIN BANDS THAT ALTERNATE WITH PYRITE OR GANGUE-RICH BANDS

Hand sample not supplied; etched offcut shows fine-grained, grey, finely banded/laminated semi-massive sulfide composed mainly of pyrite and sphalerite in abundant carbonate gangue. The rock is distinctly magnetic, shows no discernible reaction to cold dilute HCl (even where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is roughly:

Gangue (70%)

Carbonate (mainly ankerite?)	65%
Sericite/muscovite	30%
Chlorite	5%

Ore (30%)

Pyrite (primary?)	20%
(±marcasite, after former pyrrhotite?)	20%
Sphalerite	30%
Chalcopyrite	25%
Magnetite	2-3%
Pyrrhotite (partly/largely altered to pyrite/marcasite)	2-3%

This sample consists of thin bands or laminae (mostly 1-2 mm thick, but aggregating to ~1 cm) of sulfide-rich (variably pyrite, sphalerite, chalcopyrite, or pyrrhotite altered to pyrite-marcasite, local magnetite-rich) or gangue-rich (mainly carbonate-sericite/muscovite, local chlorite/relict biotite).

Gangue minerals are dominated by intimately intermixed carbonate and sericite or muscovite. The carbonate forms sub- to rarely euhedral crystals mainly in the 0.5 mm (locally <0.1, or less commonly up to almost 1 mm) range, the latter mostly n rounded “augen”. The carbonate species is difficult to be sure of due to the HF attack damaging the surface and making it less reactive; it may be dolomite or ankerite (?). Sericite or muscovite forms coarse euhedral flakes up to about 1 mm, mostly aligned in the plane of banding/foliation. In some laminae/foliae, minor chlorite of similar size to biotite shows pale yellow-green pleochroism and length-slow, low to moderate birefringence suggestive of F:M slightly more than 0.5 (or it may replace relict biotite).

Ore mineral bands or laminations are highlighted by compositional variation (pyrite-rich, sphalerite- or chalcopyrite-rich, relict pyrrhotite altered to pyrite-marcasite rich). Magnetite is widely scattered as subhedra <0.5 mm, mainly in sulfide-rich bands. Most sulfides occur separately within the matrix of carbonate-sericite. Pyrite forms generally cubic sub/euhedra <0.5 mm in diameter, but where it is after pyrrhotite (relics with subhedral outlines <0.65 mm), it occurs as sub/anhedral aggregates of similar size with fine internal texture, locally intermixed with minor marcasite <0.1 mm in size. Sphalerite forms somewhat rounded sub- to rarely euhedral crystals mostly <0.75 mm in diameter but commonly in aggregates up to 2 mm long, elongated in the plane of banding; galena is not seen. Sphalerite shows very dark red-brown colour suggestive of high Fe content. Chalcopyrite occurs as subhedra mostly <0.7 mm but also in aggregates to 1.5 mm long aligned in the foliation; they are commonly intergrown with sphalerite or with relict pyrrhotite or secondary pyrite/marcasite aggregates after pyrrhotite, but less commonly with pyrite considered to be likely primary.

In summary, this is semi-massive pyrite (in part after pyrrhotite, with marcasite)-sphalerite-chalcopyrite-minor magnetite in gangue of carbonate-sericite/muscovite-minor chlorite. Chalcopyrite and sphalerite are mostly concentrated in thin bands that alternate with pyrite or gangue-rich bands.

K15-223 10.88-11.01: MASSIVE PYRITE-SPHALERITE-MAGNETITE-MINOR GALENA-CHALCOPYRITE-TRACE SULFOSALTS (PB-SB-AS?, TETRAHEDRITE?), INTER-BANDED WITH GANGUES OF BARITE?-LESSER CARBONATE, PRESUMABLY FROM THE UPPER ZONES OF A VOLCANOGENIC MASSIVE SULFIDE DEPOSIT

Hand sample not supplied; etched offcut shows mainly fine-grained, dark grey, crudely banded/ laminated massive sulfide composed mainly of pyrite and sphalerite, with only minor gangue. The rock is strongly magnetic, shows minor reaction to cold dilute HCl (only where scratched), and no stain for K-feldspar. Modal mineralogy in polished thin section is approximately:

Gangue (25%)

Sulfate (likely barite?)	65%
Carbonate (mainly dolomite?)	35%

Ore (75%)

Pyrite	70%
Sphalerite	20%
Magnetite	7%
Galena	3%
Chalcopyrite	<1%
Sulfosalt 2 (tennantite-tetrahedrite?)	trace
Sulfosalt 1 (Pb-As-Sb?)	trace

This sample consists mainly of crudely banded massive sulfides, dominated by pyrite-lesser sphalerite-significant magnetite-minor galena-trace chalcopyrite- sulfosalt, alternating with poorly defined, discontinuous bands of gangues (mainly barite, lesser carbonate).

Gangue minerals are locally concentrated into discontinuous bands up to about 2 mm thick, parallel to the poorly defined banding in the sulfides. Barite (?) forming the bulk of the gangues occurs as sub- to anhedral, irregular crystals mostly <1.2 mm long, commonly more or less aligned in the plane of banding (length:width locally up to ~3:1). Carbonate crystals typically intergrown with the barite (?) occur as ragged, irregular to skeletal anhedra mostly <0.6 mm that lack elongation in the plane of banding (but may occur in elongated aggregates to 1.5 mm long, in the plane of banding or foliation). The slow reaction to cold dilute HCl, only where powdered, suggests it is likely dolomite (?). If quartz is present it is not readily detectable.

Ore minerals are concentrated in poorly defined, thin bands or discontinuous laminae mostly <2 mm thick, but coalescing in places to almost 1 cm. They vary from pyrite rich (±magnetite, minor local chalcopyrite) to sphalerite-magnetite rich (±galena, traces of sulfosalt), the former more commonly associated with gangues of carbonate and the latter more commonly associated with gangues of barite (?) and carbonate. Pyrite typically occurs as euhedral cubic crystals ranging from 0.2 to 1.5 mm; the coarser crystals are somewhat blastic, set in a background of the finer crystals, with or without magnetite as highly fractured, ragged subhedra up to ~1.5 mm (local aggregates to almost 4 mm). The magnetite crystals commonly contain fine, rounded inclusions of pyrite, less common galena or sphalerite, rare chalcopyrite, and are partly altered to carbonate along fractures. Both pyrite and magnetite are set in a poorly developed matrix of sphalerite-galena-minor local chalcopyrite; arsenopyrite was not found. Sphalerite forms sub- to locally euhedral crystals mostly in the 0.5-1.0 mm range, with medium orange-brown colour suggestive of moderate Fe content, and commonly intergrown with or containing inclusions of galena (ragged, anhedral, <1 mm) or locally chalcopyrite (subhedral, <0.5 mm). The concentrations of galena tend to follow the banding, and to follow the concentrations of sphalerite; chalcopyrite is much less common, but where present, also appears to be distributed along the banding. Galena contains only traces of either sulfosalt 1 (almost indistinguishable from galena except by weak anisotropism under crossed polars, subhedra <0.1 mm) or the grey, apparently isotropic sulfosalt (tennantite-tetrahedrite?) as subhedral inclusions <25 μm.

In summary, this is massive pyrite-sphalerite-magnetite-minor galena-chalcopyrite-trace sulfosalts (Pb-Sb-As?, tetrahedrite?), inter-banded with gangues of barite?-lesser carbonate, presumably from the upper zones of a volcanogenic massive sulfide deposit.

K15-228 23.66-23.77: RELATIVELY UNBANDED MASSIVE PYRITE-SPHALERITE-GALENA-ARSENOPYRITE-MINOR SULFOSALT (BOULANGERITE?/UNIDENTIFIED?/TENNANTITE?) -TRACE CHALCOPYRITE-PYRRHOTITE, WITH QUARTZ-CARBONATE-MINOR BARITE? ± POSSIBLE LIMONITE/SERICITE GANGUE

Hand sample not supplied; etched offcut shows fine/medium-grained, grey, almost unbanded massive sulfide composed mainly of pyrite-lesser sphalerite in lesser gangue (locally segregated into discontinuous, <3 mm bands of coarser, partly Fe-stained carbonate). The rock is locally slightly magnetic, shows very slow reaction to cold dilute HCl (mostly where scratched) except rapid in thin bands and no stain for K-feldspar. Modal mineralogy in polished thin section is approximately:

Gangue (30%)

Quartz	80%
Carbonate (dolomite except veins of Fe-calcite?)	15%
Barite (?)	~5%
Limonite, sericite (?)	<1%

Ore (70%)

Pyrite	70%
Sphalerite	25%
Galena	3%
Arsenopyrite	1-2%
Sulfosalt 1 (Pb-As-Sb?)	<1%
Sulfosalt 2 (tetrahedrite?)	trace
Chalcopyrite	trace
Pyrrhotite (associated with chalcopyrite, sulfosalts)	trace

This sample consists of possibly formerly crudely banded, but now almost massive, sulfides (mainly pyrite; matrix of sphalerite-local galena-minor arsenopyrite-sulfosalt(s)-trace chalcopyrite-pyrrhotite); gangues are mainly quartz, lesser carbonate, minor barite. The massive sulfide "bands" appear to be 1-2 cm thick locally alternating with thinner, poorly defined, discontinuous or disrupted "bands" richer in carbonate (locally Fe-stained, possibly with minor limonite and/or sericite?). <u>These carbonate-rich bands appear to be associated with the bulk of the sulfosalts.</u>

The bulk of the sulfide bands consist of pyrite, forming either tightly interlocking, 0.1-0.5 mm sub/anhedra, or 0.5-1.0 mm sub/euhedra, set in a matrix of variable sphalerite, minor galena, quartz and carbonate. The pyrite is locally partly replaced at the core by arsenopyrite as euhedra mostly <0.1 mm. Sphalerite typically forms interlocking, subhedral crystals <0.5 mm (locally aggregating to ~2 mm) with medium orange-brown colour indicative of moderate Fe content. It is intergrown with or contains inclusions of galena as ragged, locally skeletal anhedra rarely >1 mm, closely associated with or including sulfosalts (irregular masses also to ~1 mm of locally bladed subhedra mostly <0.4 mm that are slightly or distinctly darker than the galena, with a faint to distinct olive-green tint, and distinctly to strongly anisotropic in shades of grey under crossed polars, likely Pb-As/Sb sulfosalt such as boulangerite and/or unidentified?). Chalcopyrite is relatively rare, forming subhedra <0.1 mm; intergrown with traces of sulfosalt 2 (grey, isotropic, likely tennantite-tetrahedrite?) as subhedral inclusions <50 µm, and rare pyrrhotite as subhedra <25 µm.

In summary, this is relatively unbanded massive pyrite-sphalerite-galena-arsenopyrite-minor sulfosalts (boulangerite?/unidentified?/tennantite?)-trace chalcopyrite-pyrrhotite, with quartz-carbonate-minor barite? ± possible limonite/sericite gangue.

K15-296 19.66-19.79: MASSIVE PYRITE-MINOR SPHALERITE-CHALCOPYRITE-MAGNETITE-RELICT PYRRHOTITE (ALTERED TO MARCASITE)-GALENA/SULFOSALT (MAINLY PB-SB-AS?, TRACE TETRAHEDRITE?), INTER-BANDED WITH GANGUES OF CARBONATE, MINOR QUARTZ

Hand sample not supplied; etched offcut shows mainly very fine-grained, dark grey, crudely banded/ laminated massive sulfide composed mainly of pyrite but with local chalcopyrite- or sphalerite-rich bands, and only minor gangue. The rock is distinctly to strongly magnetic, but shows only minor reaction to cold dilute HCl (only where scratched), and no stain for K-feldspar. Modal mineralogy in polished thin section is approximately:

Gangue (20%)

Carbonate (dolomite or ankerite?)	85%
Quartz	15%

Ore (80%)

Pyrite	85%
Sphalerite	5%
Chalcopyrite	5%
Magnetite	2-3%
Pyrrhotite (partly/largely altered to pyrite/marcasite)	2-3%
Galena	<1%
Sulfosalt 1 (Pb-As-Sb?)	<1%
Sulfosalt 2 (tetrahedrite?)	trace

This sample consists mainly of crudely banded massive sulfides, dominated by pyrite with only minor sphalerite-chalcopyrite-magnetite-pyrrhotite (mainly replaced by marcasite), local galena and sulfosalt, alternating with poorly defined, discontinuous bands of gangues (mainly carbonate, less quartz).

Gangue minerals locally concentrated into discontinuous bands up to about 2 mm thick are parallel to the poorly defined banding in the sulfides. Carbonate forming the bulk of the gangues occurs as sub- to anhedral, irregular crystals mostly <1.2 mm long, but locally in aggregates up to 3 mm long (length:width up to 3:1) more or less aligned in the plane of banding. Quartz crystals typically intergrown with the carbonate occur as irregular to rounded sub/anhedra mostly <1 mm that lack elongation in the plane of banding. The very slow reaction to cold dilute HCl, only where powdered, suggests it is likely dolomite and ankerite (?). If barite is present it is not readily detectable.

Ore minerals are concentrated in poorly defined, thin bands or discontinuous laminae mostly <3 mm thick, but commonly coalescing to almost 2 cm. They vary from pyrite rich (±chalcopyrite, relict pyrrhotite replaced by marcasite) to sphalerite (±galena, sulfosalt) rich, the latter more commonly associated with gangues of carbonate and quartz. Pyrite typically occurs as interlocking, sub- to euhedral cubic crystals ranging from 0.1 to 0.5 mm, locally with a matrix of chalcopyrite and/or pyrrhotite (largely altered to marcasite) or magnetite. The chalcopyrite is typically interstitial to pyrite, fine-grained (irregular to locally subhedral, <0.1 mm but aggregating to 1.5 mm). Pyrrhotite occurs as subhedra to 0.4 mm almost everywhere replaced by lamellar-textured marcasite as subhedral needles <0.1 mm long. Magnetite occurs as fractured subhedra or irregular aggregates rarely over 1 mm across. Sphalerite is only locally present, forming sub- to locally euhedral crystals mostly in the 0.2-0.5 mm range, with orange-brown to dark red-brown colour suggestive of fairly high Fe content, only rarely intergrown or associated with irregular crystals of galena (anhedral, <1 mm) and anisotropic sulfosalt (boulangerite/unidentified?) forming highly irregular masses mostly <0.5 mm long (composed of sub/anhedra mainly <0.25mm), typically located at the margins of, or included within, pyrite where associated with sphalerite or galena. This sulfosalt rarely contains inclusions of grey, apparently isotropic sulfosalt (likely tetrahedrite <50 μm in size.

In summary, this is massive pyrite-minor sphalerite-chalcopyrite-magnetite-relict pyrrhotite (altered to marcasite)-galena/sulfosalt (mainly Pb-Sb-As?, trace tetrahedrite?), inter-banded with gangues of carbonate, minor quartz.

K15-296 23.8-23.93: MASSIVE PYRITE-LESSER SPHALERITE-MINOR GALENA-MAGNETITE (ALTERED TO CARBONATE)-TRACE CHALCOPYRITE-RARE SULFOSALT (TETRAHEDRITE?), BANDED WITH GANGUES OF QUARTZ-CARBONATE±SERICITE

Hand sample not supplied; etched offcut shows mainly fine-grained, dark grey, crudely banded/laminated massive sulfide composed mainly of pyrite and sphalerite, with only minor gangue. The rock is locally distinctly magnetic, and shows minor reaction to cold dilute HCl (mainly where scratched), but no stain for K-feldspar. Modal mineralogy in polished thin section is approximately:

Gangue (20%)

Quartz	50%
Carbonate (calcite, dolomite?)	45%
Sericite (muscovite)	<5%

Ore (80%)

Pyrite	60%
Sphalerite	30%
Galena	3-5%
Magnetite (altered to carbonate)	1-2%
Chalcopyrite	<1%
Sulfosalt 2 (tetrahedrite?)	trace

This sample consists mainly of crudely banded massive sulfides, dominated by pyrite-significant sphalerite-lesser galena-trace chalcopyrite, alternating with poorly defined, discontinuous bands of gangues (containing mainly roughly equal proportions of quartz and carbonate; local minor sericite).

Gangue minerals are locally concentrated into discontinuous bands mainly <2 mm thick, parallel to the poorly defined banding in the sulfides. Quartz content is variable, locally forming the bulk of the gangue, or in places subordinate to carbonate. Quartz occurs as sub- to anhedral, irregular crystals mostly <0.65 mm, locally in aggregates with rounded outlines to ~1 mm; the crystals are typically randomly oriented. Carbonate crystals typically intergrown with the quartz occur as ragged, irregular to skeletal anhedra mostly <0.6 mm that where in aggregates locally show elongation in the plane of banding. The variable reaction to cold dilute HCl, strongest where powdered, suggests it may be calcite and dolomite (?). Minor sericite or muscovite is locally present as ragged, subhedral flakes rarely over 0.6 mm in diameter, separately or mixed with carbonate, generally not aligned.

Ore minerals are concentrated in poorly defined, thin bands or discontinuous laminae mostly <1 mm thick, but commonly coalescing in places to almost 1 cm. They vary from pyrite rich (±chalcopyrite) to sphalerite (±galena, magnetite) rich; there is no obvious relation with quartz-carbonate variation. Pyrite typically occurs as euhedral cubic crystals ranging from 0.1 to 0.5 mm; set in a matrix of sphalerite-minor galena-rare local chalcopyrite. Sphalerite forms sub- to locally euhedral crystals mostly in the 0.5-1.0 mm range, with medium orange-brown colour suggestive of moderate Fe content, and commonly intergrown with or containing inclusions of galena (ragged, anhedral/skeletal, to ~1 mm) or very rarely chalcopyrite (fine-grained, interstitial, <0.1 mm). Galena rarely contains trace amounts of the grey, apparently isotropic sulfosalt (tennantite-tetrahedrite?) as subhedra <50 μm typically located at the margins of galena. Magnetite occurs sporadically as ragged, fractured subhedra mostly <0.5 mm, typically partly altered to carbonate along the fractures; carbonate appears to include both slightly coarser, lower-relief calcite (subhedra to 0.2 mm) and finer-grained, higher-relief dolomite or ankerite (?) as granular subhedra mostly <35 μm.

In summary, this is massive pyrite-lesser sphalerite-minor galena-magnetite (altered to carbonate)-trace chalcopyrite-rare sulfosalt (tetrahedrite?), inter-banded with gangues of quartz-carbonate-minor sericite, possibly from the upper zones of a volcanogenic massive sulfide deposit.

K15-312 62.4-62.5: RELATIVELY UN- OR CRUDELY BANDED MASSIVE PYRITE-SPHALERITE-GALENA-TRACE SULFOSALTS (UNIDENTIFIED?/TENNANTITE?)-TRACE CHALCOPYRITE, WITH CARBONATE-BARITE?-MINOR QUARTZ± APATITE? GANGUE

Hand sample not supplied; etched offcut shows fine/medium-grained, grey, almost unbanded massive sulfide composed mainly of pyrite-sphalerite in lesser gangue (locally segregated into ~1 cm bands of coarser carbonate). The rock is locally very slightly magnetic, shows slow reaction to cold dilute HCl (mostly where scratched, mainly in the coarser bands), and no stain for K-feldspar. Modal mineralogy in polished thin section is approximately:

Gangue (30%)

Carbonate (dolomite except veins of Fe-calcite?)	80%
Barite (?)	15%
Quartz	~5%
Apatite (?)	<1%

Ore (70%)

Pyrite	55%
Sphalerite	35%
Galena	10%
Chalcopyrite	trace
Sulfosalt 1 (Pb-As-Sb?)	trace
Sulfosalt 2 (tetrahedrite?)	trace

This sample consists of very crudely banded, almost massive, sulfides (pyrite in significant matrix of sphalerite-galena-very rare sulfosalt(s)-chalcopyrite); gangues are mainly quartz, lesser carbonate, minor barite. The massive sulfide bands are 2-3 cm thick locally alternating with poorly defined, discontinuous or disrupted bands up to 1 cm thick rich in gangues (mainly carbonate, locally with barite (?), very minor quartz, rare apatite?). Thin, late carbonate veinlets are sub-perpendicular to the crude banding.

The bulk of the sulfide bands consist of pyrite and sphalerite, lesser galena. Pyrite forming either tightly interlocking, 0.1-0.5 mm subhedra, or 0.5-1.0 mm euhedra (in places segregated into poorly defined bands <2-3 mm thick), is set in a variable but locally almost continuous matrix of variable sphalerite, galena, and minor carbonate. The pyrite locally contains inclusions of galena or sphalerite as rounded subhedra mostly <0.1 mm. Sphalerite typically forms interlocking, subhedral crystals <1.5 mm (locally semi-continuous aggregates to ~5 mm) with medium to dark orange-brown colour indicative of moderate/high Fe content. It is intergrown with or contains common inclusions of galena as ragged, locally skeletal anhedra commonly up to 2 mm across, very rarely including sulfosalts (irregular subhedral masses <0.1 mm that are slightly anisotropic in shades of grey under crossed polars, possibly Pb-As/Sb sulfosalt?, or traces of grey, isotropic sulfosalt 2, likely tennantite-tetrahedrite? as subhedral inclusions <50 μm). Chalcopyrite is relatively rare, forming subhedra <0.1 mm; intergrown with or included within sphalerite, only in the coarse carbonate band.

Gangue-rich bands, especially the coarse-grained one, consist of interlocking carbonate (subhedra that are semi-continuous for up to about 3 mm, although somewhat recrystallized, with undulose or variable extinction suggestive of deformation; could be dolomite?), lesser probable barite (?) as rounded subhedra to 1.2 mm with locally visible cleavage, and relief near that of carbonate compared to relatively rare quartz of similar size and shape (the quartz is also distinguishable in reflected light by its strong positive relief). Rarely, rounded subhedra <0.5 mm of similar appearance to barite, within the massive sulfide, appear to give uniaxial negative interference figures, suggestive of apatite (?). Late, planar veinlets up to 1.5 mm thick consist of interlocking, relatively clear carbonate (calcite?) as subhedra to almost 2 mm long.

In summary, this is relatively un- or crudely banded massive pyrite-sphalerite-galena-trace sulfosalts (unidentified?/tennantite?)-trace chalcopyrite, with carbonate-barite?-minor quartz- ± possible apatite gangue.

K15-314 135.82-135.93: SEMI-MASSIVE PYRITE (IN PART AFTER PYRRHOTITE?)-SPHALERITE-GALENA-MINOR ARSENOPYRITE-CHALCOPYRITE-TRACE SULFOSALT IN GANGUES OF QUARTZ-CARBONATE-SERICITE/MUSCOVITE

Hand sample not supplied; etched offcut shows fine-grained, grey, finely banded/laminated semi-massive sulfide composed mainly of pyrite and sphalerite in abundant quartz?-carbonate gangue. The rock is not magnetic, shows slow reaction to cold dilute HCl (mainly where scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (65%)

Quartz	60%
Carbonate (mainly dolomite?)	20%
Sericite/muscovite	20%

Ore (35%)

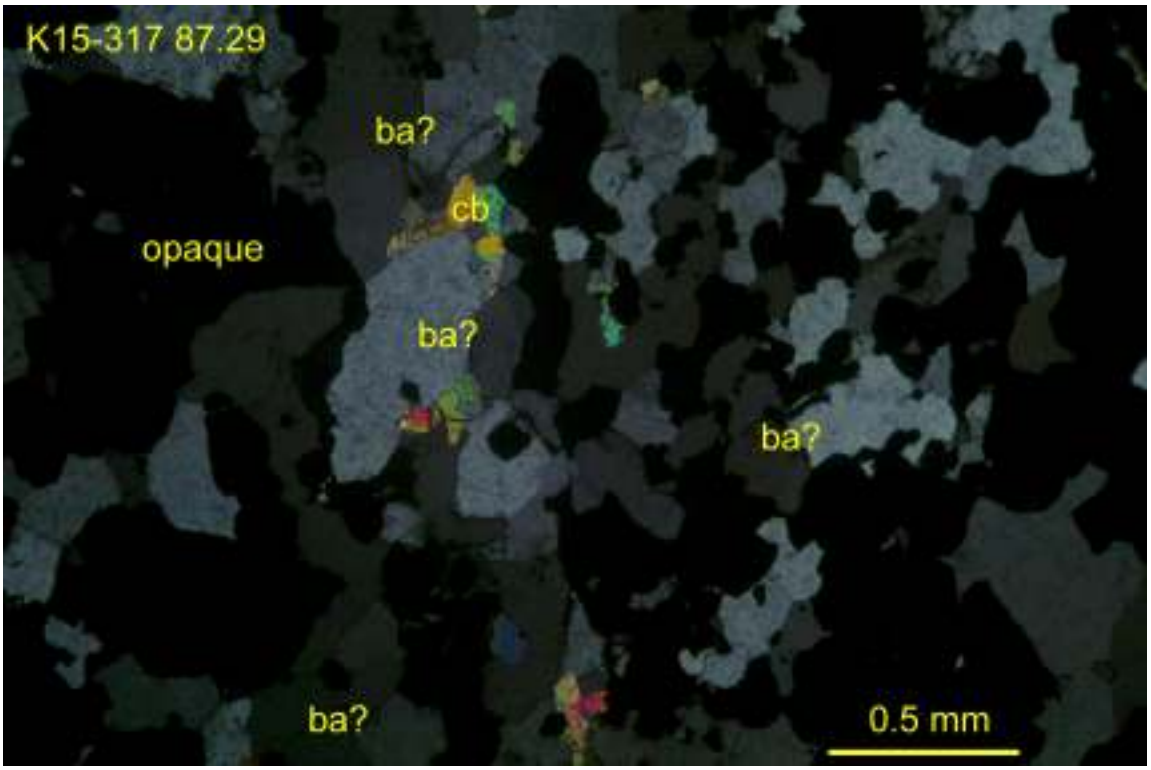
Pyrite	75%
Sphalerite	15%
Galena	3-5%
Arsenopyrite	1-2%
Chalcopyrite	<1%
Sulfosalt 2 (tennantite-tetrahedrite?)	trace

This sample consists of poorly defined, partly discontinuous, thin bands or laminae (mostly 1-2 mm thick, but aggregating to ~1 cm) of sulfide-rich (pyrite, variable sphalerite, galena, arsenopyrite, minor local chalcopyrite) or gangue-rich (mainly quartz-lesser carbonate-sericite/muscovite) rock.

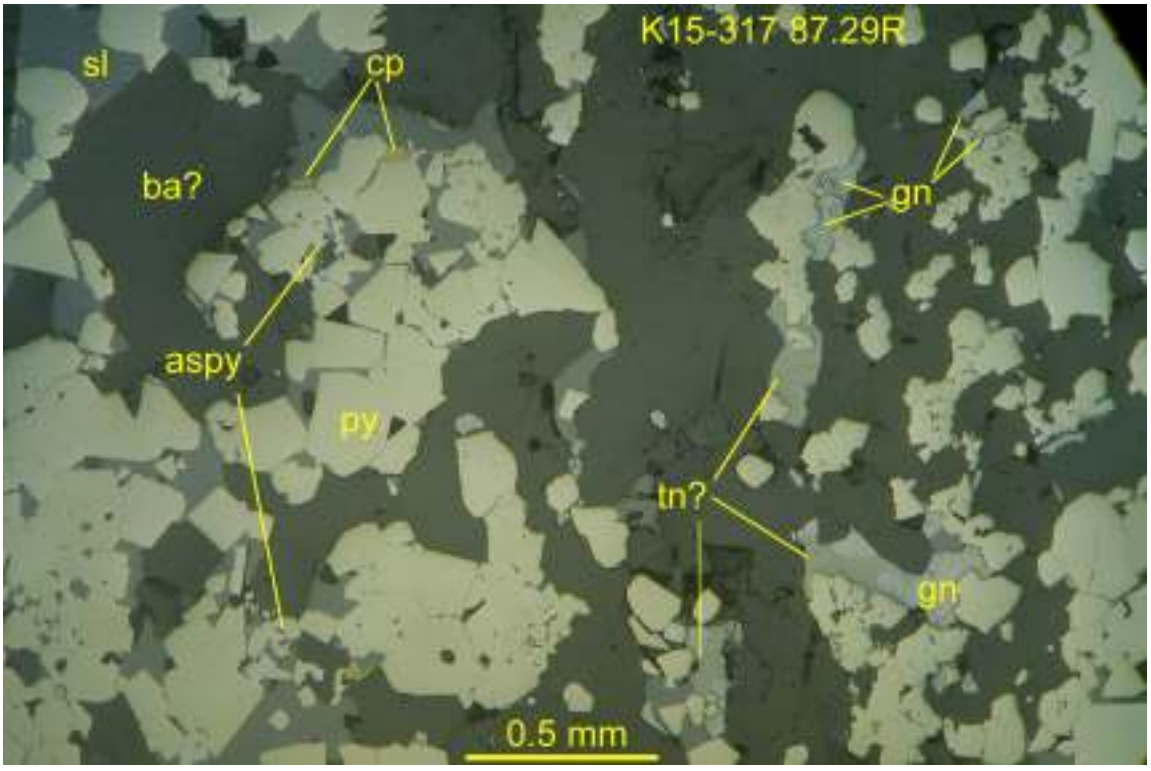
Gangue minerals are dominated by quartz, but in places with intimately intermixed carbonate and sericite/muscovite. Quartz forms interlocking, locally somewhat rounded sub/anhedra mainly in the 0.5-1.0 mm range, but locally forming lensy aggregates up to 2 mm long (aligned with the banding, somewhat elongated to ~3:1 length:width ratio). Only mild undulose extinction, no sub-grain development or suturing of grain boundaries suggests either weak deformation or post-deformation annealing; the latter is supported by poorly developed triple junctions. The carbonate typically forms sub- to anhedral crystals mainly in the 0.5 mm up to almost 1 mm range, the latter locally in lenses up to ~4 mm long also with elongation in the plane of banding/foliation. The carbonate species is difficult to be sure of due to the HF attack damaging the surface and making it less reactive, but is likely dolomite (?). Sericite or muscovite forms coarse euhedral flakes up to about 1 mm, mostly aligned in the plane of banding/foliation. In some laminae/foliae, sericite or muscovite dominates as aligned flakes that impart a foliation.

Ore mineral bands or laminations are highlighted by grain size or compositional variation (pyrite-rich, with sphalerite- or galena-rich, local arsenopyrite; chalcopyrite is much more restricted in its distribution). Pyrite forms generally cubic sub/euhedra <0.5 mm in diameter, or in some bands mainly in the 20 μm-0.1 mm range (the latter could in part possibly be after former pyrrhotite relics with sub/anhedral outlines <0.65 mm?). Arsenopyrite is locally recognized as euhedra to 0.3 mm, at the cores of (possibly replacing?) pyrite aggregates. Sphalerite forms somewhat rounded sub- to rarely euhedral crystals mostly <0.5 mm in diameter commonly mixed with galena forming ragged subhedral to skeletal crystals also <0.5 mm that tend to be tarnished (poorly polished) making search for possible sulfosalt 1 difficult. Both galena and to a lesser extent sphalerite locally show atoll texture, filling the cores of pyrite crystals (possible remnants of original sea-bed sulfides?). Sphalerite shows dark orange-brown colour suggestive of moderate/high Fe content. Chalcopyrite occurs only sparsely as sub/anhedra or aggregates mostly <0.2 mm, commonly intergrown with galena; here, traces of grey, apparently isotropic sulfosalt (tennantite-tetrahedrite?) occur included in galena as subhedra <0.1 mm.

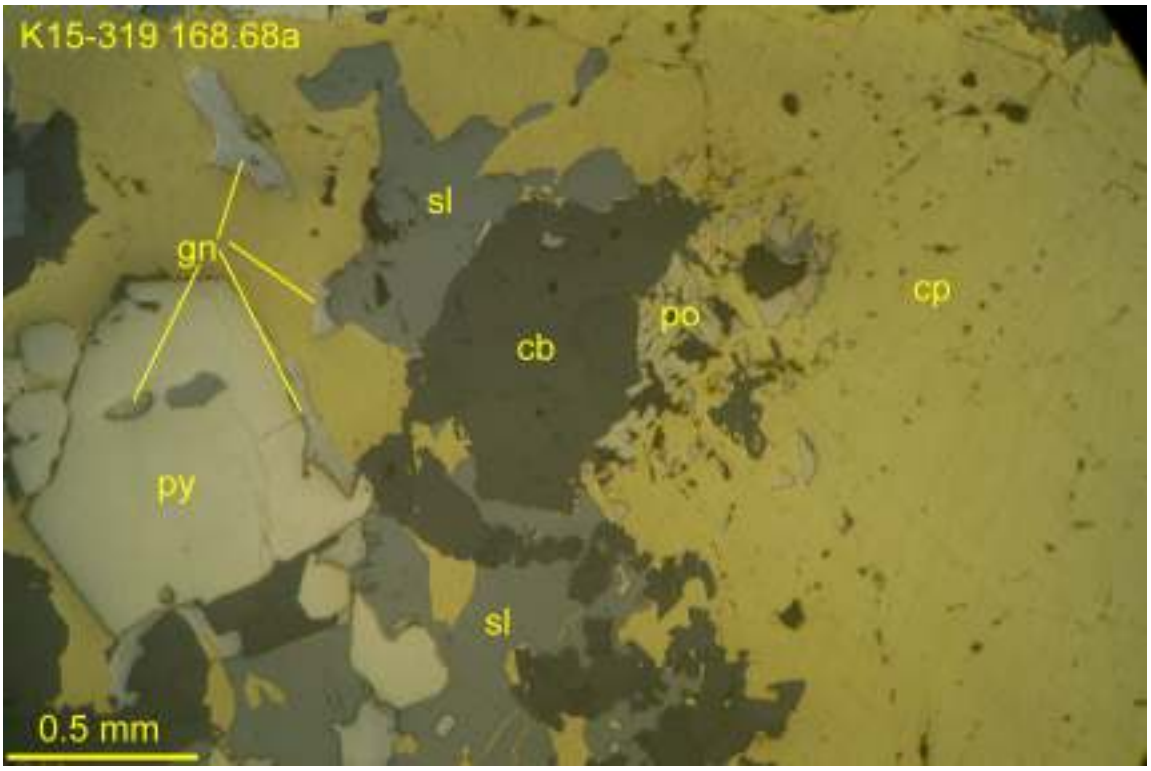
In summary, this is semi-massive pyrite (in part after pyrrhotite?)-sphalerite-galena-minor arsenopyrite-chalcopyrite±tetrahedrite? in gangues of quartz-carbonate-sericite/muscovite. Sphalerite and galena are mostly concentrated in thin bands with pyrite that alternate with gangue-rich bands.



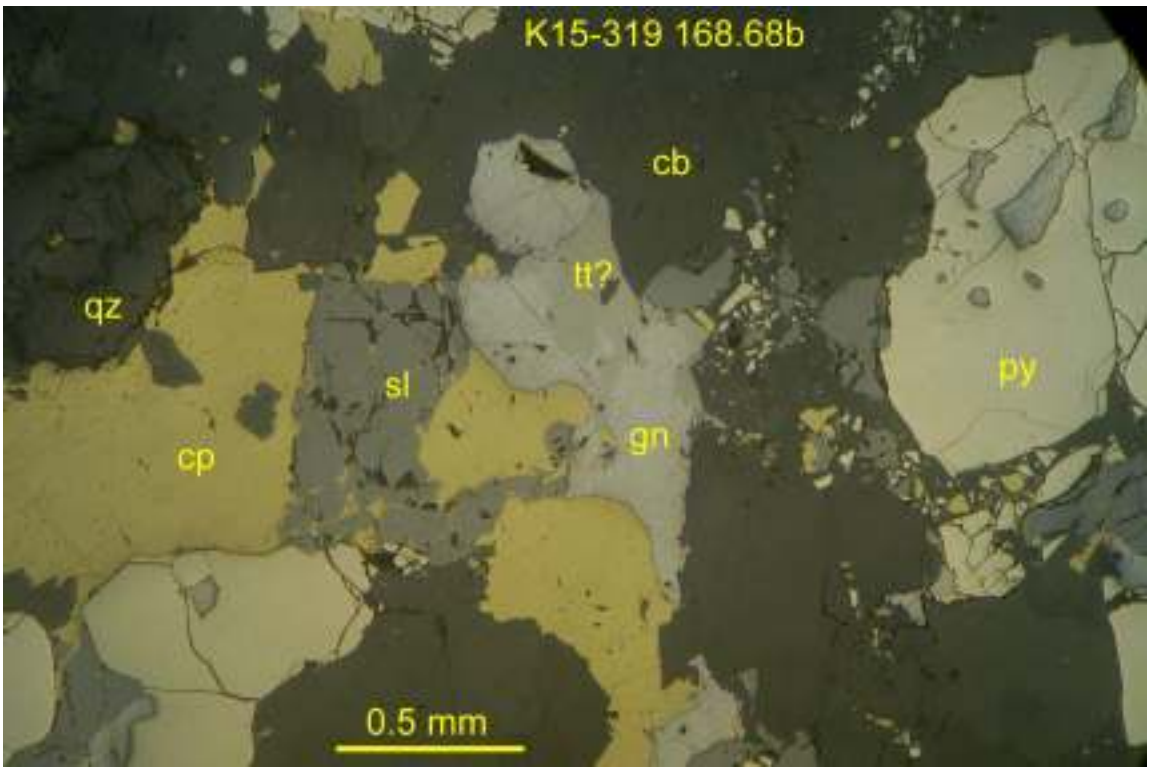
K15-317 87.29-87.44: gangue-rich band composed mainly of probable barite (ba?) with only minor carbonate (cb); opaque is mainly sulfide ±sulfosalt (see below). Transmitted light, crossed polars, field of view ~3 mm wide.



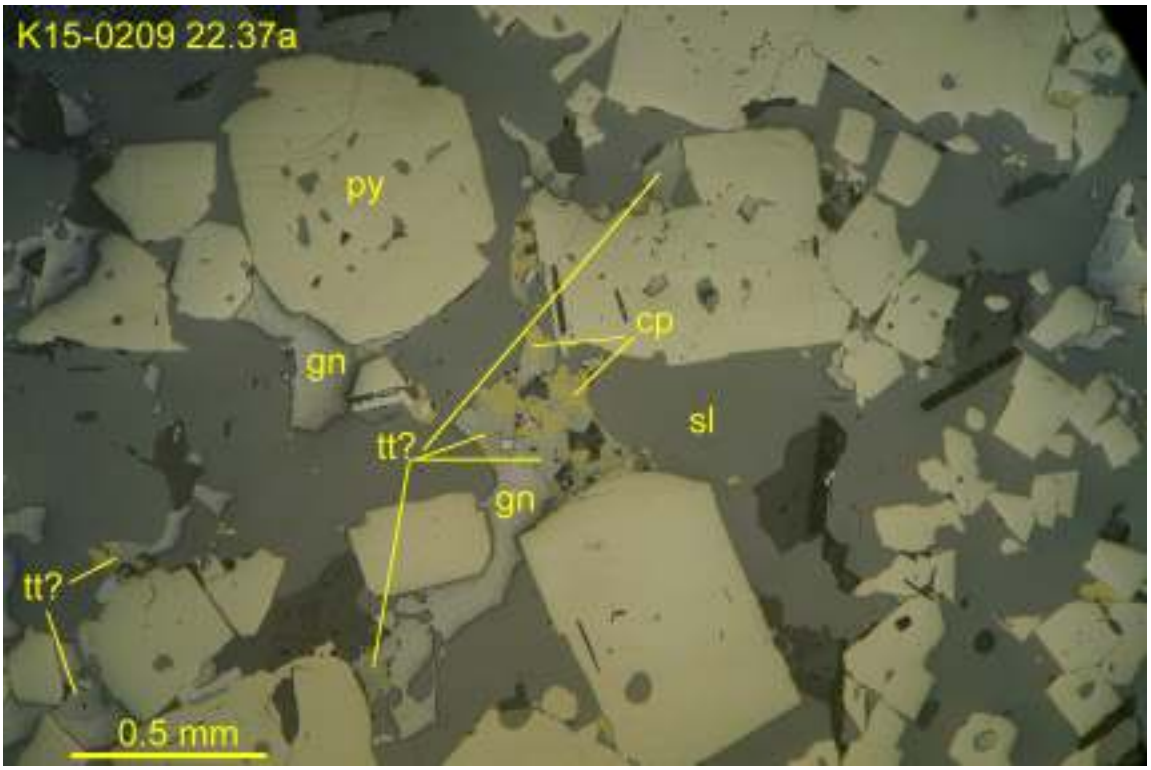
K15-317 87.29-87.44R: approximately same view as above to show grey sulfosalt (tennantite-tetrahedrite, tn?) with galena (gn) and sphalerite (sl) in gangue-rich band, flanked by pyrite (py)-minor arsenopyrite (aspy) rich bands also containing sphalerite and traces of chalcopyrite (cp). Reflected light, uncrossed polars, field of view ~3 mm wide.



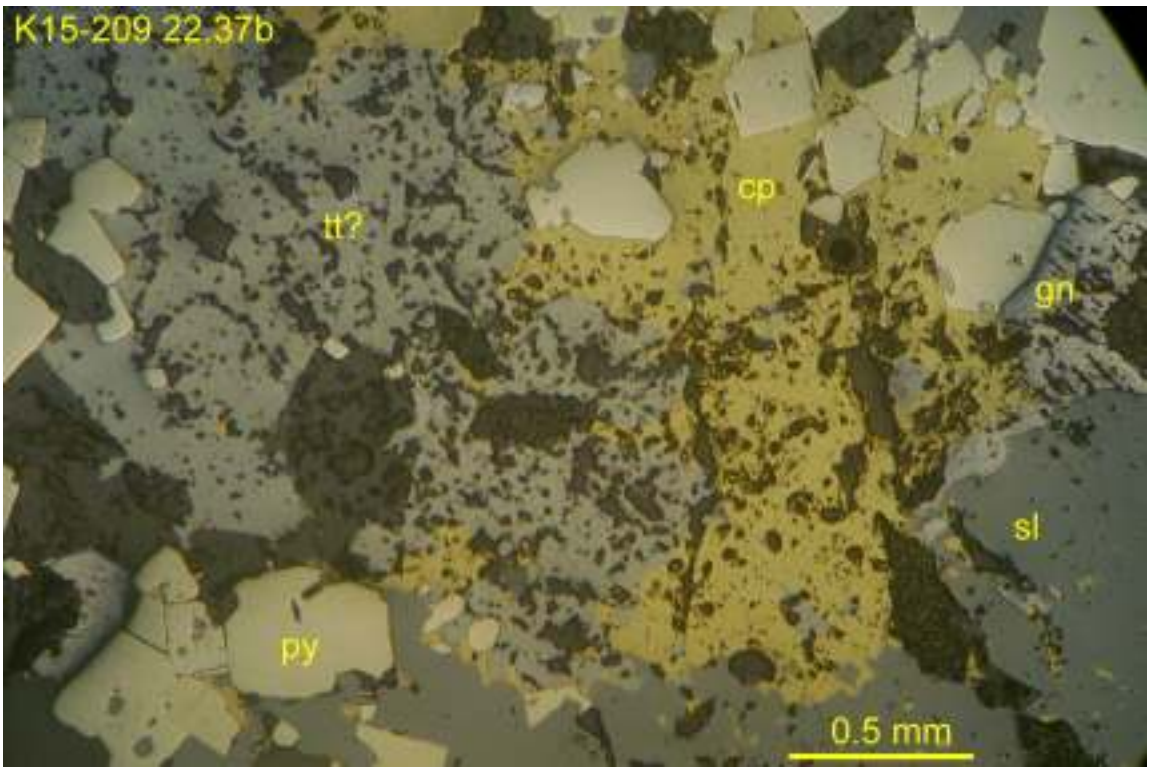
K15-319 168.68-168.83a: abundant, coarse-grained chalcopyrite (with minor inclusions of galena or local pyrrhotite, po), intergrown with or partly remobilized into adjacent sphalerite, surrounding euhedral pyrite that may contain inclusions of galena; gangues are mostly carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



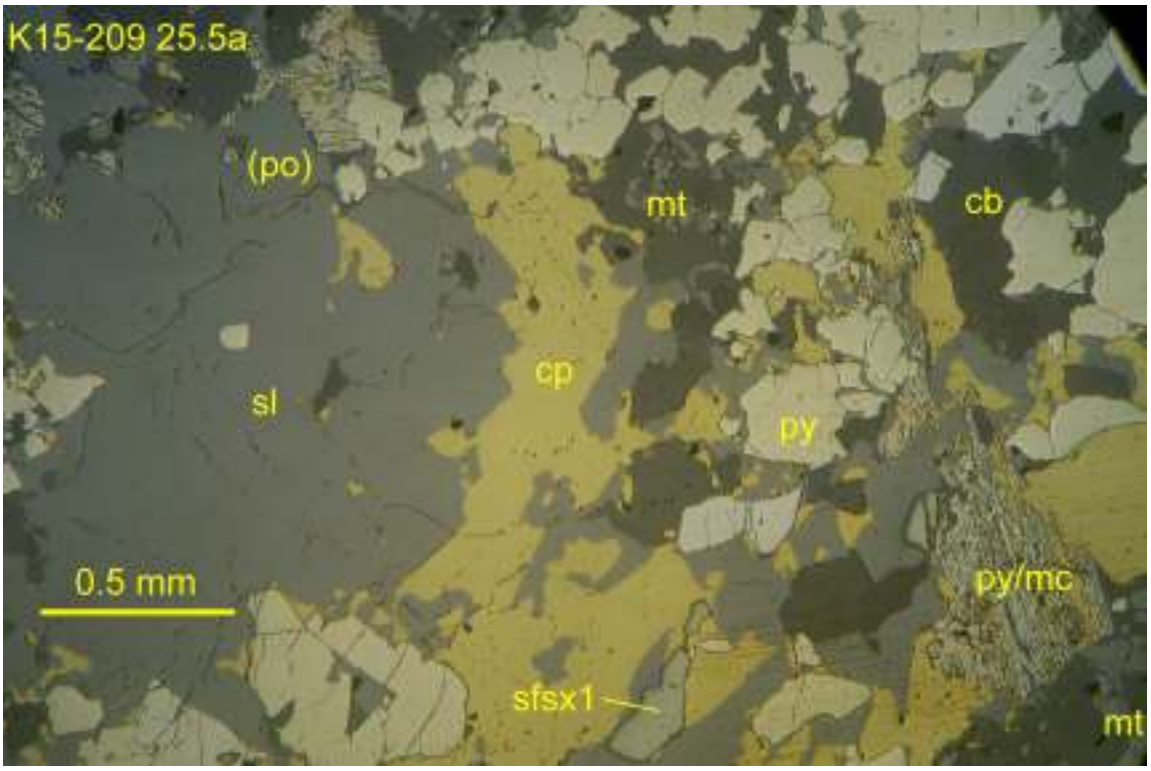
K15-319 168.68-168.83b: galena containing symplectic intergrowths/inclusions of grey isotropic sulfosalt (tetrahedrite tt?), intergrown with subhedral pyrite, chalcopyrite and sphalerite (micro-veinlets of chalcopyrite in sphalerite, galena inclusions in pyrite). Gangues are carbonate/minor quartz (qz). Reflected light, uncrossed polars, field of view~3 mm.



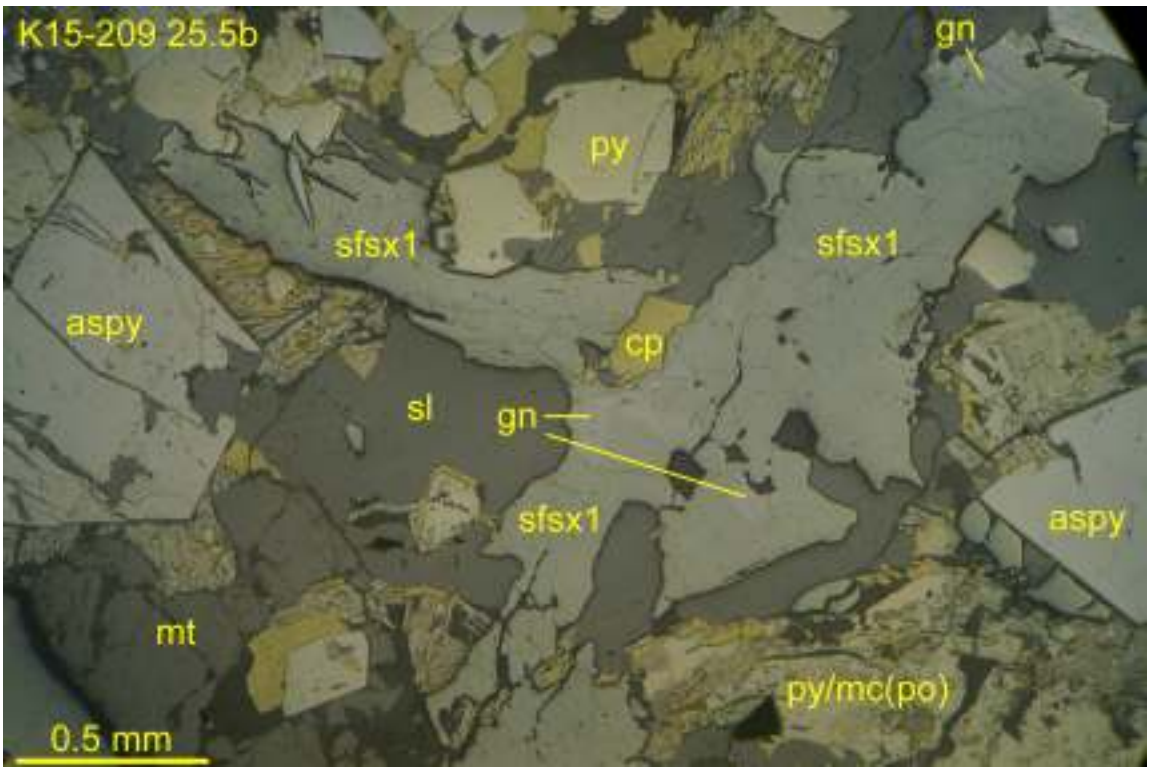
K15-209 22.37-22.5a: Zn-Pb rich band composed of matrix of sphalerite-minor galena (locally containing chalcopyrite-grey sulfosalt, likely tetrahedrite?), with coarser pyrite as cubic euhedra than in adjacent, pyrite-rich bands which contain finer-grained pyrite; gangues are barite and carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



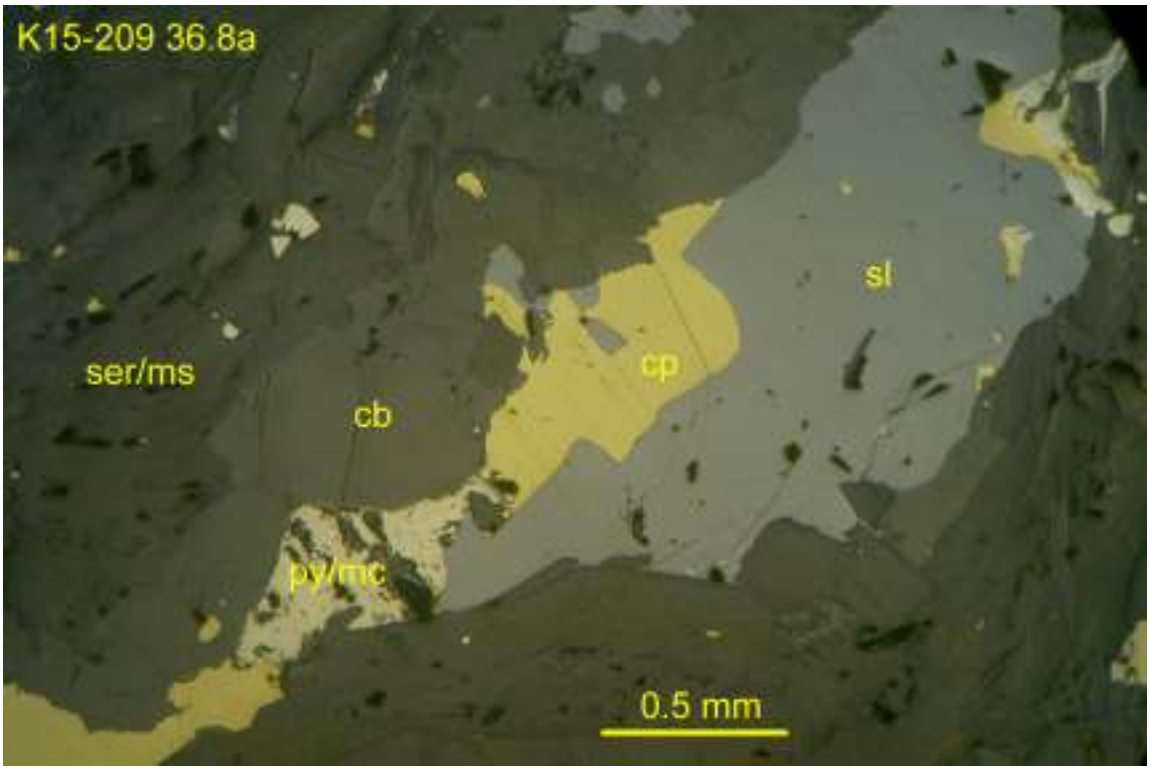
K15-209 22.37-22.5b: coarse-grained, abundant grey sulfosalt (tetrahedrite?) intergrown with chalcopyrite, sphalerite, lesser galena (gangues mostly barite, minor carbonate) in base-metal rich band between pyrite-rich bands. Reflected light, uncrossed polars, field of view ~3 mm wide.



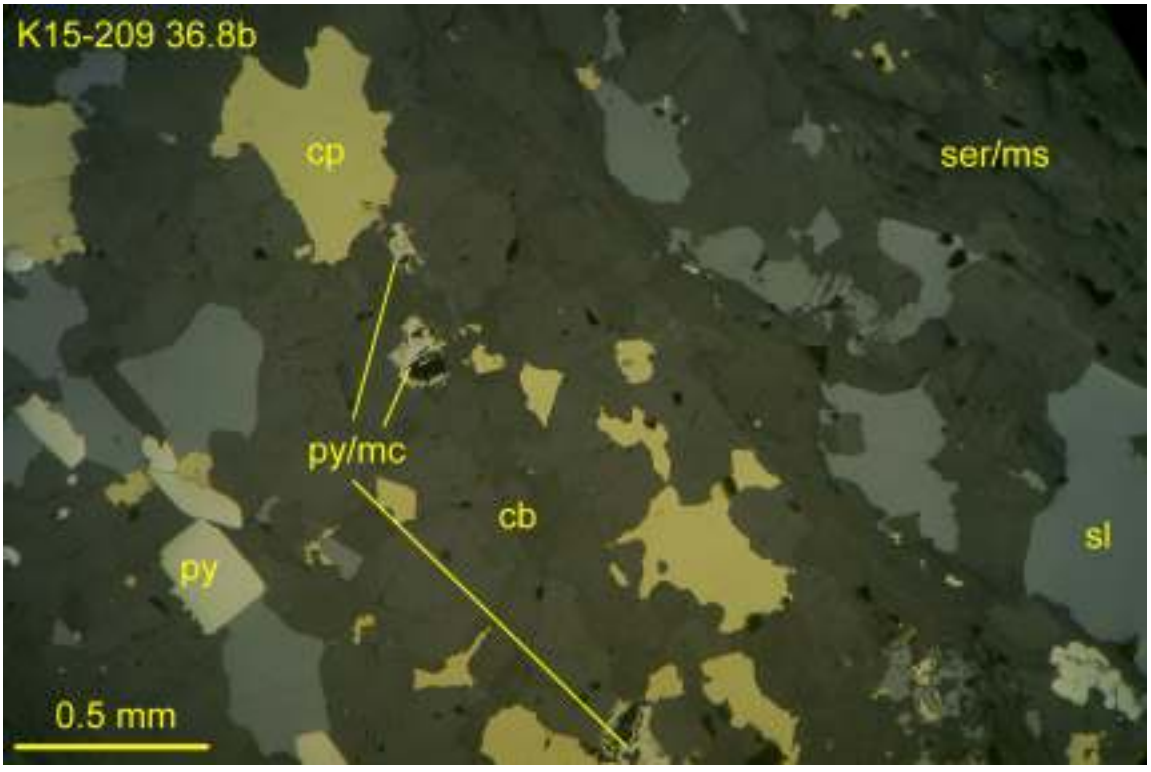
K15-209 25.5-25.63a: coarse sphalerite-chalcopyrite-minor pyrrhotite (partly replaced by lamellar-textured marcasite, mc) and carbonate gangue matrix to subhedral pyrite, local minor magnetite (mt) and rare sulfosalt 1 (sfsx). Reflected light, uncrossed polars, field of view ~3 mm wide.



