GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-200

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	01-Aug-15
UTM Easting	414748.527	Core Size:	HQ3	Azimuth:	180	Date Logging Complete:	04-Aug-15
UTM Northing:	6815599.239	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1408.934	Casing Depth (m):	6	Length (m):	211.5	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	30-Jul-15
Local Northing:		Cemented?:	VWP	Core Storage Loc.:	KZK Camp	Drill Completed:	03-Aug-15
Local Elev. (m):						Purpose:	Resource/Hydro
Comments:						Parent Hole:	

K15-200 was drilled to twin a sulphide intercept in historic hole K94-008. Packer testing was completed and a vibrating wire piezometer was installed at completion of the hole.
The hanging wall sequence consists of a felsic package of volcanics and two mudstone horizons from 6-140.6 m. MU alteration increases in intensity from 97.4-142.5 m as well as stronger CL and CI alteration in proximity to the MSXS. MSXS occurs from 140.6-159.5 m, consisting of OJ, OB, OD, OA, OC, and OG ore types. The footwall package consists of CL-altered volcaniclastic rocks from 159.5-161.7 m, CL-BI mafic sill from 161.7-186.6 m with a 4.7 m zone of MU and SI alteration believed to be associated with the RHYi. A second package of felsic volcanic rocks occurs to the end of the hole at 211.5 m.

						Parent Hole:	K15-202

Comments:

K15-201 was drilled as twin of K15-202 to collect potentially oxidized samples of the MET3 and MET7 domains. Overburden occurs to 10.2 m. MSXS occurs from 10.20 - 20.00 m, consisting of OB and OA ore types followed by a strongly MU-altered felsic volcaniclastic unit from 20.00 - 21.50 m. From 21.50 - 23.00 m a second intersection of MSXS occurs, comprising the OB ore type. From 23.00 - 26.00 m moderate-strongly MU-altered felsic volcaniclastics occur. An intrusive rhyolite dyke cuts the volcanics from 26.00 m to the end of the hole at 35.00 m.

Local Elev. (m):						Purpose:	Resource/Met/Hydro
Comments:						Parent Hole:	

K15-202 was drilled to define the shallow resource extension of the massive sulphide lens. K15-201 was drilled as a twin of K15-202 to collect core to test the metallurgical properties of MET3 and MET7 domains. Packer testing was completed on K15-202 as the hole was advanced.
K15-202 collared into overburden followed by MSXS occurring from 8.00 - 8.90 m consisting of the OB ore type. Strongly MU-altered felsic volcaniclastics were intersected from 8.90 - 9.50 m followed by a second MSXS intercept from 9.5-18.3 m comprising OB and OA ore types. From 18.30 - 20.80 m another strongly MU-altered felsic volcaniclastic unit occurs. A third MSXS intercept occurs from 20.00 - 23.00 m, consisting of the OB ore type. The footwall package comprises felsic volcaniclastics from 23.00 - 24.20 m, an aphanitic intrusive rhyolite dyke (RHYi) from 24.20 - 44.30 m, and a CL-BI mafic sill (MAFi) from 44.30 - 71.00 m. The MAFi displays MU and SI alteration near the contact with the RHYi unit.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	05-Aug-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

K15-203 was drilled as resource infill hole between historic holes K94-009 and K94-047. K15-205 was drilled as a twin of K15-203 to test the metallurgical properties of MET8, MET6, and MET7 domains.
The hanging wall package (4.6-100.9 m) consists of mixed felsic volcanics with some mudstone horizons. MU-alteration begins at 70 m and increases in intensity toward the first MSXS interval, CL and CI-alteration also increase in intensity proximal to the MSXS. The first MSXS interval occurs at 100.9-109.3 m, consisting of OG, OA, OJ, and OH ore types respectively. From 109.3-119.2 coherent rhyolites occur, with CL and CI-alteration increasing intensity toward 119.2 m. A second interval of MSXS occurs from 119.2-125.6 m, consisting of OB, OA, and OI ore types respectively. From 125.6-126.9 m CL-altered coherent rhyolite occurs. From 126.9-127.3 m a small intersection of MSXS occurs, consisting of OB ore type. From 127.3-134.3 a package of CL-altered felsic volcanics occurs. From 134.3-135 m a small intersect of MSXS occurs consisting of OH ore type. From 135-136.6 m MU-altered coherent rhyolite occurs. From 136.6-139.7 m another MSXS interval occurs, consisting of OH ore type. From 139.7-164.1 a CL-BI mafic sill occurs, with an intrusive aphanitic rhyolite between 145.1-147.2 m. From 147.2-173 a package of felsic volcanics occurs, with a 40 cm MSXS intercept from 164.5-164.9 m, consisting of OB ore type.

Comments:						Parent Hole:	

K15-204 was drilled to test the western extension of the massive sulphide lens. Packer testing was completed as the hole advanced.
The hanging wall package (6.00 - 111.90 m) consists of felsic volcanics and intermittent mudstone horizons. A weak MU-alteration zone occurs from 50.20 - 58.00 m and again at 73.00 m where it increases in intensity with proximity to the MSXS. CL-alteration occurs from 95.60 - 102.60 m, with a strong-intense CL-CI-alteration zone between 100.20 - 102.60 m. MSXS occurs between 111.9-118.1 m, consisting of OI, OD, and OA ore types. The footwall package consists of MU-Cl altered felsic volcanics from 118.1-139.1, an aphanitic rhyolite intrusion from 132.7-136.7 m, and a CL-BI altered mafic sill from 136.7-149 m.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-205

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	06-Aug-15
UTM Easting	414849.957	Core Size:	HQ3	Azimuth:	180	Date Logging Complete:	07-Aug-15
UTM Northing:	6815542.83	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1395.479	Casing Depth (m):	3	Length (m):	146	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	05-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	06-Aug-15
Local Elev. (m):						Purpose:	Metallurgical Twin
Comments:						Parent Hole:	K15-203

K15-205 was drilled as a twin of K15-203 to test the metallurgical properties of MET8, MET6, and MET7 domains.
The hanging wall package (3.0 - 100.6 m) consists of felsic volcanics and mudstone horizons. MU-alteration begins at 71.3 m and increases in intensity towards the MSXS horizon. CL-alteration occurs proximal and grading into the MSXS in association with CI. The first MSXS lens occurs from 100.6-109.3 m, consisting of OG, OA, OJ, and OH ore types respectively. Coherent rhyolite occurs from 109.3 - 119.0 m with increasing CL alteration grading into CL-CI-alteration down hole. MSXS intervals occur from 119-125.7 m, consisting of OB, OA, and OI ore types with OB occurring from 126.8 - 127.2 m. MU and CL-altered felsic volcanics occur from 127.2 - 134.9 m followed by a 30 cm OH MSXS interval. A MU-altered coherent rhyolite unit occurs from 135.2 - 136.3 m followed by a finial MSXS interval from 136.3-139.3 m. The footwall package includes a CL-BI mafic sill and aphanitic rhyolite intrusion.

UTM Elev. (m):	1430.473	Casing Depth (m):	9	Length (m):	237	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	08-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	10-Aug-15
Local Elev. (m):						Purpose:	Resource/Hydro
Comments:						Parent Hole:	

K15-206 was drilled to test the continuity/extension of the lower massive sulphide lens (MET4 domain), between historic holes K94-024 and K94-025. Packer testing was completed as the hole advanced.
The hole consists predominantly of felsic volcanics with minor mudstone units. Multiple narrow (>1.5 m) FD-porphyry mafic dykes occur above 85 m. An aphanitic rhyolite intrusion occurs from 199.7 - 213.0 m, and hosts an ~5 m wide zone containing 5% SP. MU and CL-alteration increase in intensity from 88.1 m to 199.7m and decrease in intensity from 216 to 237 m.
Based on the observed alteration pattern and historic hole data, MSXS was expected where the RHYi occurs. The occurrence of higher SP within the RHYi may confirm this hypothesis.

9.00 24.50 RHYvx Quartz and/or feldspar crystal tuff

9 - 24.5: QZ-eyes and FD crystals in homogenous volcaniclastic rock. Many lpl sized fragments as well

<<Min: 9 - 73.1 1% Min: Pyrite>>

<<Min: 9 - 73.1 1% Min: Pyrrhotite>>

<<Struc: 18 - 19.5 Weak (Alt) Fault>> moderate faulted zone with discrete fault gouge zone at 18

24.50 27.00 MDSt Rhyolite tuff dominant mudstone

24.5 - 27: Unit goes gradiationally (24.5-25.9) from RHYvx with some carbonaceous material to MDSc (25.9-26.2), then grades back to RHYvs

27.00 32.10 RHYvx Quartz and/or feldspar crystal tuff

27 - 32.1: QZ-eye rich with some FD crystals in a grey aphanitic groundmass

32.10 33.20 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

32.1 - 33.2: FD-porphyritic CL-BI dyke (?)

<<Alt: 32.1 - 33.2 Moderate-Strong (Alt) Chlorite>>

<<Alt: 32.1 - 33.2 Moderate-Strong (Alt) Biotite>>

33.20 37.00 RHYvl Lapilli tuff

37.00 47.20 RHYvx Quartz and/or feldspar crystal tuff

37 - 47.2: QZ-eye rich with some FD crystals in a grey aphanitic groundmass. FD-porphyritic CL-BI dyke from 44.5-45 m.

47.20 48.70 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

47.2 - 48.7: CA-after-FD porphyritic CLBI dyke.

<<Min: 47.2 - 48.7 20% Min: Calcite>>

<<Alt: 47.2 - 48.7 Moderate-Strong (Alt) Chlorite>>

<<Alt: 47.2 - 48.7 Moderate-Strong (Alt) Biotite>>

48.70 52.10 RHYvx Quartz and/or feldspar crystal tuff

48.7 - 52.1: QZ-eye rich with some FD crystals in a grey aphanitic groundmass

52.10 54.70 RHYc Rhyolite coherant volcanics

52.1 - 54.7: grey-brown coherent rhyolite, with curdy texture. Has chilled margins (?) where the unit becomes ~aphanatic on either end.

54.70 66.60 RHYvx Quartz and/or feldspar crystal tuff

54.7 - 66.6: QZ-eye rich with some FD crystals in a grey aphanitic groundmass

<<Vein: 64.3 - 65.6 20% Quartz-Carbonate>> Qz-carb vein set in RHYvx

66.60 69.00 RHYvl Lapilli tuff

69.00 71.90 RHYcw Curdy textured-flow banded (flows, subvolcanics)

69 - 71.9: Good curdy texture

71.90 73.10 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

71.9 - 73.1: FD-porpyritic CL dyke

<<Min: 71.9 - 73.1 15% Min: Calcite>>

<<Alt: 71.9 - 73.1 Moderate (Alt) Chlorite>>

73.10 82.60 RHYcw Curdy textured-flow banded (flows, subvolcanics)

73.1 - 82.6: Good curdy texture with dyke between 74.5-74.8 and 79.3-79.7 (MAFi)

<<Min: 73.1 - 108 0.5% Min: Sphalerite>>

<<Min: 73.1 - 108 2% Min: Pyrite>>

<<Min: 73.1 - 108 3% Min: Pyrrhotite>>

<<Min: 73.1 - 108 0.5% Min: Chalcopyrite>>

<<Min: 79.3 - 79.7 15% Min: Calcite>>

<<Alt: 75.8 - 82.6 Weak (Alt) Chlorite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

82.60 84.30 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

82.6 - 84.3: FD-porphyritic CL-BI dyke

<<Min: 82.6 - 88.1 15% Min: Calcite>>

<<Alt: 82.6 - 84.3 Moderate (Alt) Chlorite>>

<<Struc: 83 - 83.4 Moderate (Alt) Fault>> weak-moderate two discrete fault gouge zones

84.30 86.10 RHYcw Curdy textured-flow banded (flows, subvolcanics)

86.10 88.10 RHYva Coarse grained to ash tuff

<<Alt: 86.1 - 88.1 Weak-Moderate (Alt) Chlorite>>

88.10 102.00 RHYcw Curdy textured-flow banded (flows, subvolcanics)

88.1 - 102: Good curdy and flow banded textures

<<Min: 88.1 - 93.3 5% Min: Calcite>>

<<Alt: 88.1 - 93.3 Weak (Alt) Chlorite>>

102.00 109.60 RHYvl Lapilli tuff

<<Min: 108 - 164.8 2% Min: Pyrite>>

<<Min: 108 - 164.8 2% Min: Pyrrhotite>>

109.60 121.90 RHYvl Lapilli tuff

109.6 - 121.9: FD porphyry. Increases deformation from relatively unstrained (109.6) to highly strained (121.9) MB likely lithic +/- crystals as lith/xtl lapilli tuff - peperite.

<<Struc: 109.6 - 114.5 Strong (Alt) Fault>> Strongly faulted zone with >2m of core loss and lots of fault gouge

121.90 125.60 RHYvl Lapilli tuff

121.9 - 125.6: FD-crystal lpl tuff. Decrease in deformation from 121.9 to 125.6. Deformation may cause lpl like texture.

125.60 131.30 MDSt Rhyolite tuff dominant mudstone

125.6 - 131.3: carbonaceous content ~10-15%

131.30 135.00 RHYva Coarse grained to ash tuff

131.3 - 135: fine grained tuff, with some FD (?) phenocrysts. Well developed spaced cleavage folds some QZ-veinlets that appear similar to flow banding texture.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-207 was drilled to test the western continuity/extension of the massive sulphide lens.
The hanging wall package, from 6.8-76.3 m, consists of a sequence of felsic volcanics and mudstone horizons. This package includes an aphanitic rhyolite intrusion from 19.8-20.8 m. Weak MU-alteration begins at 33.7 m and increases in intensity toward the MSXS with CL-alteration occurring in proximity to the MSXS. MSXS occurs from 76.3-85.4 m consisting of OJ, OD, OA, and OH ore types. The footwall package consists of CL-altered felsic volcanics from 85.4-91.3 m, and an aphanitic rhyolite intrusion from 91.3-112 m (EOH).

Local Northing:		Cemented?:	SP	Core Storage Loc.:	KZK Camp	Drill Completed:	10-Aug-15
Local Elev. (m):						Purpose:	Hydro
Comments:						Parent Hole:	

Northing and easting coordinates are provided by Tetra Tech, and were measured with a hand-held GPS unit. Elevation value was not measured when hole was drilled; the recorded value is taken from the drill plan.
K15-208 was drilled as a monitoring well.
K15-208 encountered mafic CL+BI+FD schists with a horizon of argillite from 26.3-27 m.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	11-Aug-15
Local Elev. (m):						Purpose:	Metallurgical
Comments:						Parent Hole:	

K15-209 was drilled to collect metallurgical samples of MET5 & MET2 domains but was abandoned due to poor core recovery. The hole was re-drilled as K15-213.
The hole intersected a section of felsic volcanic rocks from 8.5-21.4 m displaying increasing MU alteration down hole, followed by MSXS from 21.4-29.4 m consisting of OA and OB ore types. A second package of felsic volcanics occurs from 29.4-39.6 m with heavily disseminated sulphide from 33.7-37.4 m and is strongly MU+CL altered. A second narrow interval of OB and OA occurs followed by a small section of CI+CL altered felsic coherent rocks from 43.4-45.3 m. A third interval of MSXS is present from 45.3-51.3 m consisting of OB and OH ore types. The footwall package consists of CL+MU altered felsic volcaniclastic rocks intruded by an aphanitic rhyolite dyke.

Local Elev. (m):						Purpose:	Metallurgical
Comments:						Parent Hole:	

This metallurgical hole was drilled to collect samples that test the near surface oxidation of MET5 and MET2 Domain, as well as validate historical results from hole K95-095.
The structural hanging wall is composed of rhyolite (felsic) flows, quartz feldspar porphyritic rocks and felsic volcaniclastic rocks. Sulphide mineralization is present in three distinct lenses from 21m - 27.7m, 39.2m - 43.1m and 44.7m - 51.6m. The structural footwall rock package is composed of a glassy felsic dike, felsic flow rocks and calcite banded chlorite rich mafic intrusive.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-216

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	14-Aug-15
UTM Easting	414845.596	Core Size:	HQ3	Azimuth:	180	Date Logging Complete:	17-Aug-15
UTM Northing:	6815743.656	Casing Pulled?:	Yes	Dip:	-65	Drill Company:	Geotech
UTM Elev. (m):	1394.852	Casing Depth (m):	6	Length (m):	233	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	13-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	16-Aug-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

K15-216 was drilled to twin the sulphide intercept of historic hole K95-157. K15-216W1 is a wedge drilled to collect a sample of the MET6 domain.
The hanging wall package consists of felsic volcanics from 5-147.3 m, with five ~2 m wide FD-porphyry mafic dykes above 63 m and two mudstone units between 136 m and 146 m. Alteration increases in intensity from moderate MU-alteration at 133 m to strong CI+CL-alteration at 146.8 m. MSXS occurs from 147.3-151.3 m, consisting of OJ, OG, and OD ore types followed by strongly MU-altered and fractured felsic volcanics from 151.3-154.8 m. A second MSXS interval occurs from 154.8-157.9, consisting of the OD ore type. A third MSXS interval occurs from 163.9-176.4 m, consisting of OD, OA, OB, and OJ ore types followed by MU+CL-altered felsic volcanics from 176.4 - 178.1 m. A mafic sill (MAFi) is present from 178.1-204.3, with a ~3 m wide wedge of coherent rhyolite within. A fourth MSXS interval occurs below the MAFi at 203.8-204.3 m consisting of semi-massive OJ type mineralization. Felsic volcanics continue to EOH at 233 m decreasing in alteration intensity from strong CL-alteration to moderate MU-alteration.
A well developed fractured and faulted zone occurs from ~135-168.9 m that includes brecciated ore zones.

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	18-Aug-15
UTM Easting	414845.596	Core Size:	HQ3	Azimuth:	195	Date Logging Complete:	19-Aug-15
UTM Northing:	6815743.656	Casing Pulled?:	Yes	Dip:	-61	Drill Company:	Geotech
UTM Elev. (m):	1394.852	Casing Depth (m):	121.5	Length (m):	182	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	16-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	18-Aug-15
Local Elev. (m):						Purpose:	Metallurgical Wedge
Comments:						Parent Hole:	K15-216

K15-216W1 wedged off K15-216 at 121.5 m depth to collect a sample of the MET6 Domain.
Unaltered felsic volcanics occur from 121.5 -134 m with strong to intense faulting from 134-169.8 m. Altered and/or faulted felsic volcanics occur from 134-155.2 m, with two carbonaceous horizons. MU-alteration increases in intensity from 136.1-155.2 m in proximity to a MSXS horizon from 155.2-158 m consisting of the OD ore type. Strong to intensely faulted and MU-altered felsic volcanics occur from 158 - 166.7 m followed by MSXS lens consisting of OD, OA, OB, and OJ ore types to 177.1 m. Alteration decreases in intensity from moderate-strong CL-alteration to moderate MU-alteration over an ~6 m interval from 173.1 - 178.9 m. CA-CL-BI altered MAFi occurs from 178.9 - 182 m.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	14-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	15-Aug-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

Resource infill to confirm extension of massive sulphide lens to below the base of the gravels. Planned as shallow hole to test oxidized/transitional sulphide at the base of the gravel overburden. Massive sulphide interval is present as three distinct lenses between 9.4m to 35m, spaced by metamorphosed felsic volcaniclastic/coherent rocks. The ore zone and structural hangingwall and footwall rocks exhibit moderate to strong syngenetic muscovite and lack presence of chlorite or cordierite alteration mineralization. The structural footwall is composed predominantly of glassy, felsic aphanitic dike with short intervals of silicified felsic volcaniclastic and felsic flow textured rocks. The ore zones are predominantly wispy, buckshot textured (OB) massive sulphides, dominated by pyrite, galena, sphalerite and isolated sulphosalts. From 17.6m to 18.2m there is chalcopyrite rich ore (OG) and from 21m to 21.7m there is magnetite bearing sulphide. The grey aphanitic dike hosts veins that contain quartz, carbonate,pyrite, galena, sphalerite.