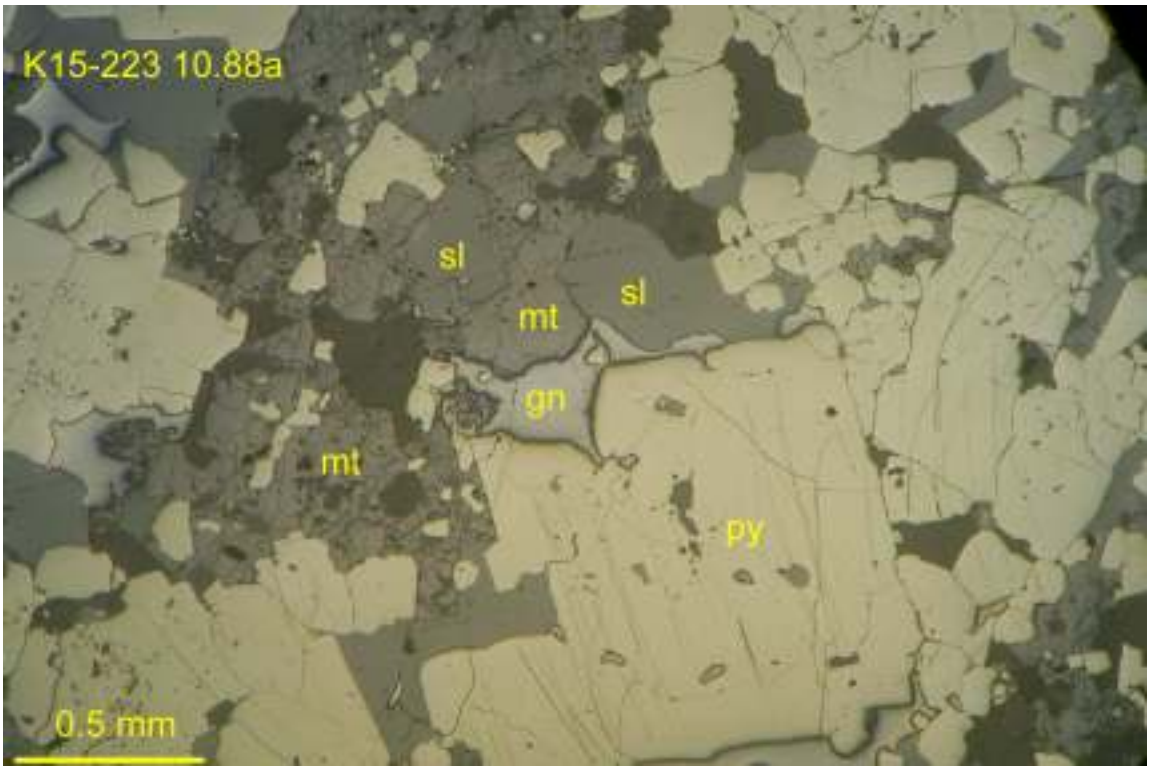
K15-209 25.5-25.63b: coarse sulfosalt 1 (possibly boulangerite, mixed with minor galena, and at margins with sulfosalt 2, likely tetrahedrite?), forming matrix with sphalerite, chalcopyrite and marcasite after pyrrhotite, to subhedral pyrite and local magnetite, euhedral arsenopyrite. Reflected light, uncrossed polars, field of view ~3 mm wide.



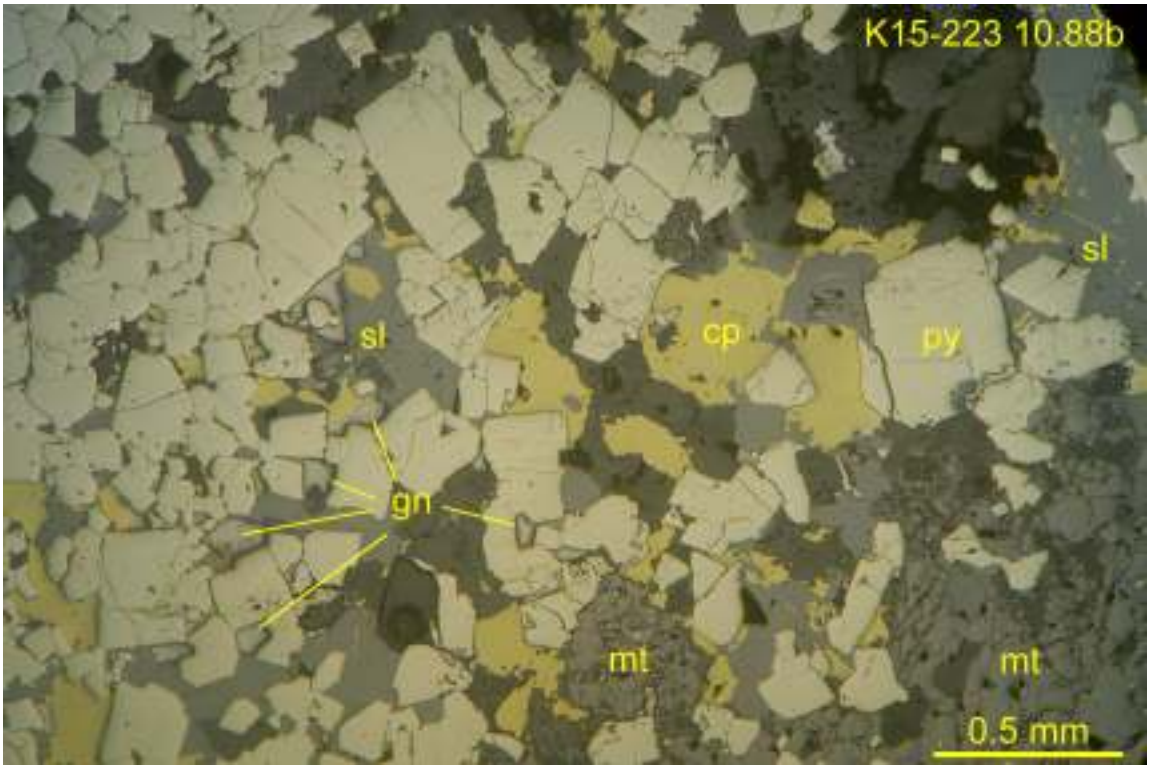
K15-209 36.8-36.9a: alternating bands/laminae of either sphalerite-chalcopyrite-relict pyrrhotite (altered to pyrite ±marcasite, py/mc) rich, or gangue (carbonate-sericite/muscovite) rich rock. Reflected light, uncrossed polars, field of view ~3 mm wide.



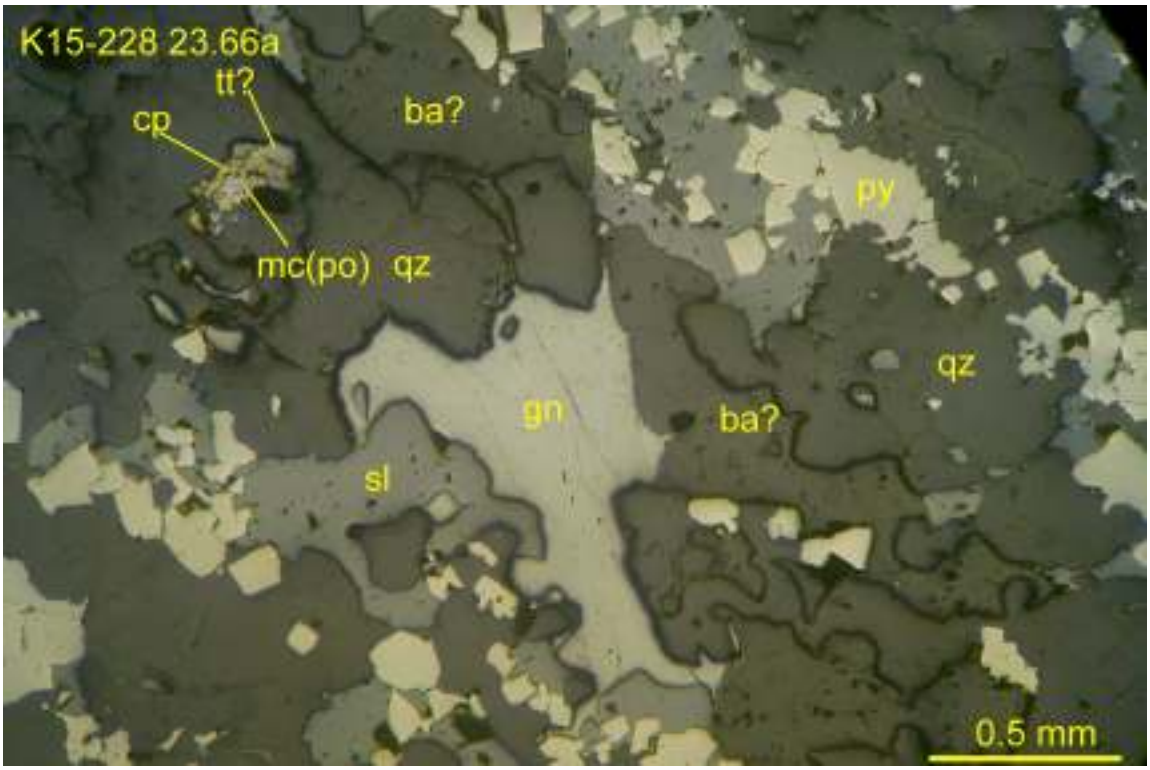
K15-209 36.8-36.9b: alternating bands/laminae of sphalerite-chalcopyrite-primary cubic pyrite or relict pyrrhotite (altered to pyrite ±marcasite)-minor magnetite, or gangue (carbonate-sericite/muscovite) rich rock. Reflected light, uncrossed polars, field of view ~3 mm wide.



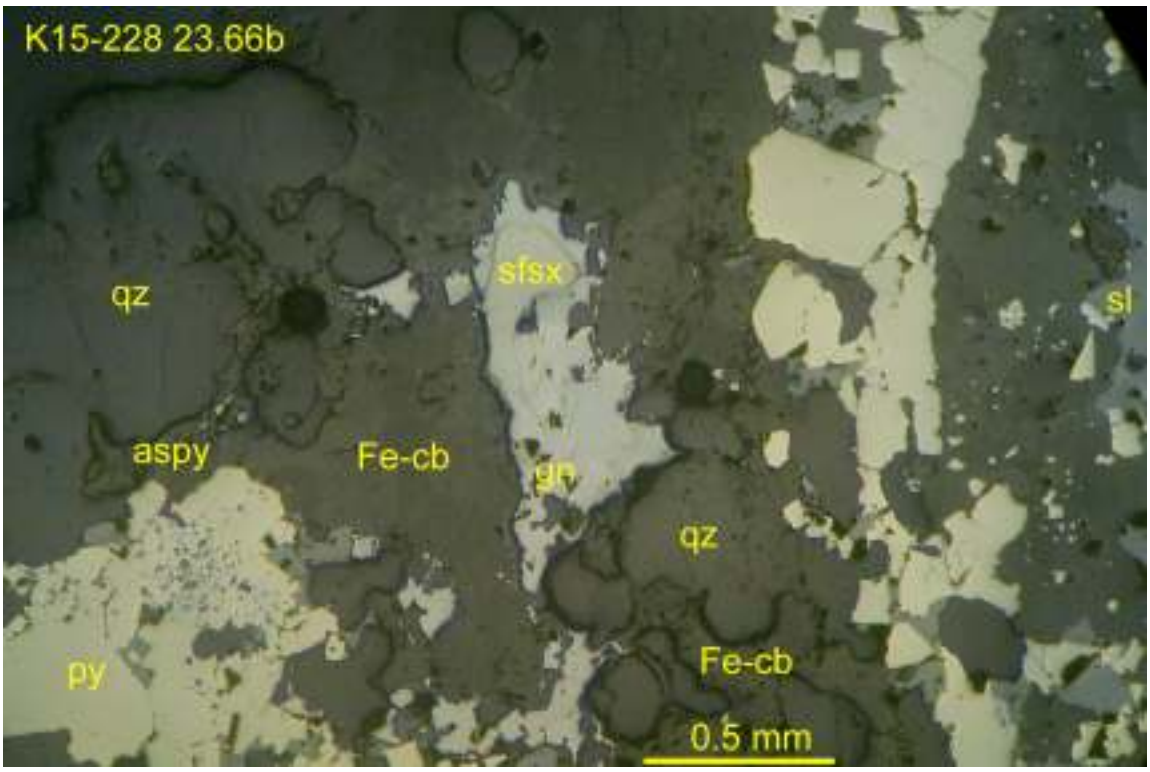
K15-223 10.88-11.01a: crudely alternating euhedral pyrite-rich and sphalerite-magnetite-minor galena rich bands; magnetite is difficult to distinguish from matrix sphalerite except by its fractured nature. Gangues are mostly carbonate in this view. Reflected light, uncrossed polars, field of view ~3 mm wide.



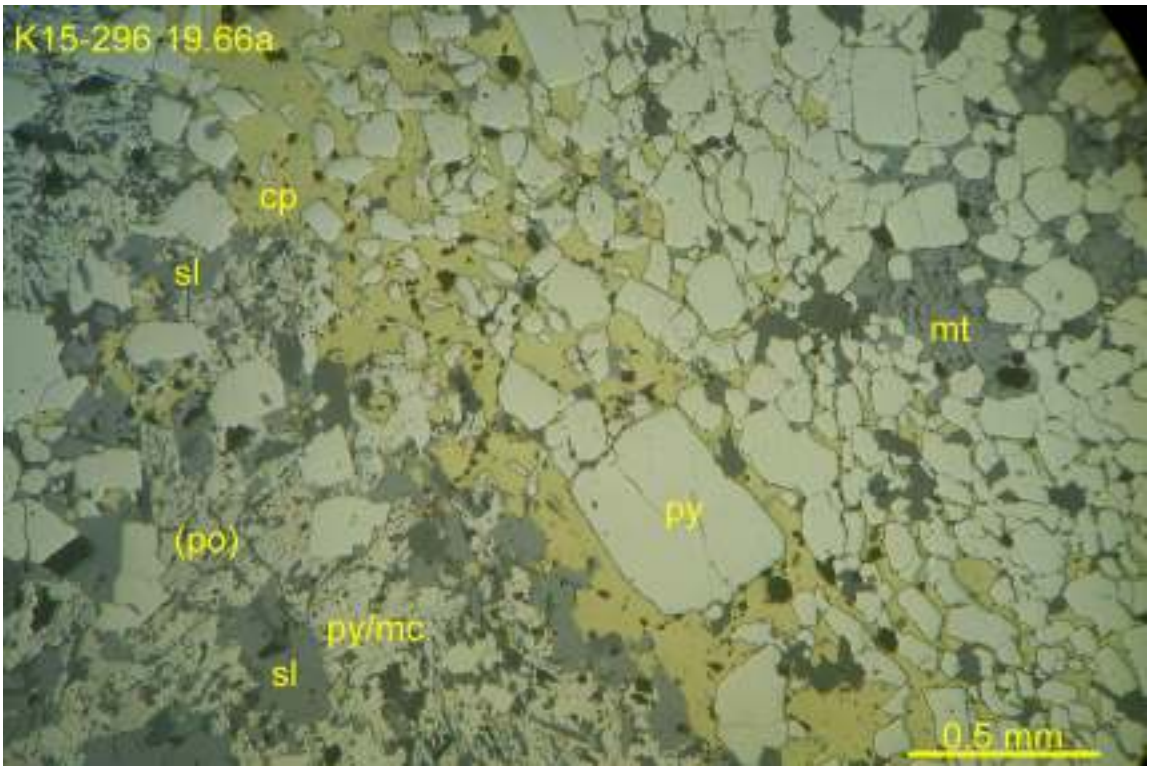
K15-223 10.88-11.01b: unusual band in which chalcopyrite is much more common, intermixed with sphalerite and minor galena as matrix to cubic pyrite crystals. Reflected light, uncrossed polars, field of view ~3 mm wide.



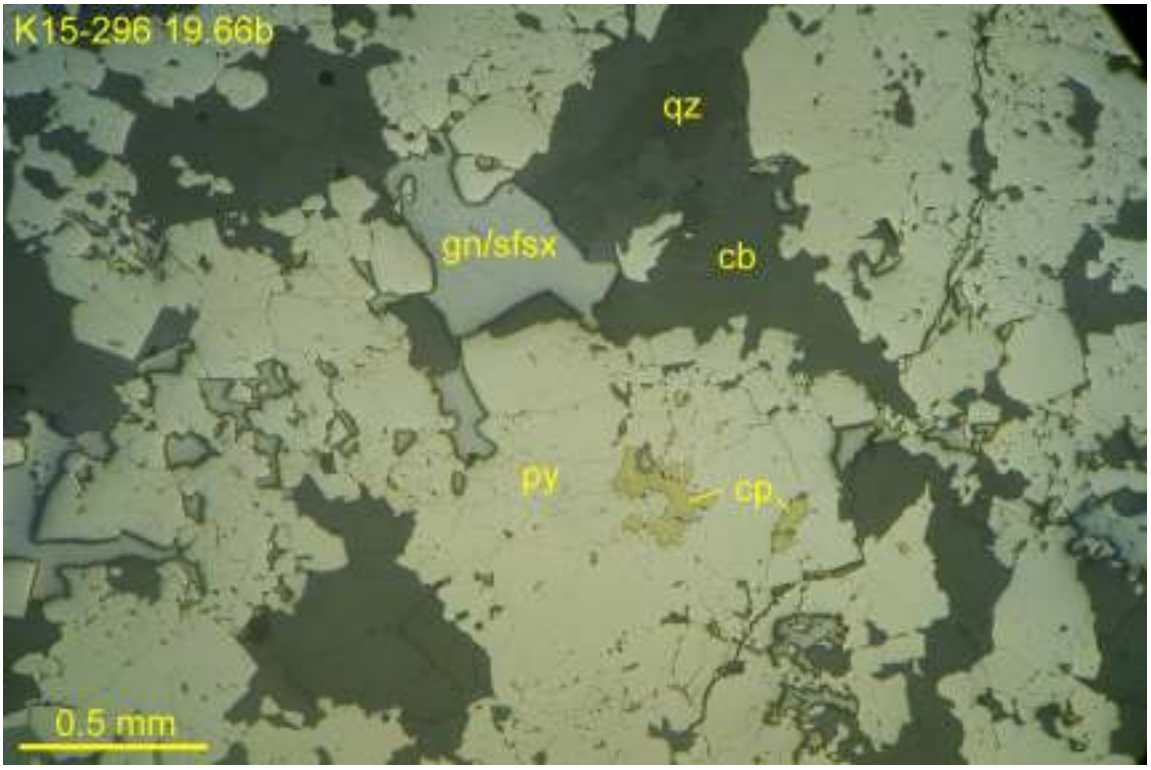
K15-228 23.66-23.77a: gangue-rich band composed mainly of quartz and barite (?), where sphalerite is associated with sulfosalt aggregate (sfsx1, faintly anisotropic under crossed polars) plus traces of chalcopyrite intergrown with trace relict pyrrhotite (altered to marcasite, mc) and minute tennantite. Reflected light, uncrossed polars, field of view ~3 mm wide.



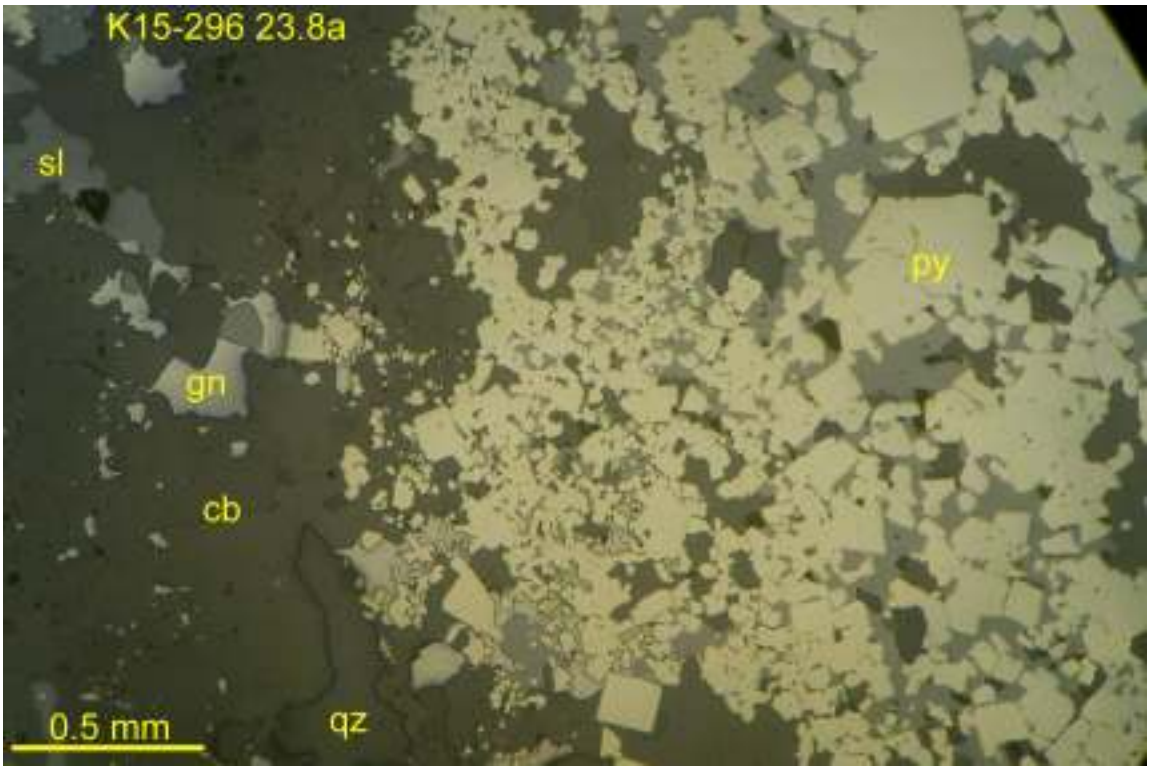
K15-228 23.66-23.77b: gangue-rich band, here mostly Fe-calcite but with quartz and barite, associated with sulfosalt showing distinct bireflectance (strongly anisotropic under crossed polars), galena and sphalerite; note minor arsenopyrite replacing pyrite at margin of adjacent sulfide-rich band. Reflected light, uncrossed polars, field of view ~3 mm wide.



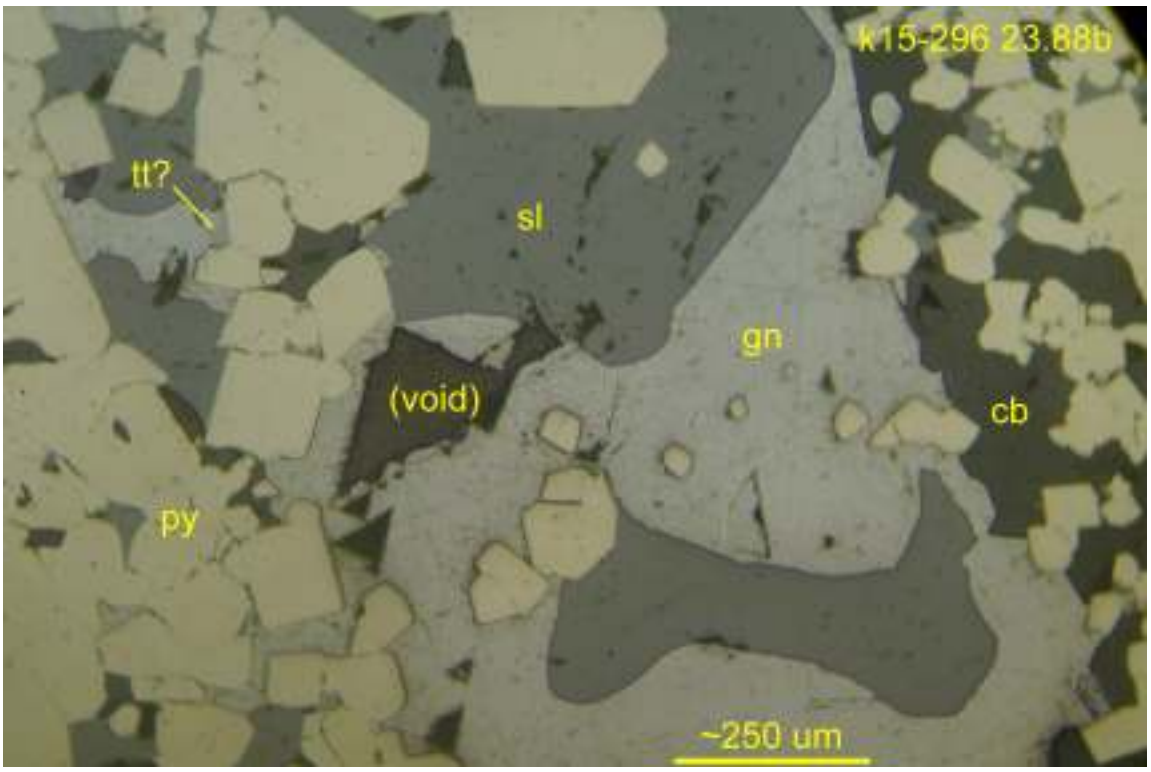
K15-296 19.66-19.79a: view across chalcopyrite-rich band (forming matrix to cubic pyrite with local magnetite, mt), adjacent to more sphalerite-rich band , containing abundant relict pyrrhotite largely altered to very fine grained marcasite (mc). Reflected light, uncrossed polars, field of view ~3 mm wide.



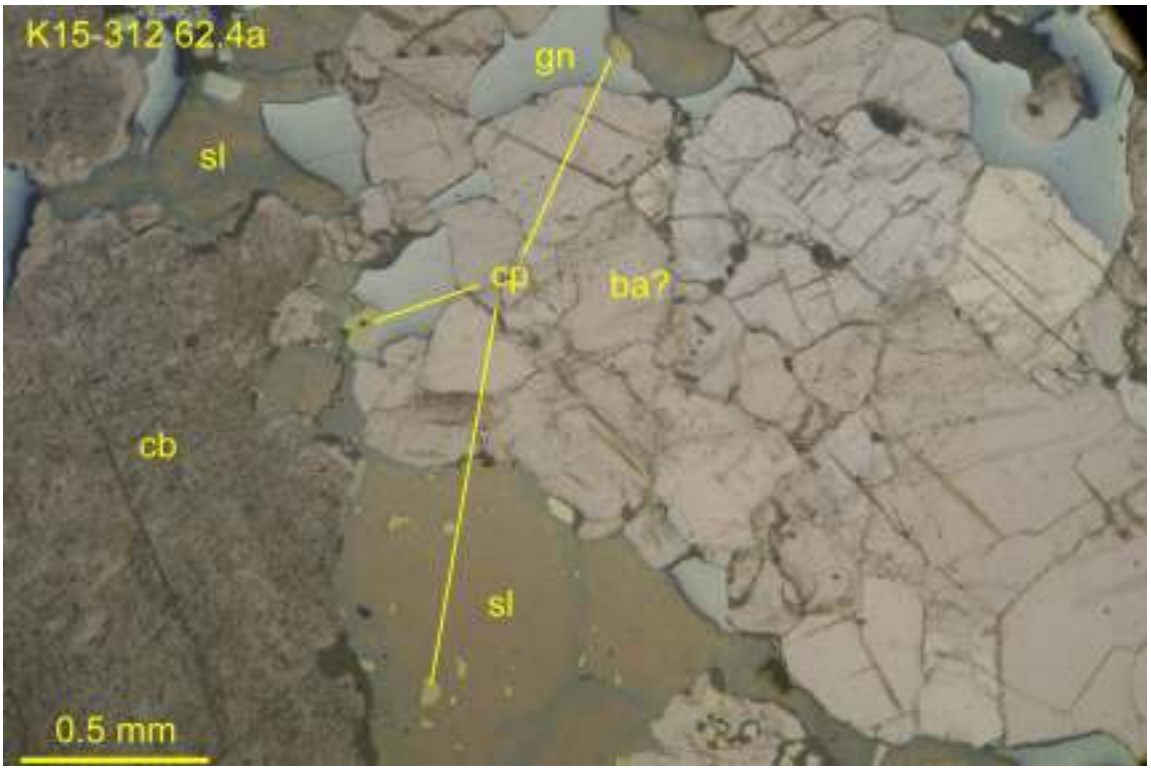
K15-296 19.66-19.79b: galena and sulfosalt 1 (virtually indistinguishable), intergrown with or included within pyrite (minor chalcopyrite also included in pyrite); gangues are mostly carbonate, local quartz. Reflected light, uncrossed polars, field of view ~3 mm wide.



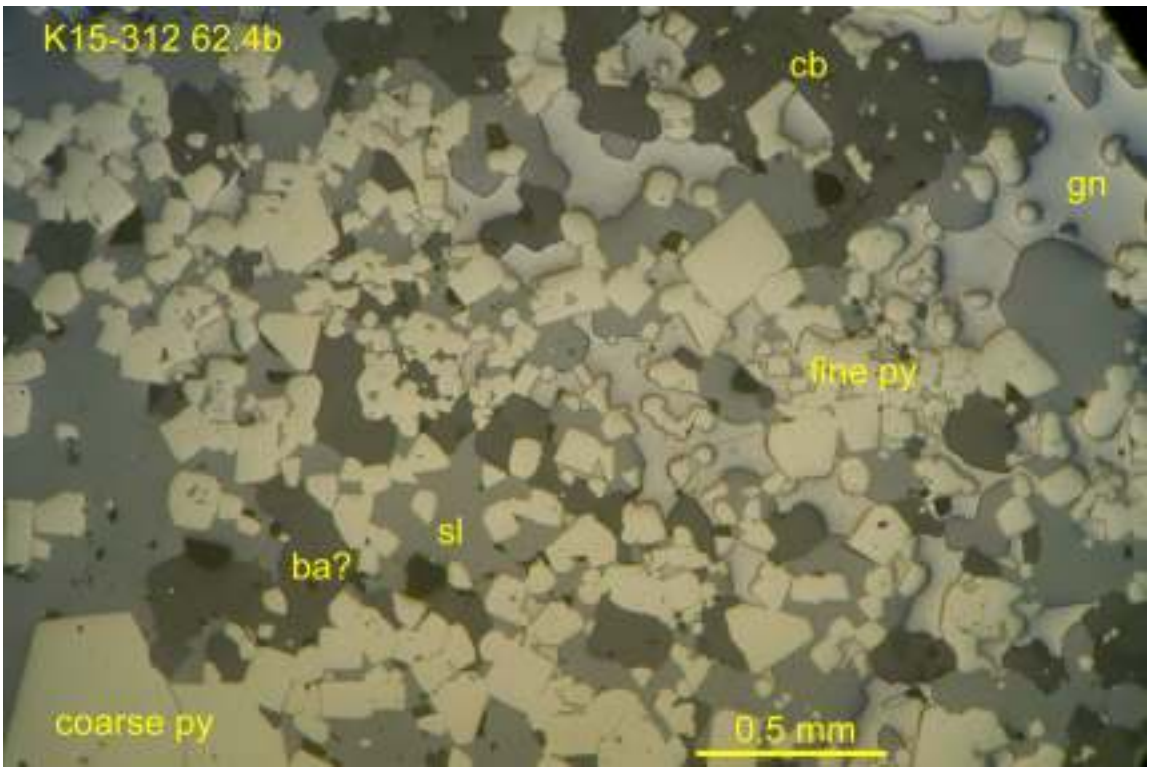
K15-296 23.8-23.93a: inter-banded pyrite-, sphalerite-, or gangue-rich bands; note the association of blebby sphalerite and galena inclusions in the carbonate-rich (minor quartz) gangue band, variably sphalerite-or galena matrix to fine-grained pyrite band. Reflected light, uncrossed polars, field of view ~3 mm wide.



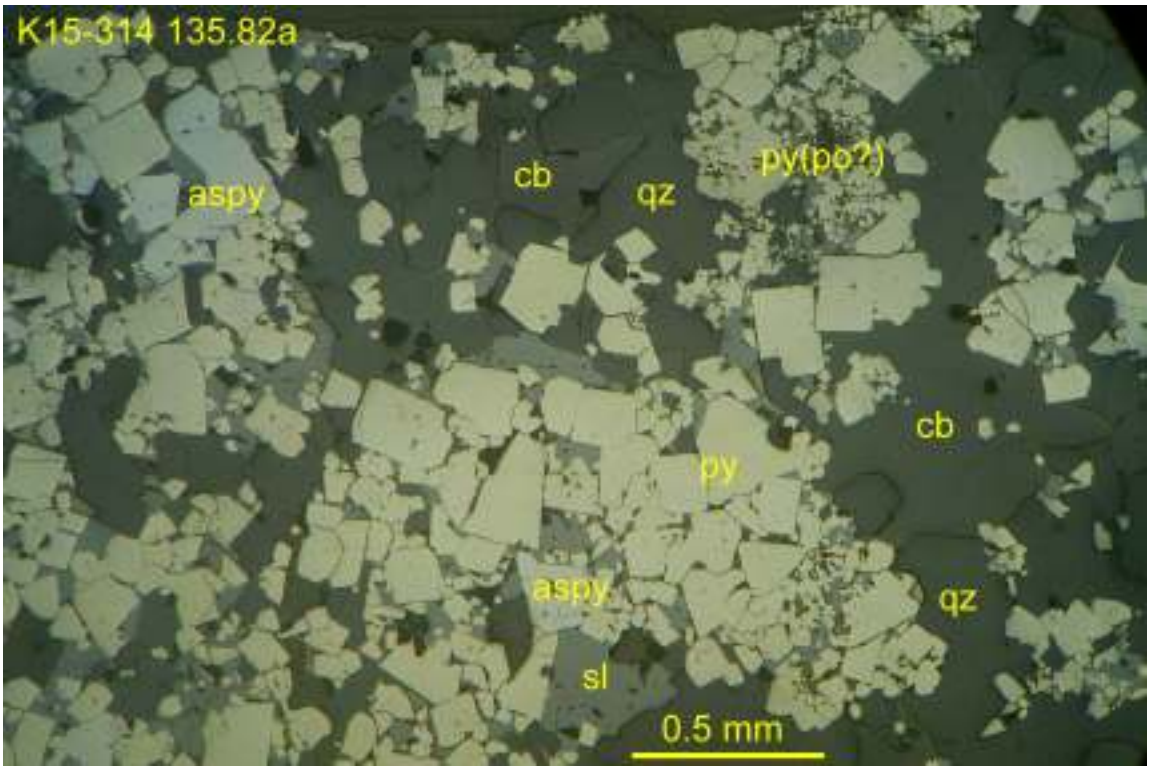
K15-296 23.8-23.93b: detailed view to show trace of grey, isotropic sulfosalt (tt?) intergrown with margin of galena mixed with sphalerite as matrix to pyrite in base-metal rich lamina. Reflected light, uncrossed polars, field of view ~1.5 mm wide.



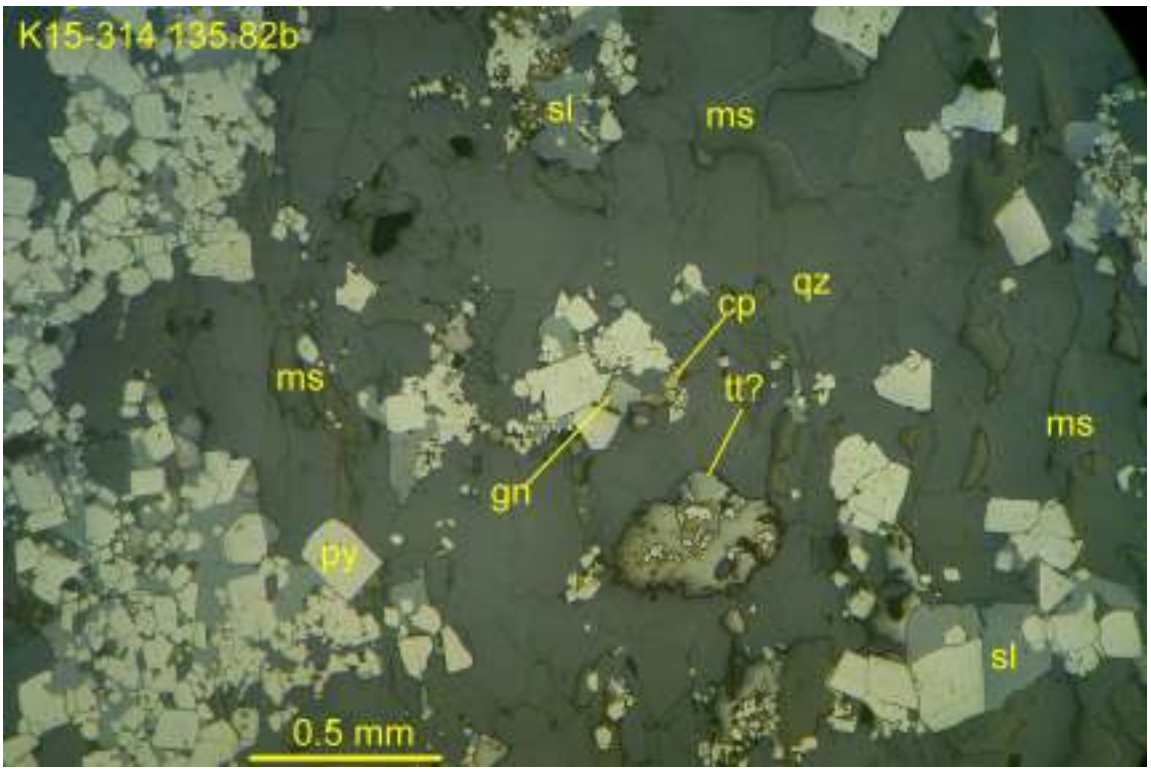
K15-312 62.4-62.5a: gangue-rich band composed of coarse carbonate (dolomite?) or probable barite (with cleavage, ba?) separated by sphalerite with medium orange-brown colour, containing minor chalcopyrite, and associated with irregular galena. Transmitted plane and reflected light, field of view ~3 mm wide.



K15-312 62.4-62.5b: cross-section over fine- and coarser-grained pyrite bands, in matrix that varies from sphalerite-rich to galena-rich; interstitial gangue inclusions are mostly carbonate, minor possible barite (?). Reflected light, uncrossed polars, field of view ~3 mm wide.



K15-314 135.82-135.93a: variably coarse, cubic pyrite (locally intergrown with/replaced by arsenopyrite, aspy) or fine-grained pyrite (the latter possibly after former pyrrhotite?), locally with matrix of sphalerite, in gangues of quartz (qz)-carbonate (cb)-minor muscovite (ms). Reflected light, uncrossed polars, field of view ~3 mm wide.



K15-314 135.82-135.93b: poorly defined, discontinuous bands of pyrite (with variable sphalerite, local galena) alternating with quartz-carbonate-variable muscovite bands. The galena-rich bleb in the center contains minor grey isotropic sulfosalt (tt?) that is difficult to distinguish. Reflected light, uncrossed polars, field of view ~3 mm wide.

Overviews of thin sections and offcuts (blue semi-circles mark photomicrograph locations).

PETROGRAPHIC REPORT ON 31 SAMPLES OF MASSIVE SULFIDES AND HOST ROCKS

Report for: Murray Jones/Trevor Rabb
Equity Exploration Consultants Ltd.

Invoice 150890

Jan. 16, 2016.

SUMMARY:

This suite of 31 samples may be roughly divided into massive sulfides (5 samples, 50-90% sulfides), vein or massive sulfides (2 samples, 35-60% sulfides), semi-massive sulfides (15-50% sulfides), especially porphyroblastic cordierite (?), relict (chloritized) cordierite (?) and/or garnet bearing, commonly with possible Zn-spinel (9 samples) and host rocks (mafic meta-volcanic, 6 samples), mafic/intermediate meta-volcanic (2 samples), felsic/intermediate meta-volcanic (5 samples), and meta-rhyolite (2 samples). They may be roughly summarized as follows:

Massive sulfides (K15-282 308, 314; K15-302 154.79; K15-306 169.58; K15-319 196.22), composed mainly of pyrite in a matrix of sphalerite-minor galena-variable pyrrhotite (generally subordinate, but locally dominant as in 302-154.79)-variable arsenopyrite and magnetite-very minor chalcopyrite-local trace sulfosalt (likely mainly tennantite-tetrahedrite?). Gangue minerals are mainly carbonate (ranging from calcite and dolomite to local ankerite or even siderite?), local quartz, mica (mainly muscovite, minor chlorite), local schorlitic tourmaline.

Semi-massive sulfides (K15-302 146.99, 147.07, 147.75, 148.66, 153.35; K15-306 164.29, 219.14, 219.75, 221.60) characterized by porphyroblasts tentatively identified as cordierite (?), chlorite after cordierite (?), local garnet, common possible Zn-spinel (?) and magnetite in foliated matrix of chlorite, biotite or phlogopite (?), muscovite, carbonate, local quartz, epidote, accessory sphene, apatite, possible allanite. Sulfides are much as in the massive samples with sphalerite the dominant base-metal sulfide followed by lesser galena and minor chalcopyrite, except that pyrrhotite (commonly relict, altered to pyrite/marcasite) tends to dominate over pyrite. Schorlitic tourmaline also occurs in these samples, as in the massive sulfides, but sulfosalt is not noted.

Mafic meta-volcanics (K15-282 309, 315.4; K15-312 57.4; K15-314 76.4; K15-317 75.61; K15-319 197.32) consist mainly of variably recognizable relict plagioclase (locally strongly recrystallized and/or transposed into the foliation, oligoclase?) and possible mafic (either porphyroblastic biotite, or lesser relict actinolitic amphibole partly/largely pseudomorphed by Fe-carbonate, chlorite and epidote) phenocryst sites in foliated matrix of chlorite, muscovite, plagioclase, epidote, carbonate, accessory sphene or rutile, only trace sulfides (pyrite, chalcopyrite, rare sphalerite).

Mafic/intermediate meta-volcanics (K15-302 155.4; K15-319 199.03) are similar but with more muscovite, carbonate, sericitized plagioclase, blastic or lensy carbonate-quartz ±Kspar, accessory rutile, only traces of pyrite, chalcopyrite.

Felsic/intermediate meta-volcanics (K15-302 192.26, 198; K15-314 158.09; K15-319 161.3, 161.75) consist of foliated quartz-muscovite-±biotite/chlorite, local blastic garnet/possible chloritized cordierite (?), Fe-carbonate, accessory sphene, rutile, possible apatite, monazite (?); minor sulfides (as in semi-massive samples) are pyrrhotite, sphalerite, lesser galena, trace chalcopyrite.

Meta-rhyolite (K15-312 72.4, K15-317 96.45) consists of distinct euhedral Kspar and less well-defined (partly flattened/deformed?) quartz phenocrysts in weakly foliated groundmass of very fine-grained Kspar, quartz, sericite, accessory rutile, cut by stringers of quartz-muscovite/sericite-carbonate and sulfides (mainly pyrite, trace chalcopyrite, sphalerite, pyrrhotite).

In a brief summary of the drill holes, K15-282 cuts massive sulfide at 308 and 314 m, hosted by mafic meta-volcanics at 309 and 315.4m. K15-302 cuts semi-massive sulfides (± blastic garnet, cordierite?) from 146.99 to 148.66, 153.35, massive sulfide at 154.79, passing into intermediate-mafic meta-volcanics at 155.4, sericitized felsic meta-volcanics at 192.26 and garnet-bearing felsic-intermediated meta-volcanics at 198. K15-306 cuts possibly former cordierite (?)-bearing semi-massive sulfides at 164.29, 219.14-221.60, with vein-like sulfides at 170.87. K15-312 cuts mafic meta-volcanics at 57.4 and meta-rhyolite at 72.4. K15-314 cuts mafic meta-volcanics at 76.48 and felsic/intermediate meta-volcanics (with blastic chloritized cordierite?) at 158.09. K15-317 cuts meta-rhyolite at 96.45 and mafic meta-volcanics at 75.61. K15-319 cuts felsic/intermediate meta-volcanics at 161.3-161.75, vein/massive sulfides at 182.46 and 196.22, mafic or intermediate meta-volcanics at 197.32 and 199.03m. Capsule descriptions are as follows:

K15-302 147.07-147.19: consists of bands of quartz-mica (biotite, chlorite) or locally porphyroblastic cordierite (?) partly altered to sericite with a matrix of sulfides (pyrrhotite, lesser sphalerite, minor galena, chalcopyrite), local blastic magnetite or pyrite, accessory spinel, garnet, rare apatite?

K15-302 148.66-148.78: foliated chlorite-biotite/phlogopite?-carbonate-minor epidote-sphene-apatite schist/gneiss with disseminated/lensy pyrite-sphalerite-galena-pyrrhotite-magnetite.

K15-302 153.35-153.48: blastic garnet and lesser magnetite, variable sulfides (pyrrhotite, minor galena, chalcopyrite), and possible Zn-spinel (?) in crudely banded matrix of mica (biotite, chlorite, sericite), local plagioclase ±Kspar (?).

K15-302 155.4-155.55: foliated, locally laminated, intermediate/mafic gneiss (biotite-muscovite-carbonate ±chlorite in matrix of fine-grained, relict (sericitized) plagioclase, accessory sphene/rutile, epidote) containing relict porphyroblasts of carbonate-quartz-Kspar-plagioclase-minor biotite/chlorite, partly flattened into the foliation.

K15-302 192.26-192.41: quartz-muscovite-minor biotite/chlorite-Kspar-Fe carbonate-trace sphene-monazite (?) gneiss with distinct bands of quartz and concentrations of sulfides (pyrrhotite, partly altered to pyrite/marcasite, lesser sphalerite, galena, minor chalcopyrite).

K15-302 198.0-201.0: strongly foliated muscovite-minor quartz-pyrrhotite-biotite-accessory rutile-apatite-monazite?-trace chalcopyrite, with sparse garnet porphyroblasts.

K15-306 164.29-164.40: relict porphyroblasts of quartz-chlorite in a matrix of mica (biotite, chlorite), sulfides (sphalerite locally intergrown with Zn-spinel?, lesser pyrrhotite, minor galena, chalcopyrite), local blastic magnetite, trace ilmenite, Kspar, possible apatite, allanite.

K15-306 169.58-169.68: medium-grained massive sulfide in which euhedral pyrite is enclosed in a matrix of abundant, Fe-rich sphalerite and significant galena with local concentrations of pyrrhotite but only trace chalcopyrite-sulfosalt (possibly argentian tetrahedrite?), with gangue inclusions of phlogopite/green biotite?-lesser carbonate.

K15-306 170.87-171.00: coarse-grained, possible vein of carbonate-muscovite (±biotite, tremolite?)-minor quartz, with massive sulfides of pyrrhotite-chalcopyrite-sphalerite-galena (the latter containing trace sulfosalt, likely tetrahedrite?).

K15-302 146.99-147.06: gneiss composed of porphyroblastic cordierite (?, partly altered to chlorite) and garnet in foliated matrix of mica (biotite, chlorite)-quartz-sulfides (pyrrhotite, lesser sphalerite, minor galena, chalcopyrite), local blastic magnetite or pyrite, accessory spinel, apatite.

K15-302 147.75-147.86: schist composed of chlorite-biotite-sphalerite-pyrite-pyrrhotite-galena-magnetite ±chalcopyrite, local possibly zincian spinel –accessory epidote-apatite-allanite? matrix to relict amphibole or chlorite-altered porphyroblasts.

K15-302 154.79-154.88: massive/semi-massive pyrrhotite-sphalerite-pyrite-galena-magnetite-trace chalcopyrite, in variable matrix of quartz (could include some barite?)-mica (biotite-phlogopite-muscovite)-carbonate-local epidote-tourmaline.

K15-306 219.75-219.83: crudely banded/foliated, cordierite (?) porphyroblastic gneiss composed of actinolitic amphibole-biotite-schorlitic tourmaline-minor (partly sericitized) plagioclase-accessory spinel (zincian?)-epidote/allanite-apatite, pyrrhotite-pyrite/marcasite (mostly after pyrrhotite?)-sphalerite (Fe-rich)-chalcopyrite-magnetite-trace galena.

K15-306 221.60-221.71: massive sphalerite ±pyrrhotite/pyrite-magnetite-trace chalcopyrite-galena, blastic cordierite (?) with inclusions of plagioclase, altered to micas, in foliated matrix of micas (biotite-phlogopite-muscovite), carbonate, plagioclase, minor tourmaline, ±spinel, epidote/allanite?

K15-306 219.14-219.21: banded/laminated, weakly foliated, alternately quartz, mica-carbonate-plagioclase-relict cordierite (?), or minor amphibole or sulfide (sphalerite-pyrrhotite-pyrite/marcasite-magnetite ±chalcopyrite-galena rich metamorphic rock, local accessory tourmaline, spinel, allanite (?)

K15-314 158.09-158.2: foliated, banded/laminated quartz-muscovite-carbonate-minor relict (chloritized) cordierite (?)-pyrite-rutile-trace allanite or monazite gneiss.

K15-317 75.61-75.75: well foliated, muscovite-chlorite-quartz-biotite-carbonate-accessory sphene/rutile-trace pyrite-chalcopyrite ±sphalerite schist/gneiss with porphyroblastic aggregates of biotite ±carbonate-chlorite-sphene/rutile ±sulfides suggestive of former mafic sites in a meta-mafic volcanic.

K15-317 96.45-96.59: quartz-Kspar phyric, meta-rhyolite cut by deformed stringers of quartz-muscovite-carbonate-pyrrhotite-pyrite/marcasite ±chalcopyrite, sphalerite, rutile.

K15-319 161.3-161.46: well foliated, muscovite-carbonate-quartz-pyrite-minor chlorite-accessory Kspar-rutile schist/gneiss may represent felsic/intermediate volcanic rock (?) originally cut by stringers of carbonate-pyrite-quartz-trace chalcopyrite-galena-sphalerite-marcasite (after pyrrhotite?).

K15-319 161.75-161.84: well foliated, muscovite-carbonate-quartz-pyrite-minor chlorite-cordierite-accessory Kspar-rutile schist/gneiss may represent felsic/intermediate volcanic rock (?) originally cut by stringers of carbonate-pyrite-quartz-chalcopyrite ±sphalerite-galena-marcasite (after pyrrhotite?).

K15-319 182.46-182.64: coarse-grained, possible vein or semi-massive sulfides (pyrite-sphalerite-galena-arsenopyrite-chalcopyrite-trace pyrrhotite, ±magnetite) with carbonate gangue, cut by a central vein/re-opening of massive sphalerite-galena-minor pyrite.

K15-319 199.03-199.14: well foliated, banded plagioclase-chlorite-carbonate-quartz?-accessory rutile/sphene-trace pyrite-chalcopyrite schist/gneiss with lensy segregations of carbonate-quartz and rare Fe carbonate-sericite altered mafic pseudomorphs in a meta-intermediate/mafic volcanic rock.

K15-282 315.4-315.5: foliated, plagioclase-chlorite-carbonate-biotite-amphibole-epidote-muscovite-accessory sphene/rutile-trace pyrite-chalcopyrite ±Kspar schist/gneiss (relict plagioclase, mafic sites, porphyroblastic biotite suggestive of a meta-mafic volcanic rock?).

K15-282 314-314.05: fine-grained massive sulfide in which euhedral pyrite is enclosed in a matrix of lesser, Fe-rich sphalerite and minor galena (locally concentrated into crudely defined bands; only trace -sulfosalt (Pb-As-Sb?), with gangue inclusions of carbonate.

K15-282 308-308.1: massive pyrite-pyrrhotite (partly altered to pyrite ±marcasite)-sphalerite-magnetite-minor chalcopyrite-trace galena, inter-banded with gangues of carbonate (dolomite, lesser ankerite and siderite?), lesser quartz, local chlorite.

K15-282 309-309.06: foliated, muscovite-chlorite-carbonate-quartz-accessory rutile-trace pyrite schist/gneiss with porphyroblastic biotite (relict mafic sites?) and lensy to vein-like calcite-quartz aggregates, suggestive of a meta-mafic volcanic rock?).

K15-319 197.32-197.42: foliated, plagioclase-chlorite-carbonate-biotite-sericite-accessory rutile-trace pyrite ±galena-chalcopyrite schist/gneiss (with minor relict plagioclase and possible mafic sites indicated by relict porphyroblastic biotite, suggestive of a meta-mafic volcanic rock?).

K15-319 196.22-196.27: fine-grained, crudely banded massive sulfide in which euhedral pyrite is set in a matrix of lesser, Fe-rich sphalerite-minor galena-arsenopyrite-trace chalcopyrite-sulfosalt (tetrahedrite?), with gangues of carbonate, quartz, muscovite and rare chlorite.

K15-312 57.4-57.52: foliated, plagioclase-chlorite-biotite-carbonate-epidote-accessory sphene-trace pyrite-chalcopyrite ±hematite schist/gneiss (relict plagioclase, porphyroblastic biotite-rich mafic sites suggestive of a meta-mafic volcanic rock?).

K15-312 72.4-72.55: quartz-Kspar phyric, meta-rhyolite partly altered to sericite-rutile, cut by deformed stringers (?) of quartz-muscovite-carbonate-pyrite ± marcasite, rutile.

K15-314 76.48-76.6: foliated, plagioclase-chlorite-biotite-carbonate-epidote-accessory sphene-trace pyrite-chalcopyrite ±hematite schist/gneiss (relict plagioclase, porphyroblastic biotite-rich mafic sites suggestive of a meta-mafic volcanic rock?).

Detailed petrographic descriptions and photomicrographs are appended (by email attachment). If you have any questions regarding the petrography, please do not hesitate to contact me.

Craig H.B. Leitch, Ph.D., P. Eng. (250) 653-9158 dromore61@gmail.com
492 Isabella Point Road, Salt Spring Island, B.C. Canada V8K 1V4

K15-302 147.07-147.19: BANDS OF QUARTZ-MICA (BIOTITE, CHLORITE) OR LOCALLY PORPHYROBLASTIC CORDIERITE? PARTLY ALTERED TO SERICITE WITH A MATRIX OF SULFIDES (PYRRHOTITE, LESSER SPHALERITE, MINOR GALENA, CHALCOPYRITE), LOCAL BLASTIC MAGNETITE, PYRITE, ACCESSORY SPINEL, GARNET, RARE APATITE

Hand specimen not supplied; offcut shows dark blackish green, medium-grained metamorphic rock with prominent black glassy porphyroblasts in a weakly foliated matrix of mica and semi-massive sulfides (likely mainly pyrrhotite to judge by the strongly magnetic character of the rock). The rock shows no reaction to cold dilute HCl, and no stain for K-feldspar (but rare white etch for plagioclase?) in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangues (65%)

Quartz	25%
Cordierite (?) porphyroblasts, partly altered to sericite/chlorite	20%
Chlorite (largely after biotite?)	20%
Biotite (partly altered to chlorite)	15%
Spinel (pleonaste or possibly gahnite??)	10%
Garnet	5%
Sericite (mainly after cordierite or plagioclase inclusions?)	5%
Apatite (?)	trace

Ore minerals (35%)

Pyrrhotite (rarely altered to lamellar pyrite/marcasite)	50%
Sphalerite	30%
Galena	8%
Chalcopyrite	7%
Magnetite, local pyrite	5%

At one end of the section, quartz forming the bulk of the sample occurs in lensy aggregates up to almost 1 cm long (crudely elongated in the plane of foliation defined by the surrounding mica-and/or sulfide-rich matrix), composed of interlocking sub/anhedra mostly <1 mm but rarely up to ~2 mm across. The quartz shows generally mild/moderate strain (undulose extinction, local sub-grain development, rare suturing of grain boundaries). At the other end of the section, porphyroblasts of cordierite (?) have rounded to subhedral outlines up to ~0.5 cm diameter, commonly simple twins, characterized by weakly developed cleavage and alteration to sericite or chlorite (subhedral flakes <20 μm) at margins, along cleavage or twin planes, or in inclusions that may be relict plagioclase (?) as subhedra <0.5 mm, now partly sericitized. Mica in the matrix forms sub/euhedral flakes to ~2 mm diameter, typically aligned in the plane of foliation, ranging from pale brown biotite to pale green chlorite (with length-fast, first-order grey birefringence, suggestive of Fe:Fe+Mg, or F:M, ratio in the 0.4-0.5 range?). The chlorite partially replaces the biotite, as well as interstitial garnet forming ragged (relict) to locally subhedral crystals mostly <0.5 mm with very pale pinkish-brown colour, but does not appear to affect spinel (?) forming similar-sized sub/euhedral crystals with distinct green colour suggestive of either pleonaste (or possibly Zn spinel, gahnite?). Both garnet and spinel are partly intergrown with or contain inclusions of very fine-grained quartz (anhedra mainly <0.2 mm), suggestive of replacement of former porphyroblastic crystals with rounded outlines to ~2 mm. Rare possible apatite forms euhedra <0.25 mm.

The sulfide matrix consists mainly of pyrrhotite (irregular masses to 0.5 cm of subhedra mostly <1 mm (locally deformed, twinned), lesser sphalerite (subhedra <1 mm, deep red-brown, high Fe), galena (ragged sub/anhedra <1 mm), chalcopyrite (skeletal anhedra to 1.5 mm), locally containing magnetite as sub/euhedra <1 mm but aggregating to 3 mm, with inclusions <0.2 mm of the sulfides, or pyrite as elongate subhedra to 2 mm. Sphalerite contains traces of chalcopyrite and pyrrhotite as inclusions <20 μm. Sulfosalts were searched for (mainly in galena) but not found.

In summary, this sample consists of bands of quartz-mica (biotite, chlorite) or locally porphyroblastic cordierite (?) partly altered to sericite with a matrix of sulfides (pyrrhotite, lesser sphalerite, minor galena, chalcopyrite), local blastic magnetite or pyrite, accessory spinel, garnet.

K15-302 148.66-148.78: FOLIATED CHLORITE-BIOTITE/PHLOGOPITE?-CARBONATE-MINOR EPIDOTE-SPHENE-APATITE SCHIST/GNEISS WITH DISSEMINATED/LENSY PYRITE-SPHALERITE-GALENA-PYRRHOTITE-MAGNETITE

Offcut shows green to dark blackish green, fine-grained metamorphic rock with foliated matrix of mica and heavily disseminated sulfides (mainly pyrite?). The rock is strongly magnetic, and shows local rapid reaction to cold dilute HCl, but no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangues (85%)

Chlorite (largely after biotite?)	48%
Biotite or phlogopite (partly altered to chlorite)	25%
Carbonate (mainly calcite, lesser ankerite?)	25%
Epidote-group (zoisite?)	1%.
Sphene	1%.
Apatite (?)	<1%

Ore minerals (15%)

Pyrite	45%
Sphalerite	25%
Galena	20%
Pyrrhotite	5%
Magnetite	5%

This sample consists mainly of foliated chlorite (partly after biotite) or, at one end of the section, mainly carbonate with lesser mica, both containing heavily disseminated pyrite-lesser sphalerite-galena-pyrrhotite-magnetite locally associated with accessory epidote, sphene and trace apatite.

In the bulk of the section, pale green chlorite and intimately intermixed very pale brown biotite (or phlogopite?) form sub- to commonly euhedral flakes up to about 1.5 mm in diameter, typically strongly aligned in and defining the foliation. Chlorite may be partly after biotite, and shows length-fast, first-order grey birefringence suggestive of F:M around 0.4 (?). Minor carbonate forms rounded/ragged subhedral crystals mostly 0.5 mm in diameter, commonly in lenses up to 3 mm long (length:width up to 3:1) sub-parallel to foliation. The carbonate appears to consist of coarser, relatively clear calcite (?) with lesser, finer-grained, higher-relief, limonite-stained Fe-carbonate that may include ankerite (?). In the carbonate-rich portion or band, which is up to about 1.5 cm thick, the proportions of carbonate to mica are reversed, but otherwise the descriptions are much the same. In places, there is minor epidote-group mineral (slender laths to 0.5 mm with low, anomalous blue-grey birefringence, possibly zoisite?) associated with sphene (very pale brown subhedra to 0.2 mm) or rare apatite (euhedra also to 0.2 mm).

In the bulk of the section, opaque minerals are mainly pyrite, typically forming flattened or elongated sub/euhedra up to 4 mm long (sub-parallel to foliation) with inclusions of carbonate, sphalerite or galena (especially near the ends, possibly due to remobilization into pressure shadows localized there). Lensy, discontinuous ribbons of sphalerite are mainly <1 mm thick by up to 5 mm long, composed of subhedra <0.5 mm with red-brown colour indicative of moderate to high Fe content, commonly intergrown with lesser galena as subhedra to ~1 mm (aggregates to 3 mm), pyrite as described above, or in places magnetite or pyrrhotite. Magnetite typically occurs as flattened, fractured subhedra or aggregates up to 2.5 mm long (also elongated along the foliation) with common inclusions mostly <0.1 mm of pyrite, pyrrhotite, galena, or sphalerite giving them a sieve-like (blastic) appearance. Pyrrhotite tends to occur with magnetite or separately as lensy aggregates to 1.5 mm composed of interlocking subhedra mainly <0.25 mm. Chalcopyrite and sulfosalts were not seen.

Ore minerals are less abundant in the carbonate-rich section but tend to be more commonly sphalerite and galena, pyrrhotite (not pyrite, except where included in pyrrhotite) either concentrated in laminae at the edge, or interstitial to carbonate. Chalcopyrite is very rare, forming anhedra <50 μm.

In summary, this is foliated chlorite-biotite/phlogopite?-carbonate-minor epidote-sphene-apatite schist/gneiss with disseminated/lensy pyrite-sphalerite-galena-pyrrhotite-magnetite.

K15-302 153.35-153.48: BLASTIC GARNET AND LESSER MAGNETITE, VARIABLE SULFIDES (PYRRHOTITE, MINOR GALENA, CHALCOPYRITE), AND POSSIBLE ZN-SPINEL (?) IN CRUDELY BANDED MATRIX OF MICA (BIOTITE, CHLORITE, SERICITE), LOCAL PLAGIOCLASE ±KSPAR (?)

Offcut shows dark to blackish green, fine/medium-grained metamorphic rock with local porphyroblastic garnet in a weakly foliated matrix of mica and locally semi-massive sulfides (likely mainly pyrrhotite, minor pyrite to judge by the strongly magnetic character of the rock). The rock shows no reaction to cold dilute HCl, and only trace stain for K-feldspar (but local white etch for plagioclase?) in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangues (85%)

Biotite (brown/local green, slightly altered to chlorite)	40%
Sericite/muscovite	15%
Chlorite (largely after biotite?)	15%
Garnet (porphyroblasts)	15%
Spinel (pleonaste or possibly gahnite??)	10%
Plagioclase (?), rare Kspar	5%

Ore minerals (15%)

Pyrrhotite	80%
Magnetite	15%
Galena	2%
Pyrite	2%
Chalcopyrite	1%

This sample consists mainly of coarse, blastic garnet in a foliated matrix of micas (biotite-chlorite-sericite/muscovite) and significant green, possibly zinc spinel (?), local feldspar, with variable lensy/wispy concentrations of sulfides (manly pyrrhotite; minor pyrite, galena, chalcopyrite) and magnetite. Feldspars (plagioclase, Kspar?) <0.1 mm are in sieve-like aggregates with micas.

Micas include mostly medium brown biotite (locally however grading to greenish-brown or even greenish, possibly ferriferous varieties) as mostly euhedral, mainly aligned flakes up to about 1.5 mm in diameter, and variably intermixed, colourless sericite or muscovite of similar or smaller size (also euhedral, aligned to define the foliation, locally segregated into muscovite-rich bands <2 mm thick). Chlorite is variably, more sparingly present, locally possibly partly replacing biotite but generally intergrown with it as aligned, euhedral flakes mostly <0.7 mm (with very pale green colour, length-fast, first-order grey to white birefringence suggestive of F:M 0.4?).

Garnet forms medium to coarse, rounded sub- to euhedral porphyroblasts up to 0.5 cm in diameter, with very pale yellowish brown colour, no anomalous anisotropism, and local zoning highlighted by cores with minute inclusions (sericite, magnetite, pyrrhotite all mainly <0.15 mm).

Magnetite porphyroblasts are mostly <3 mm in diameter, somewhat flattened in the plane of foliation, with inclusions of pyrrhotite, pyrite, less common galena or rare chalcopyrite mostly <0.25 mm in size. Significant spinel (?) forming somewhat ragged, highly fractured or parted, irregular to rounded subhedra to ~1.5 mm (locally cored by magnetite or pyrrhotite with inclusions of galena, rare chalcopyrite) has distinct bright colour suggestive of gahnite, and the absence of sphalerite in the sample supports this possible identification. Pyrrhotite, concentrated in certain bands up to 1.5 cm thick (semi-massive sulfide) in aggregates to 0.5 cm, occurs as subhedra mainly <1 mm (locally intergrown with or including pyrite as subhedra to 2 mm long, magnetite as described above, galena as elongate, skeletal subhedra to 1.5 mm, and chalcopyrite as subhedra to 1 mm.

In summary, this sample consists of blastic garnet and lesser magnetite, variable sulfides (pyrrhotite, minor galena, chalcopyrite), and possible Zn-spinel (?) in crudely banded matrix of mica (biotite, chlorite, sericite), local plagioclase ±Kspar (?).

K15-302 155.4-155.55: FOLIATED, LOCALLY LAMINATED, INTERMEDIATE/MAFIC GNEISS (BIOTITE-MUSCOVITE-CARBONATE ±CHLORITE IN MATRIX OF FINE-GRAINED, RELICT (SERICITIZED) PLAGIOCLASE, WITH ACCESSORY SPHENE/RUTILE, EPIDOTE) CONTAINING RELICT PORPHYROBLASTS OF CARBONATE-QUARTZ-KSPAR-PLAGIOCLASE-MINOR BIOTITE/CHLORITE, PARTLY FLATTENED INTO THE FOLIATION

Offcut shows fine-grained, greenish-grey, locally foliated/laminated intermediate-looking gneiss with scattered, commonly flattened relict porphyroblasts of uncertain identity. The rock is locally slightly magnetic, shows minor reaction to cold dilute HCl (only where scratched), and minor stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (~100%)

Biotite (locally partly chloritized)	40%
Sericite (mainly after feldspar), muscovite	25%
Plagioclase (relict, sericitized)	15%
Carbonate (mainly dolomite?)	7%
Quartz (only in relict porphyroblasts)	5%
K-feldspar (mainly in relict porphyroblasts)	3%
Chlorite (2 varieties, mainly after biotite?)	3%
Sphene, lesser included rutile	2%
Epidote	<1%

Ore (<1%)

Pyrite	trace

This sample consists mainly of moderately well foliated, locally somewhat laminated, mica (biotite, lesser muscovite)-relict (sericitized) plagioclase-carbonate-accessory sphene/rutile-epidote gneiss with local (commonly flattened) relict porphyroblast (?) sites of carbonate-quartz-plagioclase-Kspar.

The possible porphyroblast sites vary from somewhat rounded/ellipsoid, up to 0.5 cm in diameter, to strongly flattened/elongated in the plane of foliation (~2 mm thick by 2 cm long). They contain variable proportions of carbonate (subhedra to 1.5 mm, likely dolomite?), quartz (locally shattered subhedra to 1.5 mm) and Kspar (mainly interstitial, ragged/skeletal subhedra to 1 mm) or in places plagioclase (rounded subhedra to 1.5 mm, possibly oligoclase to judge by lack of relief against quartz?), mainly with relatively little biotite (in places brown, normal; in others, green, possibly Fe-rich?) or locally chlorite (euhedral flakes <0.2 mm with deep green pleochroism but length-fast, anomalous purple-gold birefringence suggestive of F:M near 0.5?). Sphene/rutile are uncommon, but most of the trace pyrite (subhedra <0.1 mm) occurs in them.

In the (relatively well foliated) matrix, biotite typically forms subhedral, well aligned flakes to ~1.2 mm, locally alternating in laminae <1 mm thick with similar-sized, also well-aligned euhedral flakes of muscovite. Biotite is only locally interleaved/replaced by chlorite (either with similar properties to that described above in the relict sites, or with almost no colour, length-fast first-order grey/white birefringence, suggestive of F:M around 0.4?). The background is mainly very fine-grained sericite (more or less randomly oriented, subhedral flakes mostly <50 μm), apparently after former plagioclase as rounded subhedra rarely over 0.4 mm in size, mixed with variable carbonate as rounded sub/anhedra mostly <0.6 mm long (local elongation in the plane of foliation to ~2:1) and accessory sphene/rutile (associated with biotite and carbonate in aggregates up to almost 2 mm long, stretched out into the foliation, composed of skeletal sub/euhedra mainly <0.2 mm, suggestive of former ilmeno-magnetite crystals associated with relict mafic crystals in a mafic/intermediate rock?). Epidote (colourless, with either normal or low, anomalous grey birefringence, possibly clinozoisite or zoisite?) forms euhedral crystals to 0.35 mm loosely associated with the possible relict mafic sites (?).

In summary, this appears to represent foliated, locally laminated, intermediate/mafic gneiss (biotite-muscovite-carbonate ±chlorite in matrix of fine-grained, relict (sericitized) plagioclase, with accessory sphene/rutile, epidote) containing relict porphyroblasts of carbonate-quartz-Kspar-plagioclase-minor biotite/chlorite, partly flattened into the foliation.

K15-302 192.26-192.41 QUARTZ-MUSCOVITE-MINOR BIOTITE/CHLORITE-KSPAR-FE CARBONATE-TRACE SPHENE GNEISS; CONCENTRATIONS OF PYRRHOTITE, PARTLY ALTERED TO PYRITE/MARCASITE, LESSER SPHALERITE, GALENA±CHALCOPYRITE

Offcut shows grey, weakly foliated/disrupted-looking, fine/medium-grained, siliceous-looking gneiss with local foliation-parallel bands/veins of quartz in places associated with concentrations of sulfides (mainly pyrrhotite, sphalerite/galena?). The rock is locally strongly magnetic, shows no reaction to cold dilute HCl (even where scratched, with difficulty, by steel), and only trace stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (80%)

Quartz (largely secondary, in bands/veins)	55%
Muscovite/sericite	40%
Biotite (brown, green), local chlorite in quartz bands	1-2%
Carbonate (ankerite/siderite?)	1-2%
K-feldspar	1-2%
Monazite (?), sphene/rutile	<1% each

Ore (20%)

Pyrrhotite	70%
Pyrite/marcasite (likely after former pyrrhotite)	10%
Sphalerite (Fe-rich)	10%
Galena	7-8%
Chalcopyrite (mainly only in late cross-cutting veinlet)	1-2%

This sample consists of alternating bands or in places laminae of either quartz-rich or sericite-rich rock, locally with irregular concentrations of significant sulfides (pyrrhotite, partly replaced by pyrite/marcasite; lesser sphalerite-galena-minor chalcopyrite).

Quartz-rich bands up to almost 1 cm thick, or somewhat lensy, discontinuous laminae mostly <1.5 mm thick, are composed, respectively, of interlocking subhedra up to 2 mm or anhedra mainly <0.5 mm in size. Most crystals show only mild undulose extinction, minor sub-grain development, and rare suturing of grain boundaries, but appear to be annealed post-deformation to judge by moderately developed triple junctions. Minor muscovite or sericite in these bands forms euhedral flakes mostly <0.5 mm, aligned with the foliation. Local minor pale brown or green biotite forming similar-sized, euhedral flakes is mostly concentrated at margins of the quartz-rich bands or laminae, where it may be locally accompanied by minor Kspar (subhedra mainly <0.25 mm, estimated only from the etched offcut). In places chlorite forms subhedral flakes <0.25 mm (very pale green colour, length-fast, first-order grey birefringence suggestive of F:M ~0.4?).

Muscovite-rich laminae are also lensy and discontinuous, mainly <3 mm thick, composed of matted, strongly aligned sub/euhedral flakes up to almost 1 mm, lesser quartz as subhedra mainly <0.25 mm, local sulfides (see below) rarely including minor Fe-carbonate (subhedra <0.15 mm with strong Fe staining; could be ankerite or even siderite?), accessory sphene or rutile (subhedra <0.1 mm or <50 μm) and possible monazite (fractured euhedra <0.15 mm with lower reflectance than sphene).

Sulfides are mainly concentrated in mixed quartz-muscovite rich bands up to almost 2 cm thick between quartz-rich bands (possibly suggestive of deformed stringers?). The sulfides consist mainly of pyrrhotite (ragged, irregular aggregates to ~1 cm across composed of interlocking subhedra up to bout 1.25 mm diameter, locally apparently replaced by similar-sized aggregates of pyrite with fine-grained texture suggestive of former marcasite?). Variable sphalerite occurs as adjacent, elongated aggregates to 5 mm long composed of subhedra <1 mm with intense, deep red colour (Fe0-rich), associated with lesser galena as parallel elongated, also irregular to skeletal masses up to 2 mm long. Chalcopyrite is relatively rare (irregular masses <0.6 mm), mainly associated with late, irregular cross-cutting fractures <0.5 mm thick.

In summary, this is quartz-muscovite-minor biotite/chlorite-Kspar-Fe carbonate-trace sphene-monazite (?) gneiss with distinct bands of quartz and concentrations of sulfides (pyrrhotite, partly altered to pyrite/marcasite, lesser sphalerite, galena, minor chalcopyrite).

K15-302 198.0-201.0: STRONGLY FOLIATED MUSCOVITE-MINOR QUARTZ-PYRRHOTITE-BIOTITE-ACCESSORY RUTILE-APATITE-MONAZITE?-TRACE CHALCOPYRITE, WITH SPARSE GARNET PORPHYROBLASTS

Offcut shows fine-grained, foliated/laminated, pale grey felsic-looking gneiss with wispy streaks of sulfide (mainly pyrrhotite?) along the foliation. The rock is weakly but distinctly magnetic, shows no reaction to cold dilute HCl (even where scratched, relatively readily, by steel), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (90%)

Muscovite/sericite	75%
Quartz (largely secondary, in bands/veins)	15%
Biotite (brown, green), local chlorite in quartz bands	5-7%
Garnet (porphyroblasts, widely scattered)	2-3%
Rutile	1%
Apatite, monazite (?)	<1%

Ore (10%)

Pyrrhotite	99%
Chalcopyrite	1%

This sample consists almost entirely of well-foliated muscovite with much lesser quartz, minor biotite and scattered small porphyroblasts of garnet, with wispy concentrations of pyrrhotite and accessory rutile, possible apatite.

In the bulk of the slide, muscovite or sericite forming matted, strongly aligned sub- to euhedral flakes mostly <1 mm in diameter are mixed with variable, but much lesser quartz forming sub- to anhedral, locally rounded or irregular crystals mainly <0.5 mm in size. Locally, the quartz occurs in aggregates or crystals up to almost 1 mm long (length:width ratio up to 5:1), oriented in the plane of foliation). The quartz crystals typically show only mild undulose extinction, rare sub-grain development, and lack suturing of grain boundaries (they may be mainly annealed). Minor biotite occurs as pale/medium brown sub/euhedral flakes mostly <0.25, but rarely to ~1 mm in diameter, not as obviously aligned in the foliation as muscovite/sericite.

Garnet porphyroblasts have euhedral outlines up to 1.5 mm in diameter. They are almost colourless to faintly brownish, lack anomalous anisotropism or zoning, and contain minor inclusions of pyrrhotite (aligned with the foliation, on trend of wispy pyrrhotite in the matrix, suggestive of late blastic growth) and also show minor pyrrhotite along microfractures oriented oblique (60º) to foliation.

Sulfides are almost entirely pyrrhotite, occurring as subhedra mainly <1 mm long (length:width up to 5:1) in wispy, lensy foliae or discontinuous laminae mainly <1 mm thick, parallel to foliation. Traces of chalcopyrite (subhedra <0.1 mm) are rarely intergrown with the pyrrhotite. Rutile is loosely associated with the sulfides, occurring as somewhat lensy, crude concentrations up to 1.5 mm long along the foliation, composed of pale brown sub/euhedra mainly <65 μm long. Minor possible apatite (?) forms subhedra mainly <50 μm, and there could be monazite (?) of similar size.

In summary, this is strongly foliated muscovite-minor quartz-pyrrhotite-biotite-accessory rutile-apatite-monazite?-trace chalcopyrite, with sparse garnet porphyroblasts.

K15-306 164.29-164.40: RELICT PORPHYROBLASTS OF QUARTZ-CHLORITE, MATRIX OF BIOTITE-CHLORITE±KSPAR-SULFIDES (SPHALERITE±ZN-SPINEL?-PYRRHOTITE-GALENA-CHALCOPYRITE), LOCAL BLASTIC MAGNETITE, TRACE ILMENITE-APATITE-ALLANITE?

Offcut shows dark blackish green, medium-grained metamorphic rock with local dark relict porphyroblasts in a moderately foliated matrix of mica and semi-massive sulfides (likely mainly pyrrhotite to judge by the magnetic character of the rock). The rock shows no reaction to cold dilute HCl, and only very minor stain for K-feldspar. Modal mineralogy in polished thin section is roughly:

Gangues (70%)

Biotite (brown, partly altered to green biotite)	45%
Chlorite (not obviously after biotite)	35%
Quartz (mainly in relict porphyroblasts)	10%
Spinel (pleonaste or more likely gahnite?)	7-8%
K-feldspar	~1%
'Hydrobiotite'/limonite	<1%
Apatite (?)	<1%
Allanite (?), zircon/monazite?	<1%

Ore minerals (30%)

Sphalerite (partly very fine, included in gahnite/)	45%
Pyrrhotite (partly altered to lamellar pyrite/marcasite)	30%
Pyrite (partly after pyrrhotite)	15%
Galena	5%
Chalcopyrite	3%
Magnetite (pyrrhotite inclusions)	1-2%
Ilmenite (?)	<1%

Relict porphyroblasts with lensy outlines up to almost 1 cm long (crudely elongated in the plane of foliation defined by the surrounding mica-and/or sulfide-rich matrix) are of two types. One consists of mainly quartz (interlocking sub/anhedra mostly <1 mm) and lesser chlorite (euhedral flakes <0.75 mm), rare biotite and sulfides (both <1 mm). The other consists mainly of chlorite (euhedral flakes mainly <0.6 mm, aligned in the foliation or randomly oriented) with local sulfides and euhedral flakes of biotite up to 1.5 mm projecting in from the margins. Quartz shows generally mild/moderate strain (undulose extinction, local sub-grain development, rare suturing of grain boundaries). Chlorite shows pale green pleochroism and length-fast, first-order grey birefringence suggestive of F:M ~0.4? Kspar occurs as skeletal subhedra to 0.2 mm coating quartz along narrow fracture veinlets <0.5 mm.

Mica in the matrix forms sub/euhedral flakes to ~2 mm diameter, more or less aligned in the plane of foliation, mostly medium brown locally interleaved by pale green biotite or intergrown with chlorite similar to that of the porphyroblasts. Chlorite does not appear to replace the biotite; both biotite and chlorite contain inclusions of high-relief, locally radioactive minerals (surrounded by dark pleochroic haloes) that appear to include red-brown allanite (?) as subhedra to 0.4 mm and zircon or monazite <0.1 mm; apatite forms euhedra <1 mm. Significant spinel (?) forms ragged, sub/euhedral crystals mostly <0.25 mm but in aggregates with subhedral outlines to 1 mm, with distinct green colour suggestive of either pleonaste (or possibly gahnite?), especially since the spinel contains inclusions of very fine-grained sphalerite (subhedra mainly 20 μm), locally around magnetite or intergrown with sphalerite/pyrrhotite, suggestive of replacement of former porphyroblasts.

The sulfide matrix consists mainly of sphalerite (aggregates to 3 mm long of subhedra <1 mm, deep red-brown, high Fe), pyrrhotite (irregular masses to 2 mm of subhedra <0.8 mm, commonly replaced by lamellar pyrite/marcasite), lesser galena (ragged sub/anhedra <1 mm) and chalcopyrite (skeletal anhedra <1 mm). The sulfides locally surround sub/euhedral magnetite to 2 mm, with inclusions <0.2 mm mainly of pyrrhotite; traces of ilmenite (slender euhedra <0.2 mm) are locally associated, as are traces of "hydrobiotite" <40 μm. Sphalerite contains traces of chalcopyrite and pyrrhotite as inclusions <20 μm. Sulfosalts were searched for (mainly in galena) but not found.

In summary, this sample consists of relict porphyroblasts of quartz-chlorite in a matrix of mica (biotite, chlorite), sulfides (sphalerite locally intergrown with Zn-spinel?, lesser pyrrhotite, minor galena, chalcopyrite), local blastic magnetite, trace ilmenite, Kspar, possible apatite, allanite.

K15-306 169.58-169.68: MEDIUM-GRAINED MASSIVE SULFIDE (EUHEDRAL PYRITE ENCLOSED IN MATRIX OF ABUNDANT, FE-RICH SPHALERITE AND SIGNIFICANT GALENA WITH LOCAL CONCENTRATIONS OF PYRRHOTITE BUT ONLY TRACE CHALCOPYRITE-SULFOSALT (POSSIBLY ARGENTIAN TETRAHEDRITE?), GANGUE INCLUSIONS OF PHLOGOPITE/GREEN BIOTITE?-LESSER CARBONATE

Etched offcut shows medium-grained, grey, massive sulfide composed mainly of pyrite and sphalerite, with only minor, likely mostly carbonate gangue. The rock is weakly magnetic, shows spotty reaction to cold dilute HCl (even where not scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (10%)

Phlogopite (?) partly altered to chlorite	70%
Carbonate (mainly calcite?), partly in late veinlets	30%

Ore (90%)

Pyrite	55%
Sphalerite	30%
Galena	13%
Pyrrhotite	~1%
Chalcopyrite	~1%
Sulfosalt (argentian tetrahedrite/freibergite?)	<1%

This thin section is over-thinned, making precise identifications of gangue minerals difficult. It is medium-grained massive sulfide composed mainly of abundant pyrite in a matrix of almost as abundant sphalerite, lesser galena, minor pyrrhotite and trace chalcopyrite-sulfosalt; poikilitically included gangues are mostly pale mica (phlogopite?) ±chlorite, and lesser carbonate. Banding is essentially absent, with little or no tendency to galena-rich and pyrrhotite-rich zones.

Pyrite forms mainly rounded, subhedral cubic crystals up to about 2 mm in diameter. They contain minor inclusions of rounded subhedral sphalerite <0.45 mm, or rarely bleb-like galena <0.1 mm. Sphalerite forming the bulk of the matrix occurs as interlocking, sub- to euhedral crystals mainly <1 mm diameter; medium orange-brown colour in such a thin section may be indicative of high Fe content, supported by common minute (<20 μm) inclusions of chalcopyrite along crystallographic planes, or of galena up to 0.1 mm. Galena making up most of the rest of the matrix occurs as irregular to skeletal, interstitial sub/anhedral crystals mostly <1 mm across, rarely with sulfosalt inclusions. Pyrrhotite shows a much more limited distribution, occurring only in certain zones in aggregates <0.5 mm across composed of interlocking subhedra mainly <0.25 mm, particularly around the margins of pyrite crystals. Chalcopyrite is very minor, occurring as subhedra <0.35 mm interstitial to the other sulfides, intergrown with galena and associated with pyrrhotite, also around the margins of pyrite crystals. Sulfosalt is relatively rare, forming subhedra mainly <50 μm with distinctly darker, greenish-grey colour compared to galena it is included within, but no apparent anisotropy under crossed polars, suggestive of Ag-bearing tetrahedrite (freibergite?).

Gangue inclusions in the massive sulfides are mostly irregular in outline, up to about 3 mm across, and commonly heavily plucked out by section preparation. They consist mainly of euhedral, randomly oriented flakes to 1 mm of a very pale brownish, faintly pleochroic mica suggestive of phlogopite (?), slightly altered at margins or interleaved by bright green chlorite or green biotite (generally length-slow, low to moderate birefringence) and lesser carbonate (interlocking sub- to anhedral crystals mostly <0.5 mm, possibly mostly calcite?). Late carbonate veinlets are entirely plucked out of the section, but are also likely calcite to judge by reaction in the offcut.

In summary, this is medium-grained massive sulfide in which euhedral pyrite is enclosed in a matrix of abundant, Fe-rich sphalerite and significant galena with local concentrations of pyrrhotite but only trace chalcopyrite-sulfosalt (possibly argentian tetrahedrite?), with gangue inclusions of phlogopite/green biotite?-lesser carbonate.

K15-306 170.87-171.00: COARSE-GRAINED, POSSIBLE VEIN OF CARBONATE-MUSCOVITE (±BIOTITE, TREMOLITE?)-MINOR QUARTZ, WITH MASSIVE SULFIDES OF PYRRHOTITE-CHALCOPYRITE-SPHALERITE-GALENA (THE LATTER CONTAINING TRACE SULFOSALT, LIKELY TETRAHEDRITE?)

Hand specimen not available for macroscopic information, but offcut shows what appears to be relatively coarse-grained, partly pinkish carbonate-abundant sulfide (pyrrhotite-sphalerite-galena-chalcopyrite) vein (?). The rock is distinctly magnetic, shows major reaction to cold dilute HCl (even where not scratched, fairly readily, by steel), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (40%)

Carbonate (could be dolomite and calcite?)	70%
Mica (mainly muscovite, possibly after tremolite?)	25%
Quartz (secondary)	3-5%
Biotite	1-2%

Ore (60%)

Pyrrhotite	55%
Chalcopyrite	15%
Sphalerite	15%
Galena	15%
Sulfosalt (tetrahedrite?)	<<1%

This sample consists of sulfide-rich and carbonate-rich portions of what may be a coarse-grained, somewhat remobilized vein (?); there are local rounded inclusions of carbonate within the massive sulfide portion of the sample.

Gangue-rich portions of the vein (?) up to ~1.5 cm thick are mostly composed of carbonate, forming sub/anhedra that are optically continuous for up to 3 mm, but in detail are seen to be recrystallized to sub-domains with interlocking jigsaw-like habit, mainly <1 mm (commonly <0.2 mm) in diameter. The carbonate typically contains myriads of minute inclusions (both pyrrhotite, mostly <65 μm long, or possibly fluid, mostly <20 μm) and appears to show relatively high relief, suggestive of dolomite, but reaction in offcut suggests much is likely calcite; there may be both dolomite and calcite. Mica occurs in scattered separate flakes or in semi-radiating rosettes up to ~3 mm across, composed of almost colourless, sub/euhedral flakes up to ~2 mm in diameter. In places it appears to be mixed with, and/or replacing, possible pale-coloured amphibole (pale yellowish-brown tints, length-slow, oblique extinction suggestive of Fe-poor tremolite). Some of these aggregates are intergrown with minor quartz (secondary, skeletal crystals up to ~1 mm in diameter). Within the massive sulfides, carbonate inclusions contain minor biotite (sub/euhedral, medium brown flakes to 0.25 mm, mainly around the margins of the carbonate, near sulfides0. In these areas, there is minor quartz as skeletal inclusions <0.25 mm, and minor pyrrhotite occurs as filigree-like concentrations of slender, <75 μm euhedral needles (mainly near the margins, adjacent to sulfides).

Massive sulfide portions up to 2.5 cm across consist mostly of pyrrhotite as somewhat rounded subhedral crystals mostly <1.5 mm, but commonly with recrystallized internal texture (sub-domains visible under crossed polars, mostly <0.5 mm, locally with coarse, lamellar twins suggestive of deformation). Chalcopyrite is abundant, forming lensy or lenticular zones up to almost 1 cm thick of subhedra mainly <1 mm, locally including pyrrhotite or sphalerite. Sphalerite typically occurs as deep, intense red coloured (Fe-rich) subhedra <1 mm, but aggregating to 3 mm, with chalcopyrite (and galena) as matrix to the pyrrhotite. Galena occurs as ragged, irregular to skeletal crystals or masses up to 3 m across, commonly with trace inclusions of symplectic-textured, very fine (<0.1 mm) grey, apparently isotropic sulfosalt (tetrahedrite?), closely associated with chalcopyrite/pyrrhotite.

In summary, this appears to represent coarse-grained, possible vein of carbonate-muscovite (±biotite, tremolite?)-minor quartz, with massive sulfides of pyrrhotite-chalcopyrite-sphalerite-galena (the latter containing trace sulfosalt, likely tetrahedrite?).

K15-302 146.99-147.06: CORDIERITE?-GARNET PORPHYROBLASTS IN FOLIATE MATRIX OF QUARTZ-MICA (BIOTITE, CHLORITE-PYRRHOTITE-SPHALERITE-CHALCOPYRITE-GALENA-LOCAL BLASTIC MAGNETITE, PYRITE, ACCESSORY SPINEL-APATITE

Offcut shows dark blackish green, medium-grained metamorphic rock with local black glassy or lesser pinkish-brown porphyroblasts in a weakly foliated matrix of mica and semi-massive sulfides (likely mainly pyrrhotite to judge by the strongly magnetic character of the rock). The rock shows no reaction to cold dilute HCl, and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (50%)

Chlorite (partly after biotite?)	40%
Biotite (partly altered to chlorite)	20%
Quartz (mainly in matrix)	15%
Cordierite (?) porphyroblasts, partly altered to sericite/chlorite	15%
Garnet (large porphyroblasts)	5%
Spinel (pleonaste or possibly gahnite??)	3-5%
Apatite, trace allanite or monazite (?)	<1% each

Ore (50%)

Pyrrhotite (rarely altered to lamellar pyrite/marcasite)	60%
Sphalerite	20%
Galena	10%
Pyrite	5%
Magnetite	3%
Chalcopyrite	2%

Porphyroblasts of cordierite (?) have rounded to subhedral outlines up to ~4mm diameter, commonly simple twins, characterized by weakly developed cleavage and alteration to chlorite (euhedral flakes up to 0.5 mm) at margins, or traces of clay?/sericite along cleavage or twin planes. Garnet porphyroblasts are ragged, irregular subhedra to locally euhedra, up to 6 mm, with pale brownish colour and lacking zoning; they locally appear to have overgrown spinel near the margins. Garnets are partly intergrown at the margins with or contain inclusions of sulfides, magnetite, quartz or mica (subhedra mainly <0.5 mm), suggestive of porphyroblastic crystals with rounded outlines to ~3 mm. Quartz occurs in lensy aggregates up to ~0.5 cm long (crudely elongated in the plane of foliation defined by the surrounding mica-and/or sulfide-rich matrix), composed of interlocking sub/anhedra mostly <0.5 mm but up to ~1 mm, with generally mild/moderate strain (undulose extinction, local sub-grain development, rare suturing of grain boundaries). Mica in the matrix forms sub/euhedral flakes to ~2 mm diameter, typically more or less aligned in the plane of foliation, ranging from brown biotite to pale green chlorite (with length-fast, first-order grey birefringence, suggestive of Fe:Fe+Mg, or F:M, ratio in the 0.4-0.5 range?). The chlorite partially replaces the biotite at margins, but does not appear to affect spinel (?) forming sieve-textured sub/euhedral crystals/aggregates up to ~1 mm with distinct green colour suggestive of either pleonaste or possibly Zn spinel (gahnite?). Rare apatite (?) forms rounded sub/euhedra <0.3 mm, locally within cordierite porphyroblasts, or in the intervening matrix. Traces of radioactive allanite (?) or monazite (?) as euhedra respectively <0.2 mm and <0.1 mm are marked by pleochroic haloes in biotite.

The sulfide matrix consists mainly of pyrrhotite (irregular masses to 0.5 cm of subhedra mostly <1 mm (locally deformed, twinned), lesser sphalerite (subhedra <1 mm, deep red-brown, high Fe), galena (ragged sub/anhedra <1 mm), chalcopyrite (skeletal anhedra to 0.5 mm), locally with pyrite as elongated subhedra to 2.5 mm long, or containing magnetite as sub/euhedra <1 mm but aggregating to 3 mm (with inclusions <0.2 mm of the sulfides). Sphalerite contains traces of chalcopyrite and pyrrhotite as inclusions <20 μm. Sulfosalts were searched for (in galena) but not found.

In summary, this gneiss consists of porphyroblastic cordierite (?, partly altered to chlorite) and garnet, in foliated matrix of mica (biotite, chlorite)-quartz-sulfides (pyrrhotite, lesser sphalerite, minor galena, chalcopyrite), local blastic magnetite or pyrite, accessory spinel, apatite.

K15-302 147.75-147.86: SCHIST: CHLORITE-BIOTITE-SPHALERITE-PYRITE-PYRRHOTITE-GALENA-MAGNETITE ±CHALCOPYRITE-ACCESSORY EPIDOTE-APATITE-ALLANITE? MATRIX TO RELICT AMPHIBOLE OR CHLORITE-ALTERED PORPHYROBLASTS

Offcut shows dark blackish green, fine/medium-grained metamorphic rock with large dark green, ellipsoidal/flattened relict porphyroblasts (?) in a weakly foliated matrix of mica and semi-massive sulfides (pyrite, pyrrhotite, magnetite to judge by the strongly magnetic character of the rock). The rock shows no reaction to cold dilute HCl, and no stain for K-feldspar (but rare white etch for plagioclase?) in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (65%)

Chlorite (partly after biotite?)	60%
Biotite (partly altered to chlorite)	25%
Amphibole (porphyroblasts, actinolitic hornblende?)	10%
Epidote (small cores of amphibole?)	3%
Apatite, local green spinel (possibly gahnite?)	<1% each
Allanite or monazite (?)	<1% each

Ore (35%)

Sphalerite	35%
Pyrite	30%
Pyrrhotite (rarely altered to lamellar pyrite/marcasite)	20%
Galena	10%
Magnetite	3-5%
Chalcopyrite	<1%

In this sample, possible relict porphyroblasts (could have been formerly cordierite??) now composed mainly of amphibole or chlorite, are set in a foliated matrix of chlorite-lesser biotite-sulfides-magnetite (rare spinel, possibly Zn-bearing>?)-accessory epidote-apatite-possible allanite.

Relict porphyroblast sites have typically ellipsoidal to strongly flattened, elongated outlines up to ~1 cm long, oriented sub-parallel to the enclosing foliation. Examples now composed mainly of amphibole (randomly oriented to radiating, subhedral lath-shaped crystals mostly <1.5 mm long with pale green pleochroism and small extinction angle mostly <12º, suggestive of actinolite or actinolitic hornblende?) contain inclusions of sulfides (ragged/skeletal anhedra < 0.6 mm, pyrrhotite, galena, minor sphalerite) and magnetite (subhedra <1 mm). They are better defined than those composed mainly of chlorite (strongly aligned, euhedral flakes <0.5 mm almost colourless/length-fast first-order greenish-grey birefringence suggestive of F:M around 0.4?), are difficult to distinguish from matrix except from by the elliptical outlines, and by the general absence of sulfides or magnetite.

The matrix consists largely of chlorite (much as described above) with lesser biotite (pale brown pleochroic euhedral flakes to ~2mm in diameter, somewhat aligned with the foliated chlorite hosting it), sulfides, magnetite, and accessory epidote. The epidote forms typically small, euhedral crystals up to 0.5 mm long, somewhat aligned with the foliation; they show very pale pleochroism and normal birefringence suggestive of low Fe content (clinozoisite?) and contain cores of pale green pleochroic amphibole (?) mostly <0.1 mm. The epidote is locally associated with euhedral crystals <0.1 mm of radioactive mineral (distinguished by dark pleochroic haloes in biotite, allanite or monazite?). Apatite (rounded subhedra <0.2 mm) occurs both in the matrix and porphyroblast sites.

Sulfides mostly occur in elongated, flattened aggregates <2.5 m thick oriented parallel to the foliation, composed of sphalerite as flattened sub/euhedra up to 2 mm long with deep red-brown colour indicative of high Fe content, pyrite as cubic sub/euhedra to 2 mm with inclusions of galena or sphalerite to 0.2 mm, pyrrhotite as subhedra mostly <1 mm, galena as ribbon-like aggregates <1 mm thick (deformed?) intergrown with sphalerite, pyrrhotite and trace chalcopyrite (subhedra <0.2 mm). All sulfides are locally intergrown with magnetite as blastic sub/euhedra to ~2 mm that contain inclusions of sulfides, are partly altered to hydrobiotite <0.1 mm, and are wrapped by biotite.

In summary this is chlorite-biotite-sphalerite-pyrite-pyrrhotite-galena-magnetite ±chalcopyrite –accessory epidote-apatite-allanite? matrix to relict amphibole or chlorite-altered porphyroblasts.

K15-302 154.79-154.88: MASSIVE/SEMI-MASSIVE PYRRHOTITE-SPHALERITE-PYRITE-GALENA-MAGNETITE±CHALCOPYRITE, VARIABLE MATRIX OF QUARTZ (±BARITE?)-MICA (BIOTITE-PHLOGOPITE-MUSCOVITE)-CARBONATE-EPIDOTE-TOURMALINE

Etched offcut shows fine-grained, grey/dark grey, semi-massive/massive sulfides (abundant pyrrhotite to judge by strong magnetic character of the sample) in what appears to be siliceous matrix. The rock shows local minor reaction to cold dilute HCl, and very minor stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (50%)

Quartz (may include some barite?)	65%
Biotite, phlogopite (?) partly altered to chlorite	15%
Carbonate (mainly calcite, rare cores of ankerite?)	10%
Muscovite	5%
Epidote (Fe-poor, clinozoisite?)	3%
Tourmaline (Fe-rich, schorl)	2%

Ore (50%)

Pyrrhotite	50%
Sphalerite	30%
Pyrite	15%
Galena	3%
Magnetite	1%
Chalcopyrite	~1%

Semi-massive sulfides (about half the slide) consist of crudely laminated, fine-grained pyrrhotite-sphalerite-minor pyrite-galena-trace chalcopyrite in gangue matrix of mostly quartz (difficult to be sure there is not some barite?)-minor mica (mainly either colourless muscovite or very pale brown phlogopite, grading to dark brown or green (Fe-rich) biotite as the massive sulfide portion is approached)-carbonate. Pyrrhotite forms interlocking subhedra <0.25 mm, with a strongly deformed appearance, sphalerite occurs in subhedral crystals or aggregates to ~1 mm with deep red-brown colour suggestive of high Fe content, locally intermixed with minor galena as anhedral, irregular to skeletal crystals <0.35 mm and locally containing very minor pyrite as sub/anhedra <1 mm (rarely with traces of chalcopyrite as interstitial subhedra <0.25 mm). Quartz (could include some barite?) forms rounded, granular sub/anhedra either mostly <0.5 mm or (in a few lenses up to 3 mm long, aligned with foliation) up to 1.5 mm. Rarely, the quartz shows mild/moderate undulose extinction, sub-grain development, and suturing of grain boundaries indicative of strain, but in the main the crystals appear t be annealed. Mica forming mainly euhedral flakes to 0.75 mm varies as above, with the palest colour (phlogopite) associated with most abundant sulfides, and the darkest with thin laminae <0.5 mm thick associated with minor epidote (very pale pleochroism, Fe-poor?) or in places tourmaline (very dark blue-green, Fe-rich schorl) both as euhedral laths up to ~1 mm long. The carbonate forms sub/anhedra mostly <0.65 mm, likely mostly calcite except for very minor cores <0.15 mm with high relief (ankerite?), Chalcopyrite occurs mainly in a thin cross-cutting veinlet <0.5 mm thick, with sphalerite and pyrrhotite, suggestive of remobilization from massive sulfides.

Massive sulfide portions consist mainly of pyrite (sub/euhedra to ~2 mm, with local inclusions of sphalerite, galena or pyrrhotite <0.3 mm) and minor magnetite (blastic sub/euhedra to ~1 mm) in a matrix of pyrrhotite (subhedra to~1 mm), sphalerite (subhedra <0.5 mm with medium red/orange brown colour implying moderate Fe content), minor galena (skeletal, interstitial ragged anhedra rarely over 0.5 mm) and rare chalcopyrite (sub/anhedra <0.2 mm, typically interstitial, with pyrrhotite). Gangue inclusions are much as described above for semi-massive sulfides, with a granular texture, separated by very fine-grained interstitial films of sulfides. Relict banding is locally visible (e.g. sphalerite laminae <1mm thick in massive pyrrhotite).

In summary, this is massive/semi-massive pyrrhotite-sphalerite-pyrite-galena-magnetite-trace chalcopyrite, in variable matrix of quartz (could include some barite?)-mica (biotite-phlogopite-muscovite)-carbonate-local epidote-tourmaline.

K15-306 219.75-219.83: CRUDELY BANDED/FOLIATED, CORDIERITE (?) BLASTIC GNEISS COMPOSED OF ACTINOLITIC AMPHIBOLE-BIOTITE-SCHORLITIC TOURMALINE-MINOR (PARTLY SERICITIZED) PLAGIOCLASE-ACCESSORY SPINEL (ZINCIAN?)-EPIDOTE/ALLANITE-APATITE, PYRRHOTITE-PYRITE/MARCASITE (MOSTLY AFTER PYRRHOTITE?)-SPHALERITE (FE-RICH)-CHALCOPYRITE-MAGNETITE-TRACE GALENA

Etched offcut shows dark blackish green, medium-grained metamorphic rock with scattered, green or white, relict porphyroblasts (?) in a weakly foliated matrix of mica and semi-massive sulfides (pyrrhotite, magnetite to judge by the strongly magnetic character of the rock). The rock shows no reaction to cold dilute HCl, and only trace stain for K-feldspar (but common white etch for plagioclase?). Modal mineralogy in polished thin section is approximately:

Gangue (65%)

Amphibole (matrix, actinolitic hornblende?)	50%
Cordierite (?) porphyroblasts	15%
Biotite (rarely altered to chlorite)	15%
Tourmaline (zoned, schorlitic)	10%
Plagioclase (partly sericitized/biotitized), trace Kspar	3%
Sericite (after plagioclase)	2%
Green spinel (possibly gahnite?), with sphalerite inclusions	2%
Chlorite (after biotite/amphibole?)	2%
Epidote (local rims of allanite?)	<1%
Apatite	<1%
Carbonate (dolomite?), inclusions of pyrrhotite	<1%

Ore (35%)

Pyrrhotite (partly altered to lamellar pyrite/marcasite)	35%
Pyrite (mainly after pyrrhotite?)	35%
Sphalerite	25%
Chalcopyrite	3-5%
Magnetite	~1%
Galena	<1%

Composition of this sample is unusual. Crudely defined bands of amphibole, biotite, tourmaline, sulfide- or relict plagioclase-rich rock (accessory green spinel, epidote, apatite, allanite?) contain variable relict porphyroblasts of cordierite (?) locally with inclusions of plagioclase.

Porphyroblasts of possible cordierite (tentative identification on basis of similar appearance to quartz, but biaxial character, distinct cleavage, local sector twinning, and alteration have rounded to ellipsoid, subhedral outlines up to at least 0.5 cm, with inclusions of plagioclase, amphibole, magnetite or sulfides; they range from relatively unaltered to slightly altered to sericite. Plagioclase included within them is commonly partly altered to sericite, as is plagioclase intermixed with biotite or tourmaline, which is up to 50% replaced by sericite/lesser biotite as subhedral flakes <30 μm.

Amphibole bands up to 1.5 cm thick consist of more or less randomly oriented, locally radiating or in places somewhat aligned, sub/euhedral laths up to 1.5 mm long, with pale to medium sea-green pleochroism and extinction angle mostly <12º, suggestive of actinolitic hornblende (?). Locally the amphibole is in somewhat blastic aggregates to ~3 mm, with inclusions of sphalerite. In other places, possible relict porphyroblast sites are marked by concentrations of green spinel (subhedra to 0.4 with inclusions of sphalerite <35 μm, suggestive of Zn content, i.e. gahnite?).

Biotite bands mostly <j1 cm thick consist of subhedral flakes up to 3 mm in diameter, commonly aligned in/defining the foliation, with very pale to medium brown pleochroism, typically intergrown with but not obviously replacing amphibole. Chlorite is relatively rare, generally in patches <1 mm across of minute scaly flakes <15 μm with relic of amphibole/rare biotite contained.

Tourmaline bands are discontinuous, containing stubby barrel-shaped euhedra up to 4 mm long with random orientations, generally strongly zoned with either pale khaki cores/blue-green rims, or blue cores with brownish green rims; both likely Fe-rich, schorl. Accessory epidote or allanite

(local epidote rimmed by allanite?) in places showing dark pleochroic haloes in both amphibole and biotite, forming euhedra to 0.35 mm is locally associated with apatite (subhedra to 0.25 mm) is associated with tourmaline-rich bands.

Sulfides occur in weakly aligned aggregates up to ~1 cm long composed of pyrrhotite (subhedra <1 mm that are typically incipiently altered to very fine-grained pyrite/marcasite (in places with lamellar or bird's-eye textures, or with cores of relict pyrrhotite, barely anisotropic under crossed polars)). Where this alteration is stronger, the mineral is classified as pyrite (but likely mainly after former pyrrhotite). Sphalerite (deep red colour, high Fe) occurs as skeletal subhedra locally continuous for up to several mm, interstitial to/intergrown with amphibole or tourmaline, or at the margins of porphyroblasts. Sphalerite typically contains minute inclusions of chalcopyrite along crystal boundaries or crystallographic orientations. Chalcopyrite also occurs in aggregates up to 0.5 cm long, intergrown with sphalerite and pyrrhotite, biotite and local carbonate (possibly dolomite, with minute inclusions of pyrrhotite; carbonate locally remobilized into thin veinlets). Magnetite is difficult to distinguish from the very Fe-rich sphalerite, but locally occurs as sub/anhedra <0.5 mm, intergrown with sphalerite. Galena is rare, forming trace inclusions <0.15 mm long in sphalerite

In summary, this is crudely banded/foliated, cordierite (?) porphyroblastic gneiss composed of actinolitic amphibole-biotite-schorlitic tourmaline-minor (partly sericitized) plagioclase-accessory spinel (zincian?)-epidote/allanite-apatite, pyrrhotite-pyrite/marcasite (mostly after pyrrhotite?)-sphalerite (Fe-rich)-chalcopyrite-magnetite-trace galena.

K15-306 221.60-221.71: MASSIVE SPHALERITE±PYRRHOTITE/PYRITE-MAGNETITE-MICA-CORDIERITE-CARBONATE-PLAGIOCLASE-TOURMALINE ±SPINEL, EPIDOTE/ALLANITE?

Etched offcut shows dark grey, fine/medium-grained metamorphic rock with scattered, green or white, relict porphyroblasts (?) in a weakly foliated matrix of mica and semi-massive to locally massive sulfides (mainly sphalerite ±pyrrhotite/magnetite to judge by the magnetic character of the sample). The rock shows trace reaction to cold dilute HCl, and only trace stain for K-feldspar (but common white etch for plagioclase?). Modal mineralogy in polished thin section is approximately:

Gangue (50%)

Mica (brown biotite, pale brown/very pale green phlogopite?)	40%
Cordierite (?) porphyroblasts	25%
Carbonate (dolomite, local cores of ankerite?)	15%
Plagioclase (partly sericitized/biotitized), trace Kspar	10%
Muscovite, trace sericite (after plagioclase)	5%
Tourmaline (zoned, schorlitic)	2%
Pale green spinel (possibly zincian?), with sphalerite inclusions	2%
Epidote/allanite (?)	1%

Ore (50%)

Sphalerite	90%
Pyrrhotite (partly altered to lamellar pyrite/marcasite)	5%
Pyrite (mainly after pyrrhotite?)	3%
Magnetite	~1%
Galena	~1%
Chalcopyrite	<1%

A large portion of this sample consists of semi-massive to almost massive sphalerite-local minor pyrrhotite (partly altered to pyrite or pyrite/marcasite), with a crudely banded character, interlayered with more mica-carbonate bands with irregular porphyroblasts of cordierite (?), some with significant inclusions of relict plagioclase, minor local tourmaline, accessory spinel and epidote/allanite (?).

Ore minerals are strongly dominated by sphalerite, forming crude laminations mostly <1 mm thick but commonly aggregating to bands up to ~1 cm in thickness. Sphalerite forms subhedra to 2 mm long, somewhat elongated in the plane of foliation, with intense red colour suggestive of high Fe content, typically with minor inclusions of chalcopyrite arranged along crystallographic planes or grain boundaries, as well as somewhat more common inclusions of pyrrhotite up to 0.35 mm long. Pyrrhotite occurs more abundantly in local bands mainly <0.7 mm thick, in whish it forms subhedra up to 0.5 mm long, aligned with foliation, locally associated with minor galena (ragged, irregular anhedra <0.2 mm) or lesser chalcopyrite (mainly anhedra <0.1 mm, locally aggregating to 0.2 mm), all in a host matrix of sphalerite. Magnetite is only locally present, sparingly with the sphalerite or more commonly within adjacent gangue-rich bands, where it forms sub/euhedra up to 0.5 mm.

In the gangue-rich portions, porphyroblasts have rounded to ellipsoidal outlines up to almost 1.5 cm in maximum dimension (somewhat aligned with foliation) although these areas are actually only composed of about half cordierite (?) and half plagioclase, as inclusions up to 1 mm across, or in places micas, which may in part replace former cordierite (?). The mineral tentatively identified as cordierite forms subhedra to ~3 mm, with crude sector twinning, and minor replacement along microveinlets of carbonate; inclusions of mica increase toward the margins, grading to aggregates of mica flakes in a matrix of cordierite (?). Mica (euhedral flakes <0.5 mm except to 1.5 mm in adjacent areas) ranges from medium brown biotite to very pale brownish or greenish phlogopite (?) to colourless muscovite, mixed in the adjacent bands with significant carbonate as rounded subhedra mainly <1 mm that may include both dolomite and minor cores of ankerite (?). Local patches of tourmaline up to 2 m across consist of somewhat radiating subhedra up to 1 mm in size, with blue to khaki pleochroism implying schorlitic composition. Accessory spinel forming subhedral to ragged

rounded anhedra up to 1.25 mm is very pale green, with small inclusions of sphalerite or biotite at margins; allanite (?) forms pale brown euhedra <0.3 mm surrounded by dark pleochroic haloes.