Northing and easting coordinates are provided by Tetra Tech, and were measured with a hand-held GPS unit. Elevation value was not measured when hole was drilled; the recorded value is taken from the drill plan.
K15-219 was drilled as a monitoring well.
K15-219 encountered carbonaceous mudstone throughout the hole.

Local Elev. (m):						Purpose:	Metallurgical Twin
Comments:						Parent Hole:	K15-218

Twin of ABM79 to collect oxidised sample of MET5 domain, planned to drill a minimum of 5 m into the footwall. This hole was added to increase MET spatial coverage.
A massive sulphide interval is present as two distinct lenses between 9.4m to 35m, separated by metamorphosed felsic volcaniclastic/coherent rocks. The ore zone and structural hangingwall and footwall rocks exhibit moderate to strong syngenetic muscovite and lack chlorite or cordierite alteration/mineralization. The structural footwall is composed predominantly of a glassy, felsic aphanitic dike with short intervals of silicified felsic volcaniclastic and felsic flow textured rocks. This dike hosts veins that contain quartz, carbonate, pyrite, galena, sphalerite. The ore zones are predominantly wispy, buckshot textured (OB) massive sulphides, dominated by pyrite, galena, sphalerite and isolated sulphosalts. From 17.6m to 18.2m there is chalcopyrite rich ore (OG) and from 21m to 21.7m there is magnetite bearing sulphide.

UTM Easting	414752.647	Core Size:	NQ3	Azimuth:	180.8	Date Logging Complete:	19-Aug-15
UTM Northing:	6815349.063	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1408.797	Casing Depth (m):	9	Length (m):	71	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	17-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	18-Aug-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

The purpose of this drill hole was to determine if the massive sulphide zone comes to surface in this location and to see if the OH zone above the OA and OB zones of K95-081 is present in this area. Results showed that the massive sulphide zone comes to surface at 6815350 mN along the 414750 mE section and that the OH zone in K95-081 is absent at this location.
Overburden extends from surface to 9 m. Below that depth, the hole intersected OA massive sulphide from 9.0-14.0 m, OB massive sulphide from 9-14 m, variably strained RHYi aphanitic rhyolite intrusive from 16.3-50.92 m, MAFi mafic sill from 50.92-59.52 m, and RHYva rhyolitic ash tuff from 59.52-65.2. The total thickness of the massive sulphide intercept is 7.3 m. A strong to intense overprint of silicification and weak to moderate muscovite alteration dominates the RHYi unit. The upper portion of the MAFi unit is intensely silicified and moderately muscovitized. The MAFi unit has moderate pervasive chlorite/biotite alteration. The RHYva unit has been weakly to moderately overprinted by muscovite. The presence of the RHYi unit directly below the massive sulphide zone and the lack of an intense restricted or proximal alteration zone may indicate that the felsic intrusive truncated the bottom of the syngenetic alteration zone. A small section of rubbly massive sulphide from 59.93-60.0 is due to caving of ore zone when the drill bit was changed. Poor recoveries were achieved during the drilling of the massive sulphide zone in this hole.

Comments:						Parent Hole:	

Southernmost hole on Section 419400E. Intended as fill-in hole for resource on GP4F, and should be similar to K98-188.
The hole intersected the GP4F Zone from 91.30 to 99.0, semi-massive sulphide from 95.8 to 99, strongly faulted and poor core recovery. Second zone at 154 consists of two 1m zones of 5-10% PY-SP-GLand CL-CI alteration separated by a mafic dyke.
Overall, the hole consists of metamorphic rocks of sedimentary and intrusive (feldspar and quartz porphyry) affinity in the upper 80 m, felsic volcanic rocks from 80-206 m, and sedimentary rocks to bottom. Faulting is common, particularly in the lower half of the hole where the faults appear to be carbonaceous though not conductive.

2.00 13.10 RHYi Aphanitic Rhyolite (intrusion)

2 - 13.1: similar to Glassy dyke in ABM section, green-grey alteration locally, bleaching around QV's, lge QV's included

<<Min: 2 - 13.1 0.01% Min: Pyrite>> rare

<<Alt: 2 - 8.5 Weak-Moderate (Alt) Silicification>> glassy portion

<<Alt: 8.5 - 10.3 Weak (Alt) Muscovite>> mostly in fractures

<<Alt: 10.3 - 13.1 Weak (Alt) Muscovite>>

<<Alt: 10.3 - 13.1 Moderate (Alt) Biotite>> fractures

<<Vein: 2.5 - 4.5 100% Quartz>> bull QZ vein, broken to bottom, lost core

13.10 43.20 SED undifferentiated Sediment dark grey FG

13.1 - 43.2: BI pblasts consistent t/o unit, TO pblasts also?, harder to ID but visible on fractures, variable colour, MU in bands vary in yellowy green bands common, multiple dark BI (CA) rich dykes cut through with some dark colouration of wall rock common. Locally, small sections of siliceous, lt coloured rock, flow banded?- felsic component? Maybe a tuffaceous/sedimentary mix - porphyry unit?

<<Min: 13.1 - 27.5 0.1% Min: Calcite>> fractures

<<Min: 13.1 - 32.3 0.01% Min: Pyrite>> quite rare, locally on fol'n

<<Min: 27.5 - 29.8 8% Min: Calcite>> diss'd in groundmass

<<Min: 32.3 - 34.3 0.01% Min: Pyrrhotite>> in mx TO vein, minor Diss'ns

<<Min: 32.3 - 34.3 10% Min: Calcite>> to pervasive locally

<<Min: 34.3 - 42.3 0.01% Min: Pyrrhotite>> scattered

<<Min: 34.3 - 43.2 0.01% Min: Pyrite>>

<<Min: 34.3 - 43.2 0.1% Min: Calcite>> local fractures

<<Alt: 22 - 27.5 Weak-Moderate (Alt) Muscovite>> bands and lenses of lghter coloured, altered SCHS, MU visible on frac. On surfaces

<<Alt: 29.8 - 32.3 Trace (Alt) Muscovite>>

<<Alt: 34.3 - 43.2 Weak (Alt) Muscovite>> still gives streaky look to core

<<Vein: 14.2 - 14.7 95% Quartz 70 deg. >> bull QV

<<Struc: 15 - 15.1 Moderate (Alt) Fault>> gouge, broken core below

<<Struc: 26.9 - 27.5 Moderate (Alt) Fault>> gouge and broken core over interval, dyke below

<<Struc: 34.8 - 36 Moderate (Alt) Fault>>

43.20 46.90 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green MG

43.2 - 46.9: dark green/black bands, AC dominated rock, CL after AC, BI pblasts t/o, patches of fg BI, lt brown colour with coarse black pblasts (Cl?, TO?), local QZ-CA bands with AC, leucoxene scattered in patches.

Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-223

Comments:

The purpose of this hole was to twin K15-223 to collect potentially oxidised sample of MET7 Domain. Oxidized OH was sampled. A massive sulphide body consisting of OH, OA, and OB sits structurally above RHYi. No syngenetic alteration was found directly adjacent to the massive sulphide body in the RHYi. The ore body was intersected at surface. The thickness of massive sulphide intercept was 8 m. The presence of the RHYi unit directly below the massive sulphide zone and the lack of an intense restricted or proximal alteration zone may indicate that the felsic intrusive truncated the bottom of the syngenetic alteration zone.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	21-Aug-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

Hole K15-226 was drilled to intersect the historical hole K94-022 in the sulfide zone.
Hole K15-226 is made up of coherent and volcaniclastic rhyolite crosscut by mafic or intermediate dykes on the top 35 meters. A mudstone unit is observed between 125m and 130m. The hole shows progressive moderate to strong muscovite alteration followed by the mineralized zone.
The massive sulfide unit is intersected from 143.7m to 175.7m (32m thick). The footwall consists of a mafic sill crosscut by an aphanitic rhyolite intrusion with green-grey alteration associated from 179.6m to 185.2m. The hole ends at 230.0m in a muscovite altered volcaniclastic rhyolite unit.
The dominant domain of the massive sulfide unit is OB. OA and OG domains are observed as well as minor OH and OJ respectively at the upper and the lower contacts of the massive sulfide.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-226W1

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Jerome de Pasquale
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	23-Aug-15
UTM Easting	414850.978	Core Size:	HQ3	Azimuth:	180	Date Logging Complete:	24-Aug-15
UTM Northing:	6815676.392	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1396.44	Casing Depth (m):	6	Length (m):	182	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	22-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	23-Aug-15
Local Elev. (m):						Purpose:	Metallurgical Wedge
						Parent Hole:	K15-226

Comments:

Hole K15-226W1 was a wedge from 111.5m to 182m off of K15-226 in order to collect samples of MET6 and MET7 domains and to increase the spatial coverage of potential underground ore.
The units encountered outside of the massive sulfide are very similar to K15-226 in term of lithology, alteration and depth, with a rhyolitic unit above the ore deposit and strong muscovite alteration of the hanging-wall. The footwall consists of a mafic intrusive sill intersecting the ore deposit at 178.0m. Green-grey alteration suggests the proximity of the felsic dyke.
The massive sulfide extends from 144.2 to 178.0m (33.8m wide). Most of the unit is made up of OA, OB and OG and shows abundant CP relative to the parent hole. The proximal chlorite alteration contains cordierite.
This hole confirms the lateral variations of the massive sulfide domains.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-227

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	David Nuttal
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	21-Aug-15
UTM Easting	414871.848	Core Size:	NQ3	Azimuth:	180	Date Logging Complete:	22-Aug-15
UTM Northing:	6815376.6	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1391.054	Casing Depth (m):	12	Length (m):	86	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	19-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	21-Aug-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

This hole was drilled as resource infill to confirm extension of massive sulphide lens to below the base of the gravels. It is a shallow hole to test oxidised/transitional sulphide at the base of the gravel overburden.
The logging of this hole confirms that an extension of the massive sulphide lens does continue towards the south below the base of the gravels. The structural hanging wall is composed of overburden gravels and coherent/clastic felsic volcanics. Massive sulphide intervals occur from 11.45m to 11.9m (OB code). 12.65m to 18.2m (OA, OB, OJ codes) and from 33.6m to 36.1m (OB, OI codes) with small coherent/clastic felsic volcanic intervals between. The structural foot wall is composed of a mafic dike that was intruded by a grey, aphanitic felsic dike. The main ore zone is found between 12.65m to 18.2m. Muscovite alteration is pervasive and increases in intensity towards the massive sulphide lenses. Chlorite alteration is pervasive in the mafic dike and is interpreted to be the result of metamorphic overprinting, and therefor not associated with massive sulphides. This hole is significant because it confirms the extension of the massive sulphide ore zone towards the south on section 414850E. In addition an unexpected interval of heavily disseminated sulphides in proximally altered rock (OJ) occurs between 49.2m to 50.8m.

Local Elev. (m):						Purpose:	Resource Confirmation
Comments:						Parent Hole:	

The purpose of this hole is to confirm the resource delineated by K95-081. The presence of the massive sulphide body was confirmed within an interval of RHYi. This sulphide bearing rhyolite unit sits stratigraphically above MAFi which appears to have intruded RHYi. The ore zone was first intersected at 21.4 m and is 10.4 m thick. The ore zone is diluted by 1.7 m of RHYi. The ore zone consists of OB, OH, and OA massive sulphide types. All alteration types logged were overprinted and not believed to be syngenetic. The RHYi unit appears to be eliminating any syngenetic alteration.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	21-Aug-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The purpose of this hole is to infill the gap and confirm the resource between K94-038 & K94-039.
The presence of the massive sulphide body was confirmed. The sulphide zone in K15-229 is thicker than that of K94-038 but the thinner than than that of K94-039. Structural hanging wall rhyolitic volcanics are present from surface to 43.4 m. The upper 28.7 m of hanging wall volcanics consists of rhyolite flows which contain variable amounts of carbonaceous material and a thin horizon of carbonaceous mudstone. An undifferentiated unit of rhyolitic volcanics sits stratigraphically above the sulphide zone. The ore zone was first intersected at 43.4 m, consists of OB, OA, OI, and OF sulphide types, and is cumulatively 24.15 m thick, cut (diluted) by 9.53 m of RHYi. The stratigraphic footwall consists of MAFi with RHYi. A possible RHYcw unit was identified at the end of the hole. The only syngenetic alteration observed was located 9.53m below the main sulphide body and consisted of moderate to strong muscovite and moderate to strong chlorite alteration over 3.38 m thickness.

Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-227

Comments:

This hole is a twin of K15-227 to collect oxidised sample of MET7 & MET6 domains and for increased MET spatial coverage. The hole was drilled to 41m depth and successfully captures the portion of massive sulphide to be analysed for MET7 and MET6 domains. Massive sulphide (OB) occurs below and adjacent to overburden cobbles and gravels. Massive sulphide intervals are 11.3m to 12m (OB), 12.5m to 12.8m (OB), 13.2m to 18.45m (OA, OB) and 35.6m to 37.5m. Only intervals between 11.3m to 18.45m were sampled for MET.

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The purpose of this whole was to confirm the resource between K94 - 039 & K94 - 007.
From surface to 52.9 m K15-236 consists of a thick package of rhyolite flows +/- carbonaceous material and carbonaceous mudstones. The shallowest of two massive sulphide intercepts consisting of OA, OB, and OH ore types was intersected between 52.9-73.3 m (20.4 m total thickness). The two massive sulphide intercepts are separated by RHYi and RHYvx between 73.03 -82.5 m. The deeper of the two massive sulphide intercepts consisting of OB, OA ore types was intersected between 82.5-89.78 m (7.28 m total thickness). The lower sulphide zone contains 2.25 m of RHYv.
The structural footwall consists of MAFi intruded by RHYi, both of which sit stratigraphically above a thick succession of RHYvx and RHYvl. The footwall was intersected between 97.52-176.0 m. A thin unit of what appeared to be OJ was intersected between 127.12-127.9 m.
There is no syngenetic alteration in the felsic volcanic hanging wall. Weak to moderate MU and moderate to strong CL syngenetic alteration is present within a the unit of RHYv in the lower ore zone(89.78-92.03 m). Moderate MU and CL syngenetic alteration is present from 98.37-99.8 m; weak CI alteration present between 98.37-98.66 m. Syngenetic alteration of the footwall has been eliminated by MAFi and RHYi units with the exception of a thin zone of strong CL, moderate CI, and weak BI alteration between 127.12 and 127.9 m. Alteration of the footwall is characterized by a strong CL, and weak BI overprint as well as strong to intense silicification associated with RHYi.

Downhole Surveys:

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	22-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	24-Aug-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

This hole is designed to confirm resource grade between K94-047 & K94-010.
The structural hanging wall of this hole is composed of metamorphosed clastic and coherent felsic volcanics mixed with biotite rich/carbonaceous mudstones and small foliation parallel mafic intrusives. In the structural hangingwall muscovite alteration is pervasive and intensity increases towards the ore body. Proximal to the massive sulphide is an increasing intensity of chloritic and cordierite alteration. Massive sulphide is heavily disseminated within host schist rocks (OJ) between 134.52m to 139.46m. Massive sulphide lenses are 142.47m to 144.91m (OG, OA), 148m to 150.8m (OB, OA), 151.35m to 163.3m (OB, OJ, OI), 163.8m to 164.1m (OB). The structural footwall is composed of a felsic dike, a mafic intrusive and felsic volcaniclastic/coherent shist. An anomolous OJ interval occurs with strong chloritic alteration at 189.8m to 190.06m; this interval contains abundant CP. The footwall contains both chloritic alteration in the mafic intrusive as well as siliceous overprinting thought to be derived from the felsic dike.

Comments:						Parent Hole:	

Hole K15-233 was drilled to intersect the massive sulfide in a target zone between 180 to 200m.
The upper units (hanging wall) are made up of coherent and lapilitic rhyolite crosscut by mafic dykes, followed by a mudstone unit directly above the massive sulfide. Mineralization starts at 175.2m and ends at 181.36 m (6.16m thick), and consists of both OI and OA domains.
In the hanging-wall, strong muscovite alteration (from 141.80 to 177.22m) as well as strong proximal chlorite alteration with cordierite (from 161 to 177.2) is present. The footwall includes a mafic sill at 181.36m with a progressive contact. The drill hole ends in a fault zone which can be correlated with the fault encountered in hole K15-238.

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The hole intersected the typical GP4F stratigraphy with a mixed sediment-mafic-felsic dominated package high in the hole, a broad section of feldspar and quartz porphyry sills and tuff through the middle, and into the "Mineralized Sequence", quartz and feldspar porphyry intruding rhyolite tuff and strongly chlorite, biotite, cordierite and garnet altered rock, including disseminated to semi-massive sphalerite-galena-pyrite-chalcopyrite (OJ? Mineralization). The mineralized and altered section stretches from 306 to 327 metres, with a section of unaltered porphyry from 309-313 and mafic dyke from around 319 to 323 metres.

Alteration associated with fault at bottom of hole is potentially quite significant, with strong MU and stringer sulphide with GL, and potential SP.

Note that on run of core was dropped at drill and core appears to be jumbled from 367.5 to about 369 m. 369 to 372 was reassembled with confidence.

<<Min: 34.7 - 43.9 0.1% Min: Pyrrhotite>>

<<Alt: 33.01 - 34.7 Moderate (Alt) Muscovite>> seems to be focused around a QZ vein and fault

43.90 47.85 RHYcq Quartz porphyry dark grey VFG

43.9 - 47.85: banded, siliceous, flow? Rock, is broken and oxidized on fracs

<<Struc: 46.2 - 57.2 Strong (Alt) Fault>> broken core, gouge, lost core

47.85 57.20 MAFt Mafic Volcaniclastics green

47.85 - 57.2: possibbly CL alt'd felsic tuff?, broken ground and dykes cut through, small white phenos-FP?

57.20 70.87 RHYcf Feldspar & feldspar quartz porphyry grey-green

57.2 - 70.87: bluish QE, conc'd locally, FP phenos less common, generally fg, fol'd tuff. Banding near the bottom, both compositional and BI/MU banding.

<<Min: 57.2 - 112.8 0.01% Min: Pyrite>>

<<Min: 60 - 62.82 3% Min: Calcite>> in BI SCHS

<<Alt: 62.82 - 69.7 Weak (Alt) Muscovite>> actually MS, overprints BI

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

70.87 85.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green-brown FMG

70.87 - 85: strong BI locally, aphanitic, maybe dyke, mixed looking unit with speckled and homogeneous tx's, overprint by MS common, bleaches (replaces BI) and gives rock light green colour.

<<Min: 80.35 - 85 2% Min: Calcite>>

<<Alt: 77.26 - 80.35 Moderate (Alt) Muscovite>> bleached biotite by MS

<<Struc: 71.7 - 72.8 Weak (Alt) Fault>> broken core, minor gouge

85.00 95.93 MAFta Coarse grained to ash tuff green

85 - 95.93: very well fol'd, striped green with QZ-CB veins/bands, BI is lesser, locally faulted strongly, MS overprint

<<Min: 85 - 95.93 8% Min: Calcite>> in bands in CL SCHS

95.93 106.75 MAFt Mafic Volcaniclastics green-brown MG

95.93 - 106.75: strongly CL-BI banded, possible mixed tuff/sed, coarse and fg CL bands, CA in lenses and veins, BI bands, PO? As very fine diss'ns in BI bands

<<Min: 95.93 - 101 5% Min: Calcite>> bands

<<Min: 95.93 - 106.75 0.01% Min: Pyrrhotite>> seems to be in BI bands, not visible

<<Min: 101 - 108.8 1% Min: Calcite>>

<<Struc: 105.65 - 107 Moderate (Alt) Fault>> gougy, bleaching around structure

106.75 116.99 SED undifferentiated Sediment black

106.75 - 116.99: laminated, siliceous locally, deformed bands,

<<Min: 108.8 - 112.8 5% Min: Calcite>> veins, lenses, fractures

<<Min: 112.8 - 118 1% Min: Calcite>> mostly but also patchy

<<Min: 112.8 - 135.2 0.01% Min: Pyrrhotite>> minor wisps locally

116.99 125.75 MAFt Mafic Volcaniclastics green-brown

116.99 - 125.75: CA bands/patches

<<Min: 118 - 125.75 3% Min: Calcite>> greenish tuff

125.75 153.01 SED undifferentiated Sediment black

125.75 - 153.01: minor CL bands, mafic tuff beds?,

<<Min: 125.75 - 130.85 1% Min: Calcite>>

<<Min: 130.85 - 133.93 3% Min: Calcite>> bands

						Parent Hole:	

Comments:

This hole was drilled to define the resource between historic holes K94-011 & K94-012. The hole was aborted at 47m depth from the original plan of 180m depth, due to significant deviation in dip from 63 degrees (planned azimuth) to 59 degrees. Therefore, pierce point on resource domain was not achieved. The log information for this hole represents a package of felsic coherent and volcaniclastic rocks and a small interval of felsic volcaniclastic dominated mudstones. No massive sulphide intersections are present. Muscovite alteration intensity increases towwards a large quartz vein structure at 22m to 24.8m. Chlorite alteration is weak and disseminated within the biotite-rich mudstones.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	28-Aug-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

This hole is planned to define the resource between historic holes K94-011 & K94-012.
The hole confired sulphide mineralization continuity and characterized structural footwall litho-units. Sulphide mineralization (both massive and heavily disseminated) is present from 130.35m to 137.43m (OI, OB), 159.45m, to 160.35m (OI, OB), 165.85m to 166.4m (OJ) and 169m to 172m (OJ). The structural hanging wall is composed of a package of felsic meta-volcaniclastic rocks. The structural footwall is composed of a mafic dike that is structurally underlain by felsic volanics.
Muscovite alteration is pervasive through both the structural hanging wall and footwall, and increases in intensity towards the massive sulphide interval. O-type sulphide mineralization is associated with strong chlorite alteration/replacement that intesifies towards zones of accumulated sulphides. Cordierite porphyroblasts are rare and occur only proximally to massive sulphide mineralization. Silicification is present in the structural footwall mafic dike and may represent that this hole is in proximity to the felsic aphanitic dike present on adjacent sections to the west of this location.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-236

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	26-Aug-15
UTM Easting	414750.866	Core Size:	NQ3	Azimuth:	179.69	Date Logging Complete:	27-Aug-15
UTM Northing:	6815498.936	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1406.81	Casing Depth (m):	7	Length (m):	149	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	23-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	25-Aug-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

The purpose of this whole was to twin the historical hole K94-040. The first 75.97 m of K15-236 consists of a thick package of rhyolitic flows and volcaniclastics +/- carbonaceous material, and carbonaceous mudstones. The shallowest of two massive sulphide intercepts consisting of OA, OB, and OC ore types was intersected between 75.97-89.23 m (13.26 m total thickness). The two massive sulphide intercepts are separated by cordierite altered RHY and a zone of OI from 95.22-97.22 m. The second massive sulphide intercept, consisting of OA, OB, and OI ore types, was intersected between 98.86-110.87 m (12.01 m total thickness). The structural footwall consists of MAFi intruded by RHYi, both of which sit stratigraphically above RHYvx. The footwall was intersected between 110.87-149.0 m. The structural hanging wall felsic volcanics are moderate to strongly MU altered. This syngenetic alteration increases in intensity with proximity to the sulphide zone. A weak CI-CL alteration was logged between 89.23-93.78 m. Syngenetic alteration of the footwall has been eliminated by MAFi and RHYi units. Alteration of the footwall is characterized by a moderate to strong CL-BI overprint as well as intense silicification associated with RHYi.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-237

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	27-Aug-15
UTM Easting	414750.629	Core Size:	HQ3	Azimuth:	179.15	Date Logging Complete:	28-Aug-15
UTM Northing:	6815496.738	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1406.768	Casing Depth (m):	4.5	Length (m):	119	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	25-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	26-Aug-15
Local Elev. (m):						Purpose:	Metallurgical Twin
Comments:						Parent Hole:	K15-236

The purpose of this whole was to twin K15-236 and to provide material for MET 2 and MET 7 domains, both of which were successfully intercepted.
The first 75.26 m of K15-237 consists of a thick package of carbonaceous rhyolite flows and crystal tuffs with thin carbonaceous mudstones throughout. The shallower of two massive sulphide intercepts consists of OA, OB, and OC ore types and was intersected between 75.26-88.60 m (13.34 m total thickness). The two massive sulphide intercepts are separated by undifferentiated RHY between 88.60-96.80 m. The lowermost 2.65 m of the RHY unit contains heavily disseminated PY, PO, SP, CP, and GL and was logged as OI. The deeper of the two massive sulphide intercepts consisting of OB, OA, and OH ore types was intersected between 96.80-109.43 m (12.63 m total thickness). The structural footwall (109.43-119 m) consists of MAFi intruded by RHYi. The planned depth was 122 m but the hole was terminated at 119 m due to a blocking error made by the drill crew.
Syngenetic alteration in the felsic volcanic hanging wall consists of moderate to strong MU alteration within about 7 m of the top of the sulphide zone. Weak to moderate CL alteration is present within 30 cm of the top of the ore zone. From 88.60-96.80 m moderate to strong MU alteration predominates with weak to moderate CL alteration. Syngenetic alteration of the footwall has been eliminated by MAFi and RHYi units. Alteration of the footwall is characterized by a moderate to strong CL, BI overprint and strong to intense silicification associated with RHYi.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	26-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	28-Aug-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

Hole K15-238 is made up of primarily rhyolitic rock (RHYcw and RHYvl) with two minor mudstone units. The top of the hole is cut by mafic dykes. The massive sulfide was intersected within a shear zone from 179.84 to 181.88, and consists exclusively of the OB domain. The footwall consists of mafic sill crosscut by rhyolitic aphanitic dyke (green/grey alteration associated) and followed by biotite rich and weakly chloritized rhyolitic units.
The hole shows progressive muscovite alteration in the hanging-wall followed by strong to intense proximal alteration from 171m to 177m (cordierite) with wispy laminated PO/PY/AS/SP/GL mineralization.
This drill hole contains a significant shear zone (177m to 185m) hosting massive sulfide as well as multiple minor faults under the mafic intrusion. Multiple strong chlorite alteration zones are present.

6.00 10.91 RHYva Coarse grained to ash tuff grey-green

6 - 10.91: Trace of oxidation, BI at lower contact with mafic dyke.

<<Min: 9 - 66.53 1% Min: Pyrite>> Locally in discontinuous veins, coarse grain.

<<Min: 9 - 66.53 1% Min: Pyrrhotite>> Often elongated along the foliation or in foliation mostly in flow banded zone.

<<Min: 9 - 66.53 1% Min: Chalcopyrite>> Trace

<<Alt: 9 - 66.53 Weak (Alt) Muscovite>> maybe some chlorite,greenish color.

10.91 11.77 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

10.91 - 11.77: Dyke. Foliated. Phenoblasts (feldspar?), few calcite, SP agregate.

11.77 18.45 RHYvl Lapilli tuff grey-green

<<Vein: 14 - 14.5 Tourmaline>> TML in fracture along the core axis

18.45 23.88 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

18.45 - 23.88: Dyke. Silicified mafic dyke, locally RHYvl, few CA, SP at lower contact.

23.88 26.03 RHYvl Lapilli tuff grey-green

26.03 26.40 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

26.03 - 26.4: Dyke. CA.

26.40 28.40 RHYvl Lapilli tuff grey-green

28.40 32.69 RHYvx Quartz and/or feldspar crystal tuff grey-green

28.4 - 32.69: Probably phenoblats,randomly oriented locally (or RHYvl).

32.69 35.00 RHYcw Curdy textured-flow banded (flows, subvolcanics) beige

32.69 - 35: Flow banded, SI rich.

35.00 36.43 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

35 - 36.43: Dyke. Silicified. Calcite at upper and lower contact.

From (m)	To (m)	Rocktype & Description		From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

36.43	**41.63**	**RHYcw**	**Curdy textured-flow banded (flows, subvolcanics)**	**grey-green**
41.63	**44.19**	**MAFi**	**Mafic Intrusions (primarily footwall mafic intrusion)**	

41.63 - 44.19: Dyke. CA in matrix, large patch CA/SP and few CL at upper contact (30 cm wide).

<<Min: 41.63 - 41.93 20% Min: Sphalerite>> Patch at contavt with mafic dyke, associated with CA vein.

44.19	**46.51**	**RHYcw**	**Curdy textured-flow banded (flows, subvolcanics)**	**grey-green**

44.19 - 46.51: Flow banded.

46.51	**48.71**	**RHYvl**	**Lapilli tuff**	**grey-green**
48.71	**53.55**	**RHYcw**	**Curdy textured-flow banded (flows, subvolcanics)**	**grey-green**

48.71 - 53.55: Flow banded.

53.55	**54.09**	**MAFi**	**Mafic Intrusions (primarily footwall mafic intrusion)**	

53.55 - 54.09: Dyke. CA at upper nd lower contact.

54.09	**56.55**	**RHYcw**	**Curdy textured-flow banded (flows, subvolcanics)**	**grey-green**
56.55	**77.47**	**RHYvl**	**Lapilli tuff**	**dark grey**

56.55 - 77.47: Containing clasts locally. BI.

<<Min: 66.53 - 115 1% Min: Pyrite>> Discontinuous vein, voarse grain, and dissemated

<<Min: 66.53 - 115 2% Min: Pyrrhotite>>

77.47	**98.08**	**RHYcf**	**Feldspar & feldspar quartz porphyry**	**grey-green**

77.47 - 98.08: QZ eyes, blue.

<<Vein: 81 - 81.1 Quartz-Sulphide>> QZ ven, 1cm wide, shallow angle (10 degre),contaning mineralization PO/PY/CP.

<<Vein: 82.4 - 82.44 Quartz>> QZ few CA/CL

98.08	**100.71**	**RHYvl**	**Lapilli tuff**	**medium grey**

From (m)	To (m)	Rocktype & Description		From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

100.71 113.09 RHYcw Curdy textured-flow banded (flows, subvolcanics) medium grey

100.71 - 113.09: Wavy QZ, folded. BI

113.09 114.23 RHYvl Lapilli tuff medium grey

114.23 117.44 RHYcw Curdy textured-flow banded (flows, subvolcanics) medium grey

114.23 - 117.44: Silicification from 115.95 to 117.46m. Weak MU ateration at proximity of the fault (115.48).

<<Struc: 115.95 - 116 Weak (Alt) Fault>> Fault gouge, minor fault.

117.44 127.38 RHYvl Lapilli tuff medium grey

117.44 - 127.38: Probably carbonaceous. Dyke with wavy contact at 115.20 and 116-20, 35 cm wide, probably the same dyke folded.

127.38 131.85 MDSt Rhyolite tuff dominant mudstone dark grey

131.85 143.67 RHYvl Lapilli tuff medium grey

131.85 - 143.67: Locally fragmental.

<<Alt: 131.85 - 155 Weak (Alt) Muscovite>>

143.67 153.52 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

143.67 - 153.52: Possibly phenoblasts (QZ, tectngular shape).

<<Min: 143.67 - 153.32 1% Min: Pyrite>>

<<Min: 143.67 - 153.32 8% Min: Pyrrhotite>> Coud be selective replacement.

<<Vein: 152.52 - 163.2 Massive Sulphide/Sulphides undifferentiated>> PO/PY/SP/ AS stringers (4 thin veinlets every 10 cm)

153.52 155.32 MDSt Rhyolite tuff dominant mudstone dark grey

153.52 - 155.32: Foliated.

<<Alt: 155 - 162.27 Moderate (Alt) Muscovite>>

155.32 162.27 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

155.32 - 162.27: Folded stringers PO/PY.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 155.52 - 163.2 2% Min: Sphalerite>>

<<Min: 155.52 - 163.2 1% Min: Pyrite>> Associated with other sulfide. Medium to coarse grain.

<<Min: 155.52 - 163.2 2% Min: Pyrrhotite>> Stringers, multi sulfide.

<<Min: 155.52 - 163.2 1% Min: Arsenopyrite>> Associated with other sulfides.

162.27 167.00 MDSw Coherent rhyolite flow with carbonaceous content medium grey

162.27 - 167: Intense MU alteration on both side of SI vein, PY coarse grain associated. This unit could be a silicified mudstone but it apears uncilicified on a 10 cm wide zone.

<<Alt: 162.27 - 186.02 Strong (Alt) Muscovite>>

167.00 171.07 RHY undifferentiated rhyolite grey-green

167 - 171.07: Folded stringers PO/PY.

<<Min: 168.02 - 176.85 3% Min: Sphalerite>>

<<Min: 168.02 - 176.85 3% Min: Pyrite>> Discontinous vening, medium grain.

<<Min: 168.02 - 176.85 2% Min: Galena>> Difficult to estimate. All those minerals are associated most of the time as stringers.

<<Min: 168.02 - 176.85 3% Min: Chalcopyrite>> And patch.

<<Min: 168.02 - 176.85 1% Min: Arsenopyrite>>

<<Alt: 168.02 - 174.29 Moderate (Alt) Cordierite>> Agregated.

171.07 179.84 OJ Heavilly disseminated sulphides in proximal altered rock green-brown

171.07 - 179.84: Could be mudstone too, strong chlorite ateration obscuring the texture. The sheared zone above the massive sulfide is included in this unit but whithout good argument to.

<<Alt: 171.07 - 176.85 Strong (Alt) Chlorite>> Proximal alteration.

<<Struc: 176.83 - 185 Intense (Alt) Fault>> Major fault. Faukt gouge, large sherared zone, including massive sulfide zone.

						Parent Hole:	K15-238

Comments:

Hole K15-238W1 (wedge hole of K15-238 from 154.2m to 194m) was drilled to collect samples of the MET6 domain.
The hanging-wall consists of strongly muscovite altered carbonaceous rhyolite transitioning into wavy sulfide stringers, followed by strong chlorite alteration from 168.04m to 178.87m CP, PY, SP, GL and AS mineralization.
The massive sulfide zone is discontinuous, hosted in a shear zone and is intersected from 181.59m to 187.3m. It is made up of OJ, OI, OB, OH and OD domains. Its thickness is about 4.5m (thicker than in K15-238).
The footwall consists of a strongly sheared mafic sill.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-239

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	28-Aug-15
UTM Easting	414751.369	Core Size:	NQ3	Azimuth:	180.82	Date Logging Complete:	31-Aug-15
UTM Northing:	6815544.149	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1407.974	Casing Depth (m):	6	Length (m):	192	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	27-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	29-Aug-15
Local Elev. (m):						Purpose:	Resource Confirmation
Comments:						Parent Hole:	

The purpose of this whole was to twin the historical hole K94-040.
The first 98.2 m of K15-239 consists of a thick package of rhyolitic volcaniclastics (xtl/lpl) and flows (+/- carbonaceous material), and carbonaceous mudstones.
The shallowest of two massive sulphide intercepts consisting of OB, and OI ore types was intersected between 98.24-104.81 m (6.57 m total thickness). The two massive sulphide intercepts are separated by MU-CL-CI altered RHY and RHYcw from 104.81-122.13 m. The lower massive sulphide intercept, consisting of OA, OB, OC, OF, OH and OI ore types, was intersected between 122.13-136.66 m (14.53 m total thickness).
The structural footwall consists of MAFi intruded by RHYi, both of which sit stratigraphically above RHYva and RHYvl. The footwall was intersected between 136.66-192.0 m.
Syngenetic alteration of the structural hanging wall felsic volcanics is characterized by moderate MU alteration over the first 90.58 m. From 90.58-101.94m MU-CL-CI alteration increases with proximity to the sulphide zone becoming very intense from 100.82-101.94m. From 104.0-126.09 m MU-CL alteration is generally moderate and increases in intensity at the upper and lower contact with the sulphide zones. Strong CI alteration was logged between 104-104.81 m and 124.54-126.09 m.

Syngenetic alteration of the footwall has been eliminated by MAFi and RHYi units. Alteration of the footwall is characterized by a moderate to strong CL-BI overprint in MAFi as well as intense silicification associated with RHYi. RHYv units of the footwall are weakly to moderately overprinted by MU-CL-BI.
The most notable mineralized interceptions included: 20 % CP OC 126.09-127.72m, 15 % SP/5% GL OA 134.9-136.66 m.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-240

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	David Nuttal
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	30-Aug-15
UTM Easting	414952.327	Core Size:	NQ3	Azimuth:	180	Date Logging Complete:	30-Aug-15
UTM Northing:	6815425.337	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1383.411	Casing Depth (m):	9	Length (m):	110	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	29-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	30-Aug-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

This hole is designed to infil and define the resource between historic holes K95-064 & K95-065.
Sulphide intervals with O-type ore classification are present from 45.3m to 53.8m (OA, OB), from 62.34m to 65.5m (OI, OA, OB) and from 72.3m to 74.57m (OJ, OI, OB). Two anomolous OJ intervals are present from 68.84m to 69.28m and from 69.9m to 70.5m.
The structural hanging wall is composed of a package of felsic metavolcaniclastic rocks that exhibit increasing muscovite alteration intensity towards the massive sulphide intervals. Calcite/carbonate content is unusually high in the top of this hole with values ranging from 2% to 10%. The structural footwall is composed of a package of mafic intrusive rocks that exhibit a range of chlorite alteration that intensifies towards the massive sulphide lenses. Silicification is pervasive in discrete intervals within the mafic intrusive rocks. Weak muscovite alteration is also present in the structural footwall rock packages.

Downhole Surveys:

						Parent Hole:	K15-240

Comments:

Sulphide intervals are present in this hole from 43.42m to 52.5m (containing MET2 and MET7 domains), and from 61.6m to 63.6m (containing MET6 and MET7 domains). The structural hanging wall is composed of a package of felsic metavolcanic rocks dominated by litho-code RHYcw and MDSw (rhyolite flow with carbonaceous component). The structural footwall is also composed of felsic metavolcanic rocks dominated by RHYcw. This hole contains a high modal % calcite/carbonate through the structural hanging wall rocks and through the massive sulphide lenses. Calcite/carbonate mineralization commonly occurs with quartz in veins adjacent to massive sulphide. Muscovite alteration increases in intensity towards the massive sulphide lenses and adjacent to large quartz veins. Weak chlorite alteration is present within the massive sulphide lenses and in trace amounts within veins proximal to massive sulphide.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	30-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	02-Sep-15
Local Elev. (m):						Purpose:	Resource/Met/Hydro
Comments:						Parent Hole:	

The first 92.09 m of K15-242 consists of a thick package of rhyolitic volcaniclastics (xtl/lpl) and flows +/- carbonaceous material, carbonaceous mudstones, and mafic intrusives.

The massive sulphide zone was intersected between 92.09-117.25 m (25.16 m total thickness) consists of OA, OB, and OC ore types. A Cu rich strong proximal CL-CI altered zone of OC indicates the likley presence of the MET 8 domain, though the unit does contain magnetite suggests that it is actually MET 3. There are other zones of OA that have elevated levels of CP that are likely MET 3. The MET 5 domain was confirmed by the presence of OB with visibly high concentrations of GL.