K15-306 219.14-219.26: Banded/Foliated, Quartz, Mica-Carbonate-Plagioclase-Relict Cordierite?, Locally Amphibole Or Sulfide-Rich Gneiss, Local Accessory Tourmaline, Spinel, Trace Allanite?

Etched offcut shows banded white/dark grey, fine-grained weakly foliated metamorphic rock with minor thin sulfide laminae (mainly sphalerite ±pyrrhotite/magnetite to judge by weak magnetic character of the sample). The rock shows minor reaction to cold dilute HCl, and only trace stain for Kspar (common white etch for plagioclase?). Modal mineralogy in polished thin section is roughly:

Gangue (85%)

Quartz (concentrated in certain bands)	30%
Mica (brown biotite, pale greenish/brown phlogopite?)	30%
Plagioclase (partly sericitized/biotitized), trace Kspar	10%
Cordierite (?) porphyroblasts (inclusions of plagioclase)	10%
Carbonate (calcite, local dolomite?)	10%
Amphibole (fibrous, actinolitic?)	5%
Tourmaline (zoned, schorlitic)	2-3%
Pale green spinel (possibly zincian?), with sphalerite inclusions	1-2%
Allanite (?)	<1%

Ore (15%)

Sphalerite	40%
Pyrite, minor marcasite (mainly after pyrrhotite?)	30%
Pyrrhotite (partly altered to lamellar pyrite/marcasite)	27%
Magnetite	~1%
Chalcopyrite	~1%
Galena	<1%

This sample consists of crudely banded/laminated, weakly foliated, alternately quartz, mica-carbonate-plagioclase-relict cordierite (?), or minor amphibole or sulfide-rich metamorphic rock with local accessory tourmaline, spinel, trace allanite (?).

Quartz-rich bands up to 0.75 cm thick are composed mainly of somewhat rounded, sub- to anhedral, interlocking crystals mostly <1.5 mm in diameter, lacking preferred orientation or any obvious flattening/elongation. Most crystals show only mild to locally moderate undulose extinction, sub-grain development, and relatively rare suturing of grain boundaries, indicative of strain. Mica, carbonate and amphibole are either confined to thin wispy laminae or interstitial to quartz.

Alternating bands rich in micas (mostly subhedral, somewhat bent/deformed flakes <0.7 mm, aligned in/defining the foliation, with varying colour from bright medium brown through greenish brown to pale greenish) commonly contain most of the carbonate (interlocking subhedra mainly <1 mm long, somewhat flattened in the foliation; possibly both calcite and dolomite?) and the relict cordierite?/relict plagioclase, forming ragged to flattened, elongated porphyroblasts up to ~3 mm diameter, although commonly in semi-continuous bands up to 6 mm thick where they are intimately intergrown with what appears to be relict plagioclase (±minor Kspar?) in similar-sized aggregates or bands. In detail, inclusions of cordierite (?) can be distinguished from plagioclase (?) on the basis of relief difference (cordierite negative compared to plagioclase), but both are commonly more or less altered to sericite or biotite as subhedral flakes mostly <0.15 mm. The relief suggests an intermediate composition (oligoclase-andesine?) for the plagioclase. Thin bands enriched in amphibole (subhedral, locally aligned or radiating, fibrous laths <0.35 mm long with pale green pleochroism and small extinction angle, suggestive of actinolite?) are mostly <1 mm thick. Scattered, stubby euhedral prisms of tourmaline display strong zoning from paler, khaki/greenish cores to bluish, darker rims, indicative of schorlitic composition. Aggregates of very pale green spinel have rounded subhedral outlines <0.6 mm, altered to chlorite or carbonate, with minute sphalerite inclusions; local allanite (?) forms euhedra <0.15 mm marked by dark radiation-damage pleochroic haloes in surrounding micas.

Sulfides are predominantly sphalerite (deep red, high Fe subhedra<1 mm long), lesser pyrite/ minor marcasite (likely after pyrrhotite, which forms subhedra mostly <0.5 mm), associated with magnetite (subhedra <0.3 mm) chalcopyrite and rare galena as sub/anhedra <0.15 mm.

K15-314 158.09-158.2: FOLIATED, BANDED/LAMINATED QUARTZ-MUSCOVITE-CARBONATE-MINOR RELICT (CHLORITIZED) CORDIERITE (?)-PYRITE-RUTILE-TRACE ALLANITE OR MONAZITE GNEISS

Etched offcut shows banded white/pale grey, fine-grained, well foliated felsic-looking metamorphic rock with minor thin sulfide laminae (mainly pyrite?). The rock is locally slightly magnetic, shows no detectable reaction to cold dilute HCl (even where scratched, with difficulty, by steel), and no stain for Kspar. Modal mineralogy in polished thin section is approximately:

Gangue (95%)	
Quartz (in laminae alternating with mica)	60%
Mica (mainly muscovite)	30%
Carbonate (dolomite, ankerite?)	7%
Chlorite (pseudomorphs after cordierite?)	2%
Relict cordierite (?)	~1%
Allanite or monazite?)	trace
Ore (5%)	
Pyrite	98%
Rutile	2%

The mineralogy of this sample is relatively simple, composed mainly of discontinuous thin bands or laminations mostly <1 m thick of alternately quartz-, muscovite (±carbonate, chlorite altered cordierite?)-, or pyrite-rich rock. There are traces of accessory rutile, allanite or monazite (?).

Quartz forms somewhat rounded to slightly flattened crystals mainly <0.5 mm in maximum dimension (length:width <2:1, somewhat aligned with the banding/weak foliation defined by the aligned mica flakes). The crystals show almost no undulose extinction, sub-grain development, or suturing of grain boundaries, suggestive of annealing post-deformation; development of local triple junctions supports this.

Muscovite occurs as mainly euhedral, strongly aligned flakes up to about 1 mm in diameter, locally mixed with carbonate. The carbonate forms sub/locally euhedral crystals up to about 0.7 mm long, locally somewhat elongated in the plane of foliation (length:width up to ~3:1), possibly dolomite or even ankerite to judge by the lack of, or very slow, reaction to HCl in the offcut.

Small (mainly <0.5 mm) discrete pseudomorphs with rounded to irregular, rarely subhedral outlines appear to be mostly chlorite (matted, randomly oriented subhedral flakes mainly <15-20 μm) that rarely appears to be after former cordierite (?), which also occurs rarely as subhedra to 0.5 mm with incipient chlorite alteration at the rims. Traces of possible allanite or monazite (?) form scattered euhedra <0.1 mm.

The sulfide, occurring in certain bands or laminae, appears to be entirely pyrite, forming cubic euhedra to locally subhedra mainly 0.6 mm long (also elongated in the plane of foliation), locally in aggregates up to 2.5 mm long. Very minor accessory rutile (aggregates <0.15 mm of slender acicular brown euhedra mainly <45 μm long) is associated with the pyrite.

In summary, this is foliated, banded/laminated quartz-muscovite-carbonate-minor relict (chloritized) cordierite (?)-pyrite-rutile-trace allanite or monazite gneiss.

K15-317 75.61-75.75: WELL FOLIATED, MUSCOVITE-CHLORITE-QUARTZ-BIOTITE-CARBONATE-ACCESSORY SPHENE/RUTILE-TRACE PYRITE-CHALCOPYRITE ±SPHALERITE SCHIST/GNEISS WITH PORPHYROBLASTIC AGGREGATES OF BIOTITE ±CARBONATE-CHLORITE-SPHENE/RUTILE ±SULFIDES SUGGESTIVE OF FORMER MAFIC SITES IN A META-MAFIC VOLCANIC ROCK

Etched offcut shows grey-green, fine-grained, well foliated metamorphic rock apparently lacking sulfide. The rock is not magnetic, shows rapid reaction to cold dilute HCl (even where not scratched, readily, by steel), and no stain for Kspar. Modal mineralogy in polished thin section is approximately:

Gangue (99+%)

Mica (mainly muscovite)	30%
Chlorite (intimately intergrown with muscovite)	25%
Quartz (in laminae alternating with mica)	15%
Biotite (porphyroblasts)	15%
Carbonate (mainly calcite?)	13%
Sphene, rutile	2%
Allanite or monazite?)	<1%

Ore (<1%)

Pyrite	50%
Chalcopyrite	45%
Sphalerite	5%

This sample consists essentially of scattered porphyroblasts of biotite and smaller sphene/rutile aggregates in a foliated matrix of mica (mainly muscovite intimately mixed with chlorite, alternating with discontinuous laminae of quartz-carbonate. Only traces of sulfides occur.

The bulk of the matrix consists of intimately intermixed, strongly aligned muscovite (sub- to euhedral flakes mostly <0.5 mm, intergrown with similar-sized, mainly euhedral flakes of chlorite) both strongly aligned, to define the foliation. The chlorite shows pale green colour/.faint pleochroism and length-fast, weakly anomalous greenish, first-order grey birefringence, suggestive of F:M around 0.4 (?), and is typically closely associated with most of the very fine-grained sphene/rutile.

Quartz (interlocking sub/anhedra mainly <0.5 mm long, typically somewhat elongated in the plane of foliation, with length:width up to 3:1) is mixed with carbonate (ragged subhedra up to about 1 mm, somewhat elongated in the foliation with length:width mostly <2:1, likely mainly calcite?) and variable muscovite/chlorite, or somewhat segregated into discontinuous, lensy bands <1 mm thick.

Porphyroblasts or aggregates with irregular to lensy outlines up to 2.5 mm (possibly after former mafic phenocrysts?) consist of biotite (sub/euhedral flakes mainly <1.5 mm with medium brown pleochroism) mixed with variable carbonate (subhedra to ~1.5 mm, also likely calcite), local chlorite (as described above, but up to ~1 mm) and sphene/rutile. Aggregates of sphene/rutile have irregular to lensy outlines rarely over about 0.4 mm long (aligned in the foliation) composed of mainly euhedral crystals of sphene to 0.15 mm and lesser, included rutile as brownish euhedra <50 µm long; the aggregates likely represent the sites of pre-metamorphic ilmenite or ilmeno-magnetite crystals. Rare allanite or monazite (?) crystals <25 µm in size are surrounded by dark, radiation-damaged pleochroic haloes in biotite or chlorite.

Only traces of sulfide are present, in widely scattered crystals of pyrite <0.15 mm, or irregular aggregates <0.35 mm of chalcopyrite (subhedra <0.2 mm), lesser pyrite (as above) and sphalerite (?) as subhedra <0.1 mm with almost no colour indicating very low Fe content. The sulfides are mainly hosted in carbonate, associated with sphene/rutile, likely representing former mafic sites.

In summary, this is well foliated, muscovite-chlorite-quartz-biotite-carbonate-accessory sphene/rutile-trace pyrite-chalcopyrite ±sphalerite schist/gneiss with porphyroblastic aggregates of biotite ±carbonate-chlorite-sphene/rutile ±sulfides suggestive of former mafic sites in a meta-mafic volcanic rock.

K15-317 96.45-96.59: Quartz-Kspar Phyric, Meta-Rhyolite Cut By Deformed Stringers Of Quartz-Muscovite-Carbonate-Pyrrhotite-Pyrite/Marcasite ±Chalcopyrite, Sphalerite, Rutile

Etched offcut shows creamy white, fine-grained, weakly foliated felsic metamorphic rock with irregular to highly stretched/deformed relict quartz phenocrysts (?) and thin quartz ±sulfide stringers in a matrix of alkali feldspar (mainly Kspar to judge by the yellow stain). The rock is weakly magnetic, but shows no reaction to cold dilute HCl (even where scratched, with difficulty, by steel). Modal mineralogy in polished thin section is approximately:

Gangue (95+%)

Alkali feldspar (mainly Kspar, minor plagioclase?)	60%
Quartz (relict primary "eyes", secondary stringers)	25%
Sericite, muscovite	10%
Carbonate (dolomite, ankerite?)	3-5%
Rutile	<1%

Ore (<5%)

Pyrrhotite (locally altered to pyrite, marcasite)	70%
Pyrite, minor marcasite (after pyrrhotite?)	30%
Chalcopyrite	<1%
Sphalerite	trace

This sample consists of recognizable small Kspar and larger, possibly deformed relict quartz phenocrysts, small, possible deformed/altered relict mafic sites (?) set in a very fine-grained, felted groundmass of alkali feldspar (mainly Kspar, local sericitized plagioclase?), cut by what appear to be deformed/rotated quartz-muscovite-sulfide-carbonate stringers.

The matrix or relict groundmass, making up 50-60% of the section, consists of more or less randomly oriented, feathery subhedral laths of Kspar (distinct negative relief compared to quartz) mainly <0.1 mm long, or in places partly sericitized plagioclase (?) as indicated by white etched areas in the offcut. There is probably minor quartz as interstitial anhedra <20 μm, but it is difficult to be sure. The sericite forms ragged subhedral flakes <35 μm, somewhat aligned in the foliation.

Kspar phenocrysts have sharply euhedral outlines up to almost 2 mm long, with moderate negative 2V and local "grid" twinning suggestive of orthoclase and/or minor microcline. They are only rarely slightly altered to carbonate as minute subhedra <0.1 mm in size.

Quartz phenocryst sites are less well defined, with typically rounded to ellipsoid, or locally strongly flattened/elongated outlines ranging from <1 mm to slightly over 2 mm, or in the case of flattening, up to ~0.5 cm (although these are difficult to distinguish from possibly ptygmatic folded and deformed former quartz stringers). Quartz crystals are mostly sub/anhedral, interlocking, rarely over 0.75 mm in maximum dimension, only slightly flattened in the plane of weak foliation, and with weak to rare moderate undulose extinction, sub-grain development, or suturing of grain boundaries.

Possible relict mafic sites (?) with irregular to lensy outlines mostly <1.5 mm consist of loose aggregates of muscovite, sulfides and carbonate plus accessory rutile (minute dark brown euhedra mainly <20 μm), but are commonly found along the presumed relict stringer veinlets, so are difficult to distinguish from concentrations along them.

Possible deformed/rotated stringer veinlets are sub-planar to irregular, up to 2.5 mm thick (where intersecting), composed of quartz very similar to that described for relict phenocrysts, variable muscovite (mainly sub/euhedral flakes <0.5 mm), carbonate (subhedra <0.5 mm, varying from almost clear, suggestive of dolomite, to brownish with higher relief, suggestive of ankerite?) and sulfides. Sulfides are mostly either pyrrhotite, forming ragged subhedra rarely over 0.35 mm, or pyrite as cubic sub/euhedra to 0.25 mm locally accompanied by marcasite as bladed euhedra <0.15 mm, all in aggregates up to ~2 mm long along the veinlets. Various stages of replacement of pyrrhotite by pyrite and marcasite are seen. Very minor chalcopyrite and traces of sphalerite (both subhedral, <0.15 mm) are locally present; sphalerite has dark red-brown colour indicative of high Fe content

In summary, this appears to be quartz-Kspar phyric, meta-rhyolite cut by deformed stringers of quartz-muscovite-carbonate-pyrrhotite-pyrite/marcasite ±chalcopyrite, sphalerite, rutile.

K15-319 161.3-161.46: WELL FOLIATED, MUSCOVITE-CARBONATE-QUARTZ-PYRITE-MINOR CHLORITE ±KSPAR-RUTILE SCHIST/GNEISS (FELSIC/INTERMEDIATE VOLCANIC?) ORIGINALLY CUT BY STRINGERS OF CARBONATE-PYRITE-QUARTZ-TRACE CHALCOPYRITE-GALENA-SPHALERITE-MARCASITE (AFTER PYRRHOTITE?)

Etched offcut shows greenish-grey/white, fine-grained, felsic metamorphic rock with irregular to highly stretched/deformed relict phenocryst sites (?) and/or quartz-carbonate ±sulfide stringers (rotated into the foliation?) in a foliated mica-rich matrix (trace Kspar to judge by the yellow stain). The rock is not magnetic, but shows local rapid reaction to cold dilute HCl (even where not scratched, fairly readily, by steel). Modal mineralogy in polished thin section is approximately:

Gangue (90%)

Muscovite, sericite (foliated matrix)	60%
Carbonate (calcite, dolomite?)	25%
Quartz (relict primary "eyes" and/or secondary stringers?)	10%
Chlorite (small patches suggestive of relict mafic sites?)	3-5%
Kspar (?)	1-2%

Ore (10%)

Pyrite	98%
Rutile	1-2%
Chalcopyrite	<1%
Galena, sphalerite, marcasite (after pyrrhotite?)	traces

This sample consists essentially of alternating, muscovite-rich or carbonate-quartz-pyrite rich bands (accessory rutile occurs in both). Deformation is so strong that relict phenocryst sites, if present initially, are now very difficult to recognize with confidence; small blastic or lensy aggregates of carbonate and/or very fine-grained chlorite may represent former mafic sites (?).

Muscovite-rich bands or laminae are mostly <0.5 cm, but locally to almost 1 cm thick, composed of strongly aligned, sub- to euhedral, matted flakes mainly <0.5 mm in diameter. Possible relict mafic sites (?) in these areas consist of either aggregates of extremely fine-grained chlorite (matted subhedral flakes mostly 10-15 μm with pale yellowish/greenish brown colour, low/moderate length-slow birefringence) occur in pseudomorphs with sub/euhedral rectangular outlines mostly <0.5 mm in diameter, or euhedral crystals of Mg/Fe-carbonate (dolomite?) of similar size, and local very minor possible Kspar (subhedra <0.2 mm, mainly suggested by yellow stain in the offcut). Both carbonate and quartz are locally incorporated into lensy aggregates up to several mm long, strongly aligned in or stretched out into the plane of foliation, that are in part gradational to and difficult to distinguish from the (possible) flattened, transposed veins. Accessory rutile forming very dark brown to almost opaque, mainly euhedral stubby prismatic crystals <50 μm are mainly concentrated in the muscovite, as ragged, irregular aggregates to 0.25 mm, suggestive of former ilmenite (?) crystals.

Lensy to discontinuous bands of coarser-grained carbonate (subhedral crystals to 1.5 mm, likely mostly calcite?) and lesser quartz (sub/anhedra rarely up to 1.5 mm long) contain variable pyrite (cubic euhedra up to 4 mm in maximum dimension, aligned with foliation) but only traces of local chalcopyrite (subhedra <0.15 mm), rare sphalerite, galena and marcasite (likely after former pyrrhotite) all <0.1 mm. Galena also occurs as irregular blebs to 0.4 mm long, with traces of chalcopyrite <0.2 mm in size, included within some of the coarse pyrite crystals. These discontinuous bands, sub-parallel to foliation, are suggestive of former stringer veins that may have been transposed into the foliation during deformation and metamorphism.

In summary, this well foliated, muscovite-carbonate-quartz-pyrite-minor chlorite-accessory Kspar-rutile schist/gneiss may represent felsic/intermediate volcanic rock (?) originally cut by stringers of carbonate-pyrite-quartz-trace chalcopyrite-galena-sphalerite-marcasite (after pyrrhotite?).

K15-319 161.75-161.84: Well Foliated, Muscovite-Carbonate-Quartz-Pyrite-Minor Chlorite-Cordierite-Accessory Kspar-Rutile Schist/Gneiss (Felsic/Intermediate Volcanic Rock?), Stringers of Carbonate-Pyrite-Quartz-Chalcopyrite ±Sphalerite-Galena-Marcasite (After Pyrrhotite?)

Etched offcut shows greenish-grey/white, fine-grained, felsic metamorphic rock with irregular to highly stretched/flattened relict phenocryst sites (?) and/or quartz-carbonate ±sulfide stringers (rotated into the foliation?) in a foliated mica-rich matrix (trace Kspar to judge by the yellow stain). The rock is not magnetic, but shows local rapid reaction to cold dilute HCl (even where not scratched, fairly readily, by steel). Modal mineralogy in polished thin section is approximately:

Gangue (90%)

Muscovite, sericite (foliated matrix)	55%
Carbonate (calcite, dolomite?)	25%
Quartz (relict primary "eyes" and/or secondary stringers?)	10%
Chlorite (small patches suggestive of relict mafic sites?)	5%
Cordierite (?), small porphyroblasts	3-5%
Kspar (?), rare biotite	<1%, trace

Ore (10%)

Pyrite	85%
Chalcopyrite	13%
Rutile	~2%
Sphalerite, galena	<1% each
Marcasite (after pyrrhotite?)	<1%
Pyrrhotite (rare, only where encapsulated in chalcopyrite)	trace

This sample consists essentially of alternating, muscovite-rich (accessory rutile) or carbonate-quartz-pyrite rich bands. Deformation is so strong that relict phenocryst sites, if present initially, are now very difficult to recognize, although small blastic or lensy aggregates of carbonate and/or very fine-grained chlorite may represent former mafic sites, and there may be local blastic cordierite (?).

Muscovite-rich bands are laminated, locally to almost 1.5 cm thick, composed of strongly aligned, sub- to euhedral, matted flakes mainly <0.5 mm in diameter. Possible relict mafic sites (?) in these bands as pseudomorphs with sub/euhedral rectangular outlines mostly <0.7 mm long consist of either aggregates of extremely fine-grained chlorite (matted subhedral flakes mostly 10-15 μm, pale yellowish/greenish brown colour, low/moderate length-slow birefringence, F:M ??), or chlorite mixed with variable euhedral Mg/Fe-carbonate (dolomite?) <0.5 mm, and local trace possible Kspar (subhedra <0.2 mm, mainly suggested by yellow stain in the offcut). Also, in places porphyroblasts (?) with subhedral/rounded/ragged outlines to 1.5 mm may be cordierite (?), partly altered to or including sericite. Both carbonate (two varieties, one relatively clear, likely calcite, the other higher relief/brownish, dolomite?) and quartz are locally incorporated into lensy aggregates <1 mm thick by up to several mm long, strongly aligned in or stretched out into the plane of foliation, that are in part gradational to and difficult to distinguish from the (possible) flattened, transposed veins. Accessory rutile forming dark brown, euhedral stubby prismatic crystals <0.1 mm are mainly concentrated in the muscovite, as ragged, irregular aggregates to 0.7 mm, suggestive of former ilmenite (?) crystals.

Lensy to discontinuous bands to 1 cm thick of coarser-grained carbonate (subhedral crystals to ~2 mm, likely mostly calcite?) and lesser quartz (sub/anhedra rarely up to 1.5 mm) contain variable pyrite (cubic sub/euhedra to 3.5 mm in maximum dimension) and significant chalcopyrite (subhedra to 2 mm), rare sphalerite (subhedra to 0.3 mm, dark red-brown, high Fe), galena (subhedra <1 mm) and marcasite (<0.1 mm, likely after former pyrrhotite, which only occurs as rounded blebs <0.1 mm where encapsulated in chalcopyrite itself included within some of the coarse pyrite crystals. These thick bands, parallel to foliation, are strongly suggestive of former stringer zone veins transposed into the foliation during deformation and metamorphism.

In summary, this well foliated, muscovite-carbonate-quartz-pyrite-minor chlorite-cordierite-accessory Kspar-rutile schist/gneiss may represent felsic/intermediate volcanic rock (?) originally cut by stringers of carbonate-pyrite-quartz-chalcopyrite ±sphalerite-galena-marcasite (after pyrrhotite?).

K15-319 182.46-182.64: COARSE-GRAINED, POSSIBLE VEIN OR SEMI-MASSIVE SULFIDES (PYRITE-SPHALERITE-GALENA-ARSENOPYRITE-CHALCOPYRITE-TRACE PYRRHOTITE, ±MAGNETITE) WITH CARBONATE GANGUE, CUT BY A CENTRAL VEIN/RE-OPENING OF MASSIVE SPHALERITE-GALENA-MINOR PYRITE

Hand specimen not available for macroscopic information, but offcut shows what appears to be medium-grained, dark grey carbonate-abundant sulfide (pyrite-sphalerite-galena-chalcopyrite) vein (?) with a central sphalerite-rich re-opening (?). The rock is locally slightly magnetic, shows widespread slow reaction to cold dilute HCl (mostly where scratched, fairly readily, by steel), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (65%)

Carbonate (mainly dolomite, minor ankerite?)	99+%

Ore (35%)

Pyrite	50%
Sphalerite	35%
Galena	10%
Arsenopyrite (largely after pyrite)	3-5%
Chalcopyrite	1%
Pyrrhotite (partly relict)	<1%
Magnetite (partly altered to carbonate)	<1%

This sample consists of sulfide-rich and carbonate-rich portions of what may be a coarse/medium-grained vein or semi-massive sulfides (?), cut by or re-opened along the center by a massive sulfide portion (mostly sphalerite-galena, with the latter "bleeding" off to partly replace the carbonate wallrock). Chalcopyrite and traces of pyrrhotite and magnetite are mostly found outside the central re-opened portion.

Gangue-rich portions of the vein (?) at least 1.5 cm thick appear to be composed almost entirely of carbonate, forming sub/anhedra that may be optically continuous for up to 1.5 mm, but in detail are seen to be recrystallized to sub-domains with interlocking jigsaw-like habit, mainly <0.7 mm (locally <0.2 mm). The carbonate typically contains myriads of minute inclusions (mostly fluid, <20 μm, or, near sulfides, pyrite, arsenopyrite, sphalerite or magnetite, mostly <65 μm); it appears to be mostly dolomite, but locally (especially near sulfides, where sulfide inclusions are most common) it show relatively high relief and distinctively brown colour, suggestive of ankerite. Within the more sulfide-rich portions, carbonate inclusions are mostly subhedral, <0.25 mm in size.

Sulfide-rich portions forming irregular aggregates up to ~1 cm long consist mostly of pyrite as cubic euhedral to subhedral crystals mostly <0.5 mm, but commonly with much finer-grained (<0.1 mm, especially where intergrown with other sulfides such as galena, sphalerite, or replaced by arsenopyrite that may almost completely pseudomorph the former coarse pyrite). Arsenopyrite in these aggregates typically forms minute euhedra mostly <50 μm, but rarely to 0.1 mm. Sphalerite forms subhedra <0.5 mm, locally mixed with lesser galena as subhedra <1 mm or chalcopyrite as subhedra <1 mm, forming a matrix to the cubic pyrite (in a fashion reminiscent of many massive sulfide samples in this suite; the faint crude banding of sulfides/carbonate supports this). Chalcopyrite locally includes or is associated with traces of pyrrhotite (subhedra <0.2 mm) or partly relict, pyrite/marcasite aggregates after pyrrhotite. Magnetite occurs as scattered, ragged subhedra <0.35 mm partly replaced at margins or along fractures by Fe-carbonate.

In the central vein or re-opening, sphalerite is almost massive, up to 0.6 cm by 2.5 cm long, with deep, intense red colour (Fe-rich) and minor zoning suggesting euhedra up to 1 cm, with abundant galena as rectangular masses up to 1 cm long projecting to the sides of the central vein; sulfosalt was searched for but not found in the abundant galena. Pyrite is found only along the margin of the central vein, and chalcopyrite is not seen.

In summary, this appears to represent coarse-grained, possible vein or semi-massive sulfides (pyrite-sphalerite-galena-arsenopyrite-chalcopyrite-trace pyrrhotite, ±magnetite) with carbonate gangue, cut by a central vein/re-opening of massive sphalerite-galena-minor pyrite.

K15-319 199.03-199.14: FOLIATED, BANDED PLAGIOCLASE-CHLORITE-CARBONATE-QUARTZ?-ACCESSORY RUTILE/SPHENE-TRACE PYRITE-CHALCOPYRITE SCHIST/ GNEISS, LENSY SEGREGATIONS OF CARBONATE-QUARTZ, RARE FE CARBONATE-SERICITE ALTERED MAFIC PSEUDOMORPHS (META-INTERMEDIATE/MAFIC VOLCANIC ROCK?)

Etched offcut shows grey-green, fine-grained, well foliated metamorphic rock apparently lacking significant sulfide. The rock is not magnetic, shows local slow reaction to cold dilute HCl (mainly where scratched, fairly readily, by steel), and no stain for Kspar (but extensive white etch indicative of plagioclase). Modal mineralogy in polished thin section is approximately:

Gangue (99%)

Plagioclase (virtually indistinguishable from quartz, oligoclase?)	35%
Chlorite (mainly in separate bands/laminae)	30%
Carbonate (mainly dolomite, minor ankerite?)	20%
Quartz (in bands with carbonate, or bands with plagioclase?)	10%
Rutile, minor sphene?	2%
Sericite (only in rare mafic relics, with Fe-carbonate)	<1%
Apatite	<1%

Ore (1%)

Pyrite	90%
Chalcopyrite	10%

This sample consists essentially of bands of fine-grained plagioclase (±quartz?), variable carbonate and accessory rutile, alternating with laminae of foliated chlorite, and local lensy, discontinuous bands (or metamorphic "sweats"?) of coarser carbonate-quartz. Only traces of sulfides occur.

The bulk of the felsic bands consists of plagioclase as rounded sub- to anhedra mostly <0.2 mm (only rarely twinned, with extinction on 010 mainly <10º, and relief indistinguishable from possible quartz, suggestive of composition near oligoclase), intimately intermixed with possible quartz of similar size, and variable carbonate in lensy aggregates up to 1.5 m thick by 6 mm long oriented parallel to foliation. The carbonate forms interlocking, rounded sub/anhedra mainly <1 mm long (slight elongation in places in the foliation, length:width up to 2:1) and is likely dolomite (?). Chlorite and rutile/sphene are less common in these bands than in the more mafic bands, but traces of sulfide are typically found along the margins (pyrite as euhedra to 0.25 mm, lesser chalcopyrite as irregular anhedra <0.3 mm). Apatite occurs along the margins of some of these bands, forming stubby prismatic euhedra a<0.2 mm long, oriented sub-parallel to foliation

Dark-coloured, mafic bands consist mainly of strongly aligned chlorite (sub- to euhedral flakes mostly <0.5 mm), defining the foliation, locally with minor brown, fine-grained Fe-carbonate in central septae, or rarely with minor sericite (subhedral flakes <50 μm) in slender lath-like mafic pseudomorphs up to 1.5 mm long, oriented sub-perpendicular to foliation. The chlorite shows pale green colour/.faint pleochroism and length-fast, weakly anomalous greenish, first-order grey birefringence, suggestive of F:M around 0.4 (?), and is commonly associated with much of the very fine-grained rutile ±sphene that occurs as aggregates with subhedral/skeletal, disrupted to locally tabular/lath-shaped outlines to ~1 mm long (likely after former ilmenite or ilmeno-magnetite?).

Quartz is only positively identified (interlocking sub/anhedra mainly <0.5 mm, typically lacking any flattening/elongation and showing only mild undulose extinction, sub-grain development, and suturing of grain boundaries) where mixed with carbonate (rounded subhedra up to about 1 mm, not elongated in the foliation, likely mainly dolomite?) and segregated into discontinuous, lensy bands up to at least 5 mm thick, parallel to foliation.

In summary, this is well foliated, banded plagioclase-chlorite-carbonate-quartz?-accessory rutile/sphene-trace pyrite-chalcopyrite schist/gneiss with lensy segregations of carbonate-quartz, and rare Fe carbonate-sericite altered mafic pseudomorphs in a meta-intermediate/mafic volcanic rock.

K15-282 315.4-315.5: FOLIATED, PLAGIOCLASE-CHLORITE-CARBONATE-BIOTITE-AMPHIBOLE-EPIDOTE-MUSCOVITE-ACCESSORY SPHENE/RUTILE-TRACE PYRITE-CHALCOPYRITE ±KSPAR SCHIST/GNEISS (RELICT PLAGIOCLASE, MAFIC SITES, PORPHYROBLASTIC BIOTITE SUGGESTIVE OF META-MAFIC VOLCANIC ROCK?)

Etched offcut shows grey-green, fine-grained, moderately foliated metamorphic rock with scattered dark mafic crystals imparting a mottled texture, and apparently lacking significant sulfide. The rock is not magnetic, shows local slow reaction to cold dilute HCl (only where scratched, fairly readily, by steel), and very minor stain for Kspar (but extensive white etch indicative of plagioclase). Modal mineralogy in polished thin section is approximately:

Gangue (99%)

Plagioclase (partly altered to epidote, carbonate; oligoclase?)	30%
Chlorite (mainly with Fe-carbonate, after mafics)	25%
Carbonate (mainly dolomite, minor ankerite?)	20%
Biotite (porphyroblasts)	12%
Amphibole (actinolitic hornblende?)	5%
Epidote-group (zoisite/clinozoisite?)	3-5%
Muscovite (with chlorite, Fe-carbonate)	2%
Sphene, minor rutile	2%
K-feldspar (after plagioclase?)	<1%

Ore (1%)

Pyrite	95%
Chalcopyrite	5%

This sample consists of crudely defined bands of fine-grained plagioclase, chlorite, variable carbonate and accessory sphene/rutile, containing porphyroblastic biotite, relict plagioclase and possible mafic sites or local lensy, discontinuous bands (or metamorphic "sweats"?) of coarser carbonate. Only traces of sulfides occur.

Relict plagioclase phenocrysts have ragged, irregular (corroded?) subhedral outlines up to 1.5 mm, with random orientations; they are partly attacked at margins by epidote, carbonate and chlorite, and show local twinning with extinction Y^010 up to 20º, suggestive of calcic oligoclase or sodic andesine (?). There may be minor alteration to traces of Kspar (indicated in etched offcut).

Relict possible mafic sites are suggested by aggregates with irregular to rounded outlines to ~1.5 mm composed of intimately intergrown carbonate (lamellar-textured, acicular crystals to 1 mm, likely ankerite?) and amphibole (ragged, corroded relics <1 mm with dark green pleochroism and small, <10º extinction angle suggestive of actinolitic composition), variable epidote (euhedra mainly <0.35 mm long with very little colour or pleochroism, Fe-poor, clinozoisite?), local chlorite (see below), accessory sphene ±rutile as lath-like aggregates to ~1 mm of subhedra <0.2 mm.

Porphyroblasts or aggregates with irregular to lensy outlines up to 3 mm (possibly also after former mafic phenocrysts?) consist of biotite (sub/euhedral flakes mainly <2.5 mm with medium brown pleochroism, locally attacked at margins by chlorite as described below) and sphene up to 0.4 mm long locally with trace included rutile as brownish euhedra <15 μm long; the aggregates likely represent the sites of pre-metamorphic ilmenite or ilmeno-magnetite crystals.

The matrix consists of relatively fine-grained, intimately intergrown plagioclase (sub/anhedra mainly <0.5 mm, but with seriate texture from <0.1 to relict phenocryst size), chlorite (subhedral flakes <0.5 mm with pale green pleochroism, first-order grey birefringence, F:M~0.4?), carbonate with either fine grain size <0.2 mm, high relief, brownish colour (ankerite?) or coarser, clearer, up to 1.5 mm (dolomite, locally in lensy aggregates parallel to foliation), local muscovite as euhedral flakes <0.25 mm, euhedral epidote and sphene as above. Only very minor sulfides are present, in widely scattered euhedra of pyrite <1.5 mm, or irregular aggregates <0.2 mm of chalcopyrite, in mafic sites.

In summary, this is foliated, plagioclase-chlorite-carbonate-biotite-amphibole-epidote-muscovite-accessory sphene/rutile-trace pyrite-chalcopyrite ±Kspar schist/gneiss (relict plagioclase, mafic sites, porphyroblastic biotite suggestive of a meta-mafic volcanic rock?).

K15-282 314-314.05: FINE-GRAINED MASSIVE SULFIDE IN WHICH EUHEDRAL PYRITE IS ENCLOSED IN A MATRIX OF LESSER, FE-RICH SPHALERITE AND MINOR GALENA (LOCALLY CONCENTRATED INTO CRUDELY DEFINED BANDS; ONLY TRACE - SULFOSALT (PB-AS-SB?), GANGUE INCLUSIONS OF CARBONATE

Etched offcut shows fine-grained, grey, massive sulfide composed mainly of pyrite and sphalerite, with only minor, likely mostly carbonate gangue in irregular poddy inclusions. The rock is not magnetic, shows slow reaction to cold dilute HCl (even where not scratched), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (20%)

Carbonate (dolomite, cores of ankerite??)	99%

Ore (80%)

Pyrite	75%
Sphalerite	20%
Galena	3-5%
Sulfosalt (Pb-As-Sb?)	<1%

This sample consists of fine-grained massive sulfide composed mainly of abundant pyrite in a matrix of lesser sphalerite, minor galena, possible trace sulfosalt; locally coarse, poikilitically included gangues appear to be entirely carbonate. Banding is very faint, but there is a tendency to galena-rich zones. Late fractures cut the rock oblique to the poorly defined banding.

Pyrite forms mainly cubic euhedral crystals mostly in the 0.1 to 1.0 mm size range, commonly fractured (locally shattered along the linear fracture zones). They contain minor inclusions of rounded subhedral sphalerite <0.15 mm, but not galena. Sphalerite forming the bulk of the intermittent, discontinuous matrix occurs as interlocking, sub- to euhedral crystals mainly <1 mm (local aggregates up to 3.5 mm long in sphalerite-rich bands), with dark red-brown colour indicative of high Fe content. In the larger aggregates, galena and pyrite may occur as small to minute (0.1 to <20 μm) inclusions especially along margins. Galena making up most of the rest of the matrix occurs as irregular to skeletal, interstitial sub/anhedral crystals mostly <1 mm across mainly confined to discrete but poorly defined bands, rarely with possible sulfosalt inclusions, also around the margins of pyrite crystals. Sulfosalt is hard to be sure of (only suspected by weak anisotropism under crossed polars), forming subhedra mainly <50 μm with indistinguishable colour compared to galena it is included within, suggestive of Pb-As-Sb sulfosalt (?).

Fracture zones occur as sharply defined planes mostly <0.1 mm thick, but locally multiple with widths up to ~1 mm in total. Pyrite is shattered or crushed, and there appears to be local remobilization of both sphalerite (and lesser galena) along and into them.

Gangue inclusions in the massive sulfides are mostly irregular in outline, either <0.5 mm or where more abundant, with irregular to rounded outlines up to about 0.7 cm across. They consist entirely of subhedral, randomly oriented crystals up to about 3 mm (but commonly deformed to sub-domains mostly <1 mm of either relatively clear (dolomite) or in places pale brownish, inclusion-rich (mainly pyrite <30 μm) variety suggestive of ankerite (?), to judge by reaction in the offcut. The latter locally occurs as well-defined cores to the former.

In summary, this is fine-grained massive sulfide in which euhedral pyrite is enclosed in a matrix of lesser, Fe-rich sphalerite and minor galena (locally concentrated into crudely defined bands; only trace -sulfosalt (Pb-As-Sb?), with gangue inclusions of carbonate.

K15-282 308-308.1: MASSIVE PYRITE-PYRRHOTITE (PARTLY ALTERED TO PYRITE ±MARCASITE)-SPHALERITE-MAGNETITE-MINOR CHALCOPYRITE-TRACE GALENA, INTER-BANDED WITH GANGUES OF CARBONATE (DOLOMITE, LESSER ANKERITE AND SIDERITE?), LESSER QUARTZ, LOCAL CHLORITE

Etched offcut shows mainly fine-grained, dark grey, crudely banded/laminated massive sulfide composed mainly of pyrite but with local sphalerite-rich bands, and only minor gangue. The rock is strongly magnetic, but shows only minor reaction to cold dilute HCl (only where scratched), and no stain for K-feldspar. Modal mineralogy in polished thin section is approximately:

Gangue (30%)

Carbonate (dolomite?	65%
Fe-carbonate (ankerite, siderite?)	15%
Quartz	15%
Chlorite	5%

Ore (70%)

Pyrite (partly ±marcasite, after pyrrhotite?)	50%
Pyrrhotite (partly/largely altered to pyrite/marcasite)	20%
Sphalerite	15%
Magnetite	10%
Chalcopyrite	3-5%
Galena	<1%

This sample consists mainly of crudely banded massive sulfides, dominated by pyrite-pyrrhotite (partly replaced by pyrite-marcasite)-sphalerite-magnetite with only minor chalcopyrite, trace galena, with poorly defined, discontinuous bands of gangues (mainly carbonate, less quartz, chlorite).

Gangue minerals locally concentrated into discontinuous bands to ~3 mm thick are sub-parallel to the poorly defined banding in the sulfides. Carbonate forming the bulk of the gangues occurs as 1) sub- to anhedral, irregular crystals mostly <1 mm, but locally in aggregates up to ~0.5 cm long somewhat aligned in the plane of banding, intergrown with quartz, or 2) euhedral to subhedral, lath-like to acicular, dark brown crystals up to 2 mm long, locally in finer-grained, fibrous aggregates of similar size. The first type is more or less clear, or locally pale brownish (i.e. mainly dolomite, local ankerite?); the second type may be Fe-rich, i.e. siderite (?). The very slow reaction to cold dilute HCl, only where powdered, supports their identification as likely dolomite and ankerite or siderite (?). Quartz crystals typically complexly intergrown with the carbonate occur as irregular to rounded sub/anhedra mostly <1 mm that lack elongation in the plane of banding; in places they contain oriented fine inclusions that could indicate cordierite (?) of similar size, but this is speculative. Local patches or in places single crystals of chlorite with sub/euhedral outlines to ~1 mm are pale bright green, but with length-fast anomalous green birefringence suggestive of F:M ~0.4 (?).

Ore minerals are concentrated in poorly defined, thin bands or discontinuous laminae mostly <3 mm thick, but commonly coalescing to almost 2 cm. They vary from pyrite-pyrrhotite (±chalcopyrite, relict pyrrhotite replaced by fine-grained pyrite/marcasite) or magnetite, locally sphalerite (±rare galena) rich. Pyrite typically occurs as interlocking, euhedral cubic crystals ranging from 0.1 to 0.75 mm, locally with a matrix of pyrrhotite-local sphalerite, associated with magnetite. Pyrrhotite occurs as subhedra to almost 1 mm (in places largely pseudomorphed by aggregates of pyrite ±marcasite both mostly <0.1 mm). Magnetite occurs as fractured subhedra or irregular aggregates rarely over 1 mm across. Sphalerite forms subhedra mostly in the 0.2-0.5 mm range, with very dark red-brown colour suggestive of high Fe content, only rarely intergrown galena (anhedral, <0.2 mm). Chalcopyrite is sparsely scattered as ragged subhedra <0.5 mm intergrown with sphalerite.

In summary, this is massive pyrite-pyrrhotite (partly altered to pyrite ±marcasite)-sphalerite-magnetite-minor chalcopyrite-trace galena, inter-banded with gangues of carbonate (dolomite, lesser ankerite and siderite?), lesser quartz, local chlorite.

K15-282 309-309.06: FOLIATED, MUSCOVITE-CHLORITE-CARBONATE-QUARTZ-ACCESSORY RUTILE-TRACE PYRITE SCHIST/GNEISS WITH PORPHYROBLASTIC BIOTITE (RELICT MAFIC SITES?) AND LENSY TO VEIN-LIKE CALCITE-QUARTZ AGGREGATES, SUGGESTIVE OF A META-MAFIC VOLCANIC ROCK?)

Etched offcut shows grey-green, fine-grained, moderately foliated metamorphic rock with lensy/vein-like carbonate aggregates, scattered dark mafic crystals, and apparently lacking significant sulfide. The rock is locally slightly magnetic, shows rapid reaction to cold dilute HCl (even where not scratched, fairly readily, by steel), and no stain for Kspar (but extensive white etch indicative of plagioclase). Modal mineralogy in polished thin section is approximately:

Gangue (99+%)

Muscovite (with chlorite, Fe-carbonate)	30%
Carbonate (mainly calcite in sweats, wallrock dolomite?)	25%
Chlorite (mainly with Fe-carbonate, after mafics)	20%
Quartz (matrix, and in "sweat" veinlets)	15%
Biotite (porphyroblasts)	7-8%
Rutile, minor sphene	2-3%

Ore (<1%)

Pyrite	99%

This sample consists of well-foliated muscovite-chlorite and accessory rutile/sphene containing porphyroblastic biotite, with lensy discontinuous bands (or metamorphic "sweat veinlets"?) of coarser carbonate-variable quartz. Only traces of sulfides occur, typically intergrown with rutile.

Porphyroblasts with ragged, in places corroded-looking sub/euhedral outlines mostly <3 mm (possibly after former mafic phenocrysts?) consist mostly of biotite (sub/euhedral flakes mainly <2 mm with medium/dark brown pleochroism, locally attacked at margins by chlorite as described below, or intergrown with inclusions of quartz, carbonate, or locally accessory rutile all mainly < 0.4 mm (see below for description of rutile)

The matrix consists of strongly foliated, relatively fine-grained, intimately intergrown muscovite (aligned, sub/euhedral flakes mainly <0.5 mm) and lesser chlorite (subhedral flakes <0.5 mm with pale to distinct green pleochroism, near-zero to slightly length-fast anomalous purplish birefringence, F:M~0.4-0.5?), carbonate as sub/euhedra mainly <0.35 mm, (dolomite?) and lesser quartz as rounded sub/anhedra mainly <0.25 mm. Rutile occurs as common, very dark brown/almost opaque, skeletal euhedra <0.25 mm long; the aggregates up to 0.65 mm long likely represent the sites of pre-metamorphic ilmenite or ilmeno-magnetite crystals. Only trace sulfides are present, typically in the form of minute euhedra of pyrite <35 μm, intergrown with rutile.

Lensy or locally veinlet-like aggregates up to 3 mm thick, parallel or sub-parallel to foliation, typically consist of coarser, clear carbonate (rounded subhedra up to 2 mm, slightly flattened in the plane of foliation, likely calcite), and lesser quartz as sub/anhedra <0.45 mm. These may in part represent metamorphic "sweat" veins.

In summary, this is foliated, muscovite-chlorite-carbonate-quartz-accessory rutile-trace pyrite schist/gneiss with porphyroblastic biotite (relict mafic sites?) and lensy to vein-like calcite-quartz aggregates, suggestive of a meta-mafic volcanic rock?).

K15-319 197.32-197.42: FOLIATED, PLAGIOCLASE-CHLORITE-CARBONATE-BIOTITE-SERICITE-ACCESSORY RUTILE-TRACE PYRITE ±GALENA-CHALCOPYRITE SCHIST/ GNEISS (MINOR RELICT PLAGIOCLASE, POSSIBLE MAFIC SITES INDICATED BY RELICT PORPHYROBLASTIC BIOTITE, SUGGESTIVE OF A META-MAFIC VOLCANIC ROCK?)

Etched offcut shows grey-green, fine-grained, moderately foliated metamorphic rock with lensy dark green chlorite alternating with creamy-buff felsic bands, and apparently lacking significant sulfide. The rock is not magnetic, shows common rapid reaction to cold dilute HCl (even where not scratched, fairly readily, by steel), and no stain for Kspar (but common white etch indicative of plagioclase). Modal mineralogy in polished thin section is approximately:

Gangue (99%)

Plagioclase (partly relict phenocrysts; oligoclase?)	35%
Chlorite (mainly with Fe-carbonate, after mafics)	25%
Carbonate (mainly calcite, minor ankerite?)	25%
Biotite (porphyroblasts, altered to carbonate-chlorite)	10%
Muscovite, sericite (partly after plagioclase)	2-3%
Rutile, minor sphene	2-3%

Ore (1%)

Pyrite	99%
Chalcopyrite	<1%
Galena	<1%

This sample consists of crudely defined, lensy bands alternately rich in chlorite or fine-grained plagioclase, variable carbonate and accessory sphene/rutile, containing local relict plagioclase and possible mafic sites (porphyroblastic biotite altered to carbonate-chlorite), with lensy, discontinuous bands (metamorphic "sweats"?) of coarser carbonate. Only traces of sulfides occur.

Relict plagioclase phenocrysts have ragged, irregular (corroded?) subhedral outlines up to 1.5 mm, with random orientations; they are partly attacked at margins by sericite, carbonate and chlorite, and show local twinning with extinction Y^010 mostly <10º, suggestive of oligoclase (?).

Relict possible mafic sites are suggested by aggregates with irregular to rounded outlines to ~2.5 mm composed mainly of the porphyroblast biotite (sub/euhedral flakes mainly <2 mm with medium brown pleochroism, mostly partly to largely attacked by possible Fe-carbonate (fibrous to acicular crystals mostly <0.2 mm, perpendicular to biotite cleavage, likely ankerite?) and chlorite (as described below), locally associated with rutile in lath-like aggregates to ~1 mm of subhedra <0.2 mm (similar to those in the adjacent matrix; such aggregates likely represent the sites of pre-metamorphic ilmenite or ilmeno-magnetite crystals).

The matrix consists of either mainly chlorite or mainly plagioclase and carbonate. Chlorite-rich lenses up to 4 mm thick are discontinuous, pinching out along strike; they consist of subhedral flakes <0.5 mm with pale green pleochroism, length-fast, anomalous greenish grey birefringence (F:M~0.4?). Relatively fine-grained plagioclase (sub/anhedra mainly <0.2 mm, but locally with seriate texture from <0.1 to relict phenocryst size) is intimately intergrown with fine-grained sericite (<0.1 mm) and with carbonate (lensy subhedra mainly <2 mm long, somewhat elongated in the foliation, likely calcite) that grade to the lensy aggregates up to mm thick by cm long that may represent metamorphic sweat veins. Both minor chlorite (locally interleaved by very minor muscovite <0.15 mm) and local small relict porphyroblastic biotite are locally included within the plagioclase-rich bands. Only very minor sulfides are present, in widely scattered euhedra of pyrite <1.5 mm (rarely containing inclusions of bleb-like galena <0.15 mm, or associated with traces of chalcopyrite as anhedra <25 μm).

In summary, this is foliated, plagioclase-chlorite-carbonate-biotite-sericite-accessory rutile-trace pyrite ±galena-chalcopyrite schist/gneiss (with minor relict plagioclase and possible mafic sites indicated by relict porphyroblastic biotite, suggestive of a meta-mafic volcanic rock?).

K15-319 196.22-196.27: FINE-GRAINED, CRUDELY BANDED MASSIVE SULFIDE (EUHEDRAL PYRITE IS IN MATRIX OF LESSER, FE-RICH SPHALERITE-MINOR GALENA-ARSENOPYRITE-TRACE CHALCOPYRITE-SULFOSALT (TETRAHEDRITE?), GANGUES OF CARBONATE, QUARTZ, MUSCOVITE AND RARE CHLORITE

Etched offcut shows fine-grained, dark grey, massive sulfide composed mainly of pyrite and sphalerite, with only minor, likely mostly carbonate gangue in irregular lensy to banded inclusions. The rock is not magnetic, shows reaction to cold dilute HCl (mainly only where scratched by steel), and no stain for K-feldspar in the etched offcut. Modal mineralogy in polished thin section is approximately:

Gangue (15%)

Carbonate (mainly dolomite, minor ankerite?)	75%
Quartz	20%
Muscovite (sericite)	5%
Chlorite	<1%

Ore (85%)

Pyrite	65%
Sphalerite	25%
Galena	5%
Arsenopyrite	5%
Chalcopyrite	<<1%
Sulfosalt (tennantite-tetrahedrite?)	<<1%

This sample consists of fine-grained massive sulfide composed mainly of abundant pyrite in a matrix of lesser sphalerite, minor galena, very minor sulfosalt; locally coarse, poikilitically included gangues are mostly carbonate, locally with minor muscovite. Banding is crudely defined, with a tendency to sphalerite-galena-rich zones, and quartz is confined to certain poorly defined bands.

Pyrite forms mainly cubic euhedral crystals mostly in the 0.1 to 0.5 (rarely to 0.7) mm size range, commonly mixed with or replaced at cores by arsenopyrite forming minute, randomly oriented euhedral crystals rarely over about 25 μm in size, but locally in aggregates up to almost 2 mm long in the plane of banding). Such aggregates also occur intimately intergrown with or included within aggregates of sphalerite or galena. Sphalerite forming the bulk of the intermittent, discontinuous matrix to pyrite occurs as interlocking, sub- to euhedral crystals mainly <1 mm (local aggregates up to 3.5 mm long in sphalerite-rich bands), with dark red-brown colour indicative of high Fe content. In the larger aggregates, galena and pyrite, or locally arsenopyrite, may occur as small to minute (0.1 to <20 μm) inclusions especially around the margins of the sphalerite aggregates. Galena making up most of the rest of the matrix occurs as irregular to skeletal, interstitial sub/anhedral crystals mostly <1 mm across mainly confined to discrete but poorly defined bands, rarely with very minor sulfosalt inclusions, also around the margins of galena crystals. The sulfosalt is greenish-grey, apparently isotropic, forming subhedra mainly <50 μm, suggestive of tennantite-tetrahedrite (?); it may be Ag-bearing. Chalcopyrite is rare, forming subhedra <0.1 mm, mostly within sphalerite or quartz.

Gangue inclusions in the massive sulfides are mostly either irregular in outline, <1 mm or where more abundant, in poorly defined bands up to about 3 mm thick, parallel to vague banding in the sulfides. They consist mainly of carbonate as subhedral, randomly oriented crystals up to about 0.5 mm (relatively clear, dolomite?), to judge by reaction in the offcut, with local dark brown euhedra <0.5 mm (ankerite?). Quartz is mainly confined to one central 3 mm thick band, (interlocking ragged subhedra up to 1 mm long, partly aligned with the banding), mostly displaying only mild strain (weak undulose extinction, sub-grain development, rare suturing of grain boundaries). Muscovite forming mainly euhedral flakes <0.75 mm are most common in the quartz-rich band, but also occur with the carbonate; rare chlorite (subhedra <0.35 mm, pale green pleochroism) occur in the quartz.

In summary, this is fine-grained, crudely banded massive sulfide in which euhedral pyrite is set in a matrix of lesser, Fe-rich sphalerite-minor galena-arsenopyrite-trace chalcopyrite-sulfosalt (tetrahedrite?), with gangues of carbonate, quartz, muscovite and rare chlorite.

K15-312 57.4-57.52: FOLIATED, PLAGIOCLASE-CHLORITE-BIOTITE-CARBONATE-EPIDOTE-ACCESSORY SPHENE-TRACE PYRITE-CHALCOPYRITE ±HEMATITE SCHIST/GNEISS (RELICT PLAGIOCLASE, PORPHYROBLASTIC BIOTITE SITES?)

Etched offcut shows grey-green, fine-grained, moderately foliated metamorphic rock with scattered green mafic crystals in lensy green areas, imparting a mottled appearance, and apparently lacking significant sulfide. The rock is not magnetic, shows rapid reaction to cold dilute HCl (even where not scratched, fairly easily, by steel), and no significant stain for Kspar (but extensive white etch indicative of plagioclase). Modal mineralogy in polished thin section is approximately:

Gangue (99+%)

Plagioclase (partly altered to epidote, carbonate; oligoclase?)	30%
Chlorite (mainly matrix, rarely with Fe-carbonate, after mafics)	25%
Biotite (porphyroblasts)	20%
Carbonate (mainly calcite, minor dolomite/ankerite?)	15%
Epidote-group (zoisite/clinozoisite?)	7-8%
Sphene	2%
Amphibole (relict, altered to carbonate-chlorite)	<1%

Ore (<1%)

Pyrite	70%
Chalcopyrite	25%
Hematite	5%

This sample consists of crudely defined lenses or discontinuous bands of fine-grained plagioclase, chlorite, variable carbonate, epidote and accessory sphene, containing possible relict plagioclase (granulated/recrystallized) and mafic sites (porphyroblastic biotite) plus local lensy, discontinuous bands (or metamorphic "sweats"?) of coarser carbonate. Only traces of sulfides occur.