The structural footwall consists of MAFi intruded by RHYi, both of which sit stratigraphically below a thin unit of RHYcw. The bulk of the stratigraphic footwall is a heterogeneous package of rock that largely consists of RHYi with MAFi xenoliths. The footwall was intersected between 117.25-161.0 m.

Syngenetic alteration of the structural hanging wall felsic volcanics progressively increases in intensity with proximity to the sulphide zone. There was a relatively large weak CL-CI alteration zone in the hanging wall from 76.43-92.09 m that increased in intensity to strong from 92.09-94.33 m.

A thin zone of stongly MU altered RHYcw located directly below the sulphide zone was the only evidence of syngenetic alteration in the footwall. Syngenetic alteration of the footwall has largely been eliminated by MAFi and RHYi units. Alteration of the footwall is characterized by a moderate CL and weak BI overprint in MAFi as well a large section of strong silicification associated with RHYi.
Notable mineralized interceptions included: 15 % CP OC (92.09-94.33 m), 5% GL OB (107.41-108.63 m, 111.7-116.02 m), 5% GL OA (116.02-116.74 m), and 20 % SP (94.33-95.88 m, 98.7-100.81 m, 104.09-116.74 m).

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-243

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Jerome de Pasquale
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	01-Sep-15
UTM Easting	414801.777	Core Size:	HQ3	Azimuth:	180.04	Date Logging Complete:	04-Sep-15
UTM Northing:	6815776.435	Casing Pulled?:	Yes	Dip:	-65	Drill Company:	Geotech
UTM Elev. (m):	1403.945	Casing Depth (m):	6	Length (m):	221	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	31-Aug-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	03-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

The purpose of hole K15-243 was to test continuity and the extension of massive sulphide lens (MET7 Domain).
The hole encountered a shear zone from 173.85 to 179.4m within the primary mineralized zone from 165.2 to 185.4m.
The hole shows progressive muscovite alteration in the hanging-wall followed by strong to intense proximal cordierite alteration from 170 to 189.63m. Mineralization consists domiantly of CP (characterized by OC and OG domains), SP/GL/PY mineralization (OB domain) as well as OA, OJ and OI domains on the edge of the unit.
The footwall consists of a strongly chlorite alterated unit with CP stringers below the main massive sulfide zone and, crosscut by a mafic sill at 185.4m and underlain by rhyolite.

6.00 10.95 RHYvx Quartz and/or feldspar crystal tuff grey-green

6 - 10.95: Fragmental at contact with dyke

10.95 14.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion) medium grey

10.95 - 14: Phenos, weakly foliated, CA at contact, BI. Some lapili and flow interbedded.

14.00 17.18 RHY undifferentiated rhyolite grey-green

14 - 17.18: Flow banded locally, QZ eyes. Could be RHY vx.

<<Vein: 14 - 14.08 Quartz>> QZ at lower contact with mafic dyke.

17.18 18.30 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

17.18 - 18.3: Flow banded and lapili tuff interbedded..

18.30 19.40 RHYvx Quartz and/or feldspar crystal tuff grey-green

18.3 - 19.4: QZ eyes.

19.40 27.40 RHYvl Lapilli tuff grey-green

19.4 - 27.4: Narrow phenoblastic dyke (21.07m), flow banded at lower contact.

<<Vein: 24.6 - 27.4 Pyrrhotite>> PY/PO stringers in flow banded ryolithe.

27.40 30.51 RHY undifferentiated rhyolite grey-green

27.4 - 30.51: QZ eyes, trace of CA

30.51 31.78 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey

30.51 - 31.78: Dark green dyke, weakly foliated, with phenosplasts, CA.. Weak CL alteration

31.78 34.01 MDSt Rhyolite tuff dominant mudstone medium grey

31.78 - 34.01: Lapili and few carbonaceous band.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

34.01 37.19 RHYv Rhyolite volcaniclastic grey-green

34.01 - 37.19: Few lapili and ashes. Few PO stringers in the foliation.

37.19 40.21 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

37.19 - 40.21: Flow banded. Dyke BI at upper and probably at lower contact. 2 QZ vein (5cm wide).

<<Vein: 38.18 - 38.24 Quartz>> QZ, CL trace

<<Vein: 39.23 - 39.28 Quartz>> QZ, CL trace, BI, few dolomite.

40.21 50.00 RHYv Rhyolite volcaniclastic grey-green

40.21 - 50: Few lapili and ash. Speck of TML.

50.00 54.33 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

50 - 54.33: Dyke, weakly foliated, with phenoblasts and QZ vein. Few CA. Purple color at upper contact. CL altered. Similar than dyke at 30.51m.

54.33 56.52 RHYvl Lapilli tuff grey-green

54.33 - 56.52: Fracturated along the core axis

56.52 58.16 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

56.52 - 58.16: Mafic dyke, same composition than dyke at 50m. Phenoblats, purple color.

58.16 77.70 RHYvl Lapilli tuff grey-green

58.16 - 77.7: Maybe pseudofragmenetal. Ash from 65.7 to 66.55m. Mafic dyke from 63.05 to 63.94m.

77.70 89.32 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

77.7 - 89.32: Curdy texture. Maybe locally lapilitic or speudofragmental.

<<Alt: 82.36 - 116.58 Weak (Alt) Muscovite>>

<<Vein: 86 - 86.01 Quarzt-Tourmaline-Sulphide>> QZ/TML, PY, CP and GL trace.

<<Struc: 86 - 86.01 Vein>> QZ vein containing TML, few CP, few GL. Lineation: 40 degres/core axis.

<<Struc: 86.43 - 86.44 Vein>> Late vein maybe chlorite crosscuttin the dominant foliation.

<<Struc: 86.55 - 86.56 dominant foliation>> QZ elongated.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

89.32 98.80 RHYcq Quartz porphyry grey-green

89.32 - 98.8: Probably fragmental.

<<Min: 91.3 - 105.5 0.5% Min: Calcite>> in fracture dominantly.

<<Struc: 89.32 - 98 Weak (Alt) Shear>> Fragmental, muscovite rich, broken zone.

<<Struc: 98 - 98.8 Strong (Alt) Fault>> Major fault, gouge (clay/sandy), core loss.

98.80 111.97 RHYvx Quartz and/or feldspar crystal tuff grey-green

98.8 - 111.97: Sheared, broken. Probably altered felspar.

<<Min: 110.5 - 127 1% Min: Pyrrhotite>> Elongated along the foliation.

<<Struc: 105.3 - 110.2 Strong (Alt) Shear>> Major broken zone. Fault gouge (clay) at around 105.35 and 107.0m

111.97 120.87 RHYva Coarse grained to ash tuff medium grey

111.97 - 120.87: BI rich at lower contact, maybe some carbonaceous material. PO in foliation. Weak CL alteration.

<<Struc: 112.92 - 112.95 Weak (Alt) Fault>> Minor fault,

120.87 134.25 RHYvx Quartz and/or feldspar crystal tuff grey-green

120.87 - 134.25: Feldspar and QZ phenos.

<<Min: 127 - 144.1 3% Min: Pyrrhotite>>

<<Vein: 122.9 - 123 Quarzt-Tourmaline-Sulphide 18 deg. >> QZ/TML/PO (see structure)

<<Struc: 122.9 - 123 Vein>> QZTML//PO vein.

134.25 139.73 RHY undifferentiated rhyolite grey-green

134.25 - 139.73: Weak foliation, ghost phenoblasts. MU alteration.

<<Vein: 139 - 139.05 Quartz-Pyrite 15 deg. >> QZ/PY vein offsetting the foliation.

<<Struc: 139.21 - 139.22 dominant foliation>> QZ and PO elongated.

139.73 144.10 MDSt Rhyolite tuff dominant mudstone medium grey

139.73 - 144.1: Dominantly rhyolitic, weakly carbonaceous, folded at lower contact.

<<Struc: 139.73 - 139.74 dominant foliation>> Dark blue, maybe carbonaceous band.

<<Struc: 142 - 144.2 Weak (Alt) Shear>> Carbonaceous, folded, weakly sheared.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-243W1

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Jerome de Pasquale
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	05-Sep-15
UTM Easting	414801.777	Core Size:	HQ3	Azimuth:	180.4	Date Logging Complete:	06-Sep-15
UTM Northing:	6815776.435	Casing Pulled?:	Yes	Dip:	-63	Drill Company:	Geotech
UTM Elev. (m):	1403.945	Casing Depth (m):	6	Length (m):	200	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	04-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	06-Sep-15
Local Elev. (m):						Purpose:	Metallurgical Wedge
						Parent Hole:	K15-243

Comments:

Hole K15-243W1 was wedged in hole K15-243 from 149m to 200m for metallurgical samples (MET7 Domain).
Hole K15-243W1 encountered primarily rhyolite, a massive sulphide zone and a strongly chlorite altered unit. The massive sulfide was intersected from 173.65m to 180.1m with a main mineralized zone from 167.48m to 185.54m.
The hole shows progressive muscovite alteration in the hanging-wall followed by strong to intense proximal alteration from 170 to 190.55m (cordierite). Mineralization consists of SP/GL/PY (OB domain) as well as OA, OJ and OI domains on the edge of the unit.
The footwall consists of strongly chlorite alterated unit with CP stringers below the main massive sulfide zone and a narrow chlorite altered rhyolitic unit crosscut by mafic sill at 190.55m.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	04-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

This was was designed to infill the resource between historic hole K95-087 & K95-088.
The structural hanging wall is composed of a package of felsic coherent/volcaniclastic rocks and intercalated carbonaceous/tuffaceous mudstones. Sulphide intercepts are from 60.39m to 69.1m and contain OD and OB sulphide mineralization with pervasive calcite (10-20%) and isolated intervals of trace magnetite. The sulphide interval is confirmed to be of the MET7 domain. The structural footwall is a package of felsic coherent/volcaniclastic rocks underlain by a mafic intrusive (Mafi) and cross cut by a felsic/rhyolite glassy dike (Rhyi).
Muscovite alteration is pervasive in the structural hangingwall and footwall and increases in intensity towards the massive sulphide lens. Cordierite porphyroblasts were isolated in the MDS unit adjacent to the massive sulphide in the structural hanging wall. Trace chlorite alteration is observed proximal to the massive sulphide lens. Chlorite overprinting is moderate to strong in the mafic shists. Silicification is moderate to strong and is proximal to the felsic intrusion; the alteration front forms sharp contacts.

Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-244

Comments:

This hole was drilled with the objective of collecting samples of MET7 domain for testing, as a twin of K15-244.
The structural hanging wall is composed of a package of felsic coherent/volcaniclastic rocks intercalated by carbonaceous/tuffaceous mudstones. Sulphide intercepts are from 59.21m to 67.15m and contain OB sulphide mineralization with isolated intervals of trace magnetite (<30cm intervals). The structural footwall is a package of felsic coherent/volcaniclastic rocks. Muscovite alteration is pervasive in the structural hangingwall and footwall, and increases in intensity towards the massive sulphide lens. Cordierite porphyroblasts were isolated in the MDS unit adjacent to the massive sulphide in the structural hanging wall. Trace chlorite alteration is observed proximal to the massive sulphide lens. There is a large fault zone present from 45.5m to 59m.

UTM Elev. (m):	1400.731	Casing Depth (m):	7.5	Length (m):	129	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	02-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	03-Sep-15
Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-242

Comments:

The purpose of hole K15-246 was to twin K15-242 in order to provide material for sampling MET8, MET 3, and MET 5 domains.

The first 92.09 m of K15-242 consists of a thick package of rhyolitic volcaniclastics (xtl/lpl) and flows +/- carbonaceous material, carbonaceous mudstones, and mafic intrusives.

The massive sulphide zone was intersected between 95.36-120.63 m (25.27 m total thickness) and consists of OA, OB, OC, OH, and OJ ore types. A Cu rich strong proximal CL-CI altered zone of OC may have confirmed the presence of the MET 8 domain. This unit contains magnetite though which may indicate that it is actually MET 3. There are other zones of MG bearing OC that are true massive sulphide that lack the CL-CI alteration and are likely MET 8. The MET 5 domain was confirmed by the presence of OB with visibly high concentrations of GL.

The structural footwall consists of MAFi intruded by RHYi, both of which sit stratigraphically below a thin unit of RHYcw. The footwall was intersected between 120.63-129.0 m.

Syngenetic alteration of the structural hanging wall felsic volcanics progressively increases in intensity with proximity to the sulphide zone. There was a relatively large weak CL-CI alteration zone in the hanging wall from 80.03-96.0 m that increased in intensity to strong from 93.94-96.52 m.

A thin zone of stongly MU altered RHYcw was located directly below the sulphide zone was the only evidence of syngenetic alteration in the footwall. Syngenetic alteration of the footwall has largely been eliminated by MAFi. Alteration of the footwall is characterized by a moderate CL and weak BI overprint in MAFi.

Notable mineralized interceptions included: 15 % CP (96.52-97.22 m, 106.86-107.83 m), 10% CP (109.28-110.24 m, 112.75-113.92 m, 119.43-120.63 m), 5% GL (95.36-96.52 m, 113.92-119.43 m), and 20 % SP (97.22-104 m, 106.86-109.28 m, 106.86-113.92 m).

OC logged in this hole was not logged in the parent hole K15-242. This may be due to subtle changes in mineralogy between OA and OC ore types.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-247

Prospect:	GP4F	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Murray Jones
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	05-Sep-15
UTM Easting	418952.703	Core Size:	HQ3	Azimuth:	180	Date Logging Complete:	14-Sep-15
UTM Northing:	6813685.432	Casing Pulled?:	No	Dip:	-85	Drill Company:	Geotech
UTM Elev. (m):	1476.501	Casing Depth (m):	2.3	Length (m):	414	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	03-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	13-Sep-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

This hole intersected a series of altered quartz crystal tuffs, quartz crystal, lithic lapilli tuffs, and minor ash tuffs (335.8m-379.2m). This unit marked the onset of weak to moderate, pervasive, sericite alteration cut by zones (5-20cm) of moderate to locally strong chlorite alteration with fine grained disseminated chalcopyrite (locally up to 1%) and thin (<1cm) bands of sphalerite. Weak mineralization (sphalerite-chalcopyrite) and associated moderate chlorite alteration continued below the quartz crystal tuff (379.2-414.0m). Several quartz-chlorite veins (10-20cm) with trace chalcopyrite were intersected near the bottom of the hole. The hole terminated in biotite-quartz-chlorite, pelitic meta-sediment. Downhole EM did not indicate a significant conductor at the end of the hole.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

0 - 2.32: Overburden.

2.32 5.60 RHYcq Quartz porphyry grey-brown

2.32 - 5.6: abundant light coloured felsic lenses in MU-rich matrix/partings, probably QZ-FP domains, but also looks like QZ phenos, up to 5 mm diameter.flattened severely. Minor Banding with BI. Oxidized locally

5.60 24.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green-brown

5.6 - 24: speckled unit, massive, homogeneous, BI pblasts t/o. CL-BI in groundmass,

<<Min: 5.6 - 24 5% Min: Calcite>> pervasive to fracture and vein control

<<Vein: 14.1 - 14.75 80% Quartz-Carbonate>> QZ-CB

<<Struc: 18 - 25 Strong (Alt) Fault>> broken rock, poor recovery

24.00 32.32 SED undifferentiated Sediment black FG

24 - 32.32: Might be a RHY, quite silica-rich, textures in altered section at bottom look like flow bands, spherules,massive, homogeneous, tiny white specks t/o-leucoxene?, fol'd rock, hard groundmass with BI also BI speckles

<<Min: 24 - 28.15 0.5% Min: Pyrite>>

<<Min: 24 - 28.15 0.5% Min: Pyrrhotite>> along foln

<<Min: 24 - 28.15 1% Min: Calcite>> minor lens

<<Alt: 28.15 - 32.32 Strong (Alt) Silicification>> progressive up to dyke contact, bands near 28.15, QV lenses

<<Alt: 28.15 - 32.32 Weak (Alt) Muscovite>>

<<Struc: 26.1 - 26.11 Moderate (Alt) dominant foliation>>

32.32 37.20 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown

32.32 - 37.2: massive dyke, fg, well fol'd, CA-QZ vns common, planar gnerally i.e. not intensely fol'd. some early deformed QZ-CA vns

<<Min: 32.32 - 37.2 3% Min: Calcite>> and in veins

<<Alt: 32.32 - 37.2 Weak (Alt) Chlorite>> envelopes to veins

<<Vein: 35.7 - 36.3 30% Quartz-Carbonate>> QZ-CB with CL envelopes

37.20 42.56 RHYif feldspar and quartz porphyry intrusions buff VFG

37.2 - 42.56: looks like glassy dyke, may extend above dyke i.e. SI'd SED above

<<Alt: 37.2 - 42.6 Moderate (Alt) Silicification>>

<<Alt: 37.2 - 42.6 Weak (Alt) Muscovite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Alt: 37.2 - 42.6 Trace (Alt) Garnet>>

<<Struc: 37.2 - 37.21 Moderate (Alt) Contact>>

42.56 74.25 SED undifferentiated Sediment grey FG

42.56 - 74.25: BI bands common, groundmass is QZ-rich, also locally QZ clasts(?) -overall this does not look like igneous rock but locally maybe tuff intervals,?, CL or AC locally, weakly calcareous?, no TO though, - quite broken section, faulted and numerous dykes t/o, faulting increases in lower half of interval, TO along fractures? Or MnOxide?, at upper contact, commonly contains tiny white specks -leucoxene-like?- conc'd in CL-rich dykelets (diamond shaped, beige colour, high relief, no fizz) possibly AK pblasts?

<<Min: 42.56 - 51.5 3% Min: Calcite>> fracs, veins, envelopes to QV's

<<Min: 42.56 - 68.18 0.5% Min: Pyrite>> scattered, locally weathered and exclusive of dykes

<<Min: 51.5 - 68.18 0.01% Min: Pyrite>> blebs in rare QZ-CB veins, with CL locally

<<Min: 51.5 - 71 1% Min: Calcite>> fracs mostly, small sections with 10%

<<Min: 68.18 - 74.25 0.01% Min: Pyrite>>

<<Min: 71 - 74.25 3% Min: Calcite>> contact margin of dyke

<<Min: 72.35 - 73.3 0.5% Min: Ankerite>> AK?, doesn't fizz, rhomboid

<<Alt: 42.6 - 74.25 Trace (Alt) Chlorite>> locally on fractures

<<Alt: 73.68 - 74.25 Moderate (Alt) Muscovite>> bleaches rock, along with CA

<<Struc: 42.9 - 46.25 Moderate (Alt) Fault>> attitde measured on gouge zone

<<Struc: 51 - 63.8 Strong (Alt) Fault>> to 50, measured on slips, gouge contacts, very rough section, lots of crushed and oxidized rock, several small dykes within SED, tough ground, lost core

74.25 82.96 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown

74.25 - 82.96: minor RHYcf entrained, also, CL-AC alt'd sed (lt to dark green), QZ-CA veins in fault one

<<Min: 74.25 - 80.73 0.5% Min: Pyrite>> on dry fracs in dyke

<<Min: 74.25 - 80.73 5% Min: Calcite>> fracs, veinlets, MAFi dyke

<<Min: 80.73 - 101.06 0.01% Min: Pyrite>>

<<Alt: 78.92 - 80.73 Weak (Alt) Muscovite>> related to QZ-TO veinlet

<<Vein: 82.9 - 84.5 5% Quartz-Tourmaline 15 deg. >> QZ-CA, QZ-TO veining/altn

<<Struc: 77.4 - 77.41 Moderate (Alt) Foliation>> banding

82.96 100.22 RHYcf Feldspar & feldspar quartz porphyry grey FMG

82.96 - 100.22: variably deformed, strongly strained clasts/boudins of felsic material or phenos, local blue QE's, locally banding due to flow of more massive rhyolite, micaceous groundmass, BI and MU, banding common and locally strongly schistose, blue-grey colour locally due to MU around QZ and QZ-TO veinlets, weak bleaching and oxidation locally.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Alt: 98.78 - 101.06 Moderate (Alt) Muscovite>> in groundmass, TO occurs around fractures locally

<<Alt: 98.78 - 101.06 Weak (Alt) Chlorite>> in groundmass and bands after BI

<<Struc: 83.9 - 83.91 Moderate (Alt) Vein>> QZ-TO veinlet, alt,n envelope about 5 cm wide, remains in core over about 1 m

<<Struc: 85.26 - 85.32 Strong (Alt) Vein>> QZ-CA, on fol'n, weakly deformed

<<Struc: 89.9 - 89.91 Strong (Alt) dominant foliation>>

100.22 101.06 RHYvx Quartz and/or feldspar crystal tuff dark grey

100.22 - 101.06: bed? Characterized by blue QZ eyes.

101.06 105.40 SED undifferentiated Sediment black FG

101.06 - 105.4: weakly laminated, black sediment, with BI bands common, wispy sx, CA in groundmass and veins, MAFi cuts, QZ-CA veins common, carbonaceous?

<<Min: 101.06 - 111.4 0.5% Min: Pyrite>> on fol'n, fractures

<<Min: 101.06 - 111.4 0.5% Min: Pyrrhotite>> as PY

Local Northing:		Cemented?:	VWP	Core Storage Loc.:	KZK Camp	Drill Completed:	10-Sep-15
Local Elev. (m):						Purpose:	Resource/Hydro
						Parent Hole:	

Comments:

Drill hole DDH K15-248 was drilled to test possible mineralization in a down-dropped fault block to the southeast of the main deposit.
From top to bottom, the hole intersects carbonaceous sediments and tuffs, coarse crystal lithic tuff and felsic tuff. Broken rock and fault gouge sections are common above 156.88m. A strongly disseminated and semi-massive sulphide horizon occurs at the base of the tuff near the contact with the underlying mafic tuff and may correlate with the ore horizon. Three intervals of glassy rhyolite intrude the sequence. The bottom of the hole is composed of felsic tuff and ash, cut by a fault zone marked with strong muscovite alteration and intense brecciation and fault gouge.

20-130m: carbonaceous mudstone/tuff sequence (MDSc and MDSt)
Includes 93-117: Glassy rhyolite dyke (RHYi)

130-134m: mafic dyke or tuff (MAFi).

134-199m: coarse xtal lithic tuff (or fspar porphyry) (RHYif), with local bands of heavy sulphide disseminations, also includes a few mafic intervals (1 to 3m thick).

199-204.7m: glassy rhyolite dyke (RHYi).

204.7-207.5m: Felsic tuff (RHY), loc w bands of heavy sulphide disseminations, including a 25 cm semi- massive band of po-py, possibly a weak expression of the main sulphide horizon.

207.5 - 224m: mafic tuff.
Includes 211.5-217: glassy rhyolite dyke, strongly veined and silicified with silicified selvages. Qtz-po-py-tourm veins.

224m to 278.5m (eoh): felsic lapilli and ash tuff (RHYvl, RHYva and RHY) w 1-4% diss py-po. Short sections of fault gouge are present every 2 to 3m.
Includes 244 to 266.5m: Fault zone marked by intense brecciation, fault gouge, strong sericite and diss pyrite(quartz) (overprint?) alteration.

Comments:

The purpose of this hole is to test the near surface extension of the massive sulphide lens (MET7 Domain). Results confirm the presence of this extension of the massive sulphide lens (MET7) to surface interface. Massive sulphide is present at the top of hole from 10.95m and extends to 14.26m (OA, OB) (MET7), from 17.94m to 18.64m (OB) and from 20.43m to 20.63m (OA). The structural hanging wall is composed of mafic rocks intruded by a grey, glassy felsic dike. Muscovite alteration increases towards the massive sulphide lens. Chlorite alteration is pervasive in the mafic units. Silicification is pervasive in proximity to the felsic intrusive.

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

Hole K15-250 was drilled to test the continuity and the extension of the lower sulphide lens (MET7).
The upper units are made up coherent and lapilitic rhyolite crosscut by mafic dykes. Above a shear zone, the massive sulphide is intersected from 183.48m to 187.81m within a mineralized zone (PY/CP/PO/SP/MG/GL/AS) extending from 180.42m to 190.90m. Both the hanging-wall and footwalls show strong chlorite alteration with CP/PO stringers. The ore body, made up of OA and Ob as well as OI and OJ domains on the edge, lies direclty above by a narrow rhyolitic unit crosscut by a mafic sill at 205.20m. A short felsic dyke (extending from 207.51m to 208.08m) intrudes this unit.
A mafic unit from 217.20m to 229.80m hosts green-grey alteration associated with a felsic aphanitic dyke (RHYi). Rhyolite, present from 235.63m to EOH at 251.0 is strongly muscovite altered.
The thickness of the green-grey alteration zone is particularly significant in hole K15-250.
Hole K15-250 (dip: 51) is part of a fan including hole K15-253 (dip: 65) and hole K15-257 (dip: 81).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

6.60 26.43 RHYvx Quartz and/or feldspar crystal tuff grey-green

6.6 - 26.43: QZ eyes. Curdy texture and flow locally.

<<Min: 6.6 - 35.53 0.5% Min: Pyrite>>

<<Min: 6.6 - 35.53 0.5% Min: Pyrrhotite>> Elongated, rare veinlets.

<<Min: 6.6 - 83 2% Min: Calcite>> and selective replacement. In MAFi and also in flow banding

<<Vein: 17.24 - 17.52 Quartz-Carbonate>> QZ/CA vein with oxidation trace.

<<Vein: 26.33 - 27.45 Calcite>> CA veinig in MAFi.

<<Struc: 22.8 - 22.81 dominant foliation>>

26.43 28.48 MAFi Mafic Intrusions (primarily footwall mafic intrusion) medium grey

26.43 - 28.48: Two dykes, two different composition. No BI on the margins. CA veining, weak schistosity..

28.48 33.66 RHYvx Quartz and/or feldspar crystal tuff grey-green

28.48 - 33.66: QZ eyes. Flow and curdy. Dyke from 31.84 to 32.07m containing AK.

<<Min: 31.84 - 32.07 10% Min: Ankerite>> Probably also AK in rhyolite.

<<Struc: 29.19 - 29.2 dominant foliation>>

<<Struc: 32.07 - 32.08 Contact>> Between MAFi and RHYcw.

33.66 35.33 RHYvl Lapilli tuff grey-green

33.66 - 35.33: Sharpe upper contact.

<<Struc: 34.77 - 34.78 dominant foliation>>

35.33 38.21 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

35.33 - 38.21: Flow banded.

<<Min: 35.53 - 83 2% Min: Calcite>> Veining and probably selective replacement.

<<Min: 35.53 - 149 2% Min: Pyrrhotite>> Elongated, in the foliation.

38.21 48.94 RHYvx Quartz and/or feldspar crystal tuff grey-green

38.21 - 48.94: QZ eyes.

<<Struc: 42.2 - 44.48 Moderate (Alt) Fault>> Fault gouge, angle estimated. Core loss. Major.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

48.94 67.51 RHYvl Lapilli tuff grey-green

48.94 - 67.51: Strongly lapilitic from 59m or fragmented flow. CL altered, weakly.

<<Alt: 62.49 - 72.27 Weak (Alt) Chlorite>> Stronger at dyke proximity.

<<Vein: 50.15 - 52.3 Quartz-Carbonate>> QZ/CA and brown BI, lower contact vwith mafic dyke.

<<Vein: 57 - 57.05 Tourmaline 20 deg. >> TML veinlet.

<<Struc: 52.85 - 52.86 dominant foliation>>

<<Struc: 56 - 56.01 dominant foliation>>

<<Struc: 61.65 - 61.66 dominant foliation>>

<<Struc: 64.5 - 64.51 Foliation>> Secondary foliation.

<<Struc: 64.6 - 64.61 dominant foliation>>

67.51 72.27 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

67.51 - 72.27: Speudofragmental flow, CL intense at contact with dyke, secondary foliation. Could be lapili.

72.27 79.41 RHYva Coarse grained to ash tuff grey-green

72.27 - 79.41: Including mafic dyke frpm 75.80 ro 76.69m, CL altered.

<<Struc: 73.6 - 73.61 dominant foliation>>

79.41 82.22 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey-brown

79.41 - 82.22: With AK, large chill margin, BI. Purple.

<<Min: 79.41 - 82.22 5% Min: Ankerite>> In mafic dyke.

82.22 96.79 RHYv Rhyolite volcaniclastic grey-green

<<Min: 83 - 155 0.1% Min: Calcite>> Local.

<<Vein: 91.45 - 91.5 Quarzt-Tourmaline-Sulphide 25 deg. >> QZ/TML, few PY

<<Struc: 82.65 - 82.66 dominant foliation>>

<<Struc: 91.85 - 91.86 dominant foliation>>

96.79 107.04 RHY undifferentiated rhyolite grey-green

96.79 - 107.04: Dominantly RHYcw. Weak CL.

<<Struc: 104 - 104.21 Weak (Alt) Fault>> Light brown clay.

<<Struc: 104.01 - 104.02 dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

107.04 112.81 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

107.04 - 112.81: Curdy and flow banded. Folded. PY/PO wavy stringers.

<<Vein: 107.04 - 111.6 Pyrite>> Dark wavy veins (4/metre) in flow/curdy RHY, contaning PY.

<<Struc: 107.1 - 107.11 dominant foliation>>

112.81 119.42 RHY undifferentiated rhyolite grey-green

112.81 - 119.42: Dominantly RHYcw, flow.

<<Struc: 113.04 - 113.06 dominant foliation>>

119.42 126.37 RHYvl Lapilli tuff grey-green

<<Struc: 125.1 - 125.11 dominant foliation>>

126.37 136.69 RHYva Coarse grained to ash tuff grey-green

126.37 - 136.69: Locally BI rich (maybe dyke) with whitish QZ eyes at upper contact, vein TML/few CA and PY along the core axis.

<<Vein: 129.4 - 129.45 Tourmaline-Sulphide>> Probably TML/PY, shallow angle<10

<<Struc: 128 - 128.01 dominant foliation>>

136.69 158.16 RHYvl Lapilli tuff grey-green

136.69 - 158.16: Granular texture where sheared and maybe feldspar (whitish mineral) xl. CL in shear zone.and more PY/PO.

<<Min: 149 - 155 3% Min: Pyrite>> Concentrated in shear zone and discontinuous veinlets.

<<Min: 149 - 155 3% Min: Pyrrhotite>> Associated with PY.

<<Alt: 137.38 - 153.38 Weak (Alt) Chlorite>>

<<Alt: 153.38 - 200 Moderate (Alt) Muscovite>> Starting after a shear zone.

<<Struc: 149 - 149.01 Foliation>>

<<Struc: 151.41 - 151.42 Shear>>

<<Struc: 151.51 - 155 Moderate (Alt) Fault>> Multiple fault, Average angle.

<<Struc: 152.5 - 152.51 Strong (Alt) Fault>>

<<Struc: 153 - 153.2 Strong (Alt) Fault>> Fault gouge. Sheared. PyY vein at contact.

<<Struc: 155.2 - 155.21 dominant foliation>>

<<Struc: 156.3 - 157.5 Crenulation cleavage>>

<<Struc: 157.9 - 157.91 dominant foliation>>

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	06-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	07-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

K15-251 was drilled to twin historic hole K95-092 and confirm the resource here.
Overburden was encountered to a depth of 13.5 m, where an undifferentiated, Mu-altered rhyolite unit begins. The rhyolite unit continues to a depth of 17 m. There is a semi-continuous MSXS zone from 17-33 m, consisting of interbedded OI, OB, OA, and OJ. In the footwall, a CL-CA-BI schist (MAFi) cross-cut by an intrusive rhyolite continues to the end of the hole at 86 m.

Local Elev. (m):						Purpose:	Metallurgical Twin
Comments:						Parent Hole:	K15-251

K15-252 was drilled as a mettalurgical twin of K15-251 in order to collect samples of the MET3 and MET7 domains in the near surface oxidized zone. Overburden was encountered to a depth of 14 m. From 14-16.8 m undifferentiated MU-altered rhyolite was encountered. MSXS was interecepted from 16.8-27.7 and 30-32.1 m with an intercept of strongly MU-altered undifferentiated rhyolite between. The footwall consists of MAFi.

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

Hole K15-250 was drilled to test the continuity and the extension of the lower sulphide lens (MET7).
The upper units of this hole are coherent and lapilitic rhyolite, crosscut by mafic dykes. Below this, the mineralized unit (OJ domain) is intersected from 182 to 183.42m (hosts PO/PY/CP/SP/GL).
The hole ends at 230m with rhyolitic units crosscut by mafic sill from 202.26 to 216.1m
The hole shows progressive muscovite alteration in the hanging-wall (strong from 150.65 to 179.06m).
The massive sulfide is not intersected but the proximal alteration is observed.
Hole K15-253 (dip: -65) is part of a fan including hole K15-250(dip: -51) and hole K15-257 (dip: -81).

6.50 18.92 RHYvx Quartz and/or feldspar crystal tuff grey-green

6.5 - 18.92: QZ eyes.

<<Min: 6.5 - 80 1% Min: Calcite>> In vein, mostly associated with mafic dyke.

<<Alt: 11.2 - 106.48 Weak (Alt) Muscovite>>

<<Vein: 17.15 - 17.35 Quartz-Carbonate>> QZ-CA in fracture.

18.92 23.60 RHYvx Quartz and/or feldspar crystal tuff medium grey

18.92 - 23.6: Blue, thin schistosity, maybe due to BI enrichment. Weakly carbonaceous. Qz eyes.

<<Min: 22 - 230 0.1% Min: Galena>>

<<Vein: 18.98 - 19 Quartz-Carbonate>> QZ/CA

<<Struc: 19.7 - 19.71 dominant foliation>>

23.60 24.78 RHYvl Lapilli tuff grey-green

<<Min: 23.6 - 35.2 1% Min: Pyrite>>

<<Min: 23.6 - 35.2 2% Min: Pyrrhotite>> Elongated in foliation.

<<Alt: 23.6 - 63.96 Weak (Alt) Chlorite>>

24.78 27.52 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey

24.78 - 27.52: Large chill margin, maybe two dykes.

27.52 29.01 RHYvl Lapilli tuff grey-green

29.01 31.56 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

29.01 - 31.56: Flow banded. Could be due to mafic dyke proximity.

31.56 35.20 RHYvl Lapilli tuff grey-green

31.56 - 35.2: Qz eyes.

35.20 47.00 RHYcf Feldspar & feldspar quartz porphyry light grey

35.2 - 47: Qz eyes. Mafic dyke from 46.49m to 47.00m. QZ eyes and probably feldspar. Light shearing from 41.83 to 42.73m. Mafic dyke also from 41.83 to 42.73m (BI/CA).

<<Min: 35.2 - 118 0.5% Min: Pyrite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 35.2 - 118 2% Min: Pyrrhotite>> Some discontinuous vein and elongated in foliation.

<<Struc: 38 - 40 Shear>> Locally fault gouge.

47.00 49.00 RHY undifferentiated rhyolite grey-brown

47 - 49: Narrow unit, dark color. Could be flow banded but speudo fragmental due to a secondary foliation.

49.00 57.28 RHYva Coarse grained to ash tuff grey-green

49 - 57.28: QZ eyes. Could be RHYvx (ash).

57.28 68.59 RHYvl Lapilli tuff grey-brown

57.28 - 68.59: Could be pseudofragmental (secondary foliation). Locally flow (dyke proximity effect?).

<<Alt: 63.96 - 81.74 Moderate (Alt) Chlorite>>

<<Struc: 61.3 - 61.31 dominant foliation>>

<<Struc: 61.35 - 61.36 Foliation>> Crosscut by Dfol

<<Struc: 61.61 - 61.62 dominant foliation>>

<<Struc: 61.65 - 61.66 Foliation>> Crosscut by Dfol

68.59 69.75 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

68.59 - 69.75: Dyke, large chill margin, CL overprint.

<<Struc: 68.59 - 68.6 Contact>> Mafic dyke upper contact.

69.75 73.55 RHY undifferentiated rhyolite grey-green

69.75 - 73.55: Weakly curdy or strongly lapilitic?

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-254

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	09-Sep-15
UTM Easting	415050.927	Core Size:	NQ3	Azimuth:	179.86	Date Logging Complete:	10-Sep-15
UTM Northing:	6815377.977	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1386.875	Casing Depth (m):	12	Length (m):	100	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	08-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	09-Sep-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-254 was drilled as a resource infill hole between historic holes K94-002 and K95-087.
Overburden was encountered to a depth of 19 m. The hanging wall of the MSXS (19-39.3 m) consists of mixed MU-altered felsic volcanics and minor carbonaceous units. The first MSXS was intercepted from 39.3-40.3 and consisted of the OC ore type. Below this there is an undifferentiated Mu-altered rhyolite unit to a depth of 42.1 m. From 42.1-51.7 m MSXS was encountered, consisting of ore types OB, OA, and OJ. Below this final ore interecpt there was MU-CL+/-CI altered felsic volcanics to a depth of 54.3 m. The footwall consists of MAFi, RHYi, and a minor interval of MU-altered RHYv.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	11-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

K15-255 was drilled to test and confirm the near surface extension of the massive sulphide lens. A metallurgical twin (K15-256) was drilled to test the metallurgical domains.
MSXS occurs directly below overburden (12 m) and continues to 21.7 m depth, consisting of OA and OB ore types. Below the MSXS the MAFi occurs from 21.7-64.9 m. The MAFi has a noticeable change in foliation, from a high angle to the core axis to a very shallow angle to the core axis, starting at ~42 m. Below the MAFi is another mafic unit bounded on either side by a fault zone (64.9-67 m and 77.4-80 m).

						Parent Hole:	K15-255

Comments:

K15-256 was drilled as a twin of K15-255 (ABM43) in order to collect a sample of and test MET5 domain.
The hole was cased to a depth of 11.5 m, where bedrock is encountered. From 11.5-12.6 m a highly oxidized and Mu-altered rhyolite is encountered. MSXS is intercepted from 12.6-22.6 m, consisting of OI, OA, and OB ore types. The structural footwall consists of a CL-BI+/-CA schist (MAFi) unit.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	12-Sep-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

Hole K15-257 was drilled to test the continuity and the extension of the lower sulphide lens (MET7).
Hole K15-257 is made up of primarily rhyolitic units (RHYcw and RHYvl) including two mudstone units. The top of the hole is marked by mafic dykes.
The hole shows progressive muscovite alteration in the hanging-wall, with the footwall intersecting a rhyolite unit.
A narrow chlorite alteration zone from 206.27 to 206.76m hosts PO/CP/PY. The hole shows progressive muscovite alteration in the hanging-wall (strong from 203.52 to 206.27m). This drill hole encountered a significant fault (74.4m to 77.2m) below a mafic dyke. Hole K15-257 ends at 218m with a muscovite altered rhyolite unit.
The massive sulfide is not intersected and the proximal alteration is intersected deeper than expected.
Hole K15-257 (dip: -81) is part of a fan including hole K15-250 (dip: -51) and hole K15-253 (dip: -65).