Relict plagioclase phenocryst sites have poorly defined, irregular/lensy outlines to ~2 mm, likely due to intense recrystallization and partial elongation/transposition into the foliation. The relics are composed of interlocking sub/anhedral crystals mostly 0.1-0.2 mm (rarely to 0.5 mm) with common inclusions of epidote, chlorite and minor carbonate, only rarely displaying twinning with extinction Y^010 <10º, suggestive of oligoclase (?).

Relict possible mafic sites are mostly suggested by aggregates with irregular lensy outlines to ~3 mm (typically aligned with foliation) composed mainly of porphyroblasts biotite (sub/euhedral flakes mainly <2 mm with medium brown or green pleochroism, locally attacked at margins by chlorite as described below). Inclusions of epidote (euhedra mainly <0.1 mm, oriented as in the surrounding matrix) suggest blastic growth, and accessory sphene is common as ragged, irregular aggregates up to 0.4 mm long mostly aligned in the foliation; the aggregates likely represent the sites of pre-metamorphic ilmenite or ilmeno-magnetite crystals associated with the mafic sites.. Rare relict amphibole (pale green, actinolitic, subhedra to 0.5 mm) are replaced by carbonate (subhedra <0.1 mm, likely dolomite?) and chlorite (especially at margins, euhedral flakes <0.15 mm).

The matrix consists of relatively fine-grained, intimately intergrown plagioclase (sub/anhedra mainly <0.1-0.2 mm, commonly difficult to distinguish from relict phenocryst sites), lensy aggregates of chlorite (euhedral flakes <0.5 mm with pale green pleochroism, first-order grey-green birefringence, F:M~0.4?), common euhedral epidote mostly 0.1-0.4 mm long (oriented in the foliation, with only faint colour/pleochroism indicative of low Fe content) and sphene as described above. Distribution of carbonate is irregular, mainly in lensy aggregates grading to "sweat" veinlets up to 3 mm thick composed of relatively coarse, clear, subhedra up to 1.5 mm (likely calcite). There are traces of hematite (subhedral flakes <0.1 mm) along the margins of the veinlets. Only very minor sulfides are present, in widely scattered skeletal/filigree-like euhedra of pyrite <0.2 mm, or rare subhedra <0.15 mm of chalcopyrite, most commonly within carbonate.

In summary, this is foliated, plagioclase-chlorite-biotite-carbonate-epidote-accessory sphene-trace pyrite-chalcopyrite ±hematite schist/gneiss (relict plagioclase, porphyroblastic biotite-rich mafic sites suggestive of a meta-mafic volcanic rock?)

K15-312 72.4-72.55: QUARTZ-KSPAR PHYRIC, META-RHYOLITE PARTLY ALTERED TO SERICITE-RUTILE, CUT BY DEFORMED STRINGERS (?) OF QUARTZ-MUSCOVITE-CARBONATE-PYRITE ± MARCASITE, RUTILE

Etched offcut shows creamy white/pale greenish grey, fine-grained, weakly foliated felsic metamorphic rock with irregular to highly stretched/deformed relict quartz phenocrysts (?) and thin quartz ±sulfide stringers in a matrix of alkali feldspar (mainly Kspar to judge by the yellow stain). The rock is not magnetic, and shows no reaction to cold dilute HCl (even where scratched, with difficulty, by steel). Modal mineralogy in polished thin section is approximately:

Gangue (95+%)

Alkali feldspar (mainly Kspar, minor plagioclase?)	60%
Quartz (relict primary "eyes", matrix, secondary stringers)	25%
Muscovite, sericite	12%
Carbonate (dolomite, ankerite?)	2-3%
Rutile	<1%

Ore (<5%)

Pyrite	99%
Marcasite (after pyrrhotite?)	1%

This sample consists of recognizable small Kspar, larger, possible deformed relict quartz phenocrysts, and small, highly deformed/altered relict mafic sites (?) set in a very fine-grained, felted groundmass of alkali feldspar (mainly Kspar, local sericitized plagioclase?) and significant quartz, cut by what appear to be deformed/transposed quartz-muscovite-sulfide-carbonate stringers.

The matrix or relict groundmass, making up 50-60% of the section, consists of more or less randomly oriented, feathery subhedral laths of Kspar (distinct negative relief compared to quartz) mainly <0.15 mm long, or rarely partly sericitized plagioclase (?) as indicated by white etched areas in the offcut. Lesser quartz forms interstitial anhedra ranging from <20 μm to 0.25 mm (grading to phenocrysts). Minor sericite forms subhedral flakes <50 μm, somewhat aligned in the foliation.

Kspar phenocrysts have mainly euhedral outlines up to ~2.5 mm long, with moderate negative 2V and local "grid" twinning suggestive of orthoclase and/or minor microcline, locally broken along the foliation and commonly replaced by quartz as subhedra <0.25 mm (associated with local pyrite, carbonate and sericite all mainly <0.1 mm).

Quartz phenocryst sites are less well defined, with typically rounded to ellipsoid, or locally strongly flattened/elongated outlines ranging from <1 mm to slightly over 2 mm, or in the case of flattening, up to ~0.5 cm (although these are difficult to distinguish from possibly ptygmatic folded and deformed former quartz stringers) replacing ~10-15% of the slide). Quartz crystals are mostly sub/anhedral, interlocking, rarely over 0.5 mm, typically only slightly flattened in the plane of weak foliation, with weak to rare moderate undulose extinction, sub-grain development, or suturing of grain boundaries, but common triple junctions.

Possible relict mafic sites (?) with irregular to lensy outlines mostly <1.5 mm consist of loose aggregates of muscovite (euhedral flakes to 0.25 mm, sulfides and carbonate plus accessory rutile (minute dark brown euhedra mainly <30 μm), but are commonly found along the presumed relict stringer veinlets, so are difficult to distinguish from concentrations along them.

Possible deformed/rotated stringer veinlets are sub-planar to irregular, up to 2.5 mm thick, composed of quartz very similar to that described for relict phenocrysts but up to 1.5 mm, variable muscovite (mainly sub/euhedral flakes <0.5 mm, aligned with foliation), carbonate (subhedra <0.4 mm, varying from almost clear, suggestive of dolomite, to distinctly brownish, mixed with sericite <25 μm, possibly ankerite?) and sulfides. Sulfides appear to be mainly pyrite as cubic sub/euhedra <0.25 mm, rarely accompanied by traces of marcasite as filigree-like aggregates <0.15 mm interstitial to quartz, all in aggregates up to ~0.5 mm long along the veinlets, rarely with intergrown rutile.

In summary, this appears to be quartz-Kspar phyric, meta-rhyolite partly altered to sericite-rutile, cut by deformed stringers (?) of quartz-muscovite-carbonate-pyrite ± marcasite, rutile.

K15-314 76.48-76.6: FOLIATED, PLAGIOCLASE-CHLORITE-BIOTITE-CARBONATE-EPIDOTE-ACCESSORY SPHENE-TRACE PYRITE-CHALCOPYRITE ±HEMATITE SCHIST/GNEISS (RELICT PLAGIOCLASE, PORPHYROBLASTIC BIOTITE-RICH MAFIC SITES SUGGESTIVE OF A META-MAFIC VOLCANIC ROCK?)

Etched offcut shows grey-green, fine-grained, moderately foliated metamorphic rock with scattered green mafic crystals in lensy green areas, imparting a mottled appearance, and apparently lacking significant sulfide. The rock is not magnetic, shows local reaction to cold dilute HCl (even where not scratched, fairly easily, by steel), and no significant stain for Kspar (but extensive white etch indicative of plagioclase). Modal mineralogy in polished thin section is approximately:

Gangue (99+%)

Plagioclase (partly altered to epidote-chlorite-amphibole)	35%
Chlorite (mainly with Fe-carbonate, after mafics)	20%
Biotite (porphyroblasts)	20%
Carbonate (calcite, lesser dolomite?)	10%
Amphibole (relict, altered to carbonate-chlorite)	10%
Epidote-group (zoisite/clinozoisite?)	7-8%
Sphene	2-3%

Ore (<1%)

Pyrite	75%
Chalcopyrite	15%
Hematite	10%

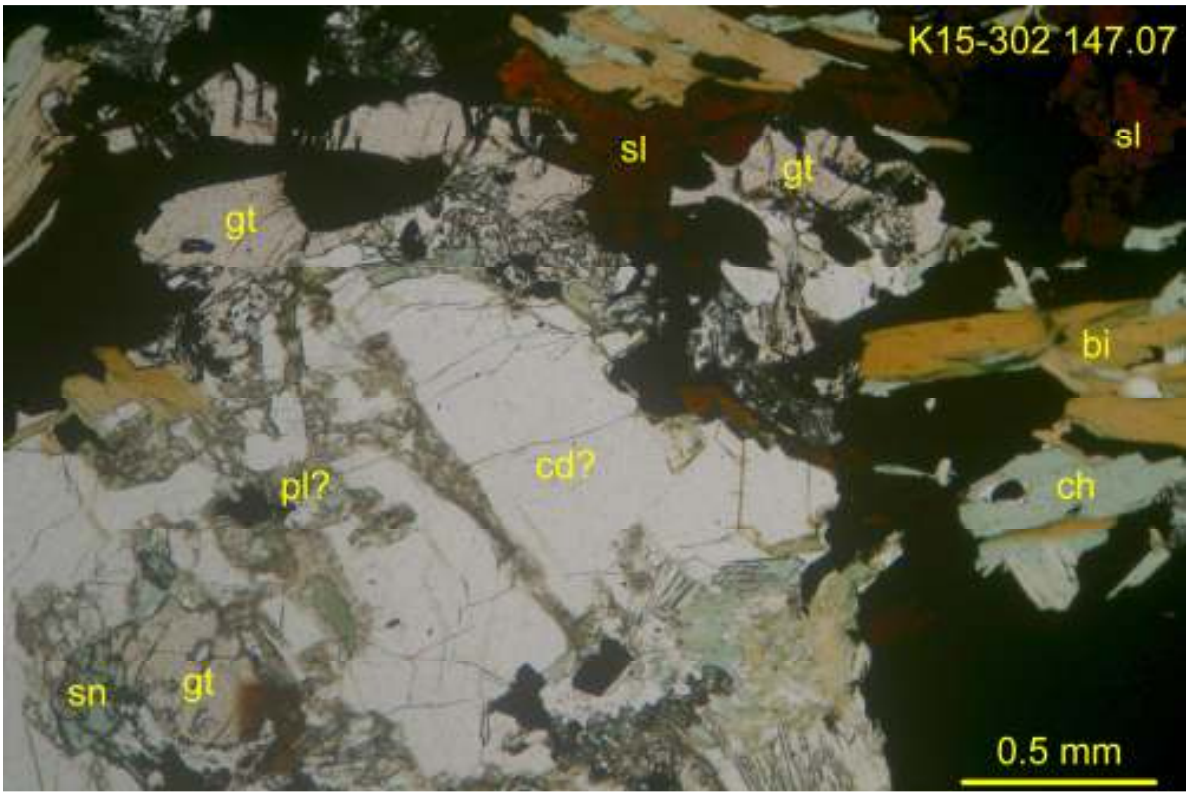
This sample consists of crudely defined lenses or discontinuous bands of fine-grained plagioclase, chlorite, variable carbonate, relict amphibole, epidote and accessory sphene, containing possible relict plagioclase (granulated/recrystallized) and mafic sites (porphyroblastic biotite, relict amphibole), cut by local veinlets of coarser carbonate, sub-perpendicular to foliation. Sulfides are very rare.

Possible relict plagioclase phenocryst sites have poorly defined, irregular/lensy outlines to ~4 mm, likely due to intense recrystallization and elongation/transposition into the foliation. The relics are composed of interlocking sub/anhedral crystals mostly <0.2 mm (rarely to 0.4 mm) with minor inclusions of epidote, chlorite, and amphibole similar to those in the matrix. Twinning is very rare.

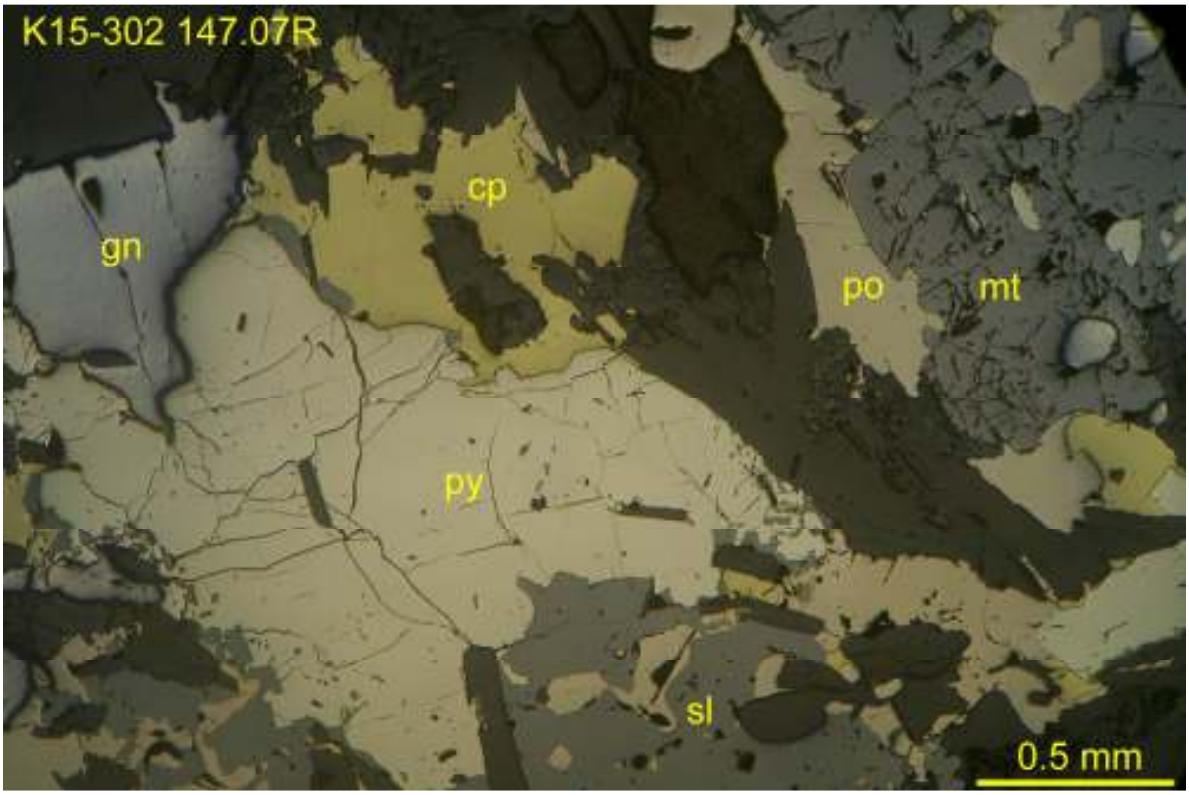
Relict possible mafic sites are mainly suggested by aggregates with irregular lensy outlines to ~3 mm (typically aligned with foliation) composed mainly of porphyroblasts biotite (sub/euhedral flakes mainly <2 mm with medium brown pleochroism, locally attacked at margins by chlorite as described below). Minor inclusions of epidote (euhedra mainly <0.1 mm, oriented as in the surrounding matrix) suggest blastic growth, and accessory sphene is common as ragged, irregular aggregates up to 1 mm long mostly aligned in the foliation; the aggregates likely represent the sites of pre-metamorphic ilmenite or ilmeno-magnetite crystals associated with the mafic sites. Lesser relict amphibole (relics to ~2 mm composed of pale green, actinolitic subhedra to 1 mm) are strongly replaced by carbonate (subhedra <0.5 mm, brown dolomite/ankerite?), epidote (euhedra to 0.25 mm) and chlorite (especially at margins, euhedral flakes <0.15 mm), associated with sphene aggregates. Only traces of sulfides are present, mostly in relict mafic sites where they form euhedra of pyrite <0.1 mm, or rare subhedra <0.15 mm of chalcopyrite, locally associated with traces of hematite (subhedral flakes <0.1 mm but in aggregates to 0.6 mm long, aligned with foliation).

The matrix consists of relatively fine-grained, intimately intergrown plagioclase (sub/anhedra mainly <0.1-0.2 mm, commonly difficult to distinguish from relict phenocryst sites), lensy aggregates of chlorite (euhedral flakes <0.5 mm with pale green pleochroism, first-order grey birefringence, F:M~0.4?), common euhedral epidote mostly 0.1-0.4 mm long (oriented in the foliation, with only faint colour/pleochroism indicative of low Fe content) and sphene as described above. Carbonate is mainly confined to veinlets <1 mm thick (relatively clear subhedra <1.5 mm, likely calcite).

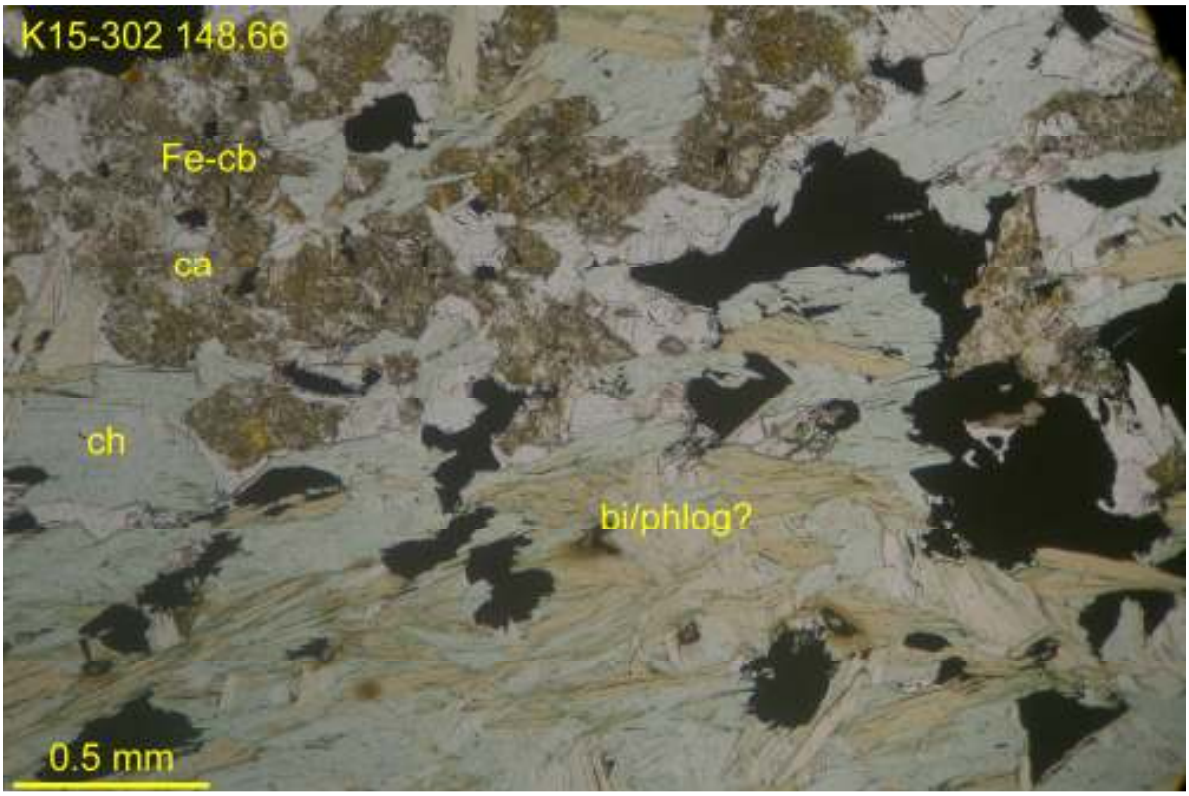
In summary, this is foliated, plagioclase-chlorite-biotite-carbonate-epidote-accessory sphene-trace pyrite-chalcopyrite ±hematite schist/gneiss (relict plagioclase, porphyroblastic biotite-rich mafic sites suggestive of a meta-mafic volcanic rock?).



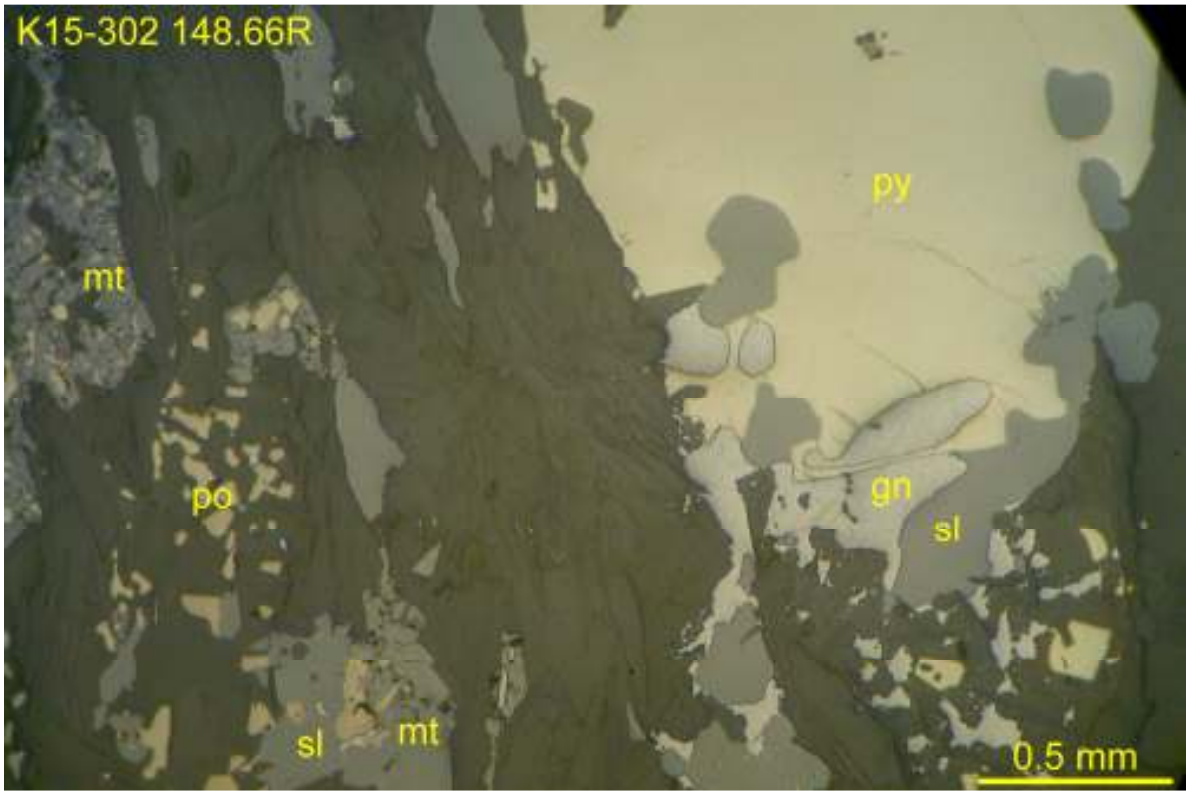
K15-302 147.07-147.19: porphyroblastic cordierite (cd?) with sericite alteration or sericite altered plagioclase? (pl?) inclusions, local garnet (gt) and green spinel (sn) in weakly foliated matrix of sulfides (opaque), pale brown biotite (bi) and pale green chlorite (ch). Note deep red-brown (Fe-rich) sphalerite. Transmitted plane light, field of view~3 mm.



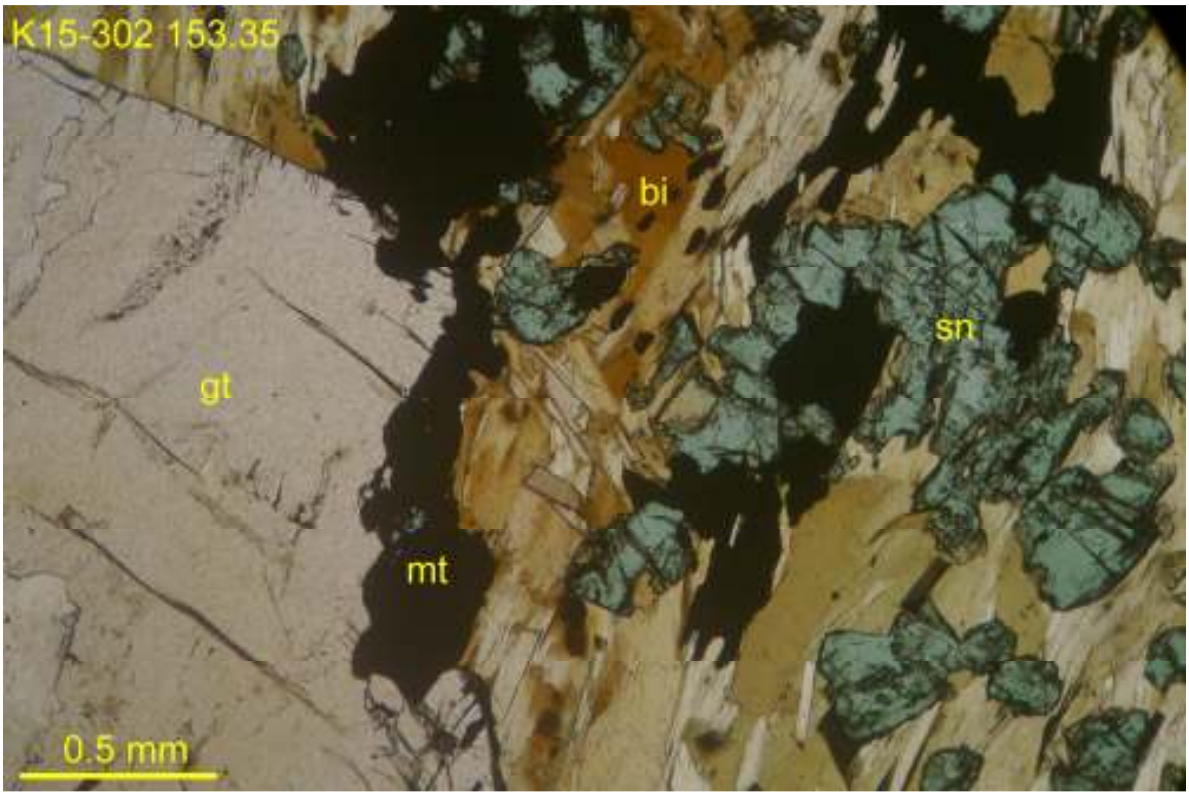
K15-302 147.07-147.19R local blastic magnetite (mt) or pyrite (py) in matrix of pyrrhotite (po), sphalerite (sl), galena (gn) and chalcopyrite (cp) intergrown with weakly foliated mica containing minor spinel). Reflected light, uncrossed polars, field of view ~3 mm wide.



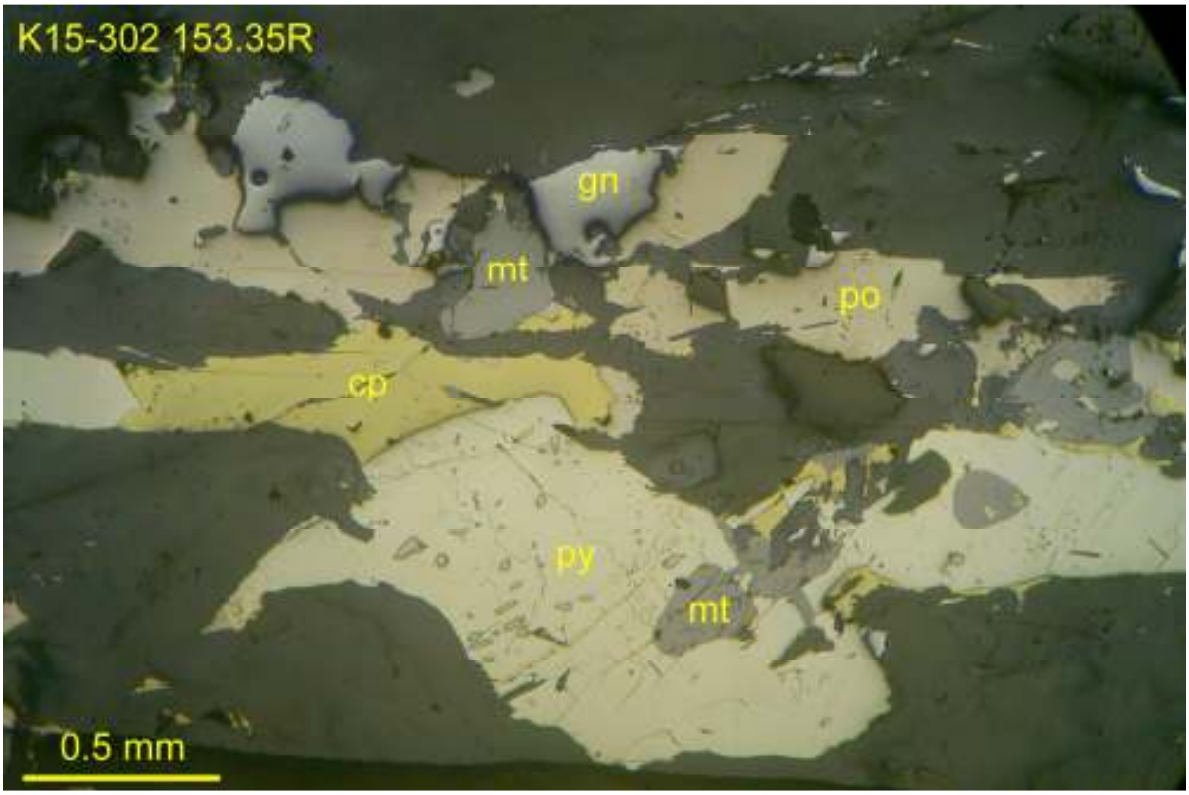
K15-302 148.66-148.78: foliated very pale green chlorite-very pale brown biotite (or phlogopite?) with lensy aggregates of carbonate (partly clear calcite, ca, and partly limonite-stained Fe-carbonate?) plus heavily disseminated sulfides and magnetite (opaque). Transmitted plane light, field of view~3 mm wide.



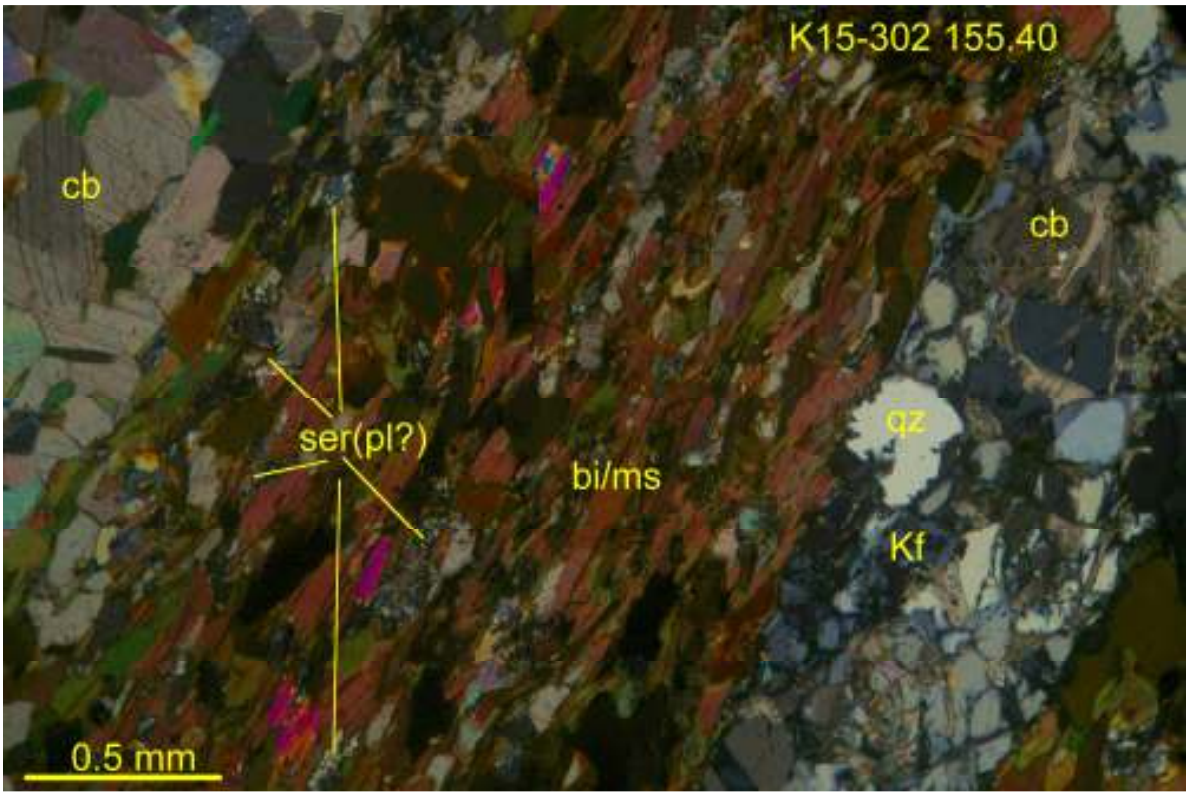
K15-302 148.66-148.78R: lensy aggregates (sub-parallel to foliated, chlorite/biotite-rich matrix) of pyrite with concentrations at the ends of sphalerite and galena, or of magnetite-lesser pyrrhotite-sphalerite. Reflected light, uncrossed polars, field of view ~3 mm wide.



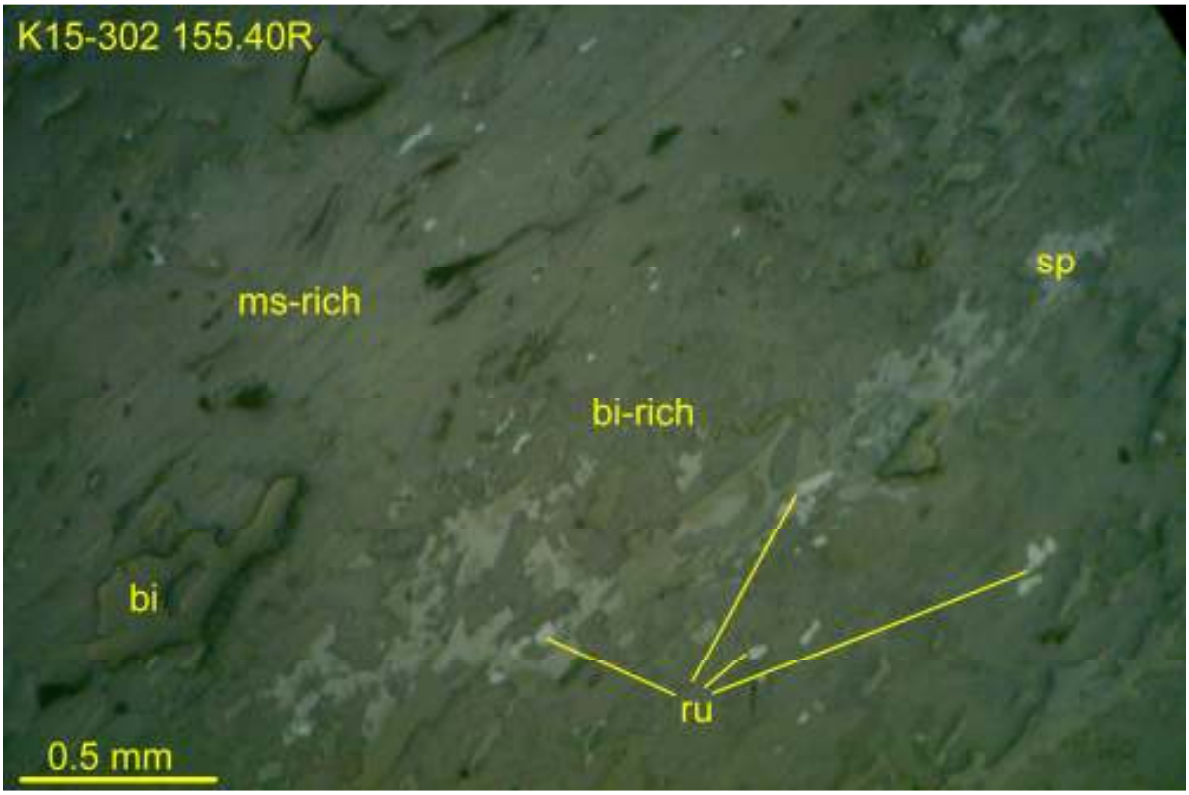
K15-302 153.35-153.48: margin of euhedral, blastic, possibly zoned garnet (gt) with finer, blastic magnetite (opaque) and bright green spinel (could be Zn-bearing, gahnite) in foliated matrix of biotite (varying from brown to greenish brown). Transmitted plane light, field of view ~3 mm wide.



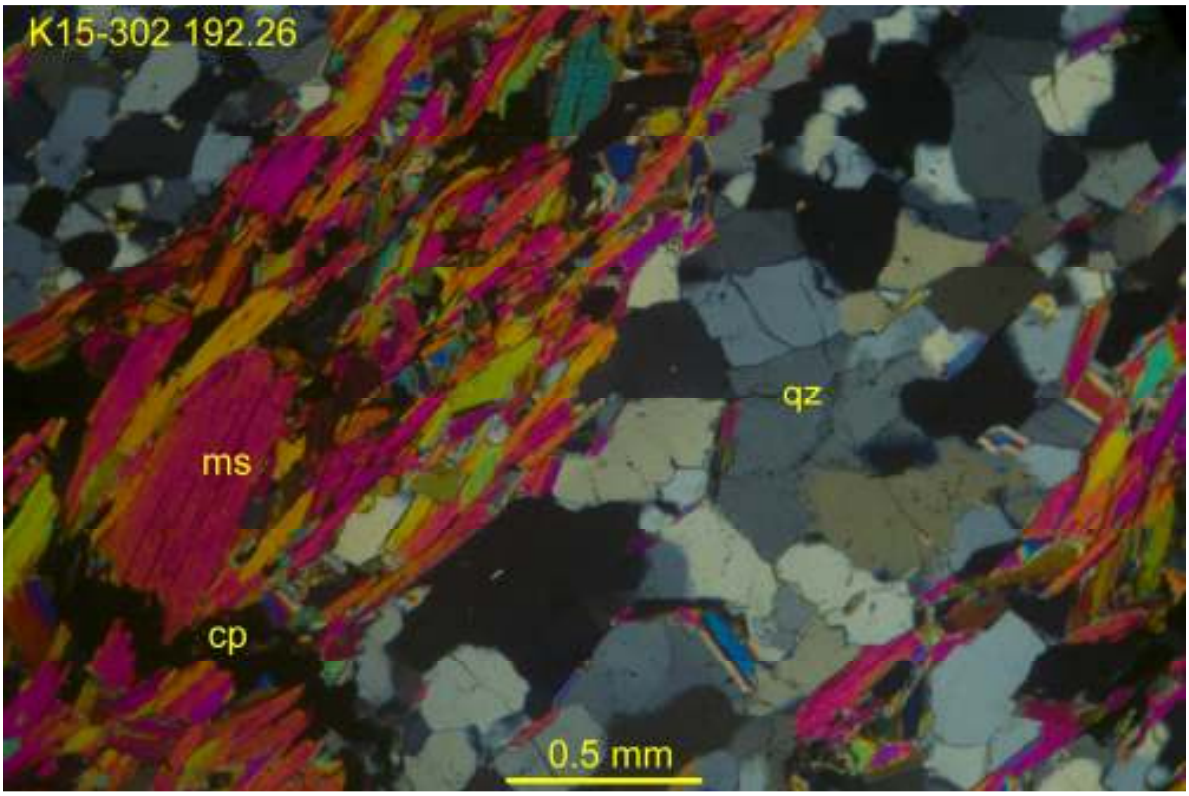
K15-302 153.35-153.48R: lensy, ribbon-like aggregates of pyrrhotite, local pyrite, galena, chalcopyrite and minor magnetite in foliated, micaceous matrix. Reflected light, uncrossed polars, field of view ~3 mm wide.



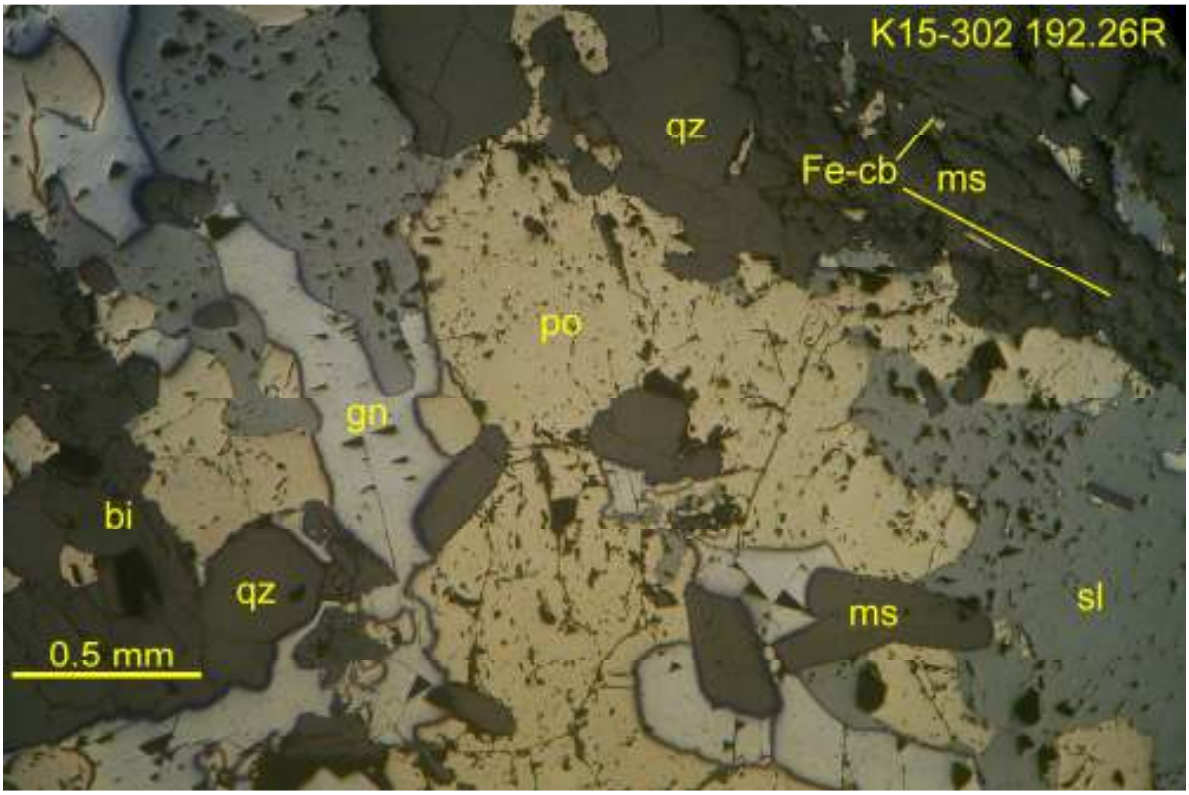
K15-302 155.40-155.55: lensy aggregates of either mainly carbonate, or mainly quartz and interstitial Kspar (flattened relict porphyroblast sites?) in matrix of mostly well foliated biotite, minor carbonate, and interstitial relict (sericitized) plagioclase. Transmitted light, crossed polars, field of view ~3 mm wide.



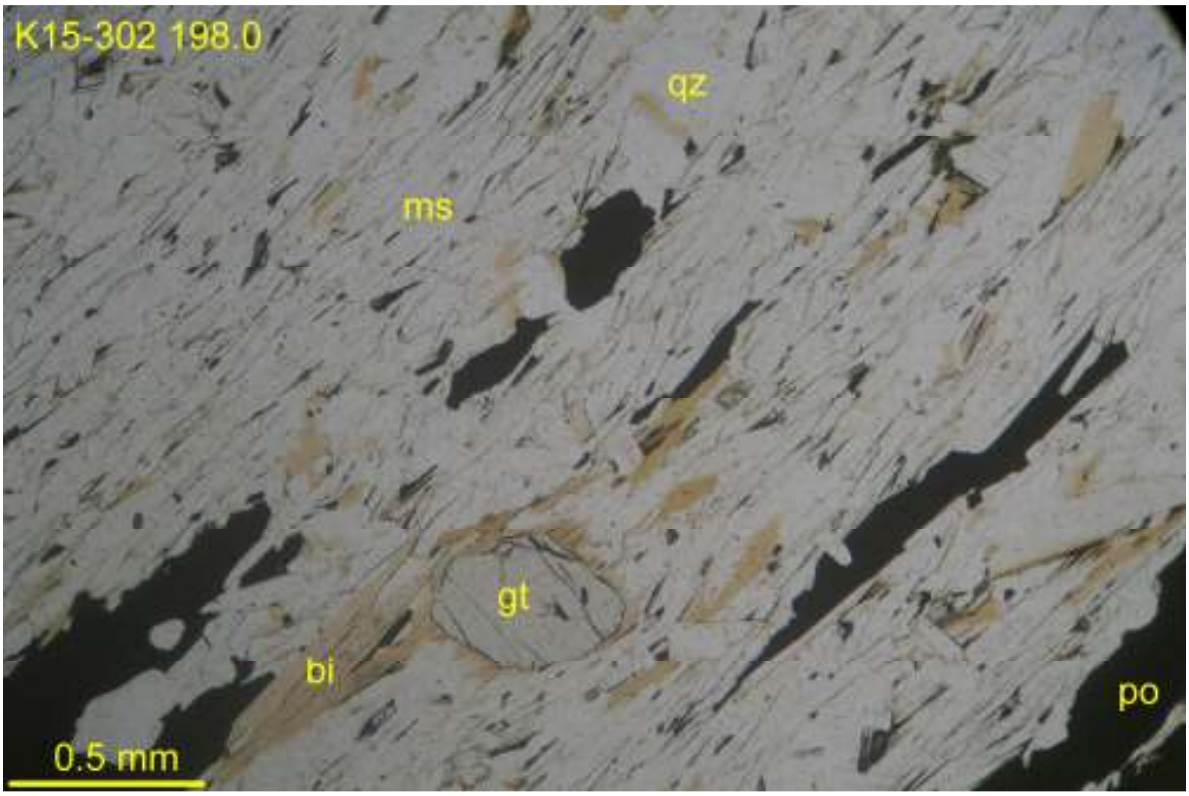
K15-302 155.40-155.55R: elongated relict mafic/ilmeno-magnetite (?) site now composed of sphene (sp) and lesser rutile (ru) associated with biotite and carbonate, stretched out into the foliation defined by the matrix of either mainly biotite (bi) or muscovite (ms) laminae (the latter with local biotite). Reflected light, uncrossed polars, field of view ~3 mm wide.



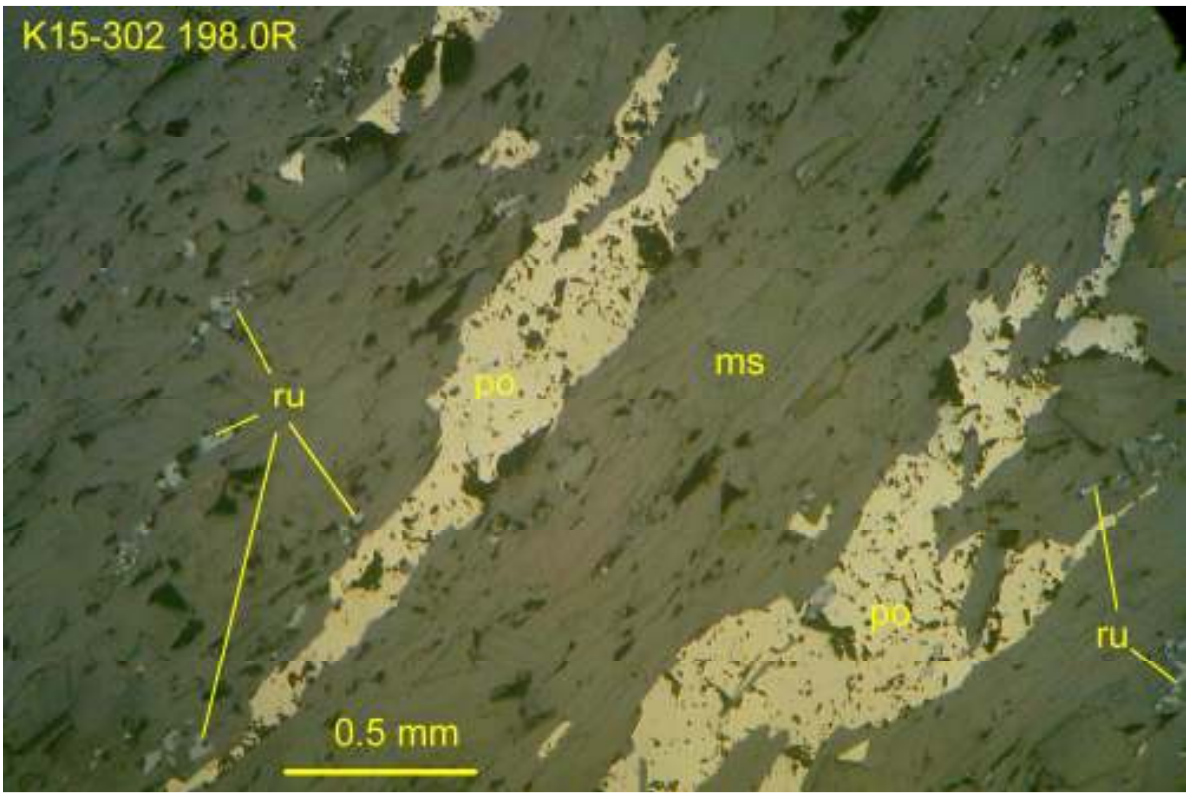
K15-302 192.26-192.41: alternating laminae of quartz-rich or muscovite-rich rock (possibly representing exhalative or stringer zone?), cut by local foliation-perpendicular fractures containing chalcopyrite (opaque; lower left). Transmitted light, crossed polars, field of view ~3 mm wide.



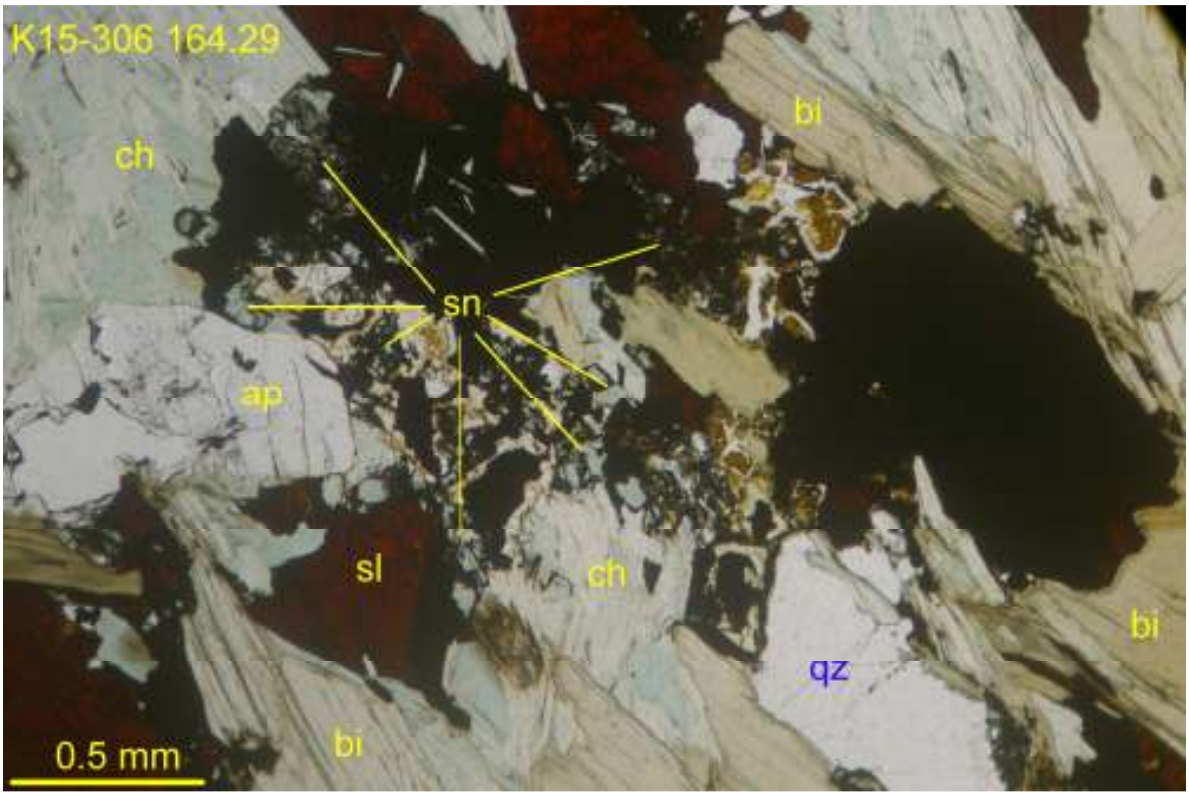
K15-302 192.26-192.41R: intergrown pyrrhotite, Fe-rich sphalerite and galena, in gangue matrix of quartz, muscovite, local minor biotite or Fe-carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



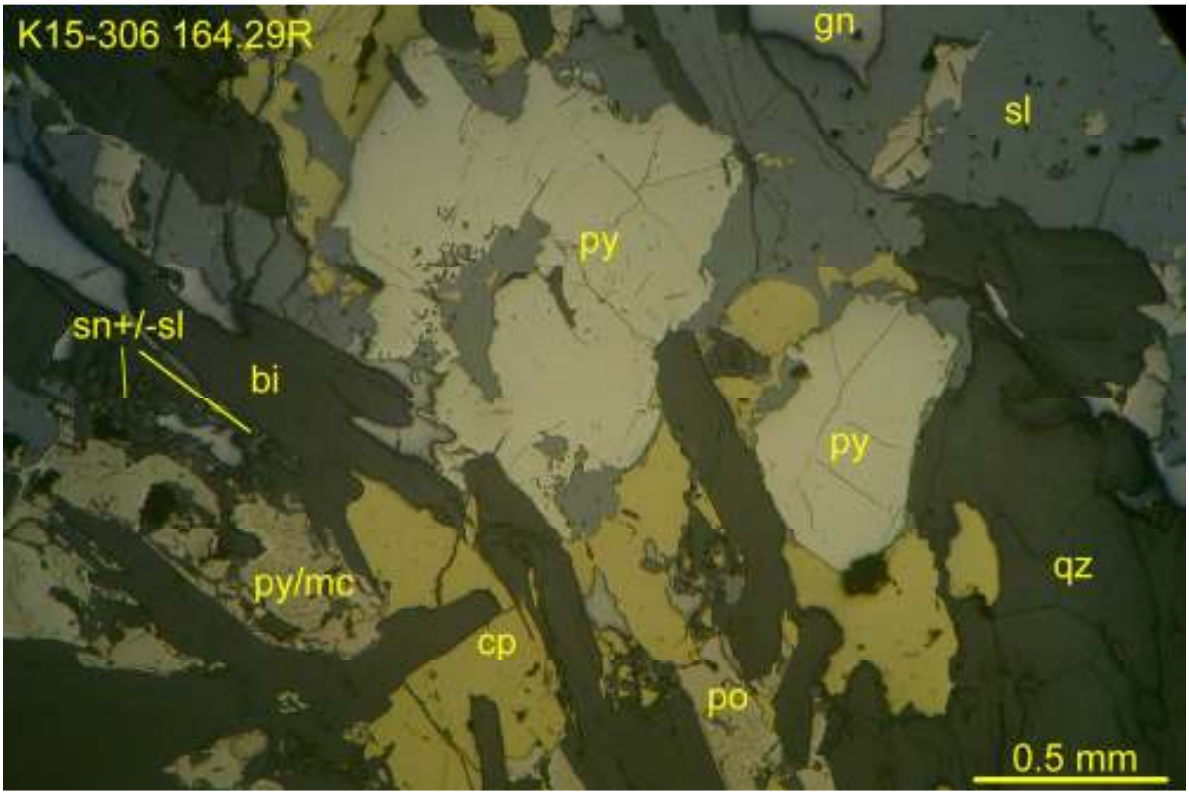
K15-302 198.0-201.0: strongly foliated, muscovite (ms)-minor quartz (qz)-biotite (bi)-local blastic garnet (gt)-wispy pyrrhotite (opaque) gneiss. Transmitted plane light, field of view ~3 mm wide.