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	11-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	14-Sep-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

The target of this hole is a deep extension of a sulphide lens on the southeast fault block, interpreted to be down-dropped from main ore body.
This hole collared in upper sequence metasediments: black argillite(MDSc)followed by mafic tuffs till 48m, followed by a thick sequence of felsic lapilli and crystal tuff with some ash-dominant sections till 205.95m. This sequence is unusually dark and silicified from 48 to 73m, possibly due to the altering effect of the rhyolite dyke intruding the sequence below from 73-79.8m. A mafic dyke with porphyroblastic biotite also intrudes this sequence from 103 to 107m.
Dark carbonaceous felsic tuff (MDSt) occurs from 205.95 to 213.5m, followed by strong to intense muscovite-altered generic rhyolite (no primary textures), with intensity of alteration increasing towards its lower contact with the massive sulphide zone (228.64 to 231.24). It consists of 30% fg diss py w 10% galena, 2% sphalerite, and one cm-bleb of cp (total <1%). The average recovery for this zone is very poor at 47%.
Below the sulphides at 231.24, the hole transitions again into rhyolite till 265m. The typical footwall mafic intrusion occurs from 265 to 272.3m, where the contact with the underlying felsic tuff is caught in a large breccia and deformation zone marked by fault gouge and breccia but also by blocky sections with extremely poor recovery but not showing deformation. The rhyolite continues to EOH at 299m, with moderate muscovite alteration.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-259

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	13-Sep-15
UTM Easting	415100.557	Core Size:	NQ3	Azimuth:	134.82	Date Logging Complete:	14-Sep-15
UTM Northing:	6815372.293	Casing Pulled?:	Yes	Dip:	-55	Drill Company:	Geotech
UTM Elev. (m):	1391.551	Casing Depth (m):	9	Length (m):	120	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	11-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	13-Sep-15
Local Elev. (m):						Purpose:	Geotech
Comments:						Parent Hole:	

K15-259 was drilled to characterize the geotechnical properties of the East Fault, as well as to attempt to pierce the upper ore lens (ABM) and the proposed down dropped portion of the deposit. However, due to the azimuth deviating during drilling, the hole was abandoned at 120 m. It was re-drilled at an azimuth of 125 degrees and a dip of 45 degrees, with HQ3 drill rods, in order to maintain a straighter drill trace.
Bedrock was encountered below overburden at 9 m. A felsic volcanic package with a few carbonaceous horizons was encountered from 9-49.1 m. MU-alteration began increasing intensity from 33-51.2 m. Strong restrictive alteration was encountered from 48.3-51.2, consisting of a MU+CI+CL+AB assemblage. From 49.1-60.7 m MSXS was encountered, consisting of OJ, OA, and OB ore types. A small unit of MU-altered rhyolite occurs between 60.7-61.4 m. From 61.4-63.6 m MSXS occurs, consisting of the OB ore type. Below the MSXS an undifferentiated rhyolite interlayered with MAFi is encountered from 63.6-66 m. MAFi is encountered from 66-120 m, with local variations in the foliation angle relative to the core axis.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-260

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Jerome de Pasquale
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	13-Sep-15
UTM Easting	414749.033	Core Size:	HQ3	Azimuth:	180.64	Date Logging Complete:	15-Sep-15
UTM Northing:	6815674.459	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1411.257	Casing Depth (m):	3	Length (m):	227	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	12-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	14-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

Hole K15-260 was drilled to intercept the sulfide zone of the historical hole K94-020.
The hole is made up of primarily rhyolitic units including two mudstone units above the ore deposit. The massive sulfide was intercepted from 156.67 to 172.12m and is hosted within a larger mineralized zone from 153.71 to 182.29m.
The hole shows progressive muscovite alteration in the hanging-wall followed by strong to intense proximal alteration from 155.75 to 157.91m (moderate cordierite) mineralized CP/PO. The massive sulfide consists in OA, OB and OH containing CP/SP/GL/PO/PY and minor AS.
The footwall consists of OI and OJ domains. A mafic sill, underlain by quartz-eye bearing rhyolite crosscuts the mineralization at 182.29m. The hole ends at 227.00m in meta-sedimentary unit.
Hole K15-260W1 was wedged at 135.00m for metallurgical samples.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	12-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	14-Sep-15
Local Elev. (m):						Purpose:	Metallurgical Wedge
						Parent Hole:	K15-260

Comments:

Hole K15-260W1 is a wedge from K15-260, and was drilled from 135.00m of the parent hole in order to collect samples of MET7 domain.
The massive sulfide (OA, OB and OH domains) was intercepted from 157.92 to 172.48m within a mineralized zone from 154.98 to 183.80m containing PY/PO/CP/GL/ SP and minor AS.
The hanging-wall consists of muscovite altered rhyolitic unit followed by strong to intense proximal chlorite alteration from 155.75 to 157.91m with CP/PO stringers.
The footwall is made up of OJ and OI domains. A mafic sill crosscuts the mineralized rhyolitic unit at 183.80m. The hole ends at 196.00m.

Local Elev. (m):						Purpose:	Exploration
						Parent Hole:	

Comments:

This hole was drilled to test the eastern extension of the GP4F horizon. This hole intersected rhyolite lapilli tuffs and pelitic metasediments (similar to the hanging wall of the GP4F deposit) from 0-99m including a quartz crystal tuff/porphyry with bluish quartz eyes, which is commonly associated with the GP4F/R15 horizon. A fault at approximately 99m appears to cut-off the lower part of the stratigraphy, including the mineralized horizon. Below the fault zone, this hole intersects quartz-feldspar lapilli tuffs and a quartz feldspar porphyry similar to the quartz porphyries in the hanging wall approximately 100-200m above the GP4F deposit. Very fine grained disseminated sphalerite (narrow bands up to 10% sphalerite) was intersected between 117.15 and 178.3m above intense chlorite+garnet alteration zone (178.3-187.3m) with fine, banded to disseminated sphalerite-galena-pyrrhotite(+/-trace chalcopyrite) mineralization. GP4F style massive sulphide (sphalerite-pyrrhotite-galena-chalcopyrite) mineralization and vein style (sphalerite-pyrrhotite-galena-chalcopyrite) mineralization were intersected at 214.45-214.9m and 214.1-224.3m respectfully. Below the mineralization this hole intersected carbonaceous siltstone and mudstone (and minor mafic intrusive) and heavily faulted ground.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

9.00 12.30 OVBN Overburden

9 - 12.3: Overburden. Large granite boulders with small rhyolite lapilli tuff boulders.

12.30 12.80 RHYvl Lapilli tuff light grey FMG

12.3 - 12.8: Light grey, well foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff.

12.80 14.10 INT undifferentiated (granitic) intrusive rocks light grey CG

12.8 - 14.1: Light grey, massive to weakly foliated, coarse grained granitic rock. Intrusive lower contact with rhyolite lapilli tuff, sharp upper contact. Granitic dyke.

14.10 15.60 RHYvl Lapilli tuff grey FMG

14.1 - 15.6: Grey, well foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Abundant 1-2cm rhyolite lapilli (70-80%) in a tuffaceous matrix. Very weak, pervasive sericite alteration. Dominant foliation 50o to ca.

15.60 18.00 SED undifferentiated Sediment brown FG

15.6 - 18: Dark grey to dark brown, well foliated, fine grained, biotite-quartz schist/metapelite. Weakly to moderately calcareous.

18.00 23.90 RHYvl Lapilli tuff light grey FMG

18 - 23.9: Light grey, well foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Abundant (~80%), densely packed, 1-2cm rhyolite lapilli. Weak pervasive sericite alteration with very weak silicification. Broken rock between 20-23m.

<<Struc: 20 - 20.1 Moderate (Alt) dominant foliation>>

<<Struc: 20 - 23 Weak (Alt) Fault>> weak fault, with broken core. No gouge.

23.90 24.90 SED undifferentiated Sediment brown FG

23.9 - 24.9: Dark grey to dark brown, well foliated, fine grained, biotite-chlorite-quartz-carbonate schist/metapelite with chlorite rich bands (mafic tuffaceous interbeds?). Weakly to moderately calcareous.

24.90 30.60 RHYvl Lapilli tuff grey FMG

24.9 - 30.6: Grey, well foliated, fine to medium grained, quartz-muscovite-biotite schist/rhyolite tuff-fine lapilli tuff. Generally finer grained with <1cm lapilli in a fine matrix. Could be a siliceous siltstone or epiclastic.

30.60 33.30 SED undifferentiated Sediment brown FG

30.6 - 33.3: Dark grey to dark brown, well foliated, fine grained, biotite-quartz schist/metapelite. Weakly to moderately calcareous.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

33.30 39.40 RHYvl Lapilli tuff grey FMG

33.3 - 39.4: Light to medium grey, well foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli (possible feldspar crystals) tuff. Abundant 1-2cm elongated rhyolite lapilli in a fine ash matrix. Several 'fragments' look boxy and could be 2-5mm feldspar crystals. Alteration is weak to very weak, pervasive sericite alteration. Cut by occasional narrow (1-2mm) quartz-tourmaline(?) veinlets at very shallow angles to core axis (10-20o ca.).

<<Struc: 36.5 - 37 Moderate (Alt) Vein>> narrow 1-2mm quartz tourmaline(?) vein.

<<Struc: 38.4 - 39 Moderate (Alt) Fault>> weak fault zone.

39.40 41.45 SED undifferentiated Sediment brown FMG

39.4 - 41.45: Dark grey to dark brown, well foliated, fine grained, biotite-quartz-chlorite-carbonate schist/metapelite with chlorite rich bands (mafic tuffaceous interbeds?). Weakly to moderately calcareous.

41.45 45.20 RHYvl Lapilli tuff light grey FG

41.45 - 45.2: Light grey, well foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Abundant 1-2cm rhyolite lapilli decreasing down hole from 50% at the top of the interval to less than 10% down hole with a general fining sequence down hole to coarse ash at the bottom of the interval.

45.20 45.90 SED undifferentiated Sediment brown FG

45.2 - 45.9: Dark grey to dark brown, well foliated, fine grained, biotite-chlorite-quartz-carbonate schist/metapelite with chlorite rich bands (mafic tuffaceous interbeds?). Weakly to moderately calcareous. Gradational lower contact, broken upper contact.

45.90 58.90 RHYvl Lapilli tuff light grey FG

45.9 - 58.9: Light grey, well foliated, weakly to moderately altered, fine grained, quartz-muscovite schist/rhyolite ash tuff. Alteration is weak to locally moderate, pervasive to patchy, sericite alteration with very fine disseminated pyrite. Cut by occasional 1-10cm quartz veins.

<<Alt: 45.9 - 58.9 Weak (Alt) Muscovite>> weak pervasive sericite alteration

UTM Elev. (m):	1391.439	Casing Depth (m):	6	Length (m):	348	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	13-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	19-Sep-15
Local Elev. (m):						Purpose:	Geotech
Comments:						Parent Hole:	

K15-262 was drilled to characterize the geotechnical properties of the East Fault, as well as attempt to pierce the upper ore lens (ABM) and the proposed down dropped portion of the deposit. It was drilled from the same pad as the abandoned K15-259, at a modified azimuth and dip in order to have a better intersection of the fault.
The casing was installed to a depth of 6 m. From 6-58.6 m a mixed sequence of felsic volcanics and carbonaceous horizons occur, with MU-alteration increasing from 36-62 m. CI-alteration becomes intense from 58.6-62 m, which coincides with OJ mineralization. MSXS occurs from 58.6-75.4 m, consisting of OJ, OB, OA, and OI. Below the massive sulphide there is a ~3.5 m intercept of MU-altered rhyolite, overlying a large intercept of CL-BI+/-CA schist (MAFi) from 78.8-125.8 m. The foliation within the MAFi unit varies from being a high angle to the core axis to being a low angle to the core axis. The lower contact of the MAFi is an intense ~10 m wide fault consisting of a polylithic fault breccia (East fault?). Below the fault is a sequence of mixed felsic volcanics, mafic dykes and two carbonaceous horizons. No significant mineralization was encountered in the footwall (of the fault) stratigraphy. However, moderate MU-alteration with two bands (~5-10 cm wide) of semi-massive PY+/-SP was encountered between 306-328.4 m.

146.70 149.70 RHYvx Quartz and/or feldspar crystal tuff

146.7 - 149.7: Crystal tuff containing QZ-eyes, FD crystals and elongated rhyolitic lpl. Unit becomes silicified from 148.1 to the bottom, possibly due to contact with RHYi.

<<Min: 146.7 - 162.4 0.5% Min: Pyrite>>

<<Alt: 148.1 - 153.4 Strong (Alt) Silicification>> Silcification of volcaniclastic rhyolite

149.70 152.60 RHYi Aphanitic Rhyolite (intrusion)

149.7 - 152.6: Patches of light grey aphanitic massive rhyolite. Original FD-crystals and QZ-eyes (from RHYvx?) are preserved within the massive rhyolite. Minor rounded QZ patches occur throughout the unit. Contacts appear gradational and are hard to distinguish form si

<<Struc: 149.8 - 149.81 dominant foliation>> Cleavage in SI-altered RHYv

152.60 162.40 RHYvx Quartz and/or feldspar crystal tuff

152.6 - 162.4: Subhedral-euhedral FD crystals and QZ-eyes in silica+MU groundmass. Continuous foliation defined by MU and elongated FD. Gradational upper (with RHYi) and lower (with RHYvl xtl) contacts.

<<Min: 153.4 - 166.8 1% Min: Calcite>>

162.40 165.90 RHYvl Lapilli tuff

162.4 - 165.9: Lithic (?) lpl, subhedral FD crystals, and QZ eyes in a silca+MU groundmass with local 1mm-2cm bands of semi-massive PY+/-PO.

<<Min: 162.4 - 165.9 3% Min: Pyrite>> Bands of semi-massive PO+PY

<<Min: 162.4 - 165.9 5% Min: Pyrrhotite>> Bands of semi-massive PO+PY

165.90 166.80 RHYcw Curdy textured-flow banded (flows, subvolcanics)

165.9 - 166.8: QZ-eye bearing curdy rhyolite. Gradational lower contact with SED. Transitions from strongly curdy rhyolite to QE tuffaceous (?) rhyolite to BT+CL+QZ+CA schist (metapelite).

<<Min: 165.9 - 174.5 1% Min: Pyrite>>

166.80 167.30 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

166.8 - 167.3: BI+CL+CA+QZ schist (metapelite). Continuous foliation defined by aligned BI grains. Fg CL+CA+QZ groundmass. Assemblage resembles a pelitic mudstone. Symmetric gradational or chilled margin contacts (?).

<<Min: 166.8 - 167.3 20% Min: Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

167.30 172.00 RHYvl Lapilli tuff

167.3 - 172: Light grey, tuffaceous rhyolite with rhyolitic and lithic lpl, subhedral FD-crystals, and QZ eyes in a Silica+MUgroundmass. Unit varies from FD-crystal rich (167.3- ~168.8 m) to lithic lpl rich (~170-172 m).

<<Min: 167.3 - 174.5 1% Min: Calcite>>

172.00 174.50 RHYcw Curdy textured-flow banded (flows, subvolcanics)

172 - 174.5: Good curdy textured rhyolite with fg MU anastomosing cleavage

174.50 178.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

174.5 - 178: BI+CL+CA+QZ schist (metapelite). Continuous foliation defined by aligned BI grains. Fg CL+CA+QZ groundmass. Assemblage resembles a pelitic mudstone. Symmetric gradational or chilled margin contacts (?).

<<Min: 174.5 - 178 3% Min: Pyrite>>

<<Min: 174.5 - 178 20% Min: Calcite>>

178.00 182.30 RHYcw Curdy textured-flow banded (flows, subvolcanics)

178 - 182.3: Good curdy textured rhyolite with disseminated QZ eyes and an anastomosing MU-cleavage

<<Min: 178 - 182.3 1% Min: Calcite>>

<<Min: 178 - 194.5 1% Min: Pyrite>>

182.30 183.40 RHYvl Lapilli tuff

182.3 - 183.4: light grey micaceous rhyolite tuff with moderate concentrations of altered lpl. Grades into RHYva at the bottom contact.

<<Min: 182.3 - 194.5 5% Min: Calcite>>

183.40 194.50 RHYva Coarse grained to ash tuff

183.4 - 194.5: Fine grained MU+Silica ashy tuff, with local patches of altered lpl.

194.50 203.20 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

194.5 - 203.2: Brownish-black, BI-CL-CA schist. Fg BI in an olive green CL-CA+/-QZ matrix with CA (after-FD?) crystals. Different than the other two MAFis in this hole. Originally logged as MAFi but the fly camp believes it to be intrusive.

<<Min: 194.5 - 203.2 3% Min: Pyrite>>

<<Min: 194.5 - 203.2 1% Min: Pyrrhotite>>

<<Vein: 49 - 49.2 40% Quartz 15 deg. >> 2 cm qtz- brown tourmaline vein w tourm in selvage also.

<<Struc: 49 - 49.2 Vein>> qtz brown tourmaline (?) vein. E-W strike, subvertical?

<<Struc: 49.8 - 49.81 dominant foliation>> NE strike/ SE dip?

53.92 54.40 RHYcw Curdy textured-flow banded (flows, subvolcanics)

53.92 - 54.4: or RHY vl. White siliceous bands dissected by sericite, once a competent flow?

54.40 56.70 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

54.4 - 56.7: fine grained,banded maroon (biot) and green f.g rx, peppered w f.g. stubby tourm or hbl?

56.70 58.25 RHYcw Curdy textured-flow banded (flows, subvolcanics)

56.7 - 58.25: or RHY vl. White siliceous bands dissected by sericite, once a competent flow?

<<Min: 56.85 - 63.95 5% Min: Calcite>>

58.25 63.95 RHYva Coarse grained to ash tuff

<<Vein: 63.4 - 139 0.06% Quartz-Tourmaline 15 deg. >> Total of 9 thin shallow angle mm-scale veins +/- py, po, cc, displaced by S2 foln but cuts coarse qtz-carb veins. Loc tourm halo in wallrock upto 2 cm. Up to 45 deg CA.

<<Struc: 59.2 - 59.21 >> 2nd foliation?

63.95 64.75 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

63.95 - 64.75: Very f.g. green rx (chl) w 1-3mm calcite porphyroblasts? Calcite veining.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 63.95 - 65.05 15% Min: Calcite>>

<<Vein: 63.95 - 64.75 5% Calcite 80 deg. >>

64.75 72.00 RHYva Coarse grained to ash tuff

<<Struc: 65.1 - 65.11 dominant foliation>>

<<Struc: 66.1 - 66.11 Vein>> thinqtz-brown tourm vein? E- strike, steep south dip.

72.00 73.45 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

72 - 73.45: Very f.g. green rx (chl) w small hbl or tourmaline xtals? Calcite veining.

<<Min: 72.15 - 74.1 10% Min: Calcite>>

<<Vein: 72.15 - 73 5% Quartz 85 deg. >> 2 veins, 4-6 cm

73.45 76.40 RHYva Coarse grained to ash tuff

76.40 78.80 RHYva Coarse grained to ash tuff

78.80 82.60 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

78.8 - 82.6: Very f.g. green rx (chl) w small hbl or tourmaline xtals? Calcite veining. Sharp contacts.

<<Min: 78.8 - 82.6 10% Min: Calcite>>

<<Vein: 81 - 82.6 2% Calcite 85 deg. >>

<<Struc: 81 - 99 dominant foliation>>

82.60 86.80 RHYvl Lapilli tuff

<<Min: 83.5 - 84.3 0.5% Min: Pyrrhotite>> Po in short flat seams // to foln and diss in band // to foln

86.80 88.85 RHYvx Quartz and/or feldspar crystal tuff

88.85 91.90 RHYvl Lapilli tuff grey

88.85 - 91.9: w faint lapilli shapes

<<Struc: 89.25 - 89.4 Strong (Alt) Fault>> small breccia fault gouge w fold in footwall w axial plane // to contact w fault gouge. Suggests reverse displacement.

91.90 96.00 RHYvl Lapilli tuff grey-green

91.9 - 96: includes 0.5m mafic dyke at UC consisting of f.g. greenish grey rx w biotite porphyroblasts at UC. Rest of interval is slightly greenish, rel hard (due to qtz veining?), w loc flecks of carbonate xtals,

<<Min: 95 - 96 0.5% Min: Pyrrhotite>>

<<Alt: 92.5 - 95.5 Weak (Alt) Chlorite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Vein: 92.4 - 94.85 8% Quartz 85 deg. >> 1 cm qtz veins slightly discordant to foln

<<Vein: 94.8 - 94.95 100% Quartz-Tourmaline 80 deg. >>

96.00 108.25 RHYva Coarse grained to ash tuff grey-brown

96 - 108.25: Mottled texture, sl sericite and chl altered groundmass, w some lapilli. Tightly folded qtz veins shows tight structure but rx not strongly foliated. 107.2-108.1: Xtal tuff (?) w ankerite-altered (?) broken xtals.

<<Min: 98.8 - 105 0.5% Min: Calcite>>

<<Min: 105 - 106.1 3% Min: Calcite>>

<<Vein: 99.2 - 166.2 0.02% Chlorite 5 deg. >> Few shallow angle fractures w chlorite coating.

<<Struc: 103.4 - 103.45 Weak (Alt) Fault>> fault gouge breccia

108.25 109.20 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

108.25 - 109.2: Irregular mottled siliceous bands in sericitic groundmass, once coherent rhyolite? Or RH?Yvl silicified by qtz veining?

109.20 121.67 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

109.2 - 121.67: Strongly mottled and striped rx showing granular chl-biot-qtz domains strongly dissected by creamy sericite foliae. Loc calcareous.Texturally destructive creamy pale pinkish sericite along S1 (dom) and S2.

<<Min: 111.6 - 123.6 0.5% Min: Pyrrhotite>> also in few heavily diss bands.

<<Min: 120.75 - 121.6 1% Min: Calcite>>

<<Min: 121.6 - 123.6 10% Min: Calcite>>

<<Alt: 109.2 - 121.67 Weak (Alt) Muscovite>> beige sericite overprinting chloritic overprint?

<<Alt: 109.2 - 121.67 Weak (Alt) Chlorite>> chloritic groundmass is dissected and overprinted by beige sericite.

<<Struc: 116.15 - 116.16 dominant foliation>> Dominant foln (S1) is later folded by axial planar S2 foln. Dom foln is E-W strike, N dip.

<<Struc: 116.17 - 116.18 >> Later axial planar S2 foln folds and crenulates dominant foln (S1). S2 has Nw Strike/ NE dip.

121.67 123.60 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown

121.67 - 123.6: fg brownish biotite-rich rx, dyke? Sharp UC (or alteration front), gradual LC, calcareous, w numerous folded carbonate veins. Could also be sed?

<<Alt: 123.26 - 135.65 Moderate (Alt) Muscovite>> beigey sericite replacing along foliations and overprinting chl.

<<Alt: 123.26 - 135.65 Weak (Alt) Chlorite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

123.60 135.65 RHYvl Lapilli tuff

123.6 - 135.65: Strongly mottled and striped rx showing granular chl-biot-qtz domains strongly dissected by creamy sericite foliae. Loc calcareous.Texturally destructive creamy pale pinkish sericite along foln. Some tightly folded bands of heavily diss po bands. 129-132.

<<Min: 123.6 - 134 1% Min: Calcite>>

<<Min: 123.6 - 153 1% Min: Pyrite>> approx 1% py mostly disseminated but also loc in heavily diss bands w dominant po. Some short sections where diss py > po.

<<Min: 123.6 - 153 3% Min: Pyrrhotite>> Approx 2% po, diss in core and in heavily disseminated folded bands. Some short sections po<1%. 152.75-152.85: 2-5% po py in bands.

<<Struc: 133.9 - 133.91 dominant foliation>> E-W/N

135.65 169.20 RHYvl Lapilli tuff

135.65 - 169.2: light greenish grey sericitic felsic rx w fragmental texture, w folded bands of heavily diss po +/- py. 160.35-160.95: MDSt. Maybe RHYc in places? 162.85-163.4: interbanded grey sericitic/ and chl-biot bands w stubby black mineral diss along foliae (limy

<<Min: 156.1 - 169.8 1% Min: Pyrrhotite>> in flat foliaform stringers and diss.

<<Min: 166 - 168 2% Min: Pyrrhotite>> po 1-2 % in flat foliaform seams

<<Min: 168 - 177 0.5% Min: Pyrrhotite>>

<<Alt: 135.65 - 145 Moderate (Alt) Muscovite>> light greenish grey sericite on foliae, loc strong?

0.00 4.00 OVBN Overburden

0 - 4: Overburden

4.00 7.20 RHYvl Lapilli tuff

4 - 7.2: Light grey, moderately foliated, < 10% of siliceous fragments/dismembered bands, deformed and folded, locally flattered within the foliation, within fine/medium matrix (Mu and CL altered). Probably lapilli tuff.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

7.20 8.93 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

7.2 - 8.93: Mafic ash tuff or mafic intrusive unit, fine to medium grained, equigranular, dark color. Moderately biotite altered (pervasive), moderate to strongly CA altered (Associated with subconcordant qtz veinlets and also pervasive). 3-4 % of thin qtz-fsp-+/-c

<<Min: 7.2 - 8.93 1% Min: Pyrrhotite>> Disseminated within the matrix.

<<Min: 7.2 - 8.93 2% Min: Calcite>> Associated with MAFta/MAFi, pervasive and thin qtz-fsp-cal veinlets.

<<Alt: 7.2 - 8.93 Moderate (Alt) Biotite>> Biotite pervasive, fine grained, within MAFta/MAFi

8.93 10.60 RHYvl Lapilli tuff

8.93 - 10.6: Light grey, moderately foliated, < 10% of siliceous fragments/dismembered bands, deformed and folded, locally flattered within the foliation, within fine/medium matrix (Mu and CL altered). Probably lapilli tuff.

<<Min: 8.93 - 13 0.1% Min: Pyrrhotite>>

10.60 11.05 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

10.6 - 11.05: Mafic ash tuff or mafic intrusive unit, fine to medium grained, equigranular, dark color. Moderately biotite altered (pervasive), moderate to strongly CA altered (Associated with subconcordant qtz veinlets and also pervasive). 3-4 % of thin qtz-fsp-+/-c

<<Min: 10.6 - 11.05 3% Min: Calcite>> Associated with MAFta/MAFi, pervasive and thin qtz-fsp-cal veinlets.

<<Alt: 10.6 - 11.05 Moderate (Alt) Biotite>> Biotite pervasive, fine grained, within MAFta/MAFi

11.05 14.55 RHYvl Lapilli tuff

11.05 - 14.55: Light grey, moderately foliated, < 10% of siliceous fragments/dismembered bands, deformed and folded, locally flattered within the foliation, within fine/medium matrix (Mu and CL altered). Probably lapilli tuff.

<<Min: 13 - 17.27 1% Min: Pyrrhotite>>

<<Struc: 13.43 - 13.44 dominant foliation>>

14.55 17.27 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

14.55 - 17.27: Mafic ash tuff or mafic intrusive unit, fine to medium grained, equigranular, dark color. Moderately biotite altered (pervasive), moderate to strongly CA altered (Associated with subconcordant qtz veinlets and also pervasive). 3-4 % of thin qtz-fsp-+/-c

<<Min: 14.55 - 17.27 6% Min: Calcite>> Associated with MAFta/MAFi, pervasive and thin qtz-fsp-cal veinlets.

<<Alt: 14.55 - 17.27 Moderate (Alt) Biotite>> Biotite pervasive, fine grained, within MAFta/MAFi

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

17.27 19.35 RHYvl Lapilli tuff

17.27 - 19.35: Light grey, moderately foliated, < 15% of siliceous fragments/dismembered bands, deformed and folded, locally flattered within the foliation, within fine/medium matrix (Mu and CL altered). Probably lapilli tuff.

<<Min: 17.27 - 19.35 1% Min: Calcite>>

<<Min: 17.27 - 27.3 0.1% Min: Pyrite>>

<<Min: 17.27 - 27.3 0.1% Min: Pyrrhotite>>

19.35 27.30 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

19.35 - 27.3: Mafic ash tuff or mafic intrusive unit, fine to medium grained, equigranular, dark color. Moderately biotite altered (pervasive), moderate to strongly CA altered (Associated with subconcordant qtz veinlets and also pervasive). 6 % of thin qtz-fsp-+/-cal

<<Min: 19.35 - 27.3 5% Min: Calcite>> Associated with MAFta/MAFi, pervasive and thin qtz-fsp-cal veinlets.

<<Alt: 19.35 - 27.3 Moderate (Alt) Biotite>> Biotite pervasive, fine grained, within MAFta/MAFi

<<Vein: 26.8 - 26.82 30% Tourmaline>> TML, irregular, in MAFt, few CA.

<<Struc: 22.76 - 22.77 dominant foliation>>

27.30 33.70 RHYva Coarse grained to ash tuff

27.3 - 33.7: Light/medium grey, massive, fine to coarse grained. Weakly foliated. Matrix weakly (Mu) altered (pervasive).<3% felsic fragments, lapilli sized, oriented within foliation. Qtz eyes, <2mm, disseminated within the matrix, weakly stretched. Ash tuff unit?

<<Min: 27.3 - 33.7 1% Min: Pyrrhotite>> Very small wisps distributed within the matrix.

<<Min: 27.3 - 44 1% Min: Calcite>>

<<Vein: 27.3 - 27.35 Quartz>> QZ vein at lower contact with MAFt.

33.70 36.70 RHYvl Lapilli tuff

33.7 - 36.7: Light grey, moderately foliated, < 15% of siliceous fragments/dismembered bands, deformed and folded, locally flattered within the foliation, within fine/medium matrix (Mu and CL altered). Locally similar "curdy" texture were observed. Probably lapilli

<<Min: 33.7 - 43.5 0.1% Min: Pyrite>>

<<Min: 33.7 - 43.5 0.1% Min: Pyrrhotite>>

36.70 53.60 RHYcw Curdy textured-flow banded (flows, subvolcanics)

36.7 - 53.6: light grey, fine to medium grained, comprinsing siliceous bands, milky, deformed,folded and locally dismembered, '' curdy" texture well conserved. Weakly/moderately MU altered.

44-49m: Siliceous bands are more fragmented, dismembered. Lapilli tuff or

<<Alt: 164.3 - 167.6 Strong (Alt) Chlorite>> Associated with mineralisation.

<<Vein: 164.7 - 165.3 80% Quartz-Chalcopyrite>> Massive irregular qtz vein, grey, deformed and discordant. Comprinsing 10 % of Cp (fracture filling).

167.30 171.22 MAFi Mafic Intrusions (primarily footwall mafic intrusion) FG

167.3 - 171.22: Green, fine grained, large interval of mafic intrusive, moderately sheared/foliated. Mainly chlorite altered (pervasive, moderate/strong). Locally centimetric biotite bands (porphyroblasts,small flakes). > 15% of Qtz-Cal veinlets/bands, concordant.

<<Min: 167.3 - 176.31 0.5% Min: Pyrrhotite>>

<<Min: 167.3 - 180.84 10% Min: Calcite>> Pervasive, porphyroblats and associated with subconcordant veinlets.

<<Alt: 167.6 - 171.22 Moderate (Alt) Chlorite>> MAFi

<<Struc: 169.3 - 169.31 Foliation>> Marqued by calcite porphyroblasts.

171.22 172.00 RHYi Aphanitic Rhyolite (intrusion)

171.22 - 172: Interval comprinsing >50 % of decimetric felsic dykes, aphanitic, banded, subconcordant. Diffused margins. Associated with MU.

<<Alt: 171.22 - 173.2 Weak (Alt) Muscovite>> Associated with RHYi interval.

172.00 176.31 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

172 - 176.31: Green to brownish, fine grained, large interval of mafic intrusive, moderately sheared/foliated. Mainly chlorite altered (pervasive, moderate/strong), locally biotite altered (small flakes disseminated, occuring as bands) > 10% of Qtz-Cal veinlets/bands,

<<Alt: 173.2 - 174.65 Moderate (Alt) Biotite>> MAFi altered by biotite (small flakes,mm, distributed within matrix)

<<Alt: 174.65 - 176.31 Moderate (Alt) Silicification>> Fuschite?

<<Alt: 174.65 - 176.31 Moderate (Alt) Muscovite>> Fuschite?

<<Vein: 175.5 - 176.12 20% Quartz-Carbonate>> Interval comprinsing qtz-cal veins, grey/milky, irregular oriented, deformed.Trace of Po and Sp at the margins.

<<Struc: 176.3 - 178.4 Moderate (Alt) Fault>> Interval moderately fractured, irregular oriented.

176.31 176.82 RHYi Aphanitic Rhyolite (intrusion)

176.31 - 176.82: decimetric felsic dykes, aphanitic, banded, subconcordant. Diffused margins. Associated with MU. Comprinsing irregular qtz-Cal veins, dm, mineralised (Sp and Py at the edges).

<<Min: 176.31 - 176.82 2% Min: Sphalerite>> Occuring as thin stringer and small aggregates

<<Min: 176.31 - 176.82 2% Min: Pyrrhotite>> Occuring as thin stringer and small aggregates.

Comments:						Parent Hole:	

The purpose of this hole was to test for eastern extent of main ABM lens. A prior hole from this pad (K15-263, at -75 deg dip) did not intersect massive sulphide but did intersect a zone of strong cordierite- greasy chlorite- talc alteration, showing brecciated textures. The top of this hole (-265) consists of a succession of lapilli tuff and ash tuff (RHYvl and va), intercalated with mafic tuffs and cut by mafic dykes, and also cut by RHYi (127.8-128.4 and 171-172.2). This hole (265, -55 dip) did intersect massive sulphide mineralization at the expected depth, topped and cored by strong cord-chl-talc alteration. A few copper rich zones were observed. The whole zone spans 172-199 m with the main massive sulphide horizon occuring between 184.15 and 199.4m. The footwall to the masive sulphides consists of felsic volcaniclastics, cut by the footwall mafic intrusion from 213 to 270.15. Its lower contact is intruded by RHYi and is marked by strong py veinlets +/- sphalerite. The hole ends in silica and musc-altered RHYv.

Downhole Surveys:

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-266

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Trevor Rabb
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	21-Sep-15
UTM Easting	414698.867	Core Size:	HQ3	Azimuth:	180.2	Date Logging Complete:	21-Sep-15
UTM Northing:	6815466.42	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1418.903	Casing Depth (m):	7.5	Length (m):	110	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	19-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	20-Sep-15
Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-272

Comments:

This hole is an HQ-size Metallurgical twin of K15-272. The hole encountered continuous and discontinuous masive sulphide lenses near top of hole from 38.85 to 41.4 (OB+OC continuous) and 52.4 to 55 (OI, discontinuous) within a stringer zone from 37.7 to 62.2m. Main ABM Massive sulphide intersected (OA and OB) from 62.2 to 104.17 with interveining wall rock totalling 3.5m dilution (RHYv).

Downhole Surveys:

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-267

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	20-Sep-15
UTM Easting	415151.403	Core Size:	NQ3	Azimuth:	179.67	Date Logging Complete:	22-Sep-15
UTM Northing:	6815554.372	Casing Pulled?:	Yes	Dip:	-65	Drill Company:	Geotech
UTM Elev. (m):	1402.897	Casing Depth (m):	15	Length (m):	218	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	19-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	21-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

K15-267 was drilled as a resource infill between historic holes K95-134 and K94-016. K15-270 was drilled as a twin to collect samples of MET3 and MET5 domains.
The hanging wall stratigraphy consists of mixed felsic and mafic volcanics/intrusives from 15-136.4 m. Noticeable MU-alteration in the hanging wall occurred from ~85.5-134.9 m, where the alteration increased to CL+CI near the MSXS. MSXS was encountered from 136.4-161.1 m, consisting of OJ, OB, OA, OH, OI. The footwall consists of volcaniclastic rhyolite from 161.1-165.3 m, with strong CL+CI alteration proximal to the MSXS. From 165.3-218 m (EOH) a CL-BI-CA schist (MAFi) was encountered.

15 - 17.1: CL+CA+/-BI schist with relatively sharp lower contact.											

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 15 - 17.1 20% Min: Calcite>>

<<Min: 15 - 72 1% Min: Pyrite>>

<<Min: 15 - 72 1% Min: Pyrrhotite>>

17.10 23.60 RHYva Coarse grained to ash tuff

17.1 - 23.6: fine grained ash tuff with minor rhyolite and mafic lpl. Local ~3 cm bands with chloritic groundmass.

<<Min: 17.1 - 23.6 2% Min: Calcite>>

23.60 24.30 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

23.6 - 24.3: Banded BI and CL with fine grained CA crystals. Sharp lower and upper contact.

<<Min: 23.6 - 24.3 20% Min: Calcite>>

24.30 26.90 RHYva Coarse grained to ash tuff

24.3 - 26.9: Medium green-grey, fine grained MU+QZ+CL+/-bi ash tuff with minor rhyolitic lpl

<<Min: 24.3 - 26.9 2% Min: Calcite>>

26.90 32.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

26.9 - 32: CL+CA+/-BI schist. CA bands and fine grain crystals. CL+/-BI makes up the foliated groundmass.

<<Min: 26.9 - 36.8 20% Min: Calcite>>

32.00 32.70 RHYcw Curdy textured-flow banded (flows, subvolcanics)

32 - 32.7: Curdy rhyolite with interstitial MAFi. Pepperitic texture?

32.70 36.80 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

32.7 - 36.8: BI+CA+CL schist, with poorly developed foliation. CA crystals rimmed with BI. Gradational lower boundary from 36.1-36.8 m.

36.80 38.90 RHYvl Lapilli tuff

36.8 - 38.9: Unit grades from rhyolitic lpl in a MU+QZ groundmass at the top to CL+CA lpl in a MU+QZ+CL groundmass at the bottom.

<<Min: 36.8 - 38.9 2% Min: Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

38.90 39.50 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

38.9 - 39.5: BI+CL+CA schist with gradational upper and lower contacts.

<<Min: 38.9 - 39.5 20% Min: Calcite>>

39.50 44.20 RHYvl Lapilli tuff

39.5 - 44.2: Unit is dominated by well foliated rhyolitic lpl within a MU+QZ groundmass. Small intersection of RHYva from 40.7-41.4 m, which lacks lpl.

<<Min: 39.5 - 44.2 2% Min: Calcite>>

44.20 44.80 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

44.2 - 44.8: banded CL-BI-CA schist with sharp upper and lower contacts

<<Min: 44.2 - 46.4 1% Min: Calcite>>

44.80 46.40 RHYvl Lapilli tuff

44.8 - 46.4: rhyolitic lpl within a MU+QZ groundmass. Fracture sets with tourmaline growths in the fracture and on the selvages.

46.40 47.30 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

46.4 - 47.3: CA porphyroblastic, CL+CA+MU+/-BI schist. Sharp upper and lower contacts.

<<Min: 46.4 - 47.3 20% Min: Calcite>>

47.30 50.00 RHYvl Lapilli tuff

47.3 - 50: Unit is dominated by rhyolitic lpl within a MU+QZ groundmass. Locally displays coherent flow banded texture.