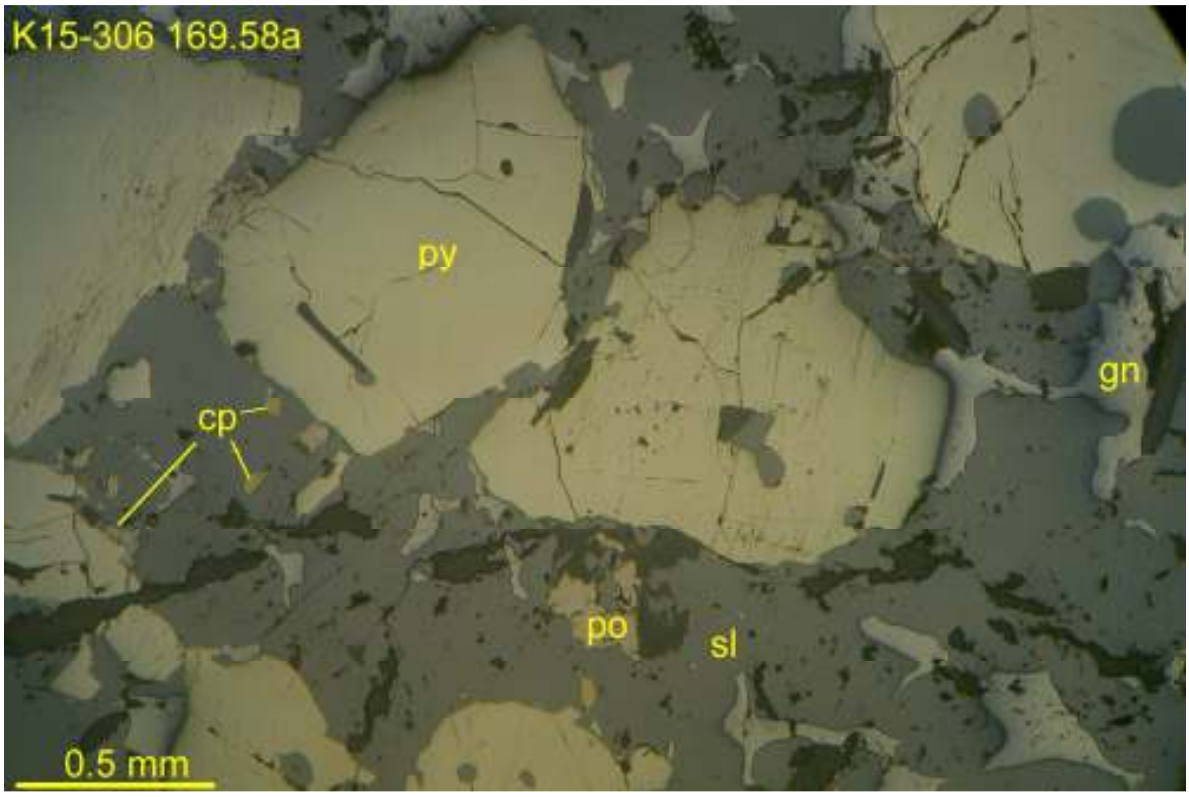
K15-302 198.0-201.0R: lensy, wispy concentrations of pyrrhotite (po) and minor rutile (ru) oriented along foliation in mainly muscovite matrix. Reflected light, uncrossed polars, field of view ~3 mm wide.



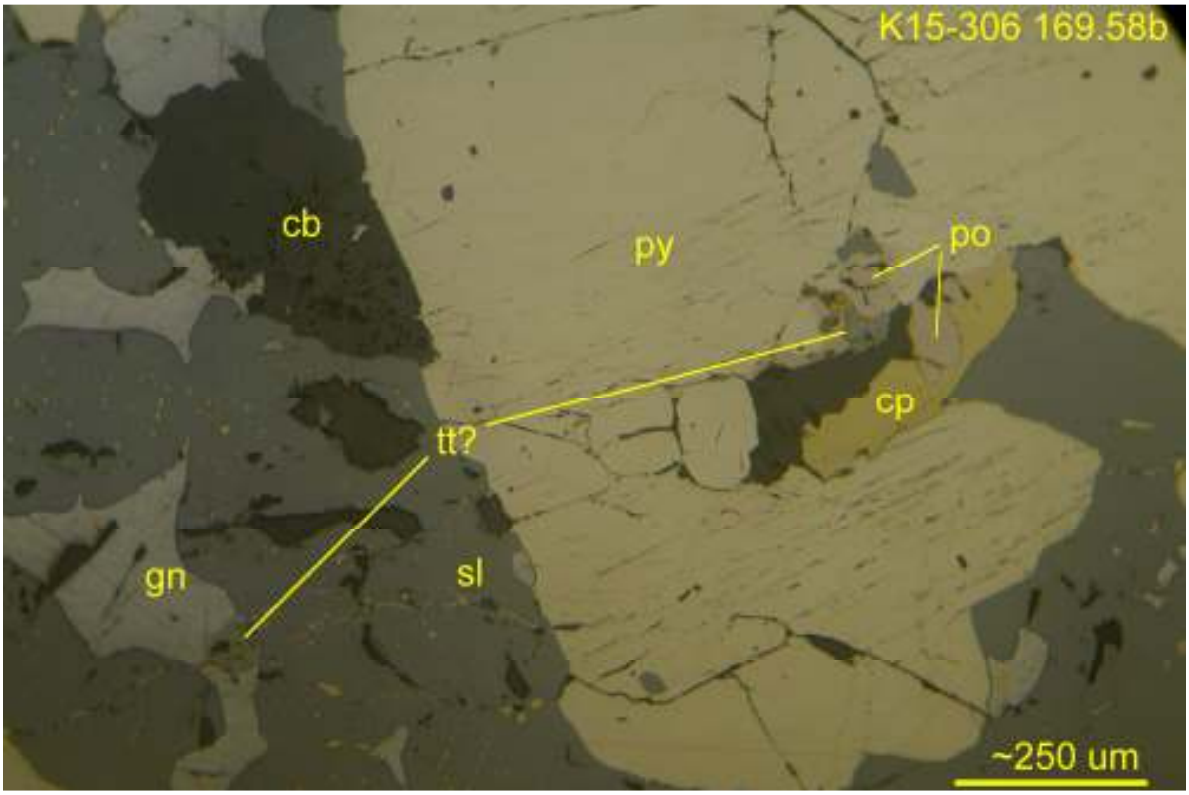
K15-306 164.29-164.40: blastic quartz, apatite (ap?) and Fe-rich sphalerite (also as minute inclusions in green, possibly zincian, spinel), associated with other sulfides (pyrrhotite, pyrite; both opaque) in matrix of weakly foliated biotite and chlorite. Transmitted plane light, field of view ~3 mm wide.



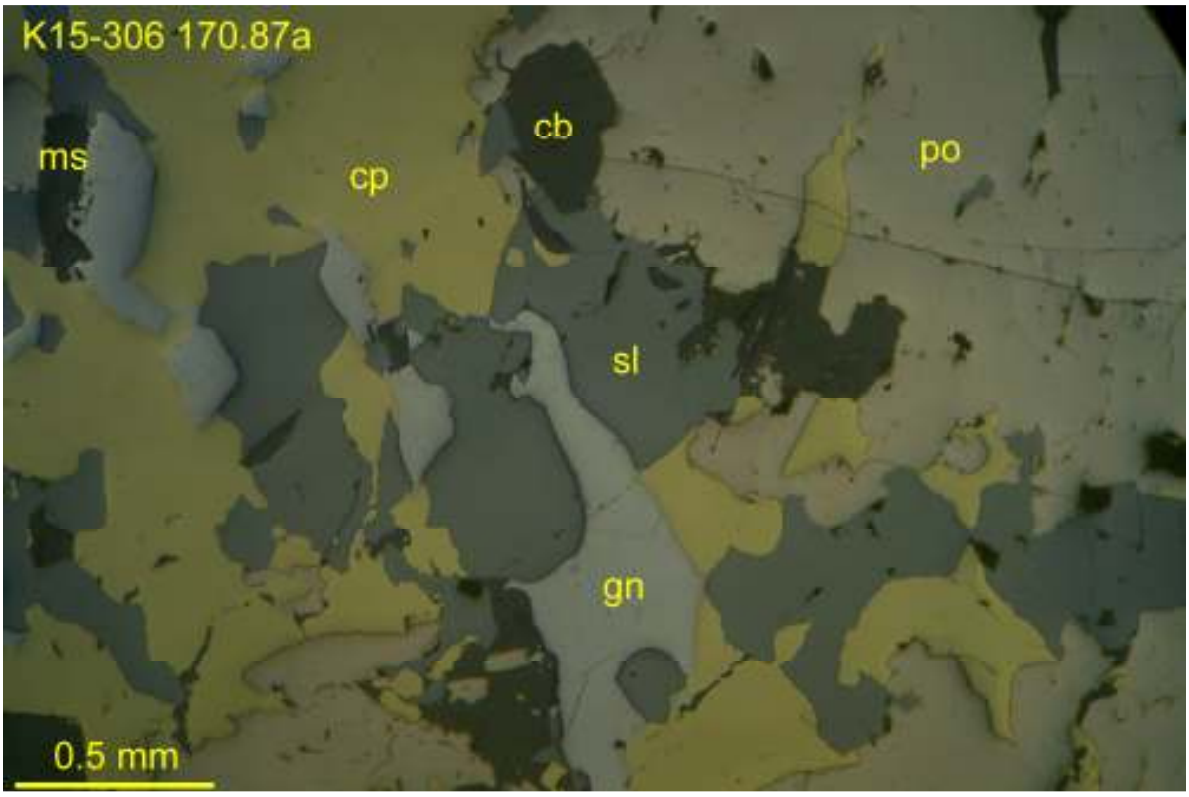
K15-306 164.29-164.40R: semi-massive sulfide matrix composed of sphalerite (note adjacent possible Zn-spinel with minute sphalerite inclusions), pyrrhotite (partly altered to lamellar pyrite/marcasite), sub/euhedral pyrite, lesser galena, and chalcopyrite. Reflected light, uncrossed polars, field of view ~3 mm wide.



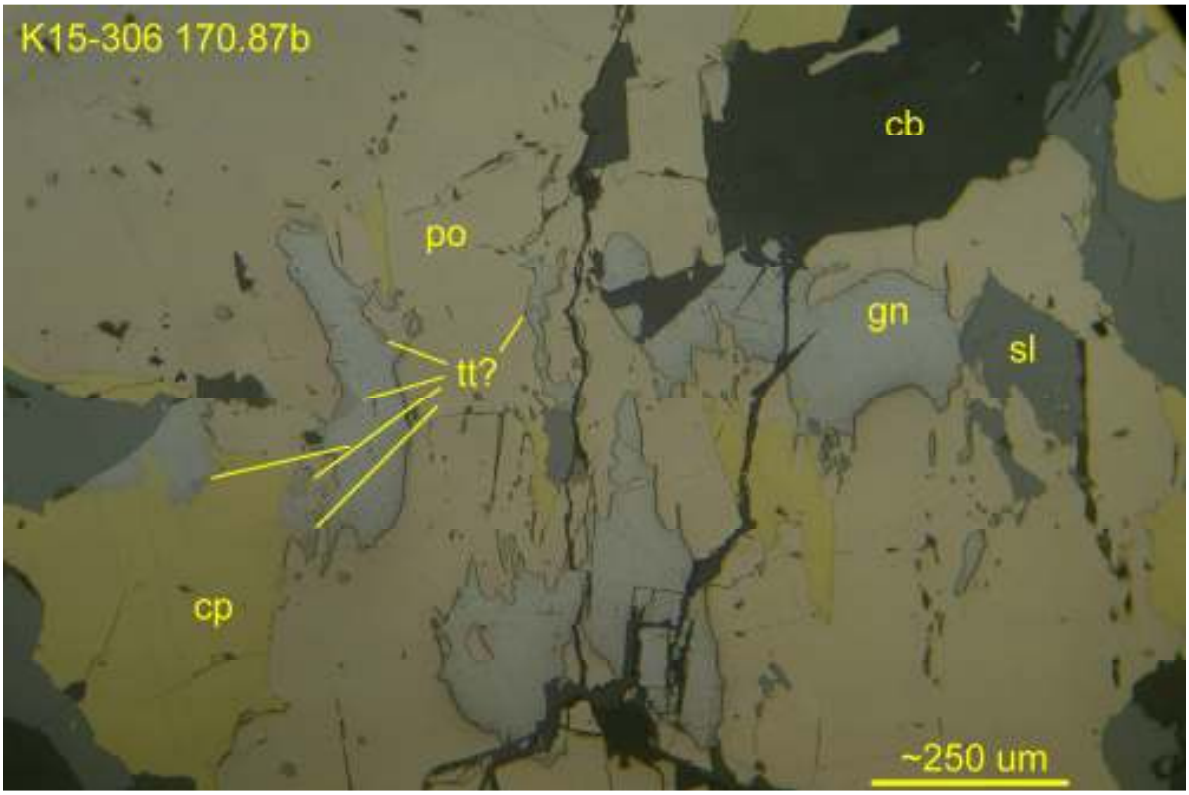
K15-306 169.58-169.68a: overview of massive sulfides composed of subhedral pyrite in near-continuous matrix of sphalerite, lesser galena, minor pyrrhotite (mainly near margins of pyrite), trace chalcopyrite; gangue inclusions are mostly either mica or carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



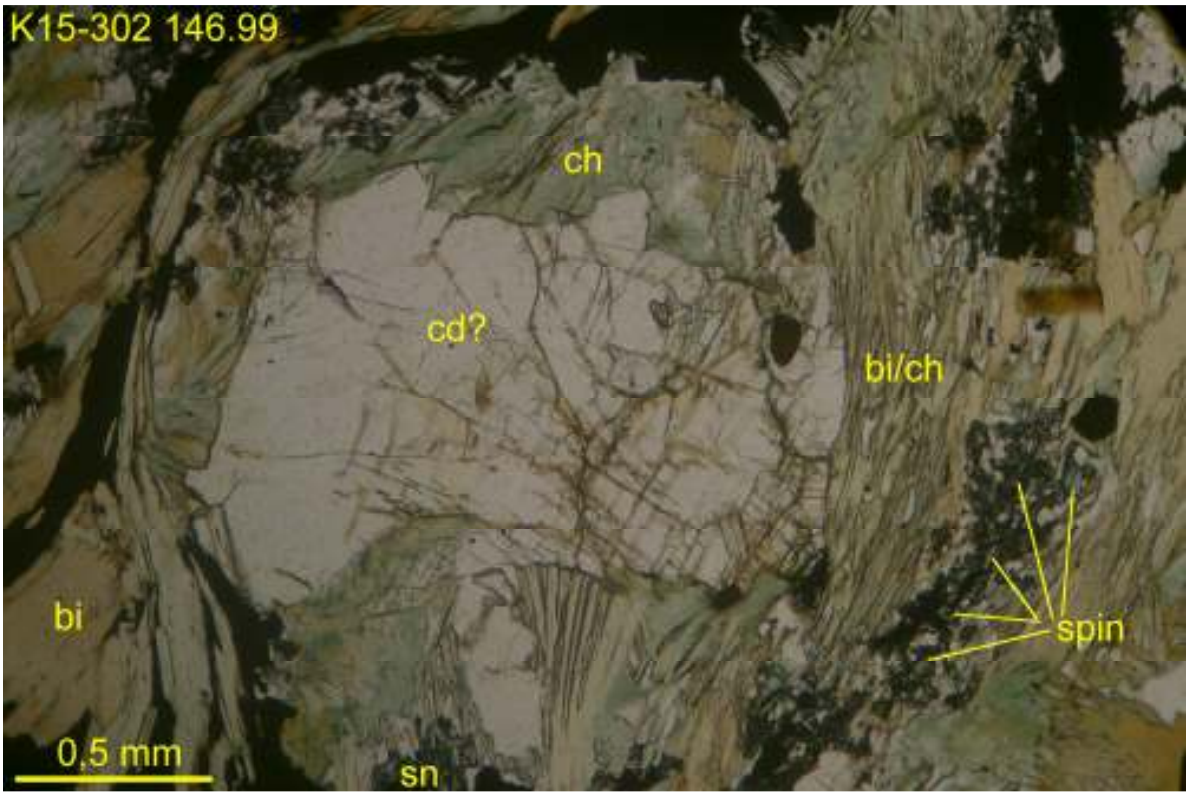
K15-306 169.58-169.68b detailed view to show inclusions of greenish sulfosalt (possibly argentian tetrahedrite, tt?) in galena or associated with chalcopyrite, in matrix of sphalerite containing pyrite crystals, carbonate gangues. Reflected light, uncrossed polars, field of view ~1.5 mm wide.



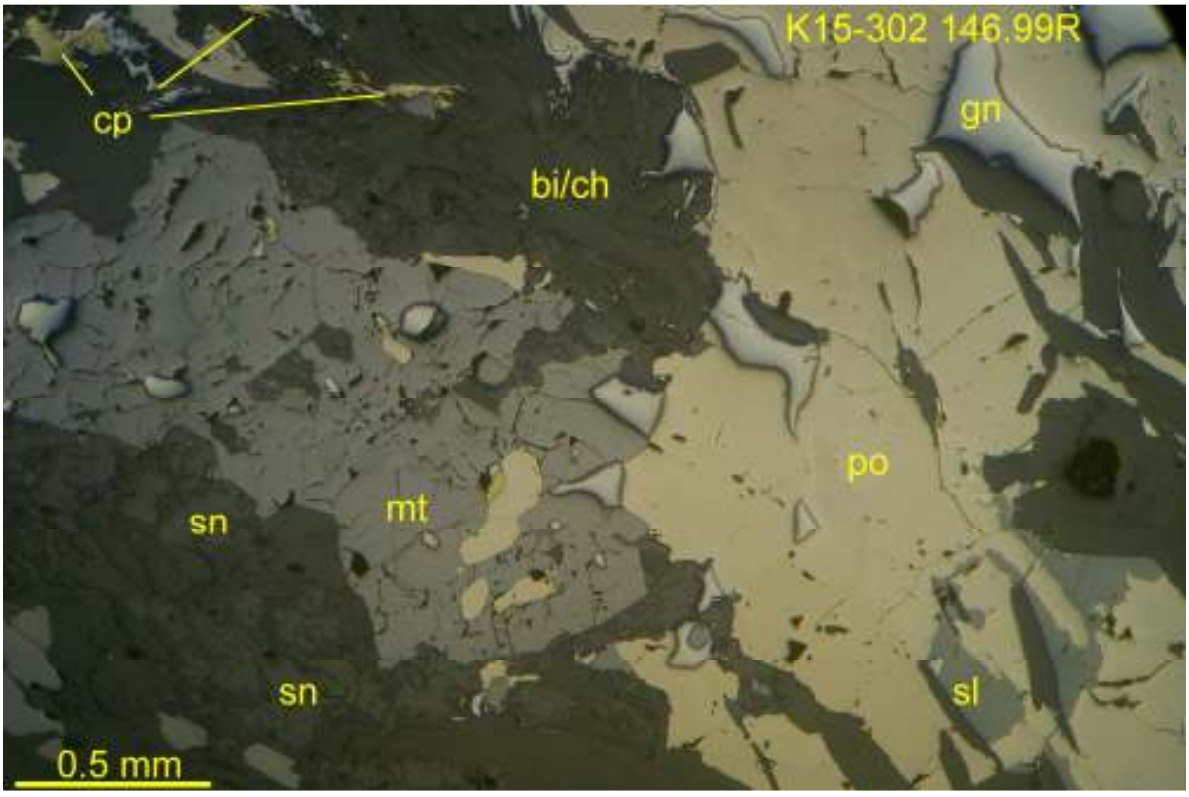
K15-306 170.87-171.00a: overview of typical assemblage of almost massive pyrrhotite, lesser chalcopyrite, sphalerite and galena; gangue inclusions are mostly carbonate, minor mica. Reflected light, uncrossed polars, field of view ~3 mm wide.



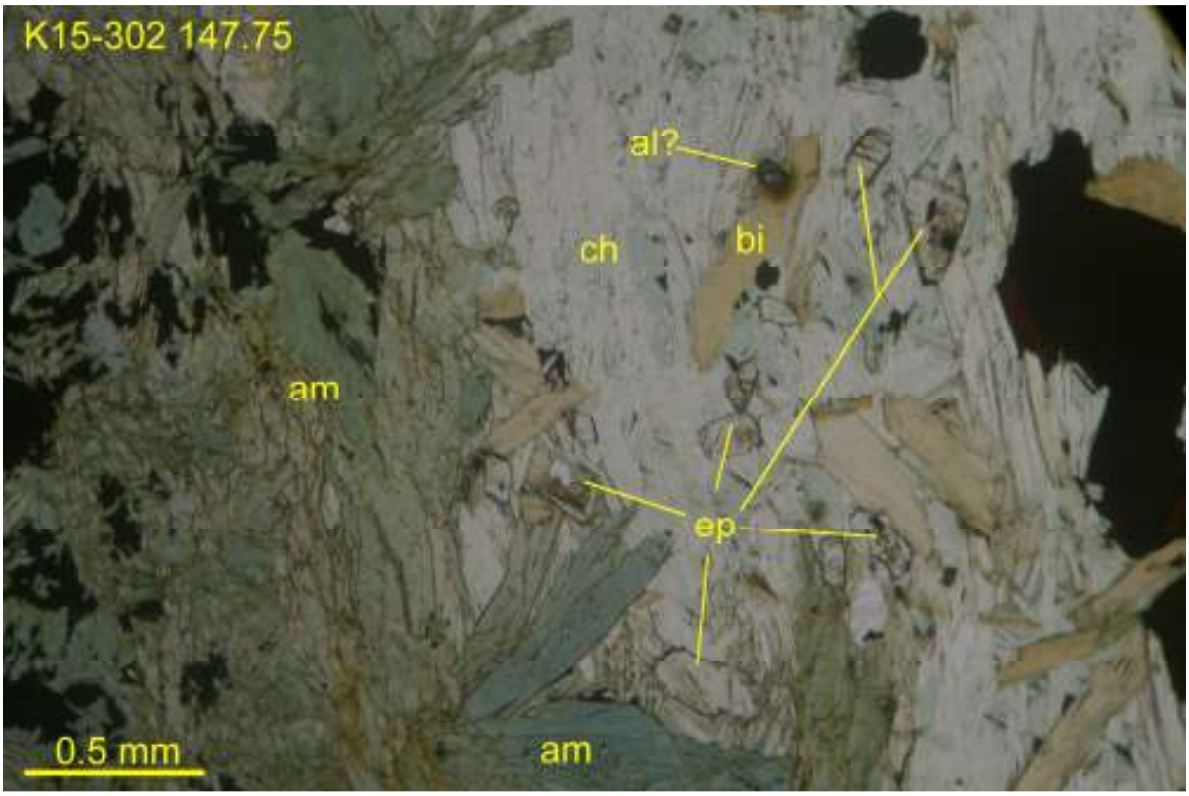
K15-306 170.87-171.00b: detailed view to show traces of grey, isotropic sulfosalt (possibly tetrahedrite, tt?) included within galena, mainly around the margins, where in contact with chalcopyrite and/or pyrrhotite. Gangue inclusions are mostly carbonate. Reflected light, uncrossed polars, field of view ~1.5 mm wide.



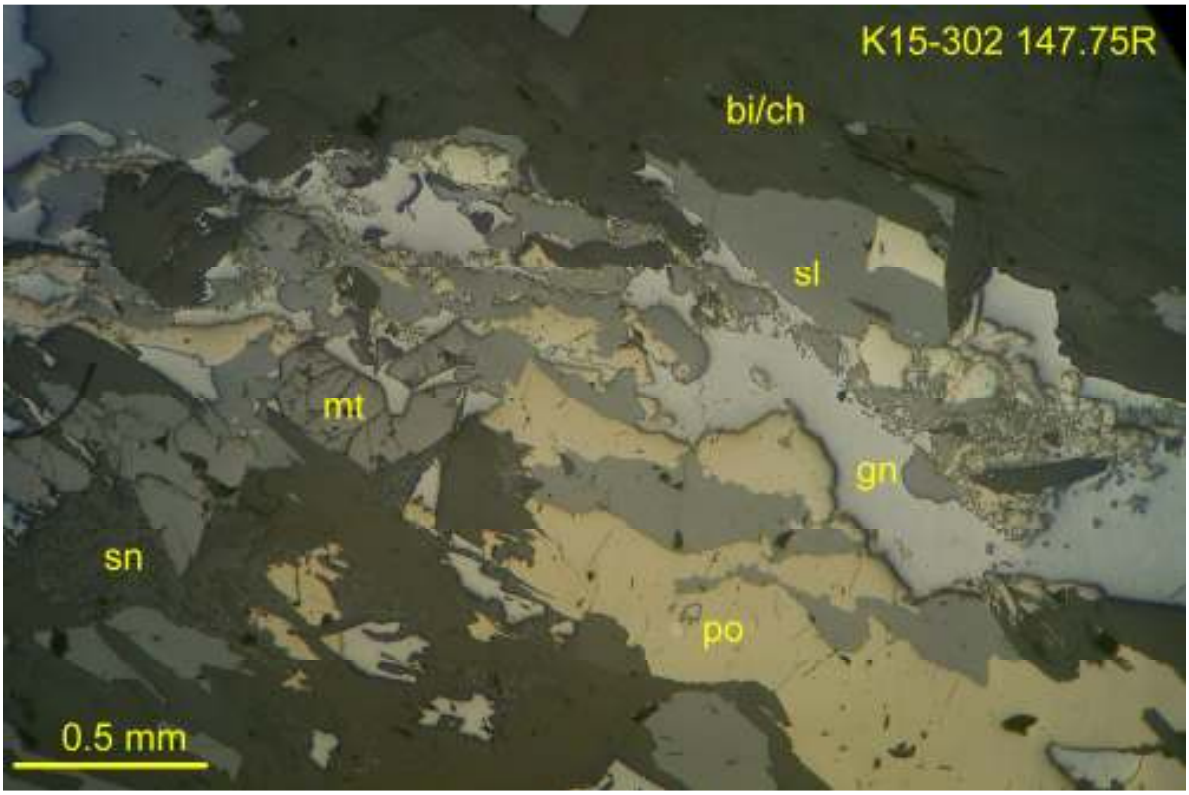
K15-302 146.99-147.06: porphyroblastic cordierite (cd?) with well-developed cleavage, and altered to chlorite at margins, in foliated matrix of biotite-chlorite-lesser quartz-green spinel that wraps around the cordierite. Transmitted plane light, field of view ~3 mm wide.



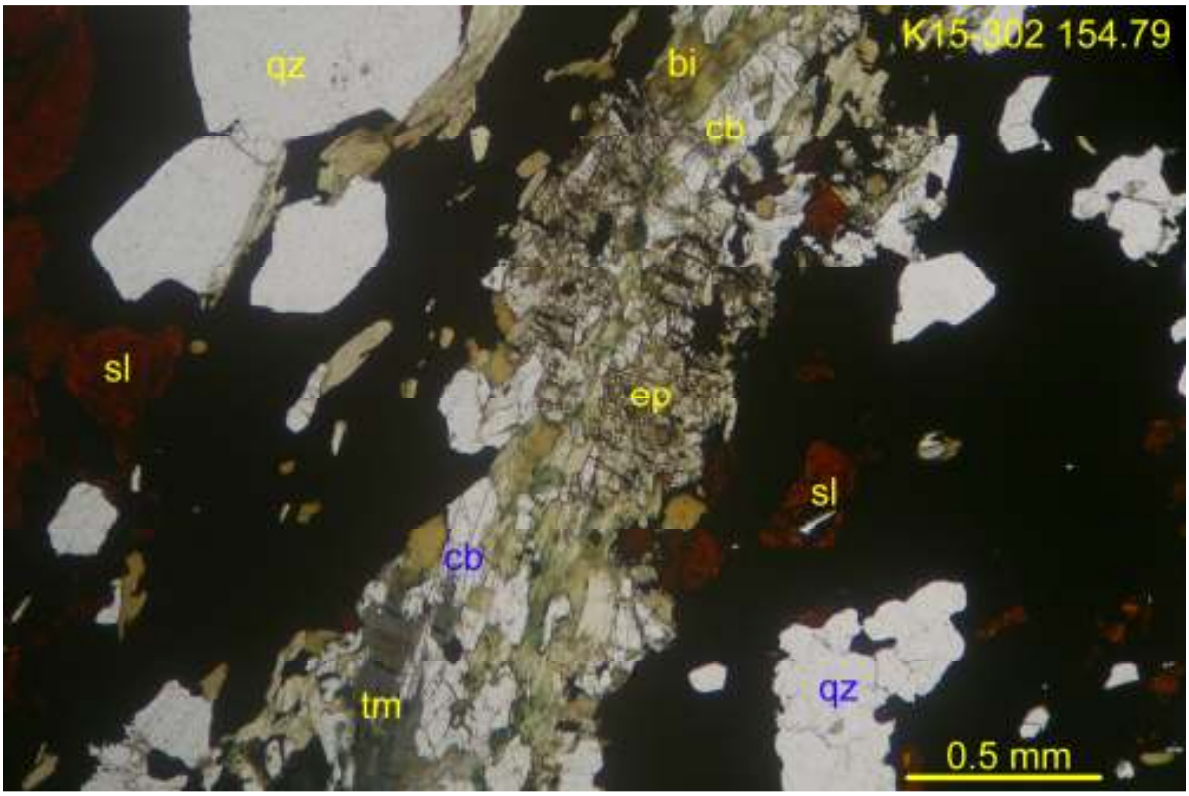
K15-302 146.99-147.06R: possible relict porphyroblast, now occupied by central magnetite, partly by sieve-textured spinel (sn, could be Zn-bearing?), wrapped around by micaceous matrix containing pyrrhotite, lesser sphalerite, galena, rare chalcopyrite. Reflected light, uncrossed polars, field of view ~3 mm wide.



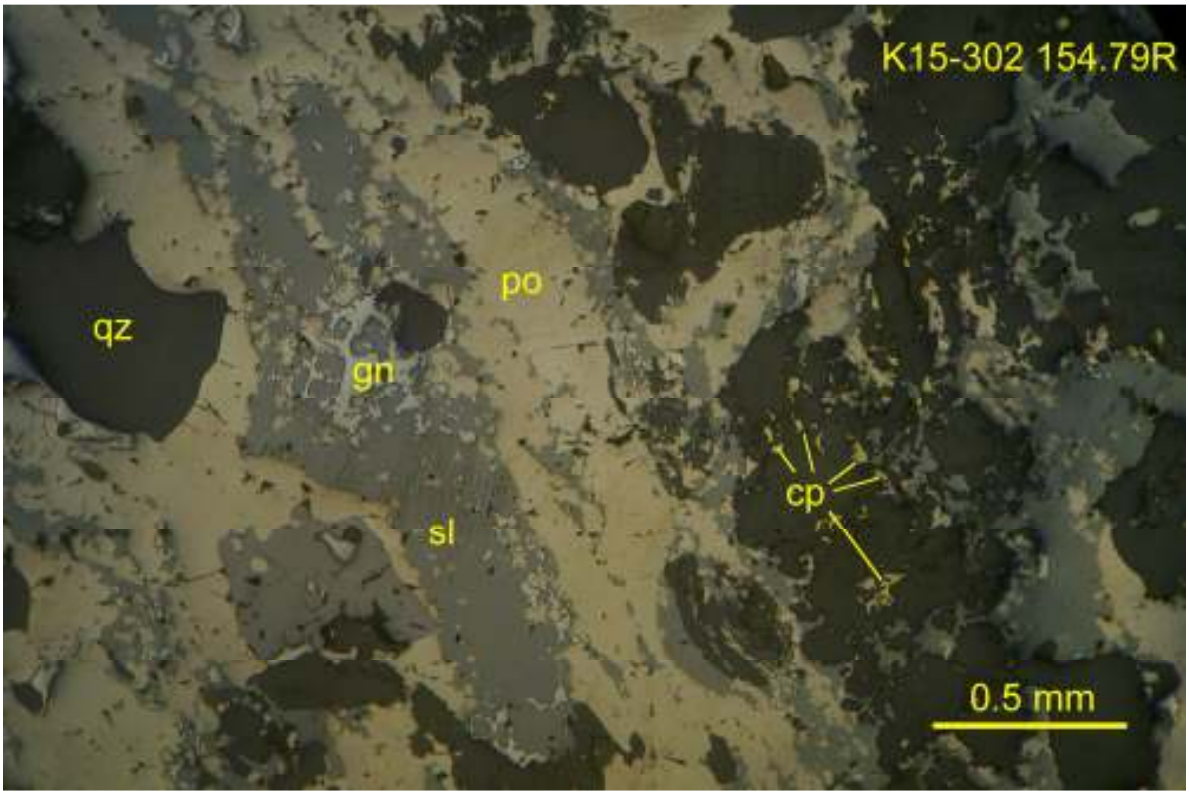
K15-302 147.75-147.86: margin of relict porphyroblast composed mainly of medium/pale green, likely actinolitic, amphibole (am) plus inclusions of sulfides (opaque), in matrix of very pale chlorite-local biotite-accessory epidote-trace allanite (dark pleochroic haloes), sulfides and magnetite. Transmitted plane light, field of view ~3 mm wide.



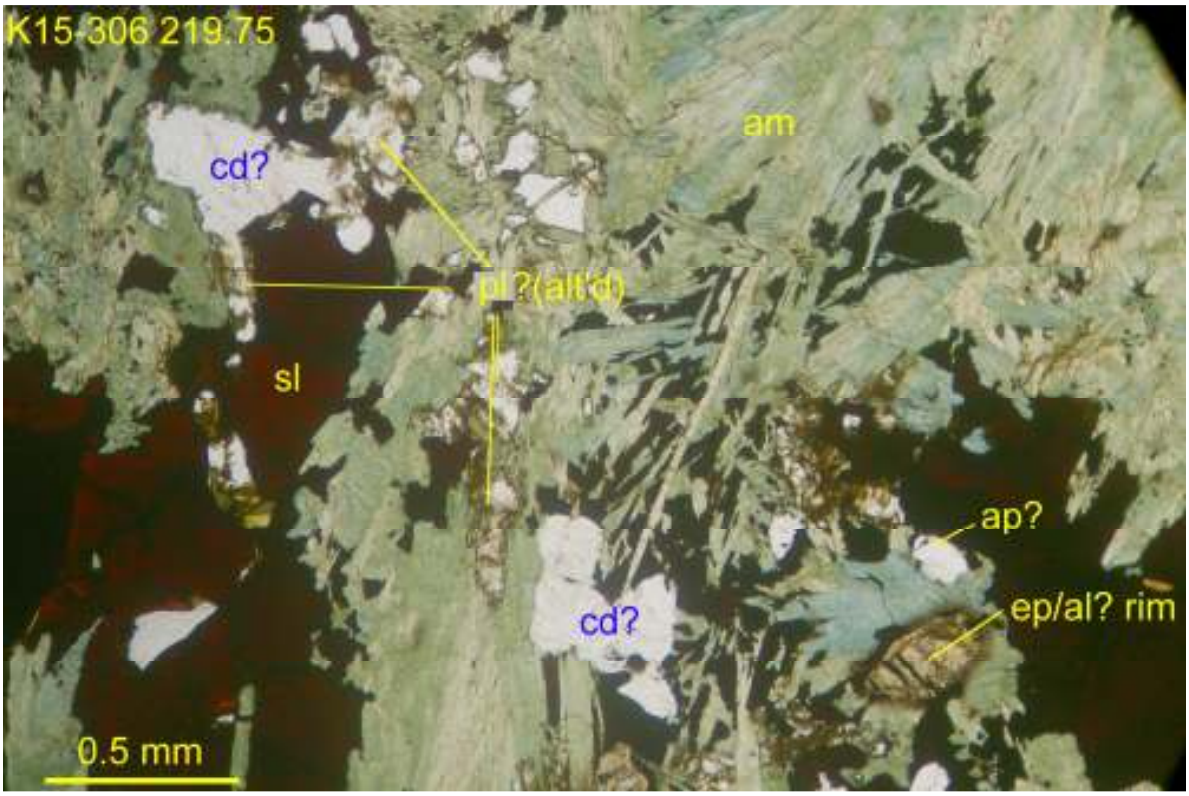
K15-302 147.75-147.86R: flattened/elongated aggregate of sphalerite-pyrrhotite-galena-minor pyrite-blastic (deformed, fractured) magnetite-minor spinel (Zn-bearing?), in foliated matrix of biotite (adjacent to and wrapping around sulfides) and chlorite. Reflected light, uncrossed polars, field of view ~3 mm wide.



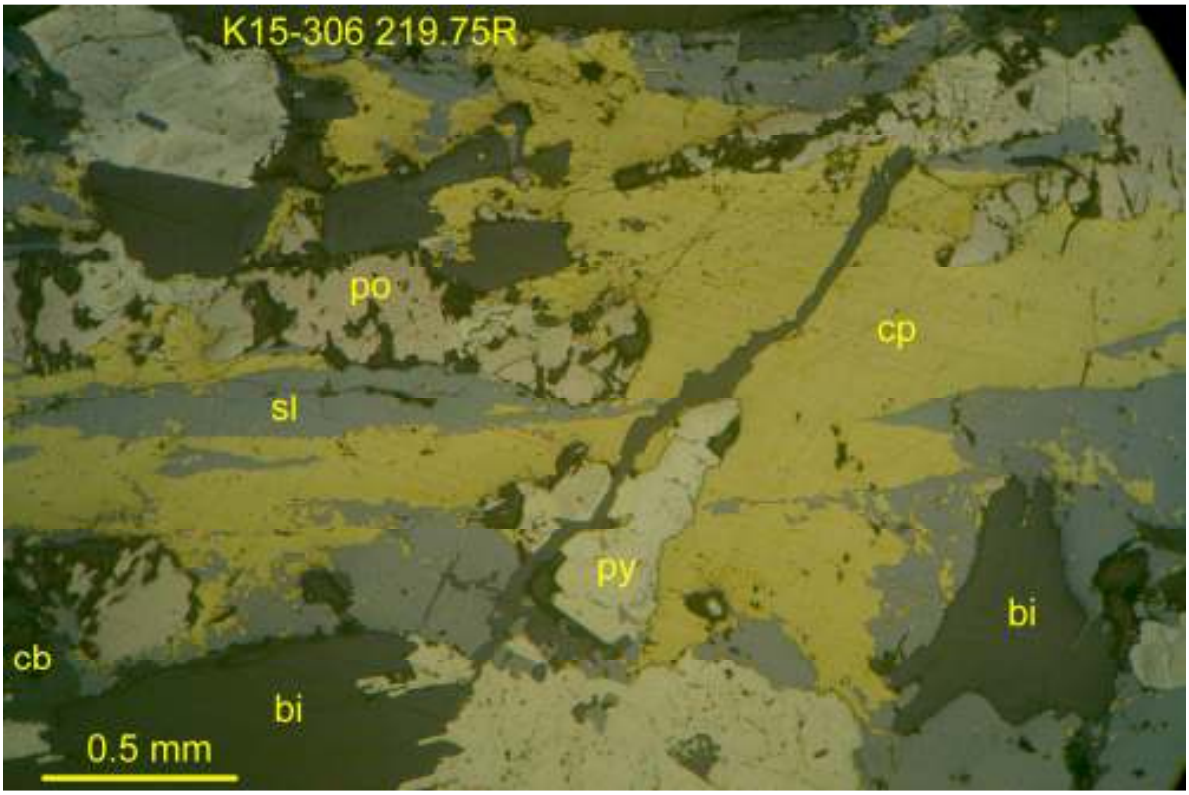
K15-302 154.79-154.88: lamina with significant epidote (ep) and dark, schorlitic tourmaline (tm) in addition to biotite and carbonate (cb), whereas adjacent gangue-rich bands are quartz-rich. Note deep red-brown (Fe-rich) sphalerite. Transmitted plane light, field of view~3 mm wide.



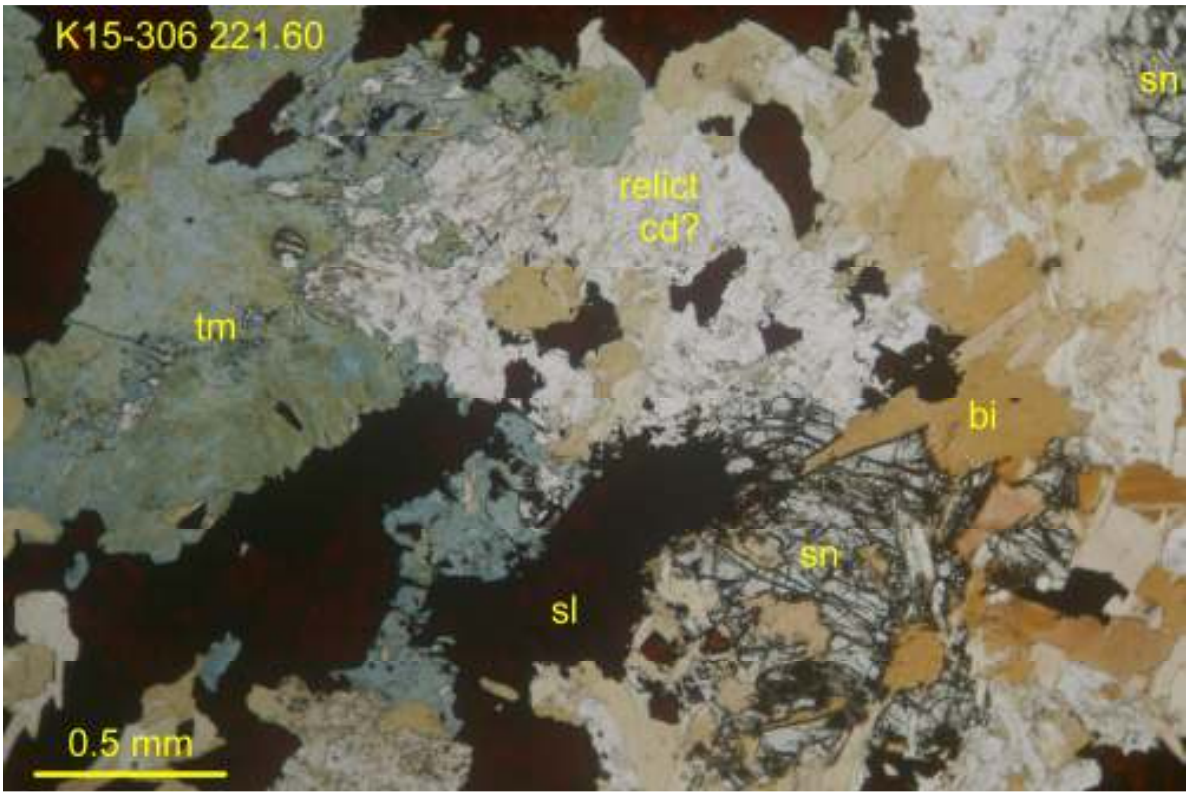
K15-302 154.79-154.88R distinct lamination (sphalerite ±galena-rich, pyrrhotite-rich) preserved in massive sulfides; note local blastic magnetite crystals included, traces of chalcopyrite in adjacent gangues of quartz-biotite-carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



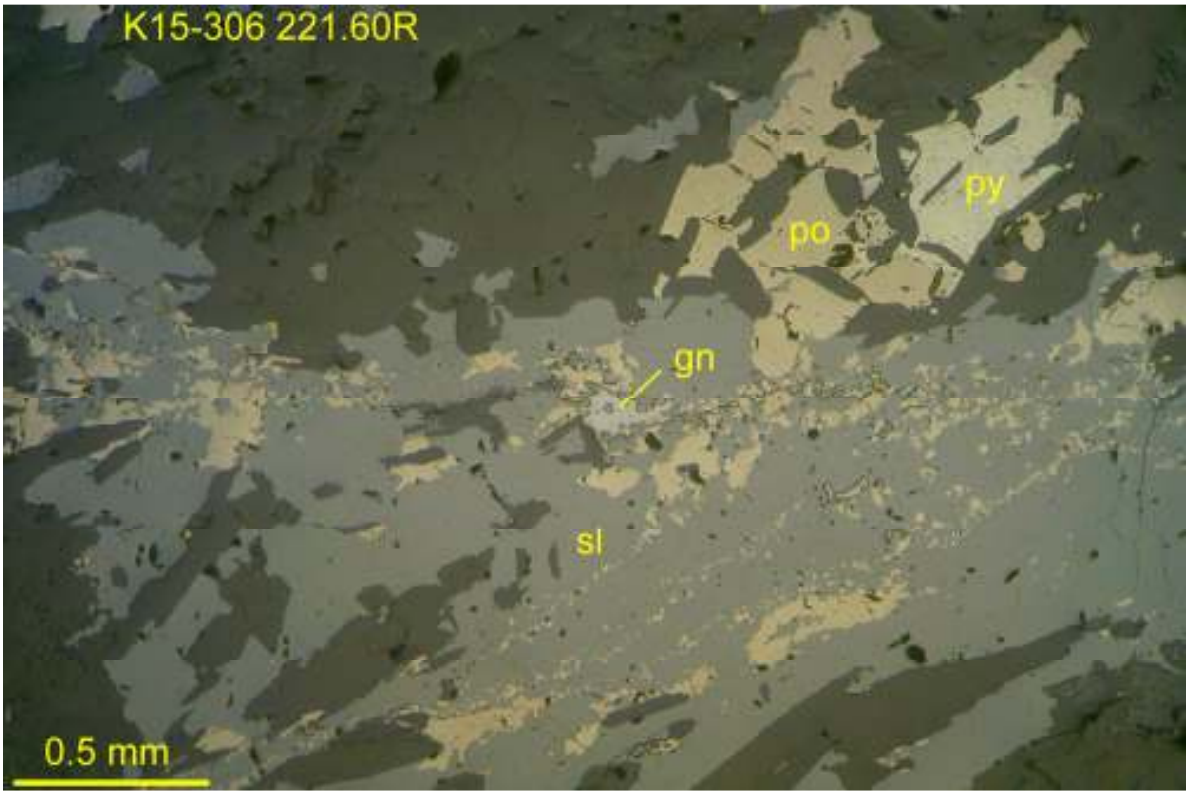
K15-306 219.75-219.83: small relict cordierite (?) porphyroblast, deep red Fe-rich sphalerite, local relict plagioclase (partly altered to clay?/sericite), accessory epidote rimmed by allanite (al?) and minor apatite (?) in matrix of randomly oriented/radiating medium green actinolitic amphibole. Transmitted plane light, field of view~3 mm wide.



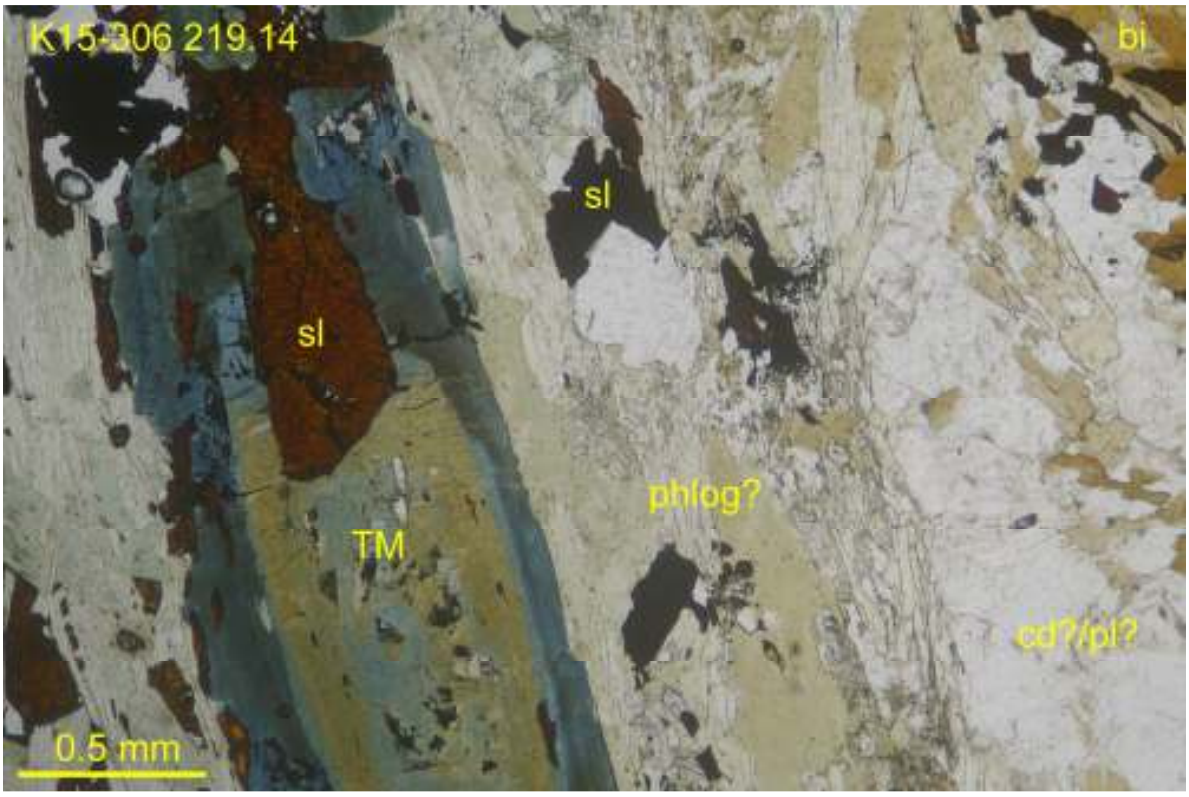
K15-306 219.75-219.83R: bands/laminae of chalcopyrite, sphalerite, pyrrhotite (partly altered to pyrite/marcasite; with local cores of partly altered pyrrhotite) with gangues of biotite, local carbonate (locally remobilized into thin veinlets). Reflected light, uncrossed polars, field of view ~3mm wide.



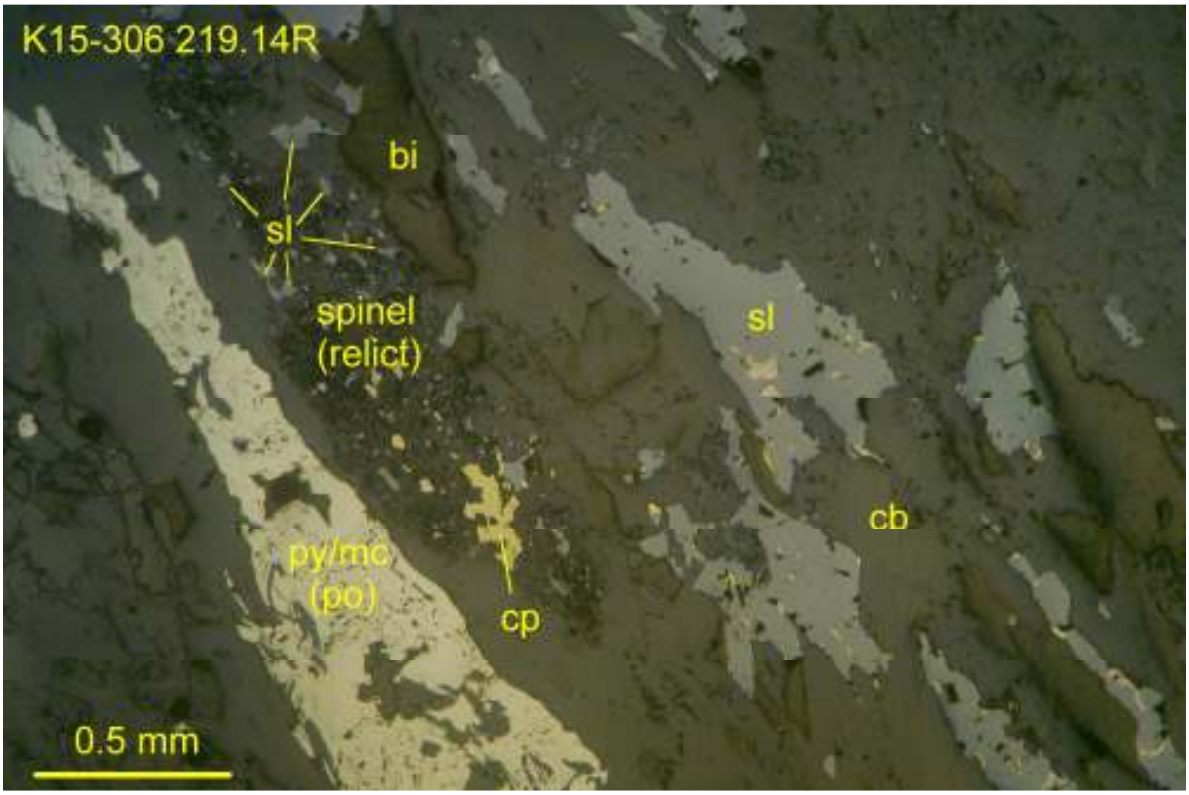
K15-306 221.60-221.71: complex assemblage of blastic cordierite (?) partly altered to/with inclusions at margins of micas or sphalerite; somewhat blastic schorlitic tourmaline(tm) or spinel (sn, also w/ sphalerite inclusions) in matrix of variably brown, pale greenish or colourless micas (biotite, phlogopite?, muscovite). Transmitted plane light, field of view 3 mm.



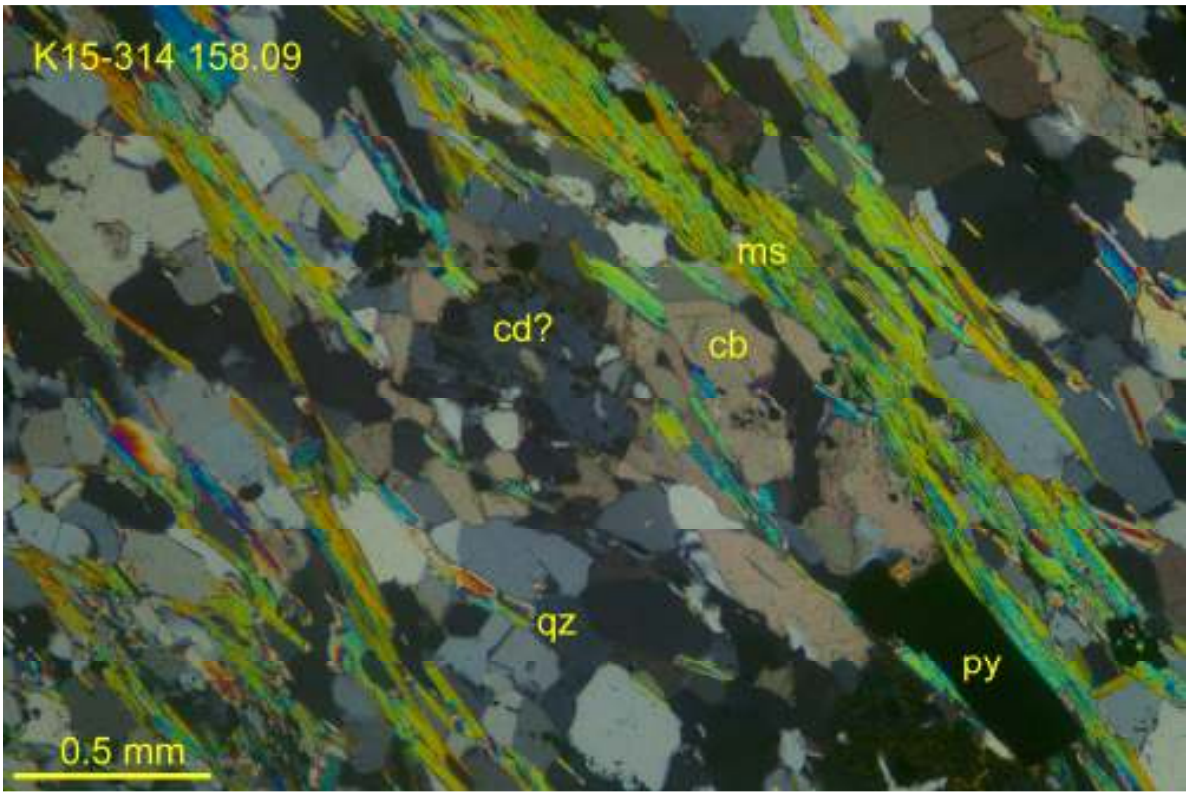
K15-306 221.60-221.71R: somewhat deformed, disrupted bands/laminae or sphalerite, minor pyrrhotite (locally partly replaced by pyrite), trace galena in matrix of intergrown micas and carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



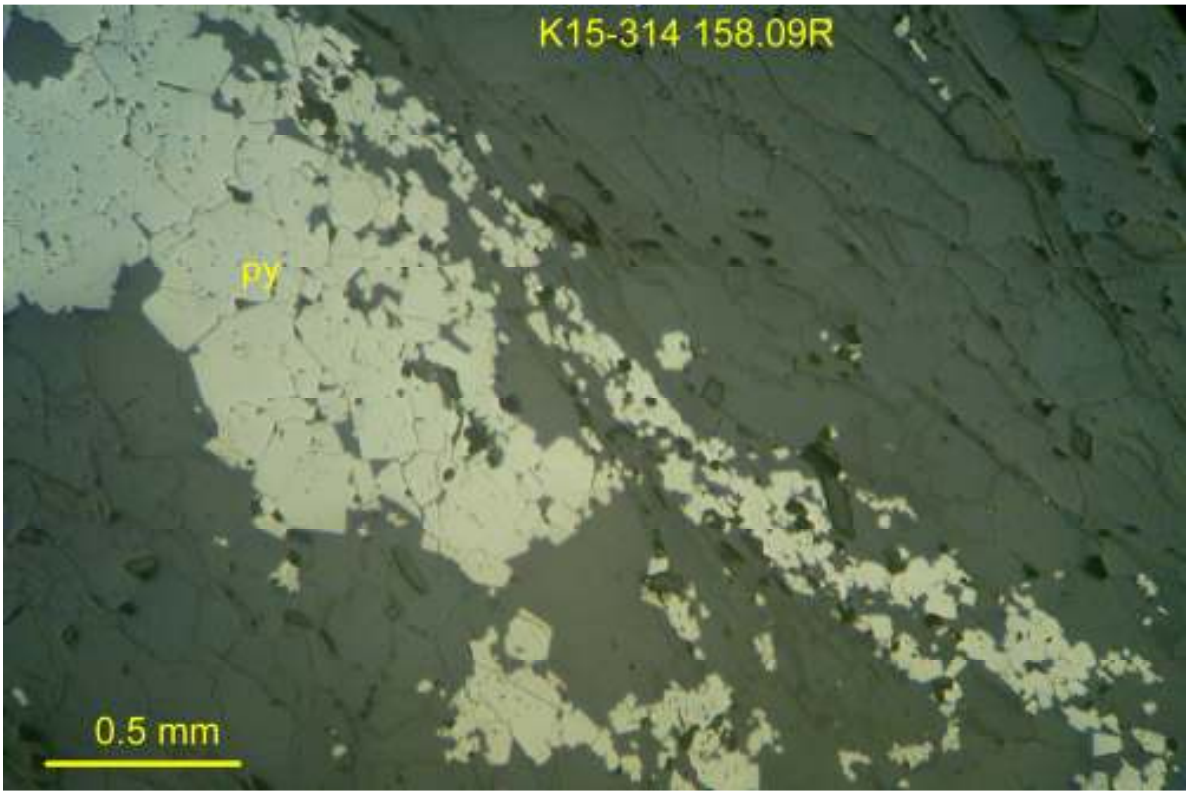
K15-306 219.14-219.26: strongly zoned, schorlitic tourmaline euhedra with included Fe-rich sphalerite, aligned with foliated matrix of pale greenish brown biotite/phlogopite, adjacent to band of quartz, possible cordierite and/or plagioclase. Transmitted plane light, field of view ~3 mm wide.



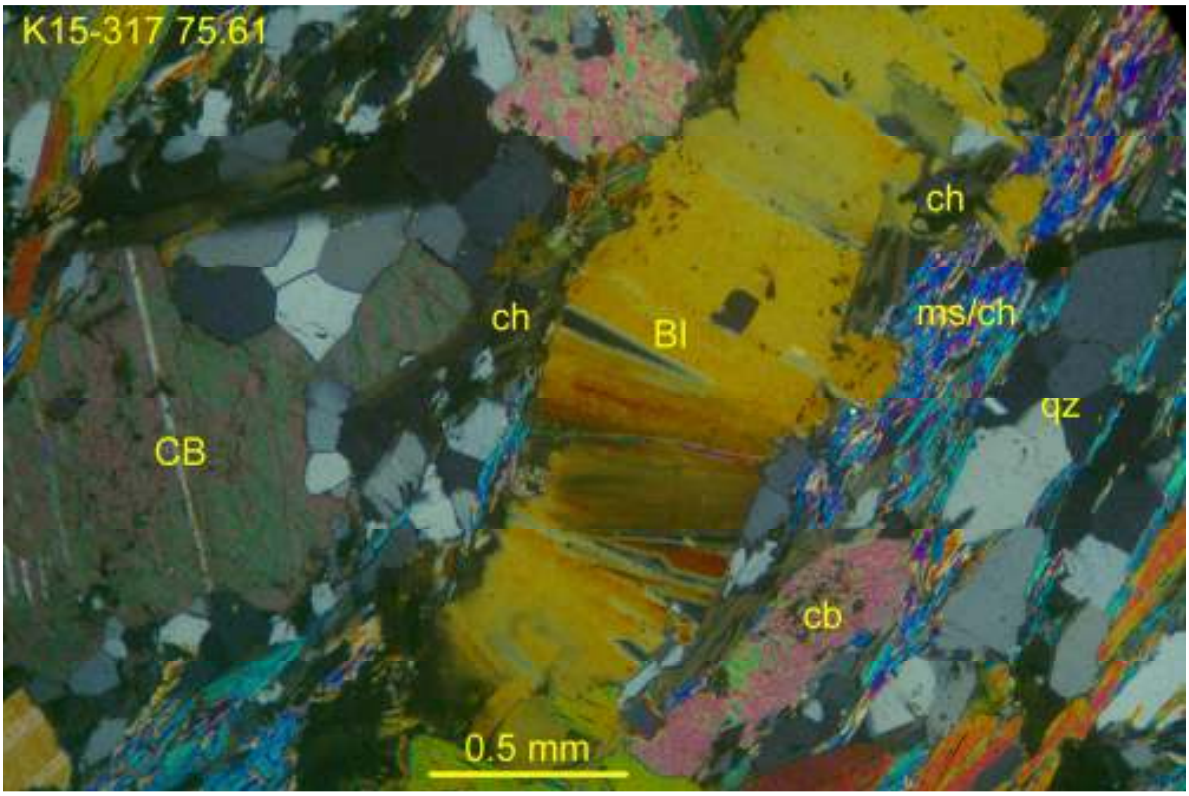
K15-306 219.14-219.26R: flattened/elongated, pyrite/marcasite (after pyrrhotite?) and sphalerite, local spinel (altered to chlorite, with inclusions of sphalerite, chalcopyrite, pyrrhotite) aggregates or discontinuous bands, alternating with gangues of mica or carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



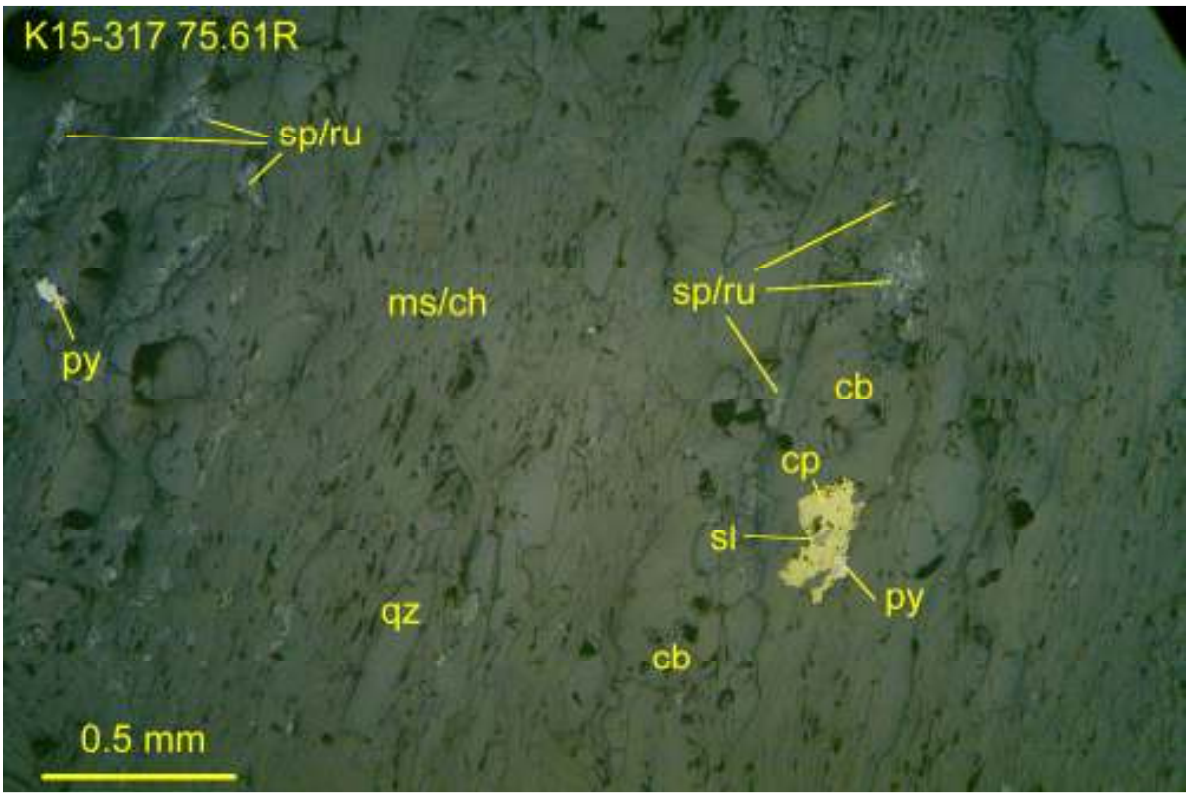
K15-314 158.09-158.2: foliated, banded/laminated gneiss composed of quartz-muscovite-lesser carbonate-local relict possible cordierite (cd?) typically altered elsewhere to chlorite; opaques are pyrite and trace rutile (see below). Transmitted light, crossed polars, field of view ~3 mm wide.



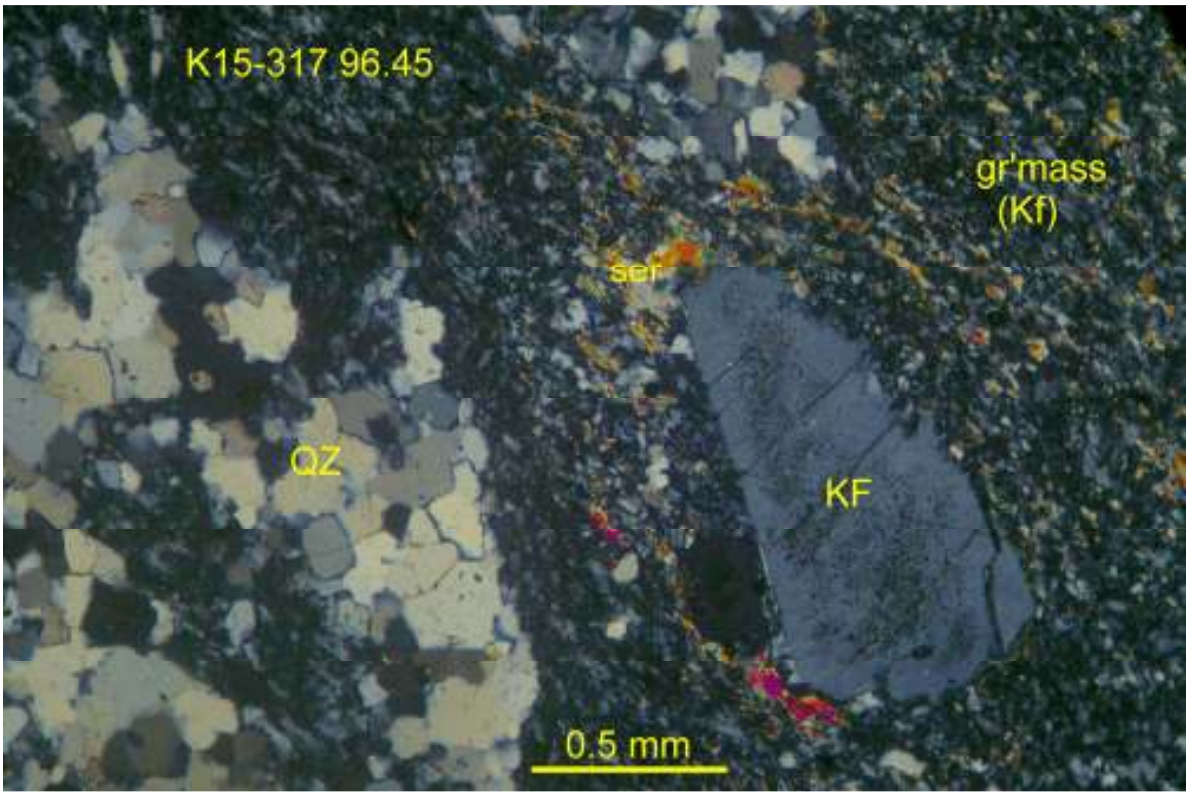
K15-314 158.09-158.2R: thin band/lamina rich in cubic pyrite, in gangues of quartz and muscovite (pyrite most closely associated/intergrown with muscovite flakes, strongly aligned in and defining the foliation). Reflected light, uncrossed polars, field of view ~3 mm wide.



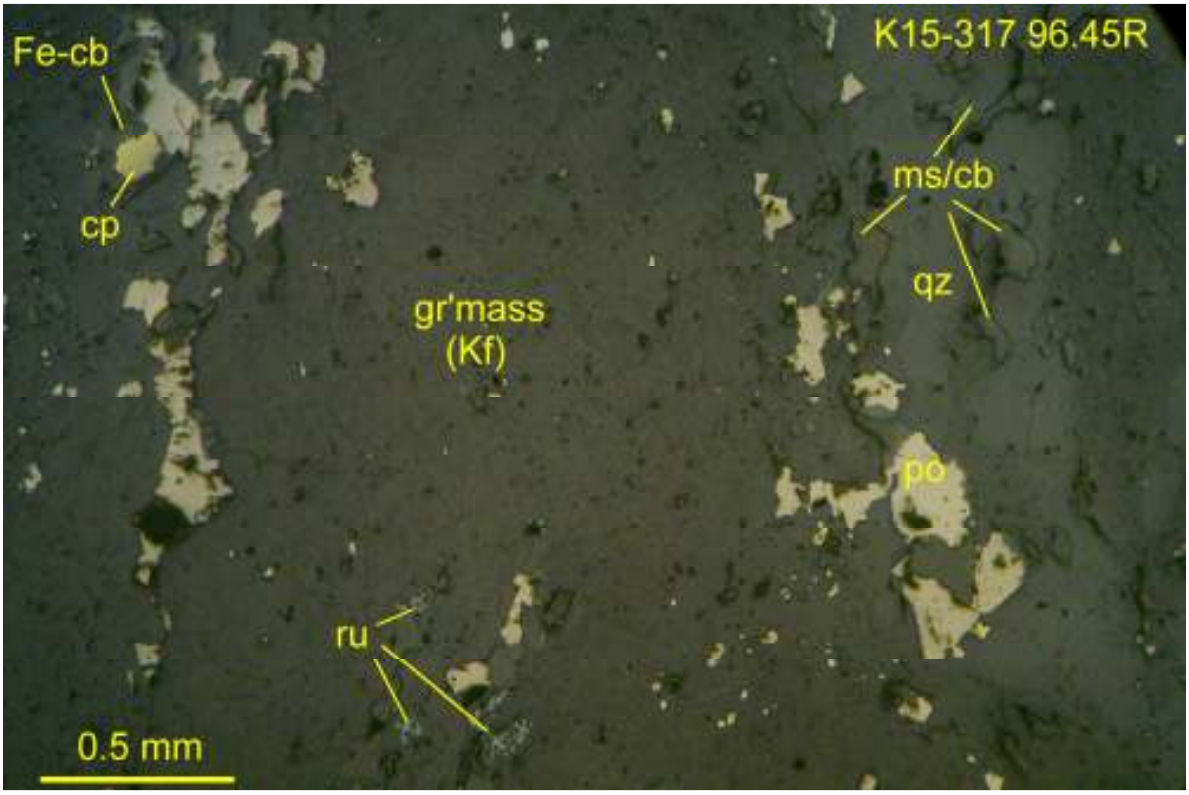
K15-317 75.61-75.75: porphyroblastic biotite (BI), locally with carbonate (CB) and chlorite (ch), in foliated matrix of muscovite-chlorite alternating with quartz. Transmitted light, crossed polars, field of view ~3 mm wide.



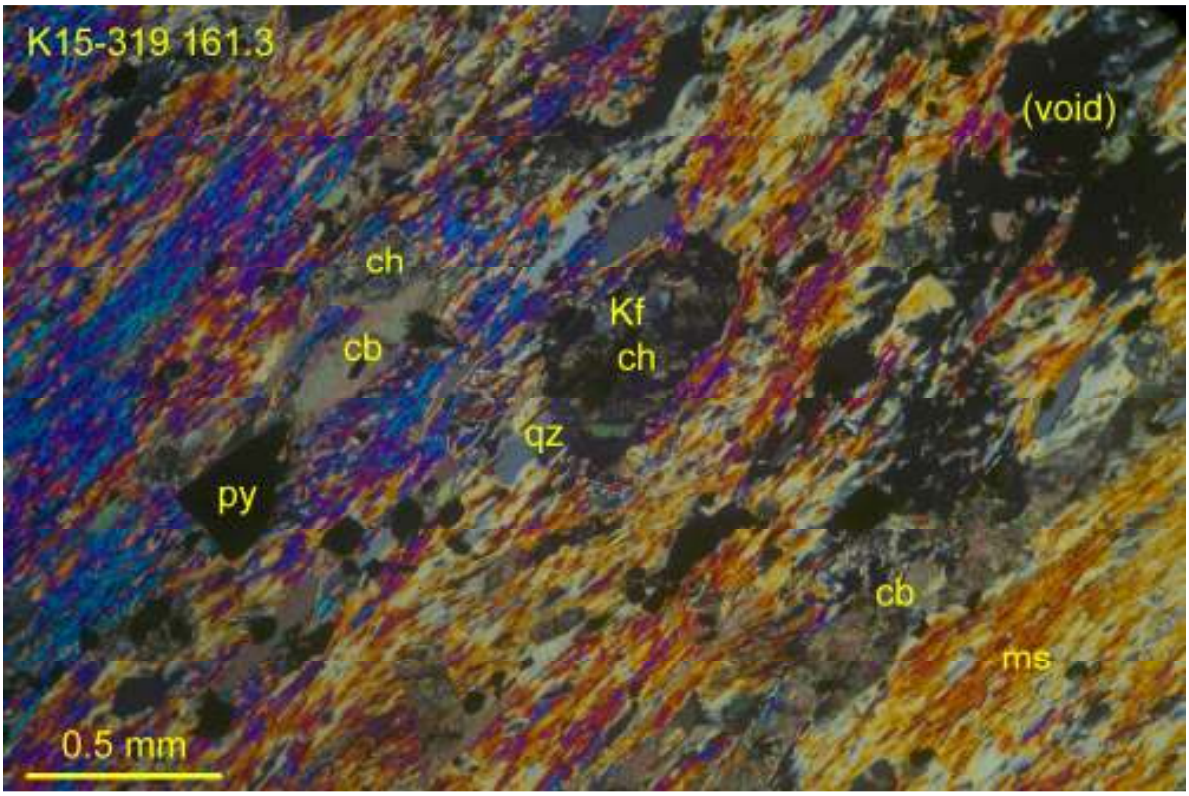
K15-317 75.61-75.75R: aggregates of chalcopyrite-minor pyrite-trace sphalerite (?) associated with aggregates of sphene/rutile (sp/ru) and carbonate, in foliated matrix of muscovite-chlorite and somewhat elongated quartz crystals. Reflected light, uncrossed polars, field of view ~3 mm wide.



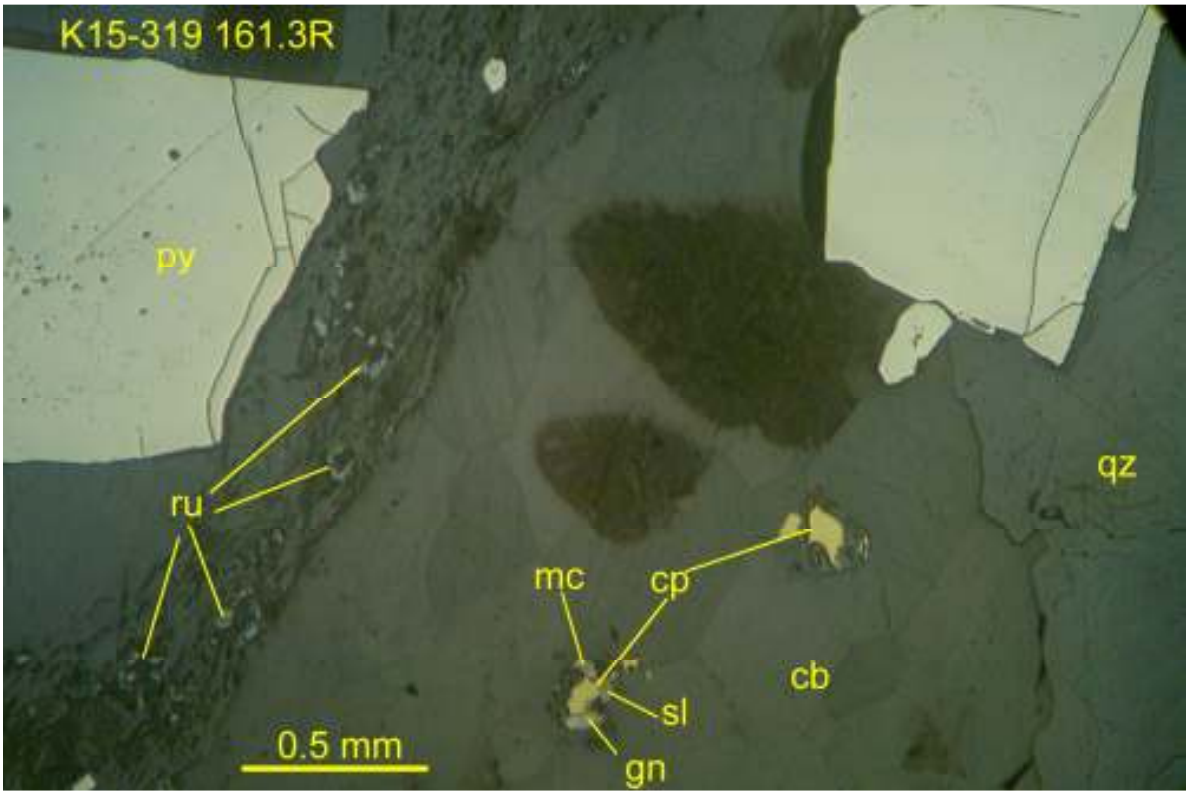
K15-317 96.45-96.59: euhedral Kspar (KF) and relict rounded quartz (QZ) phenocrysts or sites, in very fine-grained groundmass of alkali feldspar and local sericite. Transmitted light, crossed polars, field of view ~3 mm wide.



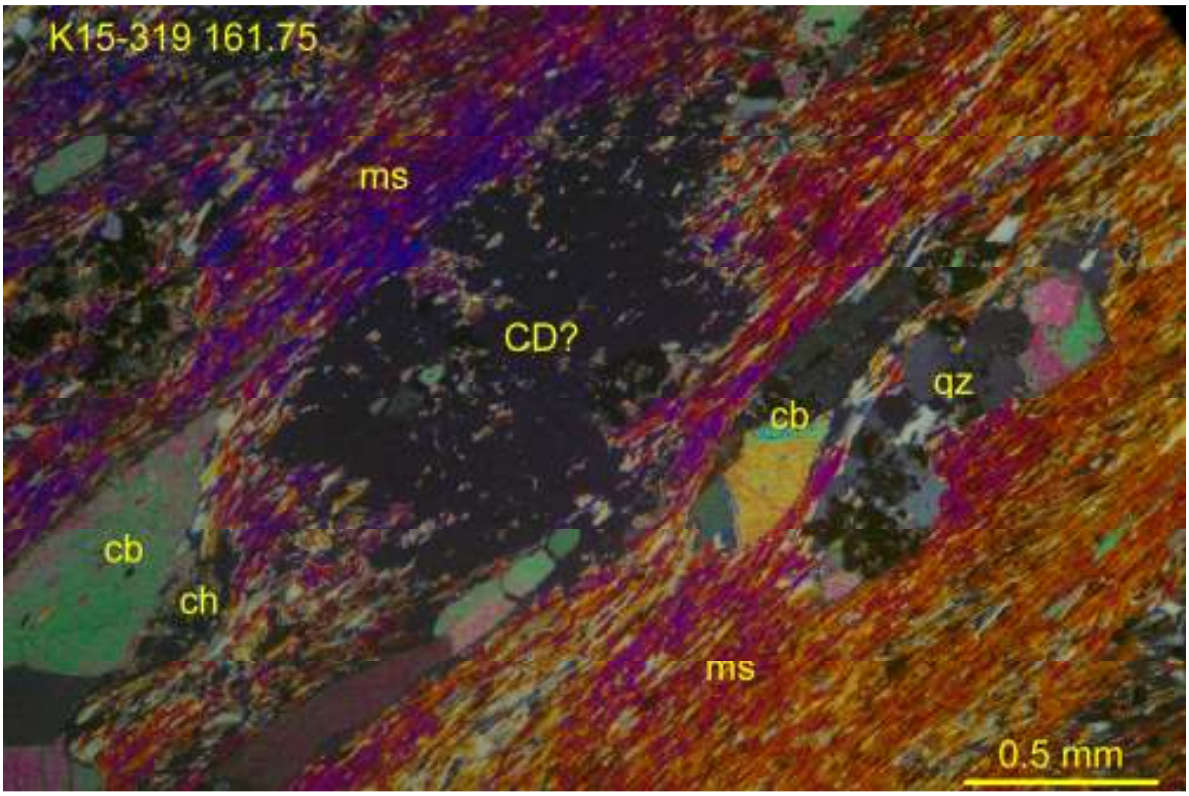
K15-317 96.45-96.59R: sub-parallel, somewhat deformed relict stringers of quartz (qz), pyrrhotite, local chalcopyrite associated with muscovite or locally surrounded by Fe-carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



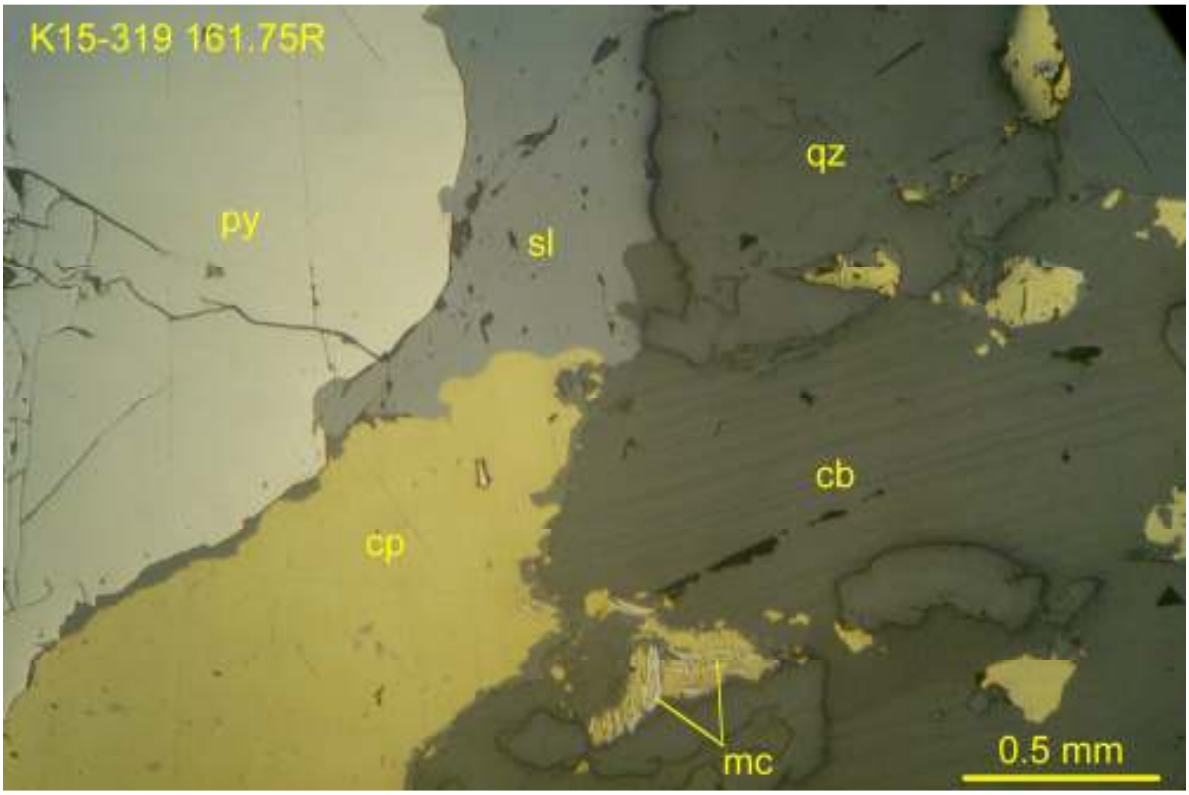
K15-319 161.3-161.46: small euhedral crystals to lensy aggregates of carbonate (dolomite?)-chlorite ±Kspar (?), pyrite and accessory rutile (both opaque), possibly representing former mafic sites, in foliated muscovite-rich matrix. Transmitted light, crossed polars, field of view ~3 mm wide.



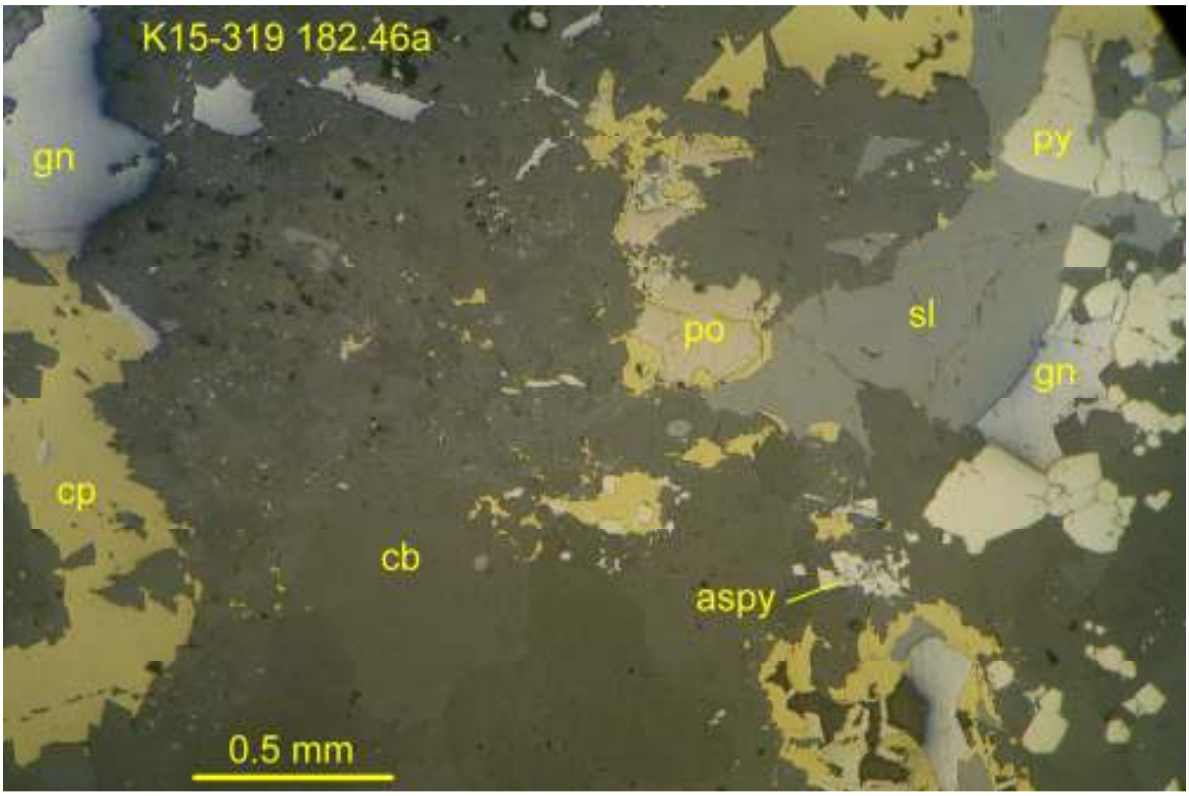
K15-319 161.3-161.46R: coarse-grained, cubic pyrite (and trace chalcopyrite, galena, sphalerite, marcasite) associated with lensy aggregates (or transposed veins) of carbonate-quartz sub-parallel to foliation in host muscovite-minor rutile schist host. Reflected light, uncrossed polars, field of view ~3 mm wide.



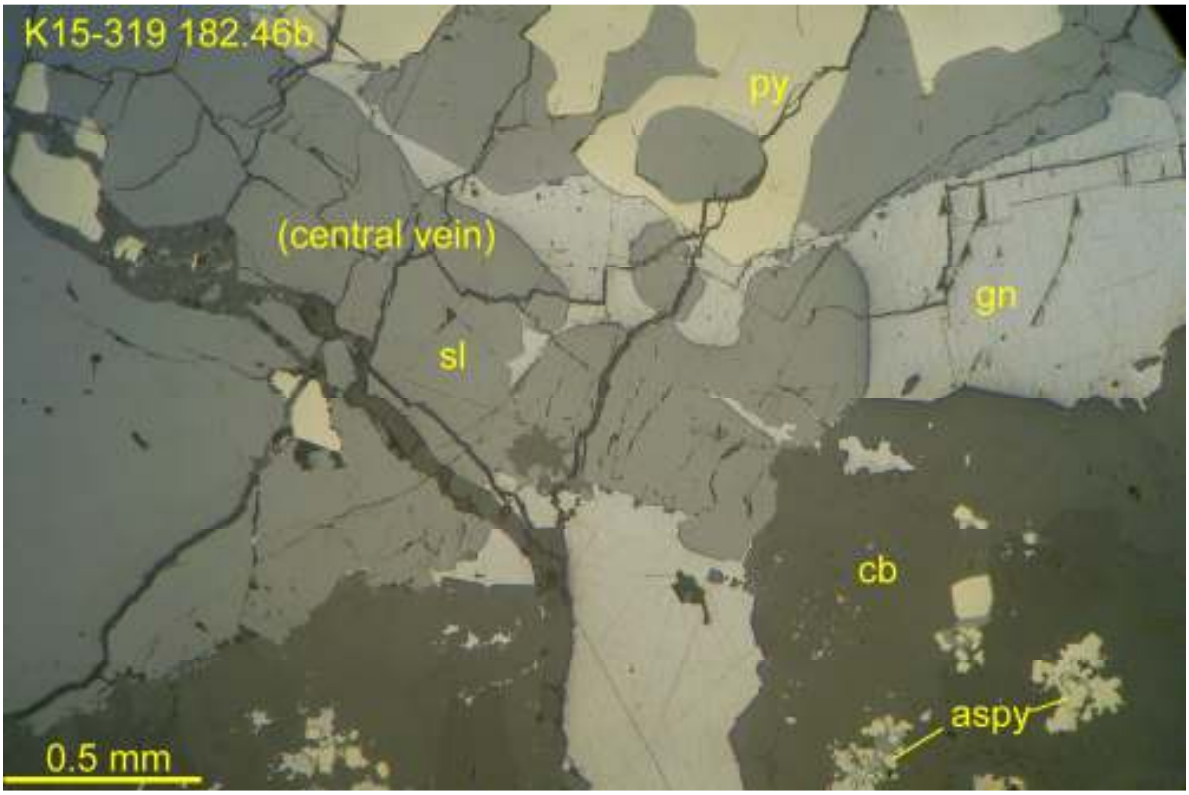
K15-319 161.75-161.84: possible porphyroblastic cordierite (?) partly altered to/with inclusions of sericite, small relict mafic sites (?) replaced by carbonate ±chlorite and rutile (opaque), and lensy aggregates of carbonate, lesser quartz and rutile, in foliated matrix of muscovite. Transmitted light, crossed polars, field of view ~3 mm wide.



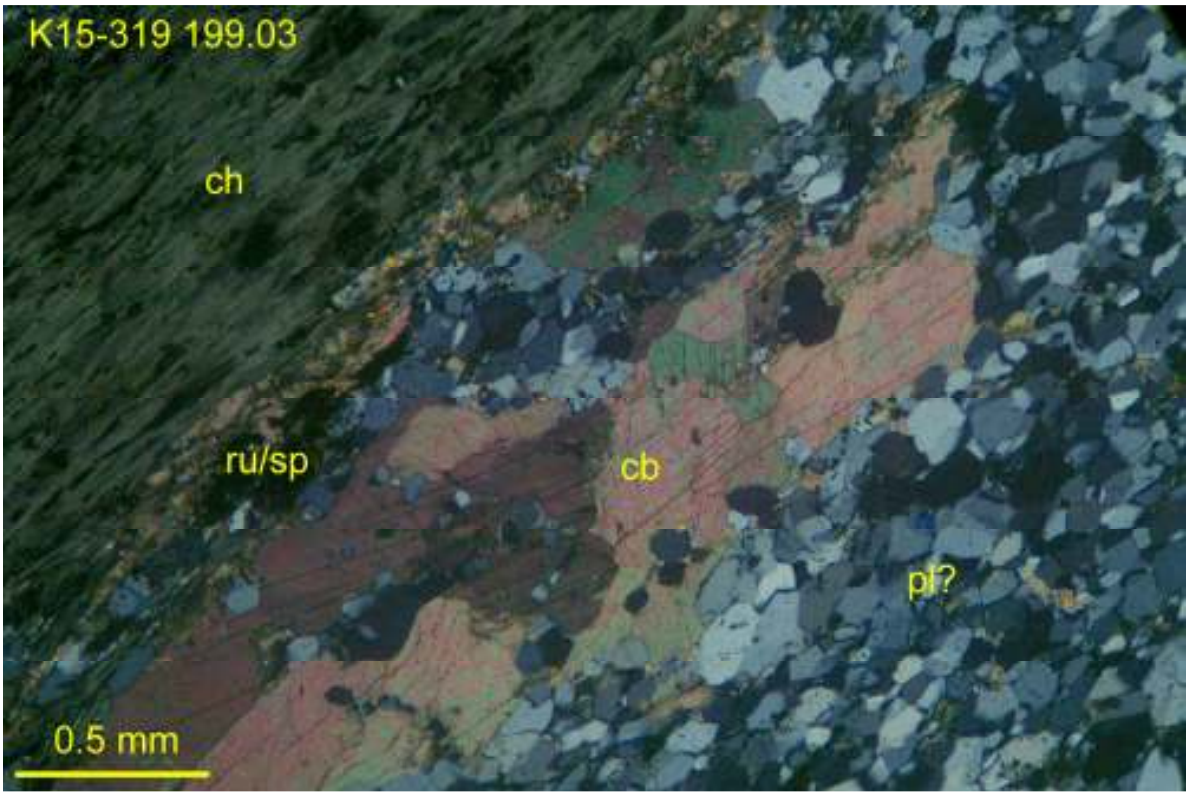
K15-319 161.75-161.84R: coarse band (transposed vein?) of carbonate-quartz-pyrite-chalcopyrite-sphalerite-local marcasite (likely after former pyrrhotite?). Reflected light, uncrossed polars, field of view ~3 mm wide.



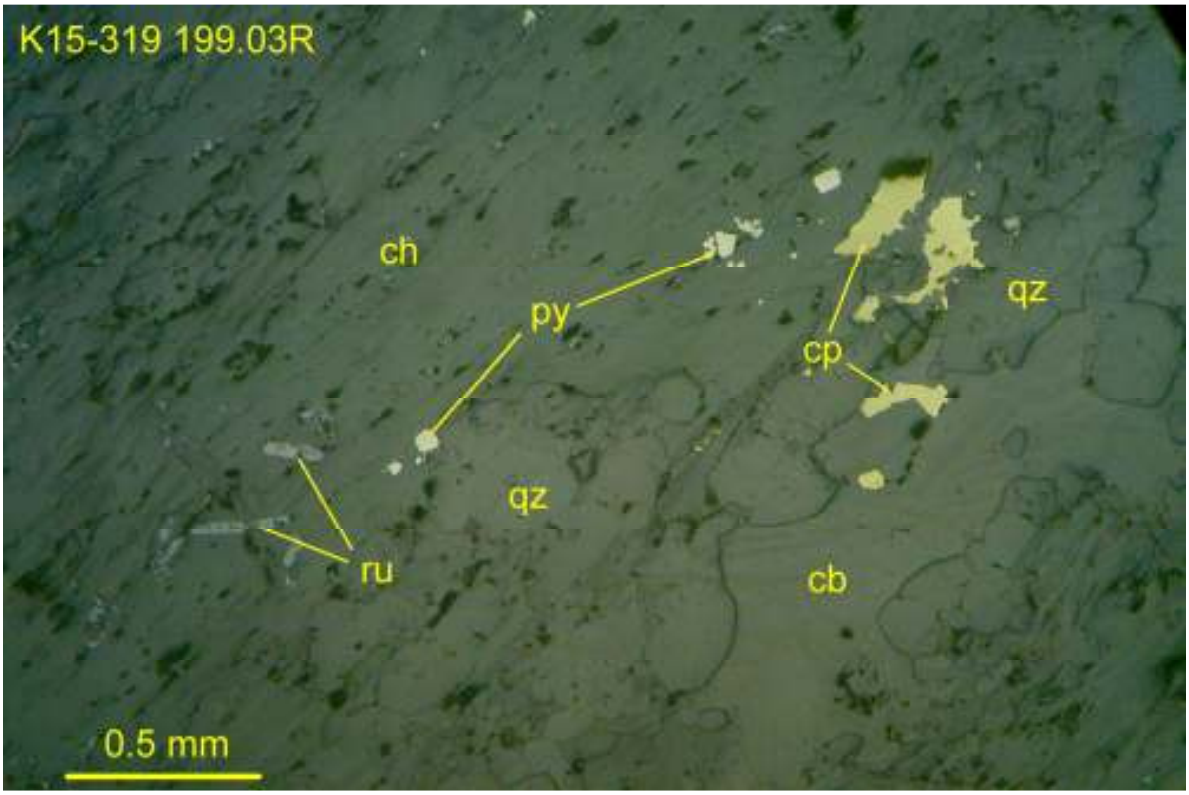
K15-319 182.46-182.64a: crudely banded (?) semi-massive sulfides, including pyrite, sphalerite, galena, chalcopyrite, local minor pyrrhotite (partly altered to pyrite/marcasite), trace arsenopyrite, in matrix of carbonate (note higher reflectance of Fe-carbonate that hosts minor magnetite). Reflected light, uncrossed polars, field of view ~3 mm wide.



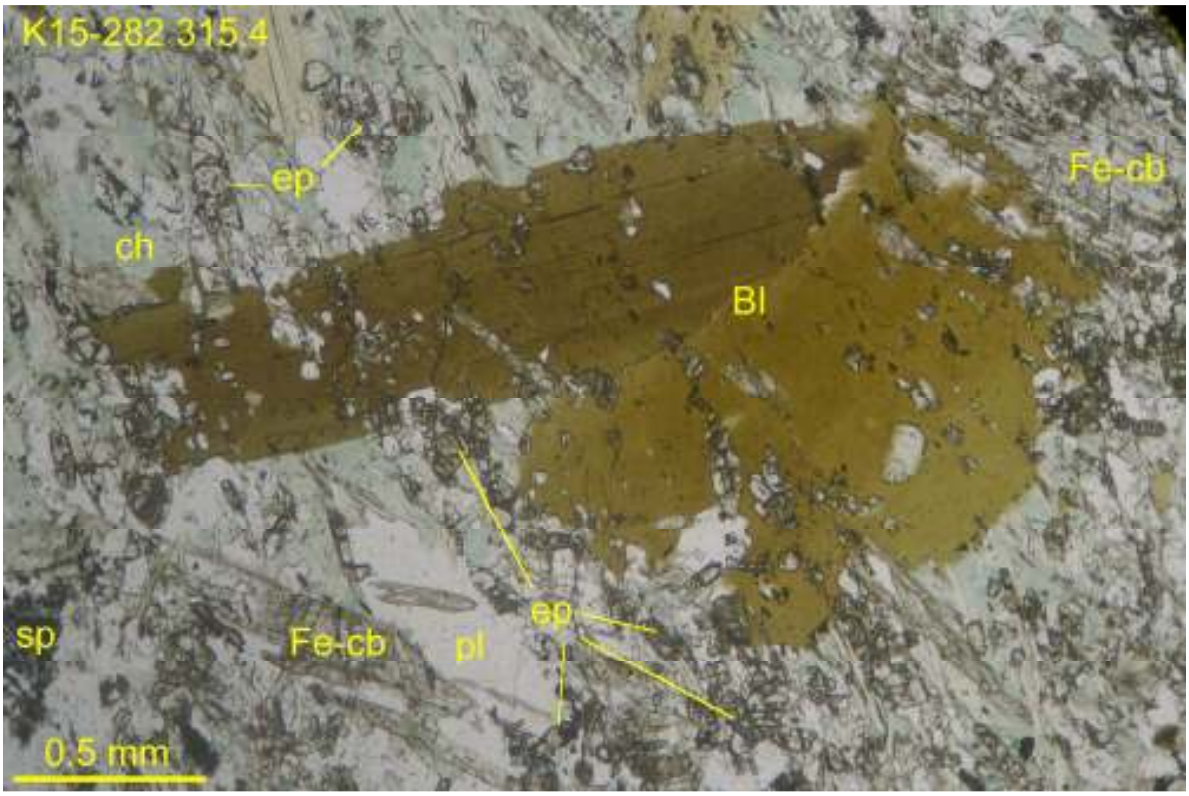
K15-319 182.46-182.64b: central vein or re-opening of massive, coarse Fe-rich sphalerite, galena (partly "bleeding" off in the presumed direction of banding in carbonate-rich wallrock), and minor pyrite; traces of arsenopyrite occur replacing pyrite in wallrock. Reflected light, uncrossed polars, field of view ~3 mm wide.



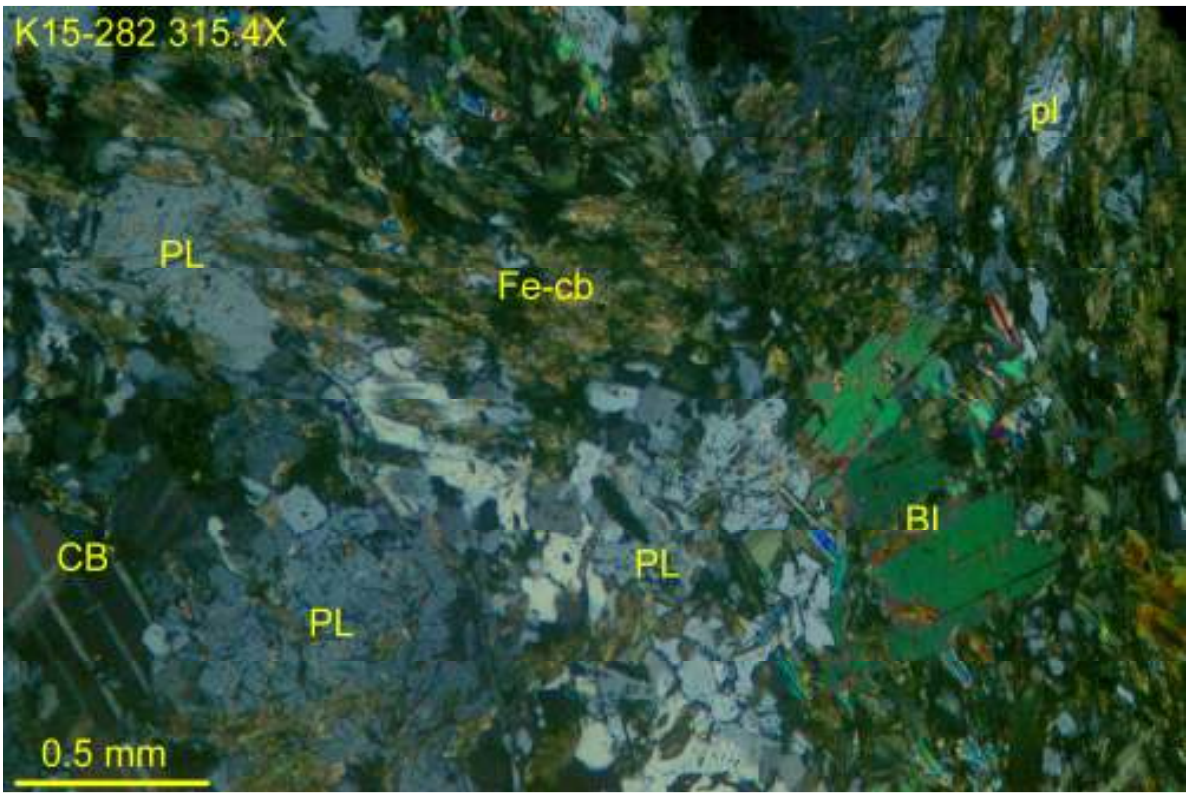
K15-319 199.03-199.14: view across 3 major components making up this sample: foliated chlorite, fine-grained plagioclase (pl, may contain some quartz?) and lensy aggregates of coarser carbonate. Aggregates of fine-grained rutile occur at margins of bands. Transmitted light, crossed polars, field of view ~3 mm wide.



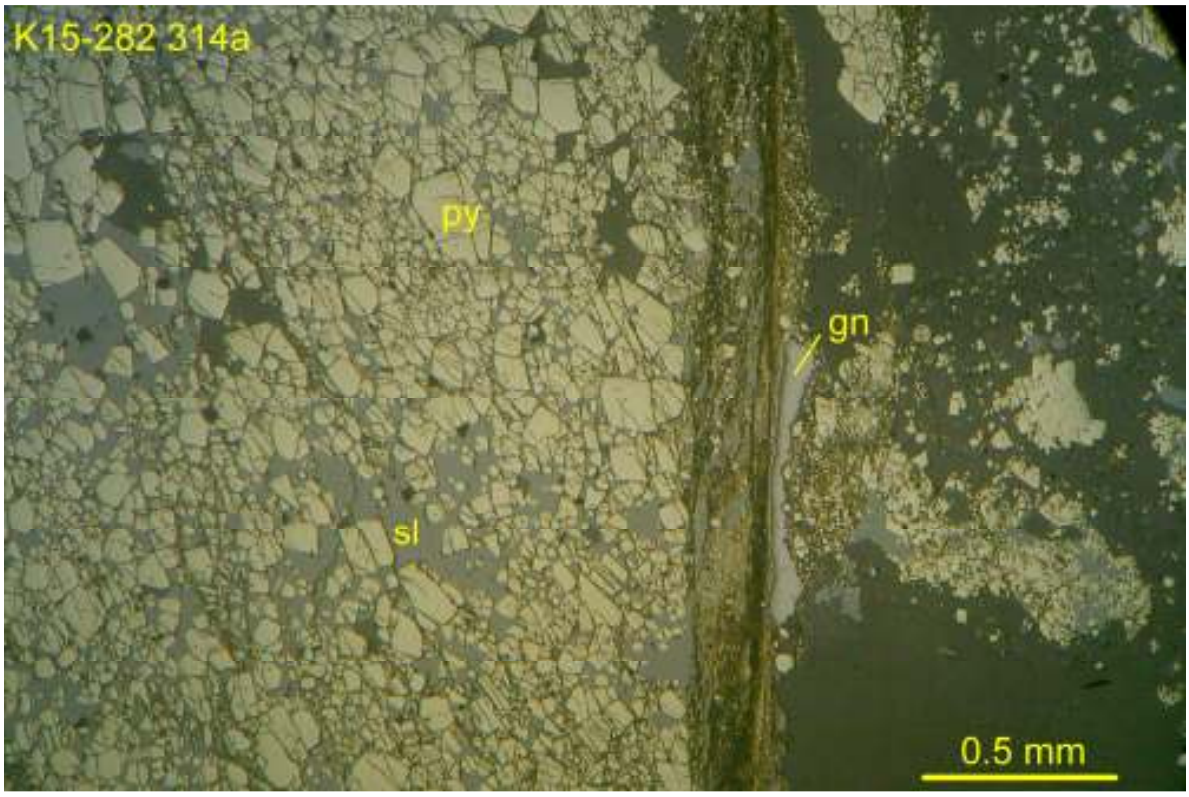
K15-319 199.03-199.14R: lath-like rutile pseudomorphs of ilmenite (?), minor pyrite and chalcopyrite associated with margin of coarser, carbonate-quartz lens in contact with chlorite-rich band. Reflected light, uncrossed polars, field of view ~3 mm wide.



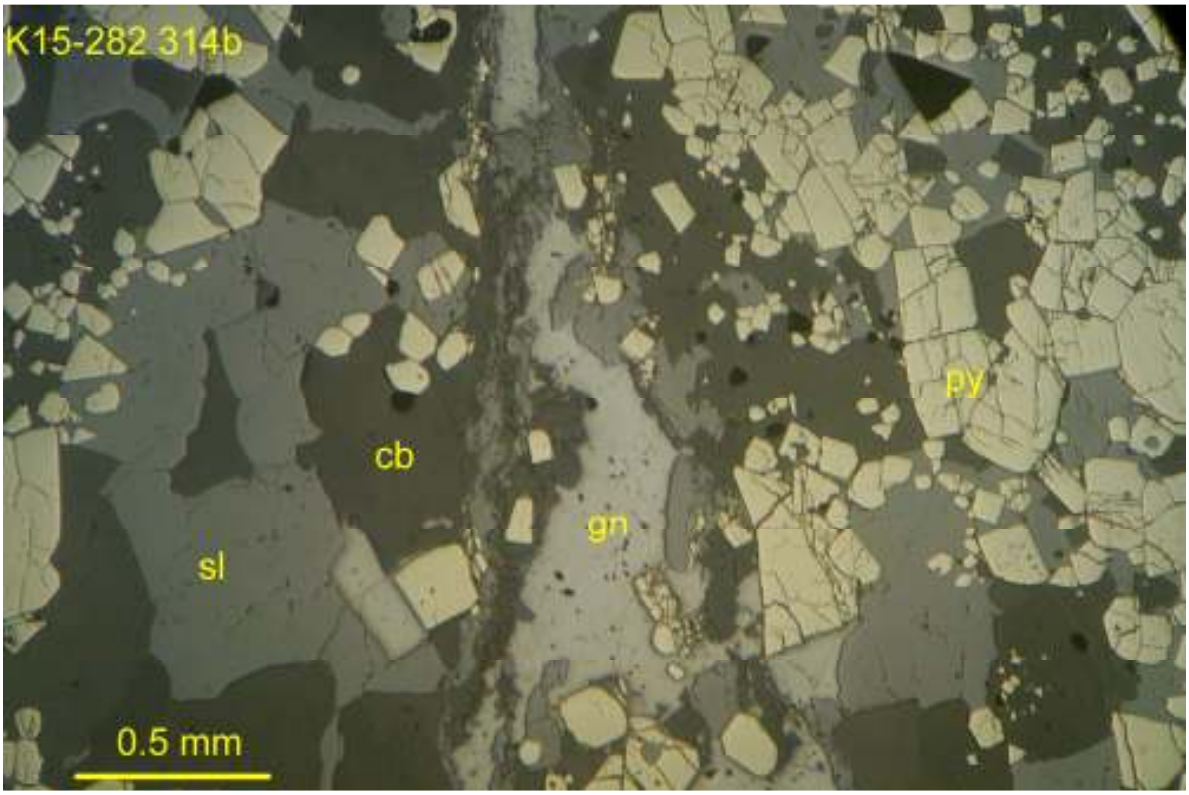
K15-282 315.4-315.5: biotite porphyroblast (relict mafic site?) in matrix of pale green chlorite, colourless plagioclase, acicular Fe-carbonate, epidote, accessory sphene. Transmitted plane light, field of view ~3 mm wide.



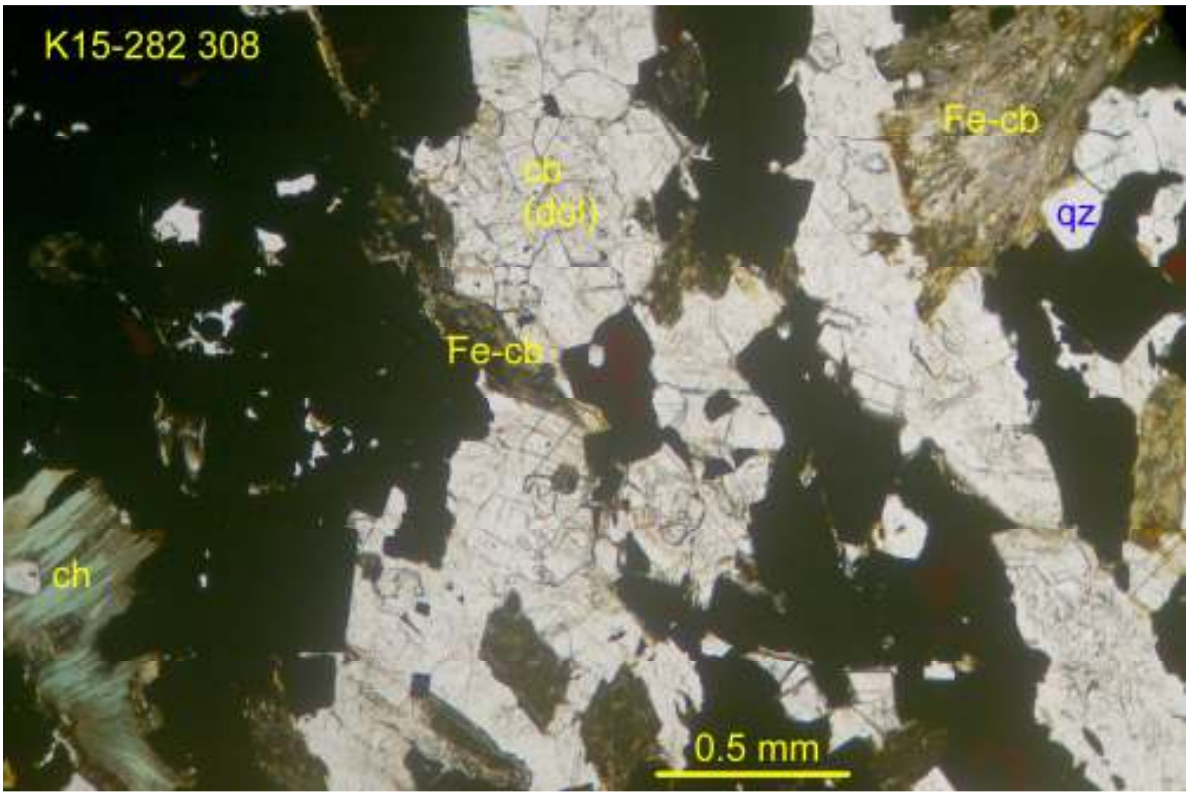
K15-282 315.4-315.5X: relict plagioclase (PL, partly altered to /intergrown with coarse, dolomitic carbonate) and mafic (M) sites, replaced by fibrous Fe-carbonate (likely after amphibole?), chlorite and accessory sphene, or biotite (BI), in matrix of plagioclase, chlorite, carbonate ±epidote, sphene. Transmitted light, crossed polars, field of view ~3 mm wide.



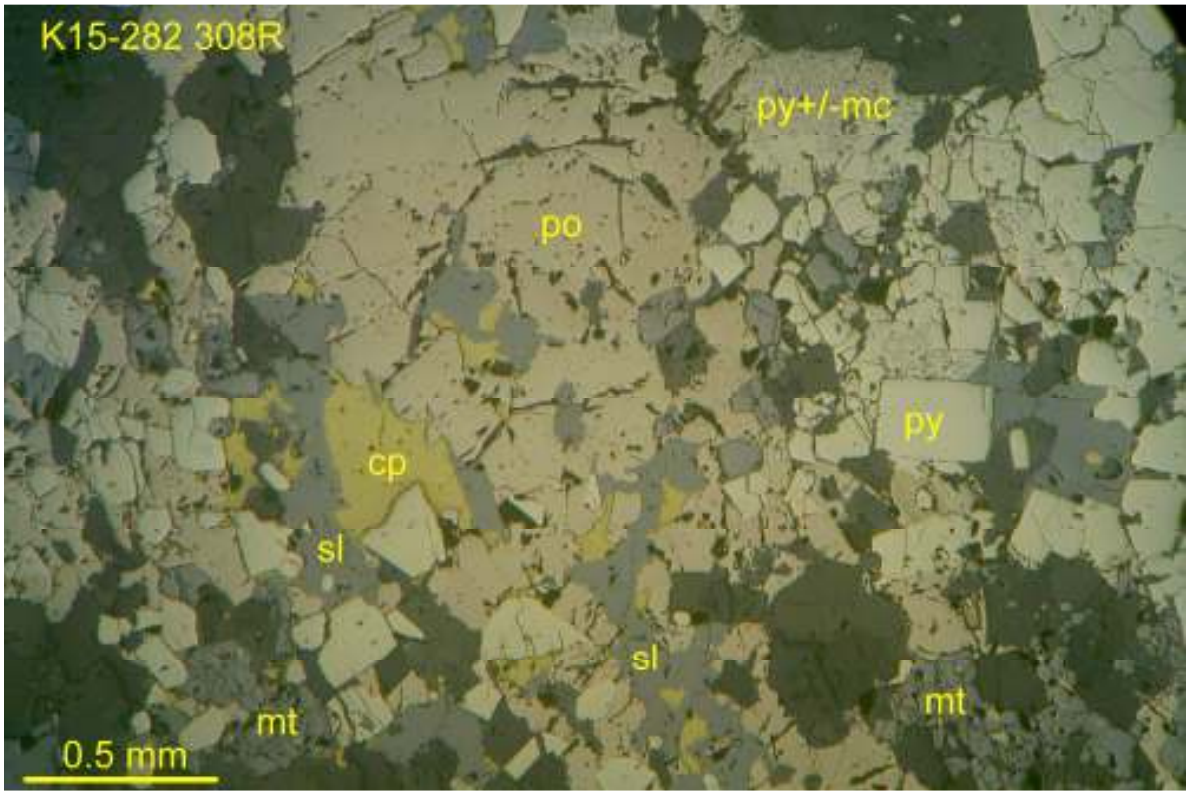
K15-282 314-314.05a: typical fine-grained massive sulfides composed of euhedral, fractured pyrite in matrix of sphalerite, cut by planar fracture zone along which sphalerite (and minor galena) appear to be remobilized; gangue inclusions are entirely carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



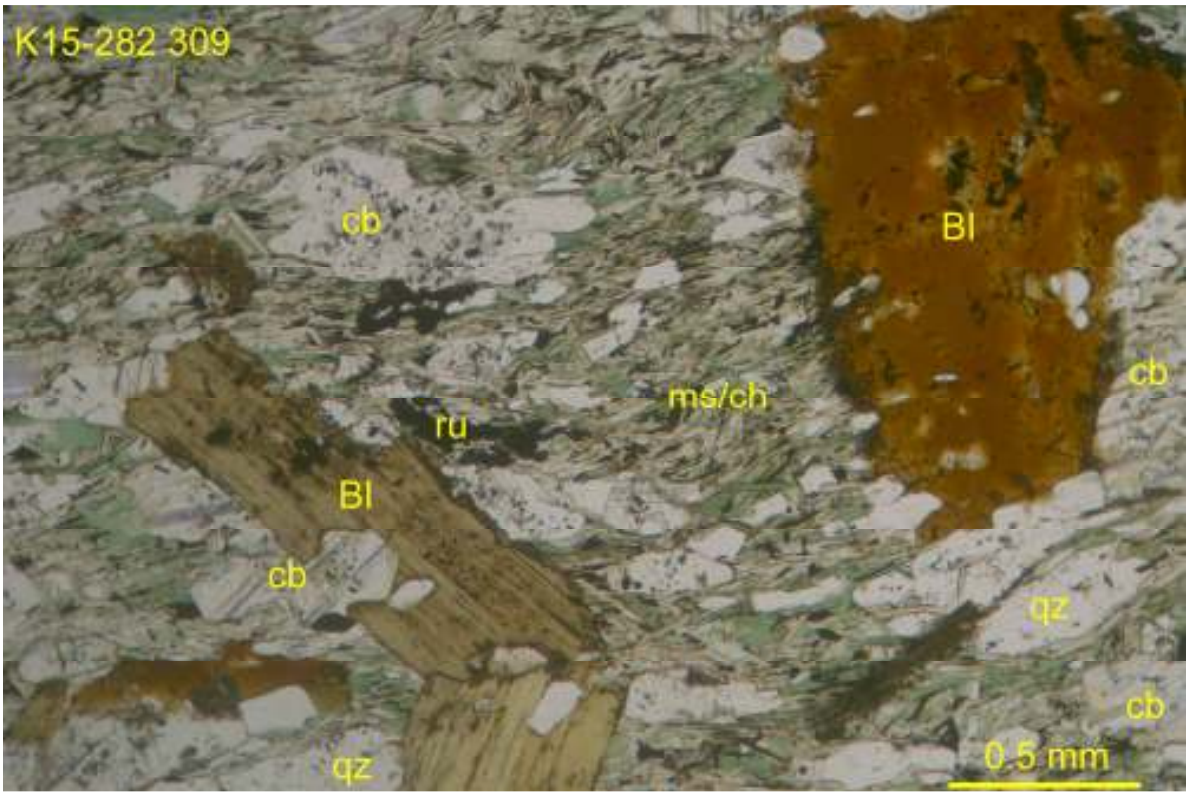
K15-282 314-314.05b: local coarser, sphalerite-galena rich band (?) with carbonate gangues, in pyritic massive sulfides, disrupted by narrow fracture zone sub-parallel /oblique to poorly defined banding. Reflected light, uncrossed polars, field of view ~3 mm wide.



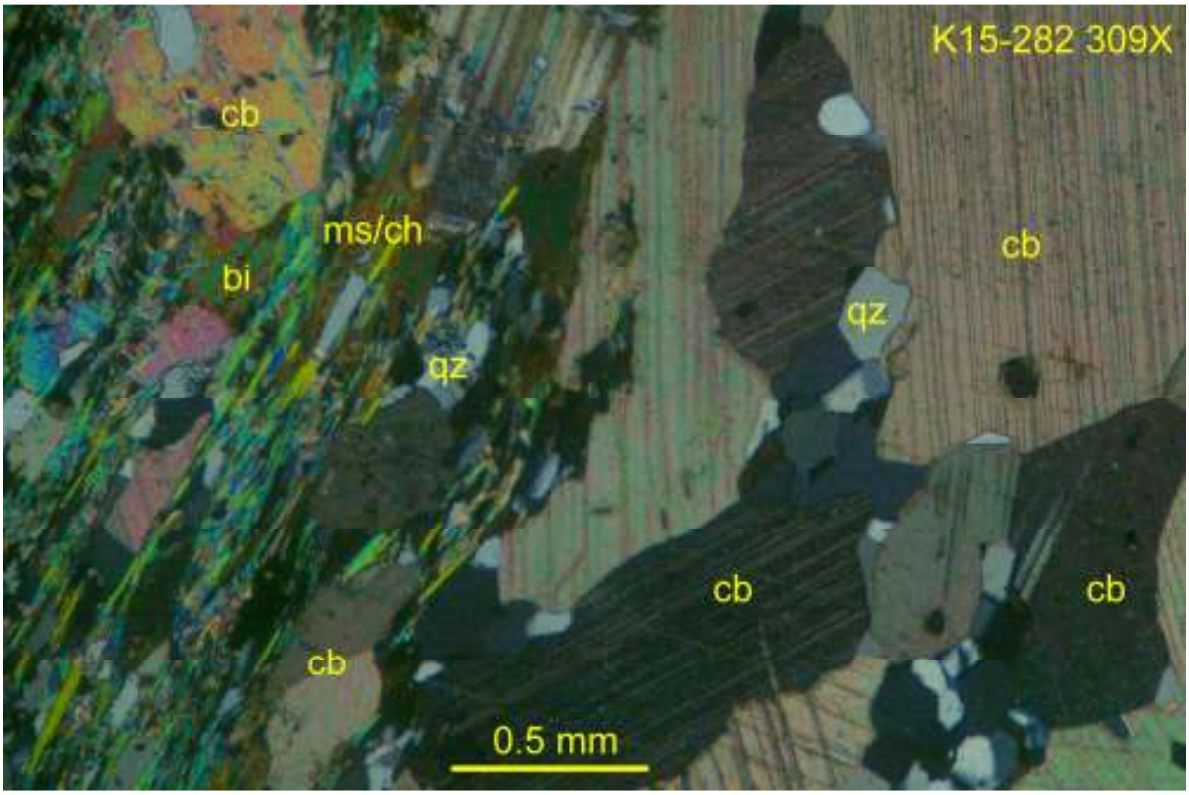
K15-282 308-308.1: massive sulfides with gangue assemblage of carbonate (relatively clear, subhedral, likely dolomite?), Fe-carbonate (brown, euhedral or fibrous, could be ankerite or siderite?), minor quartz (qz) and local bright green chlorite. Transmitted plane light, field of view ~3 mm wide.



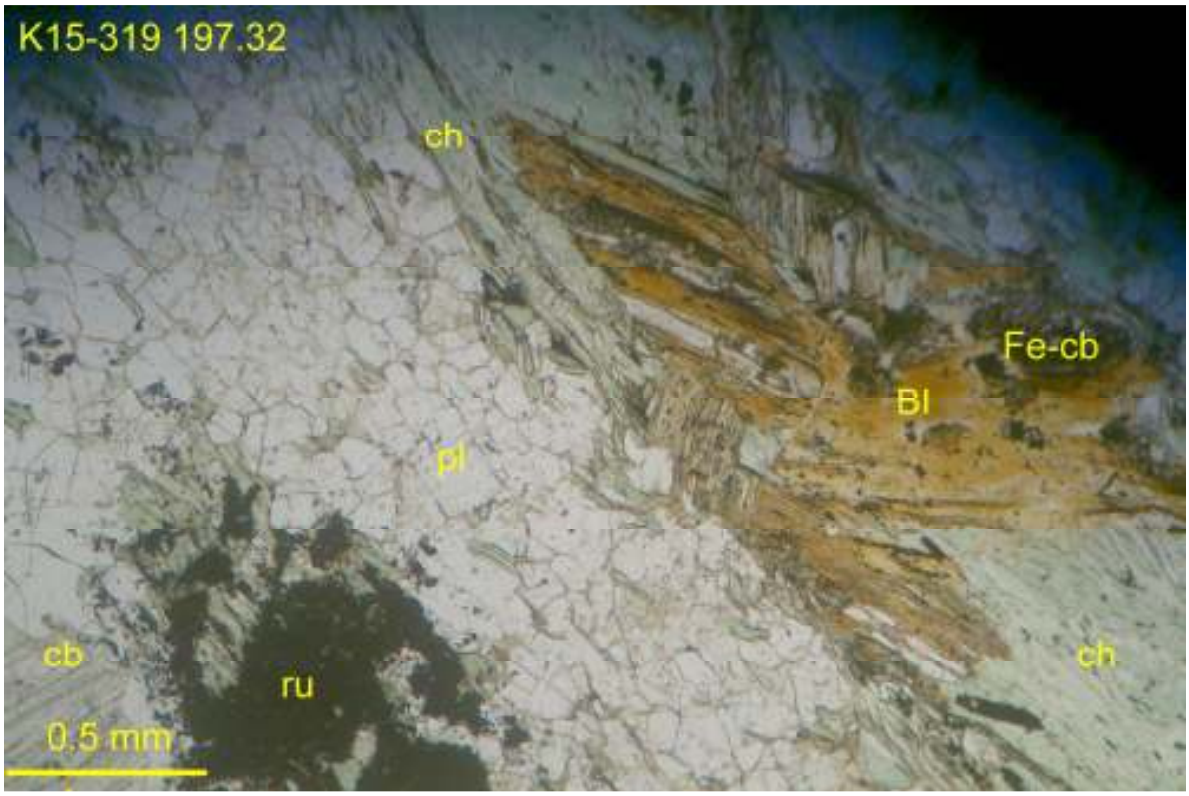
K15-282 308-308.1R: typical assemblage of cubic pyrite in matrix of pyrrhotite (locally altered to pyrite ±marcasite), sphalerite, fractured subhedral magnetite, and local chalcopyrite. Reflected light, uncrossed polars, field of view ~3 mm wide.



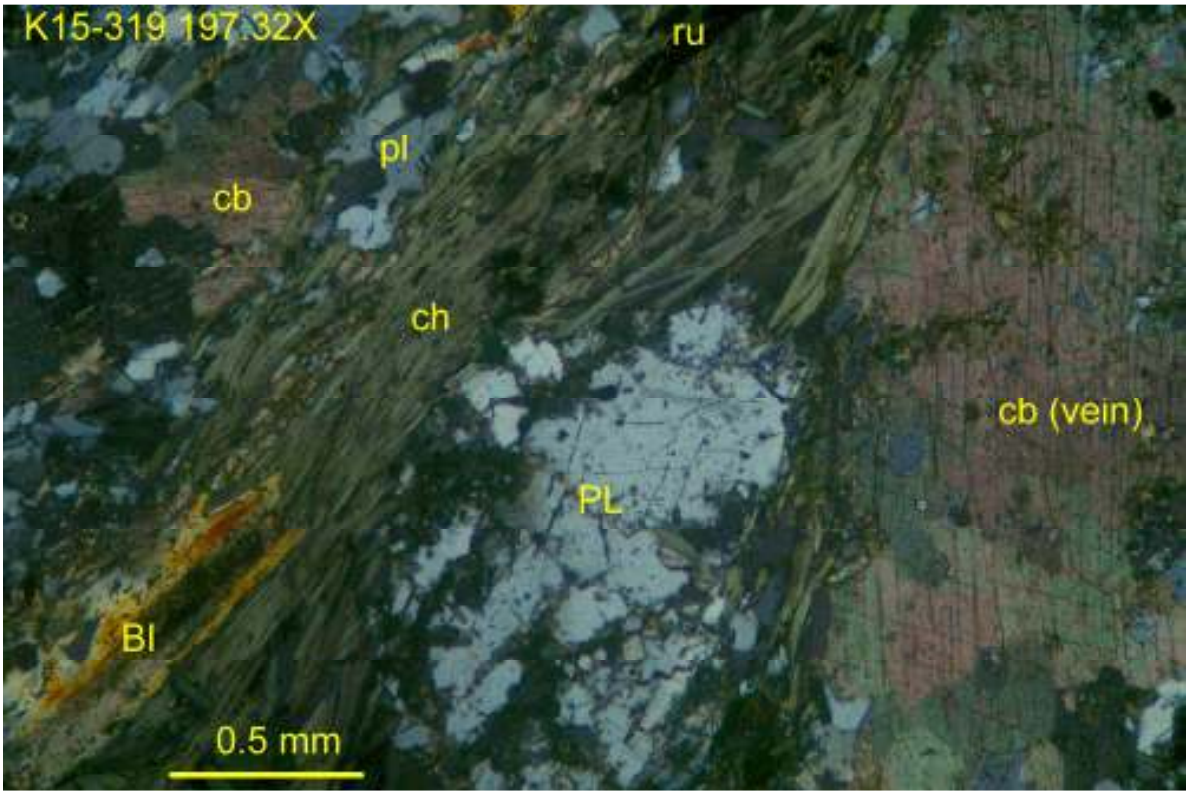
K15-282 309-309.06: porphyroblastic biotite (BI, possibly representing former mafic sites?) in well-foliated matrix of muscovite intimately mixed with lesser chlorite, scattered carbonate (dolomite?) and lesser quartz, accessory rutile (likely after former ilmeno-magnetite?). Transmitted plane light, field of view ~3 mm wide.



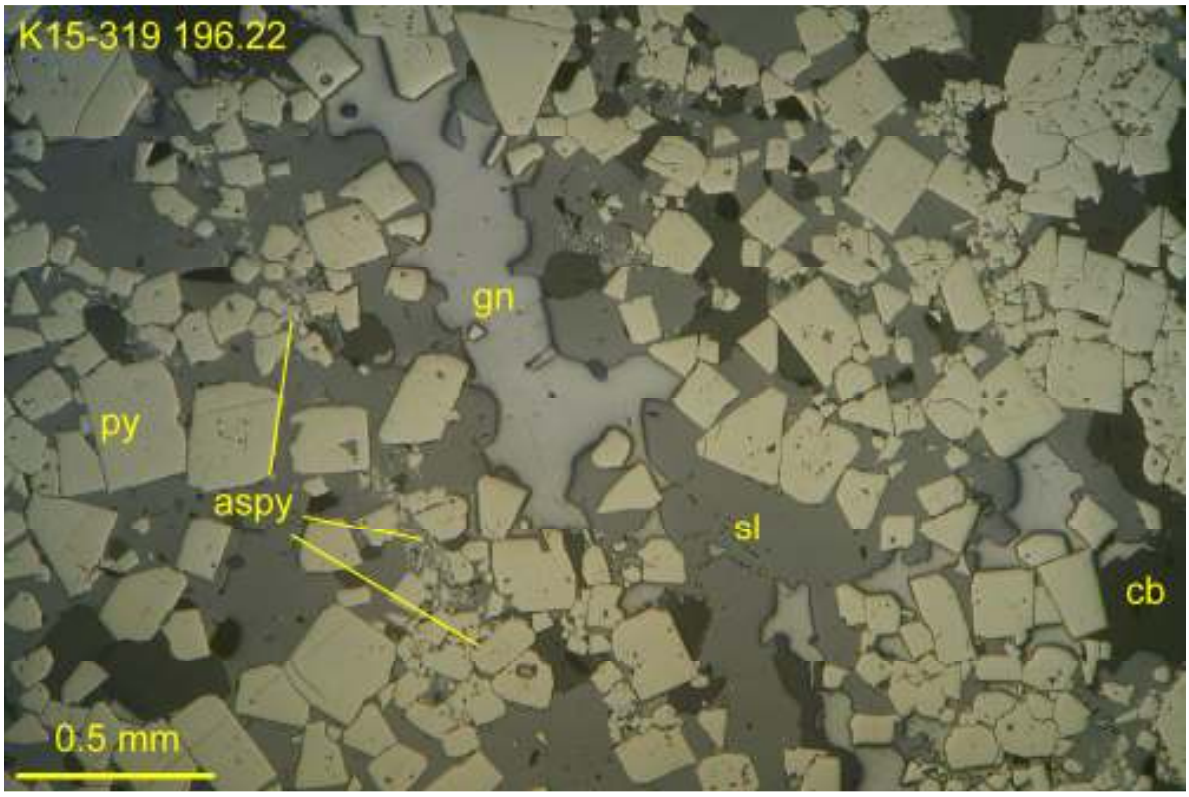
K15-282 309-309.06X: coarse carbonate (calcite), minor quartz in lensy metamorphic “sweat” vein; wallrock of muscovite-chlorite also contains small blastic carbonate crystals (possibly partly dolomite?). Transmitted light, crossed polars, field of view ~3 mm wide.



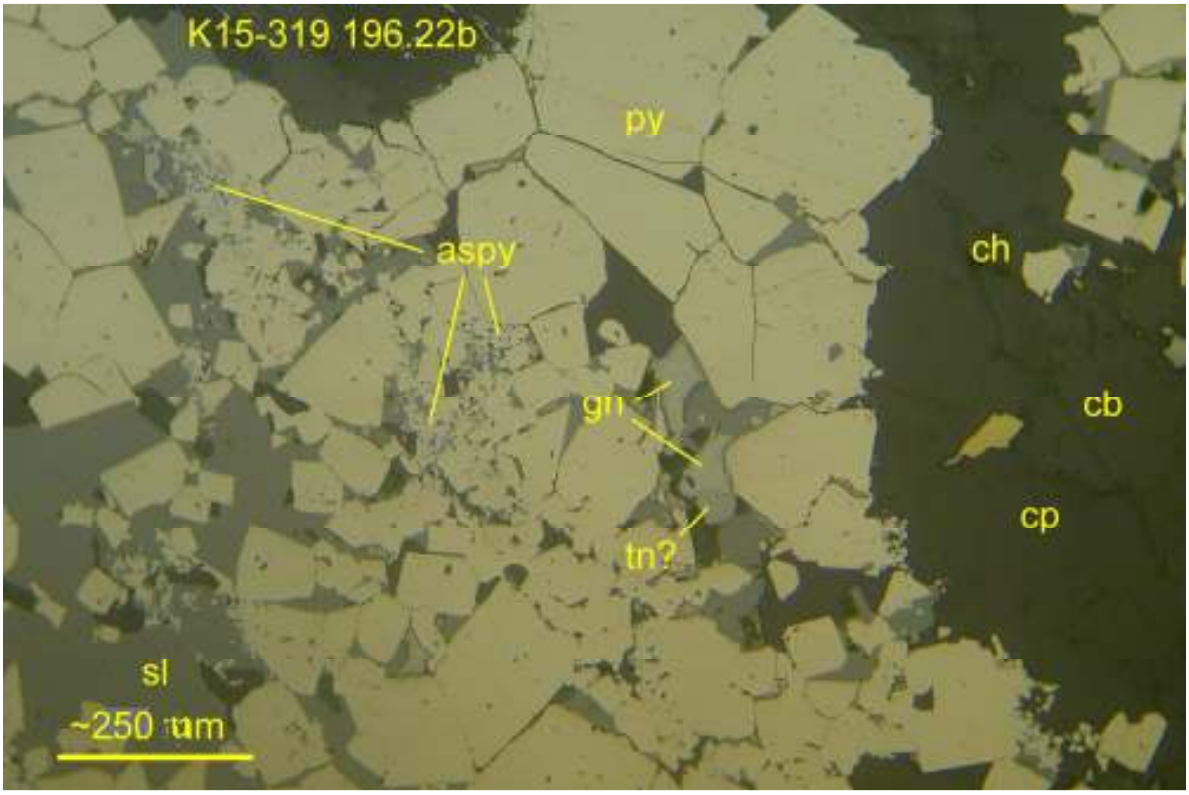
K15-319 197.32-197.42: possible relict mafic sites, mostly represented by porphyroblastic rutile (opaque), chlorite, and carbonate, or biotite somewhat altered to Fe-carbonate and chlorite, in a lens of chlorite hosted by fine-grained plagioclase. Transmitted plane light, field of view ~3 mm wide.



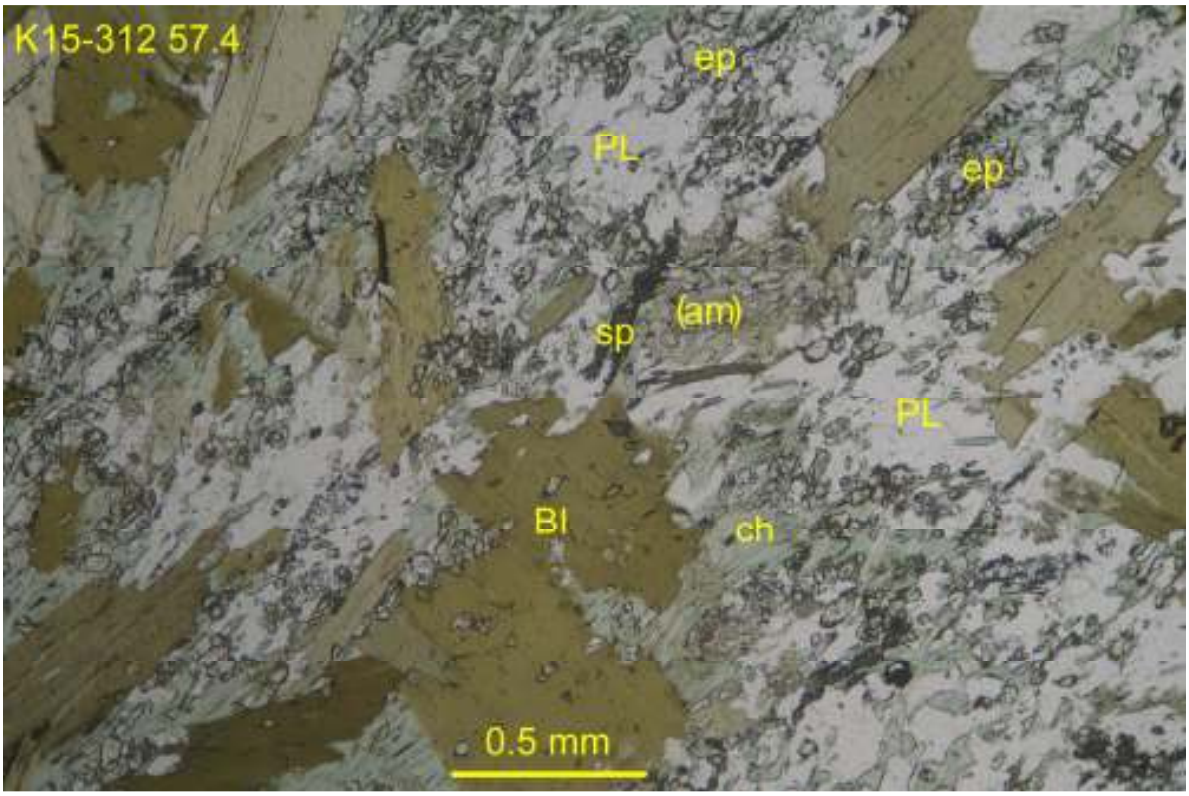
K15-319 197.32-197.42X: relict plagioclase (PL) phenocryst in matrix of strongly foliated chlorite, fine-grained plagioclase, and lensy aggregates of coarse-grained carbonate, likely mainly calcite; note lath-like aggregates of rutile, likely after former ilmenite. Transmitted light, crossed polars, field of view ~3 mm wide.



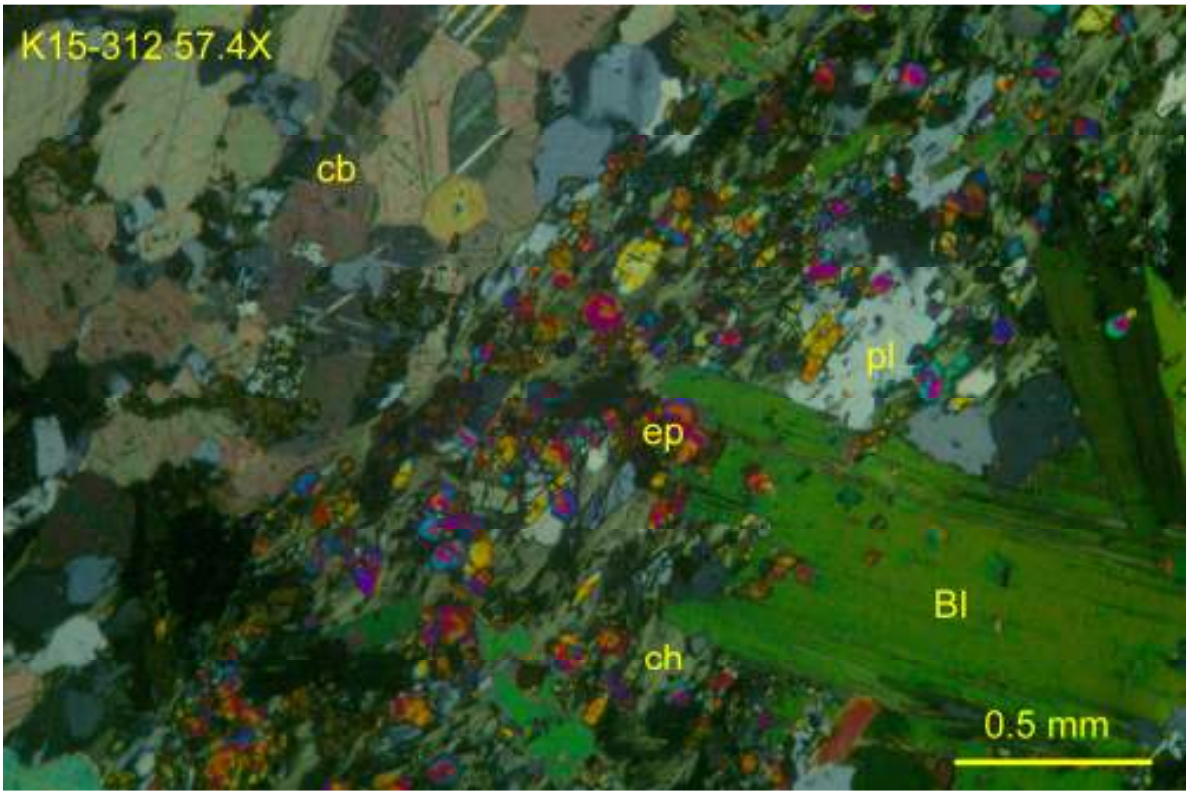
K15-319 196.22-196.27a: crudely banded, sphalerite-galena rich zones in otherwise mainly pyritic massive sulfides; gangues are mainly carbonate, local muscovite (ms). Reflected light, uncrossed polars, field of view ~3 mm wide.



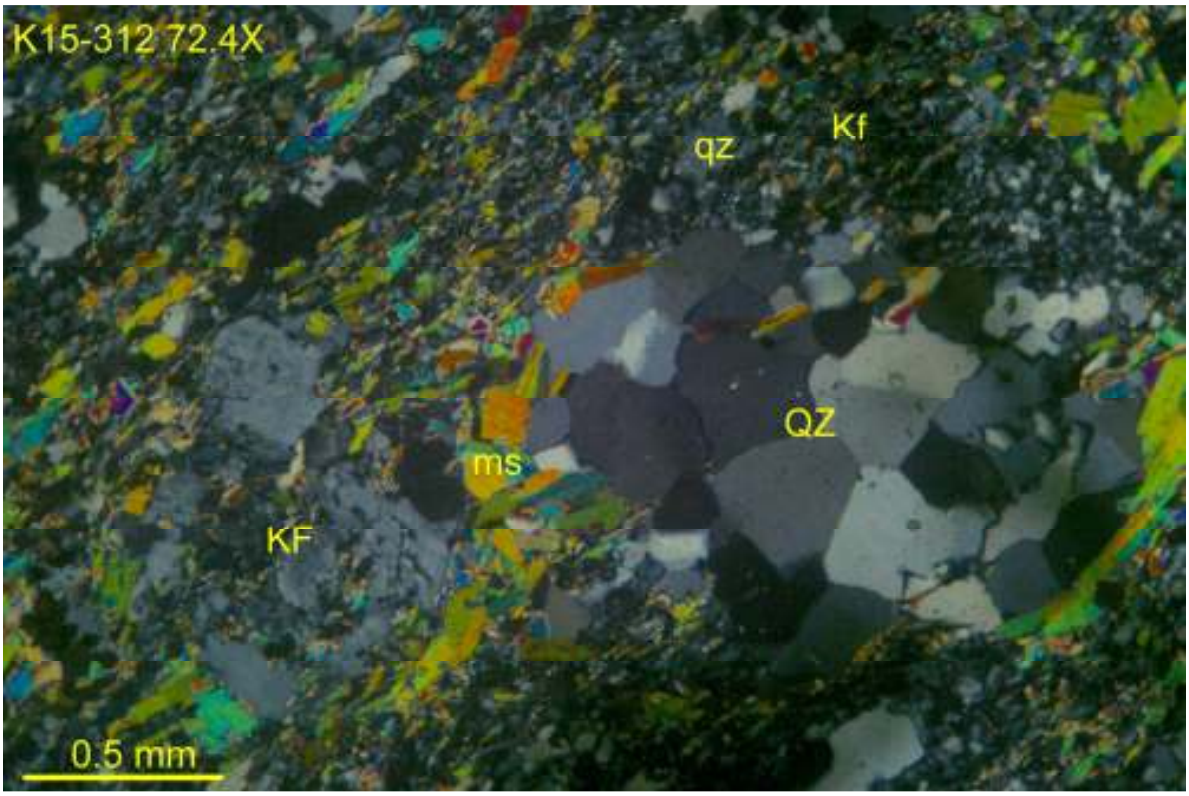
K15-319 196.22-196.27b: detailed view to show traces of grey, apparently isotropic sulfosalt (tennantite-tetrahedrite, tn?) included in galena associated with arsenopyrite replacing cores of pyrite aggregates, in matrix of sphalerite adjacent to quartz-rich band that contains trace chalcopyrite. Reflected light, uncrossed polars, field of view ~1.5 mm wide.



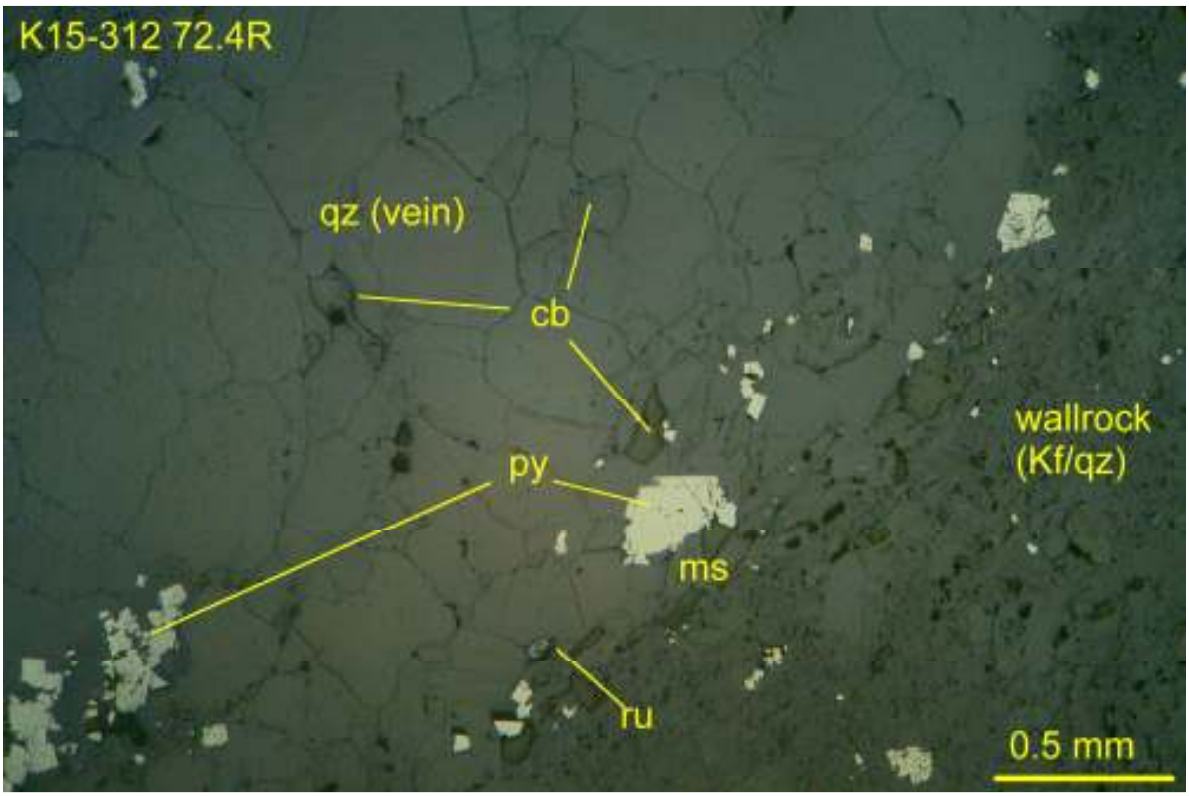
K15-312 57.4-57.52: ragged, possible relict mafic (?) phenocryst sites (porphyroblastic biotite, BI, or rare amphibole mostly pseudomorphed by Fe-carbonate) and possible relict plagioclase sites (severely recrystallized; PL) in foliated matrix of fine-grained chlorite, plagioclase, epidote and accessory sphene. Transmitted plane light, field of view ~3 mm.



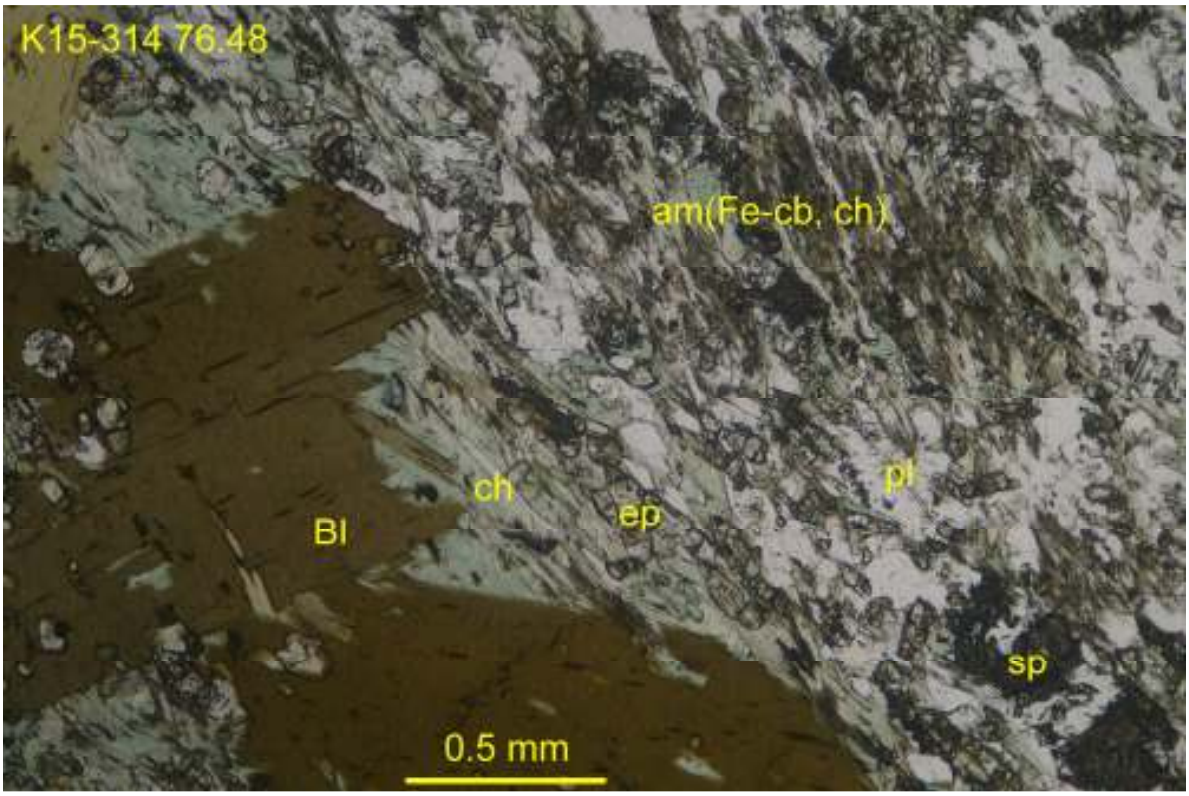
K15-312 57.4-57.52X: margin of coarse, carbonate-rich lens or veinlet in contact with fine-grained, plagioclase-chlorite-epidote rich wallrock containing porphyroblastic biotite; small aggregates of sphene occur in both. Transmitted light, crossed polars, field of view ~3 mm wide.



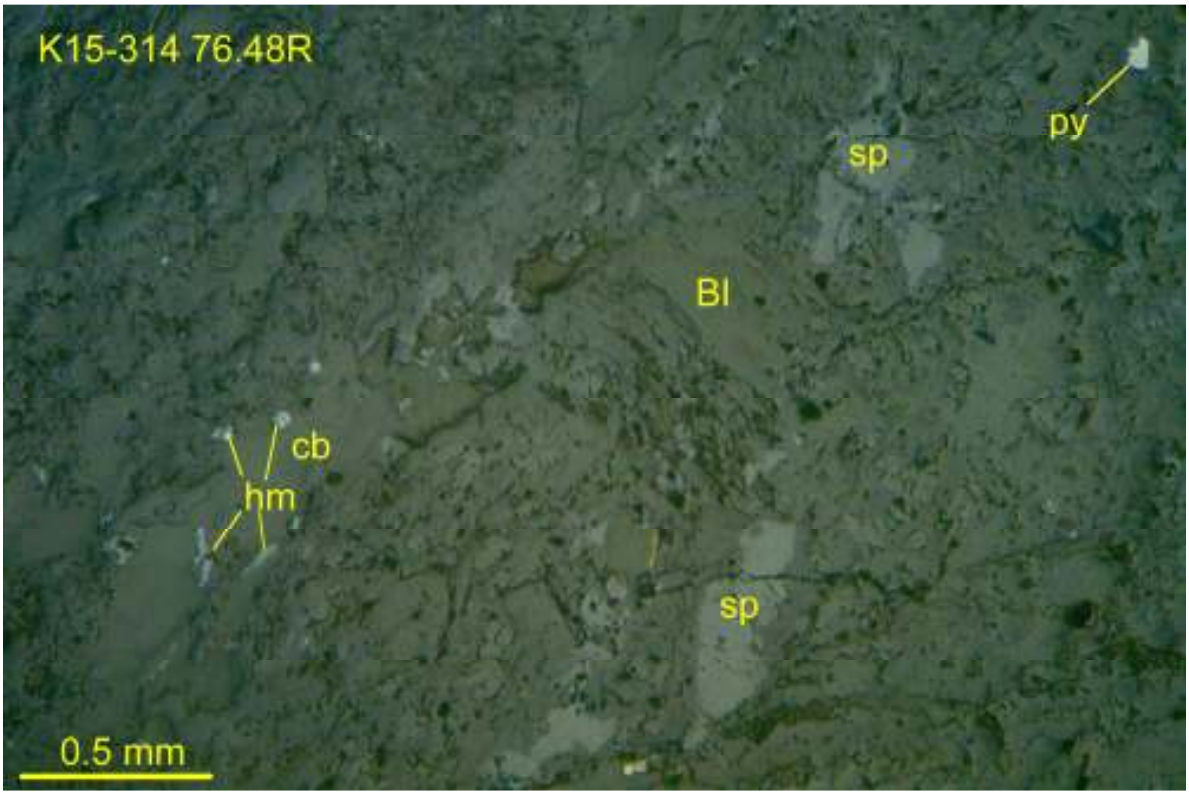
K15-312 72.4-72.55: relict quartz (QZ) and broken Kspar (KF, partly replaced by sericite) in weakly foliated matrix of fine-grained Kspar, quartz and sericite. Transmitted light, crossed polars, field of view ~3 mm wide.



K15-312 72.4-72.55R: margin of foliation-parallel quartz vein with marginal pyrite (associated with muscovite, ms) and minor central carbonate. Reflected light, uncrossed polars, field of view ~3 mm wide.



K15-314 76.48-76.6: relict mafic phenocryst sites (?) composed of either blastic biotite (BI) or relict amphibole (am, largely altered to brownish Fe-carbonate), chlorite and epidote; both are associated with accessory sphene as subhedral aggregates suggestive of former ilmeno-magnetite (?). Transmitted plane light, field of view ~3 mm wide.



K15-314 76.48-76.6R: traces of pyrite and hematite (hm) associated with sphene (sp) relics and former mafic sites (biotite, relic amphibole, chlorite, local carbonate). Reflected light, uncrossed polars, field of view ~3 mm wide.

Overviews of thin sections and offcuts (blue semi-circles mark photomicrograph locations).

Appendix S: Qualified Persons Certificates

GEOLOGIST'S CERTIFICATE

Christopher Hughes
704-900 Jervis Street
Vancouver, B.C., Canada

I, **CHRISTOPHER HUGHES**, M.Sc., do hereby certify that:

1. I am a Consulting Geologist at Equity Exploration Consultants Ltd., a geological consulting and contracting firm with offices at Suite 1510–250 Howe Street, Vancouver, British Columbia.
2. I am a graduate of the University of Auckland, New Zealand with Bachelor of Science (2003) and Masters of Science (2005) degrees in Geology, and I have practiced my profession continuously since 2005.
3. Since 2005 I have been involved in mineral exploration for gold, silver, copper, lead, zinc, iron ore and coal in New Zealand, Australia, Republic of Guinea, Cameroon, Republic of Congo and Canada.
4. I am co-author of the Assessment Report entitled “2015 Geological, Geophysical, Diamond Drilling and Environmental Report on the Kudz Ze Kayah Property” prepared for BMC Minerals (No. 1) Ltd.
5. I was directly involved with the planning, managing and execution of the 2015 exploration and development program at Kudz Ze Kayah and have examined the property which is subject of the Assessment Report.

Dated March 7, 2016 in Vancouver, British Columbia.

GEOLOGIST'S CERTIFICATE

Ronald J. Voordouw
2327 Mary Hill Road
Port Coquitlam, BC, Canada

I, **RONALD VOORDOUW**, Ph.D., P.Geo., do hereby certify that:

1. I am presently a Project Geologist with Equity Exploration Consultants Ltd, with offices at Suite 1510, 250 Howe Street, Vancouver, B.C.
2. I graduated from the University of Calgary, Calgary, AB, Canada with a Bachelor of Science degree in geology in 1999 and with a Doctorate in geology in 2006 from the Memorial University of Newfoundland, Canada
3. I am a professional geoscientist in good standing (#06962) in the province of Newfoundland and Labrador.
4. Since 2006 I have been involved in natural resource exploration for base metals and gold (2006, 2011 to present); research on PGE deposits (2007, 2008); and regional geological mapping (2009, 2010) in Canada and South Africa.
5. I am a co-author of the assessment report "*2015 Geological, Geophysical, Diamond Drilling and Environmental Report on the Kudz Ze Kayah Property*" prepared for BMC Minerals (No 1) Ltd.
6. I have not examined the property which is the subject of the Assessment Report

Dated March 7, 2016, at Vancouver, British Columbia.

#06962

Signed and sealed: "*Ronald J. Voordouw*"

EQUITY

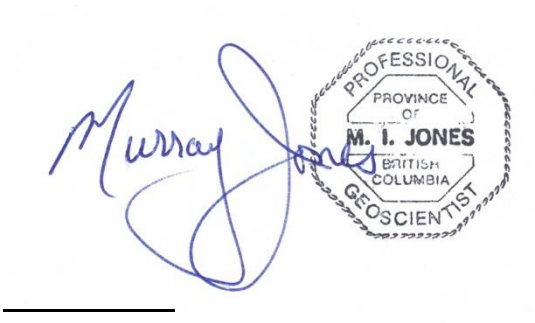
GEOLOGIST'S CERTIFICATE

Murray I. Jones
8606 144A Street
Surrey, B.C., Canada

I, **MURRAY I. JONES**, M.Sc., P.Geo., do hereby certify that:

1. I am a Consulting Geologist with offices at Suite 1510, 250 Howe Street, Vancouver, British Columbia V6C 3R8.
2. I am a graduate of the University of British Columbia with a Bachelor of Science degree in Geology in 1982, and a graduate of the University of Ottawa with a Master of Science degree in Geology in 1992.
3. I am a Professional Geoscientist registered in good standing with the Association of Professional Engineers and Geoscientists of the Province of British Columbia (#20063).
4. Since 1982, I have been involved in mineral exploration for gold, silver, copper, lead, zinc, cobalt, and tin primarily in Canada, but also in the Solomon Islands and Argentina.
5. I am a Project Geologist with Equity Exploration Consultants Ltd., a geological consulting and contracting firm, and have been with Equity in various capacities since April 1997.
6. I am a co-author of the report entitled “2015 Geological, Geophysical, Diamond Drilling and Environmental Report on the Kudz Ze Kayah Property” prepared for BMC Minerals (No. 1) Ltd. I am responsible for Sections 8.4 and 7.3.
7. The portions of the report I authored are based on field work carried out under my supervision in the period between August 16 and October 25, 2016 and on publicly available and company reports.

Dated March 7, 2016 in Vancouver, British Columbia



Murray I. Jones, M.Sc., P.Geo.

GEOLOGIST'S CERTIFICATE

Henry J. Awmack
1843 Crescent Road
Victoria, B.C., Canada

I, **HENRY J. AWMACK**, P.Eng., do hereby certify that:

1. I am a Professional Engineer with offices at Suite 1510, 250 Howe Street, Vancouver and residing at 1843 Crescent Road, Victoria, British Columbia, Canada.
2. I graduated from the University of British Columbia with a Bachelor of Applied Science (Honours) degree in geological engineering (Mineral Exploration Option) in 1982, and I have practiced my profession continuously since 1982.
3. I am a member in good standing (#15,709) of the Association of Professional Engineers and Geoscientists of British Columbia and a Fellow of the Society of Economic Geologists.
4. Since 1982, I have been involved in mineral exploration for gold, silver, copper, lead, zinc, cobalt, nickel and tin in Canada, Costa Rica, Panamá, Chile, Argentina, Brazil, Peru, Ecuador, Venezuela, Nicaragua, Bolivia, Mexico, Indonesia, China, Sénégal, Colombia, Namibia and Egypt.
5. I am a Senior Geological Consultant with Equity Exploration Consultants Ltd., a geological consulting and contracting firm, and have been with Equity in various capacities since February 1987.
6. I am a co-author of the report entitled "2015 Geological, Geophysical, Diamond Drilling and Environmental Report on the Kudz Ze Kayah Property" prepared for BMC Minerals (No. 1) Ltd. I am responsible for Sections 3.0, 4.0, 5.0, 7.1 and 7.2.
7. I have not examined the property which is the subject of the Assessment Report.

Dated March 7, 2016 in Vancouver, British Columbia

Signed and sealed: *"Henry J. Awmack"*