<<Min: 47.3 - 50 2% Min: Calcite>>

50.00 63.50 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

50 - 63.5: CL+BI+CA schist. CA blebs resemble fragmental lpl. Upper and lower contact are relatively sharp.

<<Min: 50 - 55.3 30% Min: Calcite>>

<<Min: 55.3 - 68 5% Min: Calcite>>

63.50 65.80 RHYc Rhyolite coherant volcanics

63.5 - 65.8: Good coherent siliceous banded texture with a MU+QZ groundmass. Local volcaniclastic textures (lpl).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

65.80 67.40 RHYvl Lapilli tuff

65.8 - 67.4: BI+CL+CA lpl within a MU+QZ groundmass

67.40 72.00 RHYvl Lapilli tuff

67.4 - 72: Rhyolite lpl within a MU-QZ groundmass. Local ~10 cm zone of flow banded rhyolite.

<<Min: 68 - 72 2% Min: Calcite>>

72.00 78.20 RHYvl Lapilli tuff

72 - 78.2: BI+CL+CA lpl within a MU+QZ groundmass

<<Min: 72 - 78.2 10% Min: Calcite>>

<<Min: 72 - 132.9 2% Min: Pyrite>>

<<Min: 72 - 132.9 2% Min: Pyrrhotite>>

78.20 79.40 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

78.2 - 79.4: BI+CL+CA schist. Poorly developed foliation. CA is confined mainly to bands rimmed by BI.

<<Min: 78.2 - 79.4 20% Min: Calcite>>

79.40 85.50 RHYvl Lapilli tuff

79.4 - 85.5: BI+CL+CA lpl within a MU+QZ groundmass

<<Min: 79.4 - 85.3 10% Min: Calcite>>

85.50 89.60 RHYvl Lapilli tuff

85.5 - 89.6: rhyolite and PY (after-lithic?) lpl within a yellow-green MU-altered MU-QZ groundmass

<<Min: 85.5 - 101.6 5% Min: Calcite>>

<<Alt: 85.5 - 91.4 Weak (Alt) Muscovite>>

89.60 91.80 RHYv Rhyolite volcaniclastic

89.6 - 91.8: Yellow-green MU-altered, fine grained MU+PO+QZ schist. Hard to determine whether originally RHYva or RHYvl.

<<Alt: 91.4 - 101.6 Moderate (Alt) Muscovite>>

91.80 101.60 RHYvl Lapilli tuff

91.8 - 101.6: yellow-green, cm-scale rhyolite lpl and mm-scale lithic/sulphide lpl within a well foliated MU+QZ groundmass.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

This hole was drilled to test a gravity high associated with an EM high, northwest of the GP4F deposit. This hole intersected rhyolite lapilli tuffs, ash tuffs, and crystal tuffs, and pelitic metasediments and carbonaceous sediments. This hole cuts a higher ratio of pelitic metasediments to felsic volcanic compared to the holes drilled in the immediate vicinity of the GP4F deposit. This hole intersected a quartz-feldspar phyric rhyolite crystal tuff (281.45-291.55m) which may be the lateral equivalent of the quartz-feldspar crystal tuff encountered around the GP4F horizon. This unit was relatively un-altered and showed no mineralization. Below this quartz-feldspar phyric unit this hole intersected carbonaceous and siliceous mudstones, which mark the transition from a volcaniclastic/sedimentary sequence to a dominantly sedimentary sequence. No significant mineralization or alteration was intersected in this hole. No samples were taken.

0 - 1: Overburden.

1.00 8.90 RHYvl Lapilli tuff grey FMG

1 - 8.9: Grey, to brown (where oxidized), foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli-ash tuff. Matrix supported, ash tuff with 20-30% small (1-2cm) siliceous lapilli. Several graded contacts with fining up hole. Abundant 1-2mm biotite crystals in the finer sequences. Weak to moderate oxidation along fractures.

8.90 9.85 SED undifferentiated Sediment dark grey FG

8.9 - 9.85: Dark grey to brownish grey, foliated, fine grained, biotite-quartz schist/metapelite.

9.85 32.00 RHYvl Lapilli tuff grey FMG

9.85 - 32: Grey, to brown (where oxidized), foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli-ash tuff. Matrix supported, ash tuff with 20-30% small (1-2cm) siliceous lapilli. Several graded contacts with fining-up up hole. Abundant 1-2mm biotite crystals in the finer sequences. Weak to moderate oxidation along fractures with vuggy textures associated with the strongest oxidation.

<<Struc: 22.6 - 23.6 Weak-Moderate (Alt) Fault>> Broken core.

32.00 41.90 RHYvl Lapilli tuff light grey FMG

32 - 41.9: Grey to light grey, and brown (where oxidized), foliated, fine to medium grained, quartz-muscovite schist/rhyolite, feldspar crystal, lapilli tuff. Could be feldspar porphyry; with ghosts of possible feldspar crystals although some still look like siliceous lapilli. Much more massive and homogenous unit. Oxidation continues along fractures and up to 10-20 cm from fractures.

<<Vein: 39.6 - 39.75 90% Quartz-Carbonate 80 deg. >> quartz-carbonate vein.

<<Struc: 33 - 33.5 Weak-Moderate (Alt) Fault>> Broken core.

41.90 46.70 RHYva Coarse grained to ash tuff light grey FG

41.9 - 46.7: Light grey, foliated, fine grained, quartz-muscovite schist/rhyolite ash tuff. Occasional small (10-15cm) bands with up to 10% lapilli. Cut by occasional small quartz veins, and weakly oxidized on fractures.

46.70 50.00 RHYvl Lapilli tuff light grey FMG

46.7 - 50: Light grey, well foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. This sequence fines down hole from clast supported, lapilli dominated tuff to ash dominant tuff.

50.00 57.55 RHYva Coarse grained to ash tuff light grey FG

50 - 57.55: Light grey, foliated, fine grained, quartz-muscovite-(amphibole) schist/rhyolite ash tuff. Abundant (locally up to 10%) fine (1mm) biotite porphyroblasts(?).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

57.55 62.80 SED undifferentiated Sediment brown FG

57.55 - 62.8: Brown to grey, well foliated, fine grained, biotite-quartz schist/metapelite. Cut by small quartz-carbonate veinlets.

62.80 67.30 RHYva Coarse grained to ash tuff light grey FMG

62.8 - 67.3: Light grey, foliated, fine to locally medium grained, quartz-muscovite schist/rhyolite ash tuff interbedded with small zone (20-50cm) of rhyolite lapilli tuff with gradational contacts. Abundant small (<1mm) biotite porphyroblasts.

67.30 70.70 RHYvx Quartz and/or feldspar crystal tuff light grey FMG

67.3 - 70.7: Light grey, well foliated, fine and medium grained, quartz-muscovite schist/rhyolite crystal-lapilli tuff. A fine grained matrix supported tuff with large (1-2cm) elongated altered feldspar crystals (or lapilli or both). Looks like porphyry although it appears to grade outward to a lapilli tuff and an ash tuff. No sharp contacts. Contains abundant (1mm) biotite porphyroblasts and abundant (<1mm) white porphyroblasts (leucoxene?).

70.70 73.30 SED undifferentiated Sediment grey-brown FG

70.7 - 73.3: Grey-brown, foliated, fine grained, biotite-quartz schist/metapelite. Gradational upper and lower contacts. Abundant small (1mm) white, hard, sub angular to sub rounded, porphyroblasts (leucoxene?) Cut by small quartz-carbonate veinlets.

73.30 76.75 RHYvl Lapilli tuff grey-brown FMG

73.3 - 76.75: Light grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite ash tuff interbedded with rhyolite lapilli tuff.

76.75 77.55 SED undifferentiated Sediment grey-brown FG

76.75 - 77.55: Grey-brown, foliated, fine grained, biotite-quartz schist/metapelite. Gradational contacts. Cut by small quartz-carbonate veinlets.

77.55 85.95 RHYvx Quartz and/or feldspar crystal tuff light grey FMG

77.55 - 85.95: Light grey, foliated, fine to medium to coarse grained, quartz-muscovite schist/rhyolite crystal-lapilli tuff. Excellent preservation of primary textures within this unit. Very obvious feldspar crystals (0.5cm) and large (1-2cm) lithic lapilli with visible feldspar crystals (<1mm) with in the lithic fragment. Gradational variation within this unit with variable lapilli/ash/crystal content. Gradational upper and lower contacts. Locally abundant 1mm biotite crystals (could be phenocrsyts or could be porphyroblasts).

85.95 89.60 SED undifferentiated Sediment grey-brown FG

85.95 - 89.6: Dark brown and grey, foliated, fine grained, quartz-biotite schist/metapelite interbedded with quartz-muscovite schist/rhyolite ash tuff. Both gradational contacts and sharp.

<<Min: 89 - 90.5 1% Min: Pyrite>> narrow bands (up to 5cm) with up to 5% diseminated pyrite and pyrrhotite.

From (m)	To (m)	Rocktype & Description			From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

89.60 94.30 RHYvx Quartz and/or feldspar crystal tuff light grey FMG

89.6 - 94.3: Grey, foliated, fine to medium to coarse grained, quartz muscovite schist/rhyolite lapilli tuff. Abundant, densely packed, large (1-2cm) lithic lapilli in a fine ash matrix.

94.30 96.80 SED undifferentiated Sediment grey-brown FG

94.3 - 96.8: Brown and grey, foliated, fine grained biotite-quartz schist/metapelite interbedded with quartz muscovite schist/rhyolite ash-lapilli tuff. Sharp contacts.

96.80 103.90 RHYva Coarse grained to ash tuff light grey FMG

96.8 - 103.9: Light grey, foliated (to massive), fine to medium grained, quartz-muscovite tuff/ rhyolite ash tuff. Dominantly ash tuff with minor lapilli component locally up to 10% lapilli over 10-20cm. Very small crystals visible within some of the lithic lapilli fragments.

103.90 105.10 SED undifferentiated Sediment brown FG

103.9 - 105.1: Brown, weakly foliated, fine grained, biotite-quartz schist/metapelite. Small zones with graded beds (cross bedding??), otherwise massive, equigranular quartz-biotite schist. Cut by occasional small quartz-carbonate veins.

105.10 108.50 RHYva Coarse grained to ash tuff light grey FMG

105.1 - 108.5: Light grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite ash tuff. Dominantly ash tuff with minor lapilli component locally up to 10% lapilli over 10-20cm. Abundant 1mm biotite crystals.

108.50 111.10 SED undifferentiated Sediment brown FG

108.5 - 111.1: Brown, weakly foliated, fine grained, biotite-quartz schist/metapelite.Sharp lower contact, gradational upper contact. Cut by occasional small quartz-carbonate veins.

111.10 123.00 RHYva Coarse grained to ash tuff light grey FMG

111.1 - 123: Light grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite ash tuff. Dominantly ash tuff with minor lapilli component locally up to 10% lapilli over 10-20cm. Abundant 1mm biotite crystals.

<<Vein: 115.5 - 119 5% Quartz 0 deg. >> 1 cm wide quartz-pyrite-tourmaline vein parallel to core axis.

123.00 127.10 RHYi Aphanitic Rhyolite (intrusion) beige VFG

123 - 127.1: Light grey to beige, massive to brecciated, very fine grained, rhyolite dyke (flow?). Large (123.0m 124.3m) quartz vein at upper contact containing pyrite and pyrrhotite. Lower contact is brecciated with quartz viening and several phases of intrusion (finer grained and coarse grained).

<<Min: 123 - 124 1% Min: Pyrrhotite>> pyrrhotite veinlets.

<<Min: 123 - 124.3 1% Min: Pyrite>> pyrite veinlets.

<<Vein: 123 - 124.3 80% Quartz 80 deg. >> large quartz-pyrite-pyrrhotite vein.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

127.10 127.65 RHYva Coarse grained to ash tuff grey FMG

127.1 - 127.65: Light grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite ash tuff. Dominantly ash tuff with minor lapilli component locally up to 10% lapilli over 10-20cm. Gradational lower contact.

127.65 128.60 SED undifferentiated Sediment brown FG

127.65 - 128.6: Brown, weakly foliated, fine grained, biotite-quartz schist/metapelite. Gradational contacts. Cut by occasional small quartz-carbonate (+/-pyrite) veins.

128.60 130.40 RHYva Coarse grained to ash tuff light grey FG

128.6 - 130.4: Light grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite ash tuff. Abundant small biotite xls. Gradational upper contact.

<<Struc: 130 - 130.1 Weak-Moderate (Alt) dominant foliation>>

130.40 135.50 RHYvl Lapilli tuff grey FMG

130.4 - 135.5: Grey, foliated, fine to medium grained, quartz-muscovite-biotite schist/rhyolite lapilli tuff interbedded with narrow (10-20cm) bands of pelitic sediments (biotite schist).

135.50 138.10 SED undifferentiated Sediment grey-brown FG

135.5 - 138.1: Brown, foliated, fine grained, biotite schist/pelitic metasediment. Sharp upper contact, gradational lower contact. Cut by occasional quartz carbonate veins. Relatively homogeneous otherwise.

138.10 140.70 RHYva Coarse grained to ash tuff grey FMG

138.1 - 140.7: Grey, weakly foliated to massive, fine grained, quartz-muscovite-biotite schist/rhyolite ash tuff. The bottom 40cm of this unit is a biotite-rich lapilli tuff. The tuffaceous unit is weakly silicified with weak, patchy sericite alteration.

<<Alt: 138.1 - 140.7 Weak (Alt) Silicification>> Weak quartz-sericite alteration.

<<Alt: 138.1 - 140.7 Weak (Alt) Muscovite>> Weak quartz-sericite alteration.

<<Struc: 140 - 140.1 Weak-Moderate (Alt) dominant foliation>>

140.70 144.40 SED undifferentiated Sediment grey-brown FG

140.7 - 144.4: Grey-brown, foliated, fine grained, biotite and biotite-quartz schist/metapelite. Cut by occasional quartz carbonate veins.

<<Vein: 140.7 - 141 95% Quartz 70 deg. >> quartz vein

144.40 145.80 RHYva Coarse grained to ash tuff

144.4 - 145.8: Grey, weakly foliated to massive, fine grained to medium grained, quartz-muscovite-biotite schist/rhyolite ash tuff with up to 5% lapilli locally. Abundant fine grained biotite in this unit (up to 25%).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

145.80 148.05 SED undifferentiated Sediment grey-brown FG

145.8 - 148.05: Grey-brown, foliated, fine grained, biotite schist/metapelite. Cut by occasional quartz carbonate veins.

148.05 149.00 RHYva Coarse grained to ash tuff grey FMG

148.05 - 149: Grey, moderately foliated, fine grained, quartz-muscovite-biotite schist/rhyolite ash tuff. This unit could be an epiclastic sediment with small quartz 'grains' in a quartz-biotite matrix.

149.00 150.00 SED undifferentiated Sediment green-brown FG

149 - 150: Grey to brown and weakly green, foliated, fine grained, quartz-biotite-chlorite schist/pelitic metasediment with minor mafic component. Cut by occasional quartz-carbonate veins.

150.00 157.05 RHYva Coarse grained to ash tuff grey FG

150 - 157.05: Grey, weakly foliated to massive, fine grained, quartz-muscovite-biotite schist/rhyolite ash tuff with abundant biotite (locally up to 20%). The biotite content could suggest an epiclastic sediment in places with a high component of pelitic clays in the original rock.

<<Vein: 153.7 - 153.8 95% Quartz 80 deg. >> quartz vein

<<Struc: 150 - 150.1 Weak-Moderate (Alt) dominant foliation>>

157.05 159.60 SED undifferentiated Sediment grey-brown FG

157.05 - 159.6: Grey to brown, foliated to massive, fine grained, biotite and quartz biotite schist/pelitic metasediment interbedded with possible epiclastic sediments.

159.60 176.40 RHYva Coarse grained to ash tuff grey FG

159.6 - 176.4: Light to medium grey, foliated, relatively homogenous, fine to very fine grained, quartz-muscovite, schist/rhyolite ash tuff. Up to 10% small (<0.5cm) lithic lapilli. Cut by occasional quartz veins, and cut by occasional, tightly folded, convoluted, carbonate veins. 65-65.5m broken core - weak fault zone.

<<Vein: 160.3 - 160.4 95% Quartz 80 deg. >> quartz vein

<<Vein: 164.5 - 165.1 20% Quartz-Carbonate 80 deg. >> quartz carbonate veins

<<Struc: 160 - 160.1 Weak-Moderate (Alt) dominant foliation>>

<<Struc: 170 - 170.1 Moderate (Alt) dominant foliation>>

176.40 177.00 SED undifferentiated Sediment brown FG

176.4 - 177: Brown, foliated, fine grained, biotite schist/metapelite, with rhyolite ash tuff above and rhyolite lapilli tuff below.

<<Vein: 176.4 - 176.6 60% Quartz 60 deg. >> quartz vein

177.00 177.90 RHYvl Lapilli tuff grey FMG

177 - 177.9: Grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff.

<<Vein: 177.7 - 177.8 90% Quartz 70 deg. >> quartz vein

177.90 178.40 SED undifferentiated Sediment brown FG

177.9 - 178.4: Brown, foliated, fine grained, biotite schist/metapelite.

178.40 181.30 RHYvl Lapilli tuff grey FMG

178.4 - 181.3: Grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff.

<<Struc: 180 - 180.1 Moderate (Alt) dominant foliation>>

181.30 183.15 SED undifferentiated Sediment brown FG

181.3 - 183.15: Brown, foliated, fine grained, biotite schist/metapelite. Cut by occasional, cms scale quartz veins.

<<Vein: 182.2 - 182.4 80% Quartz 80 deg. >> quartz vein

183.15 188.00 RHYva Coarse grained to ash tuff grey FG

183.15 - 188: Light to medium grey, foliated, fine to very fine grained, quartz-muscovite, schist/rhyolite ash tuff. Up to 10% small (<0.5cm) lithic lapilli. Interbeded with narrow (10-20cm) biotite rich bands of metapelite. Cut by occasional quartz veins.

188.00 190.60 RHYva Coarse grained to ash tuff light grey FG

188 - 190.6: Light grey, foliated, moderately altered, faulted, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff and fault zone. Contains partially healed breccia, broken rock and weak gouge development. Alteration is moderate, pervasive sericite alteration overprint associated with the fault zone.

<<Struc: 188 - 190.6 Moderate (Alt) Fault>> moderately sericite altered fault zone with minor fault gouge.

190.60 193.90 SED undifferentiated Sediment grey-brown FG

190.6 - 193.9: Light grey to brown, foliated, fine grained, quartz-muscovite schist/rhyolite ash tuff grading up hole to a biotite-quartz schist to a biotite schist/metapelite. Excellent example of an ash tuff grading up hole to a pelitic sediment.

<<Struc: 192 - 192.1 Moderate (Alt) dominant foliation>>

193.90 199.60 RHYva Coarse grained to ash tuff grey FG

193.9 - 199.6: Light to medium grey, foliated, fine to very fine grained, quartz-muscovite, schist/rhyolite ash tuff. Up to 10% small (<0.5cm) lithic lapilli. Cut by occasional quartz veins. Narrow bands (up to 20cm) of biotite-rich metapelite.

199.60 201.10 SED undifferentiated Sediment grey-brown FG

199.6 - 201.1: Brown, foliated, fine grained, biotite schist. Upper contact is gradational with ash tuff.

<<Struc: 200 - 200.1 Moderate (Alt) dominant foliation>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

201.10 207.30 RHYvl Lapilli tuff grey FMG

201.1 - 207.3: Grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Abundant <1cm siliceous lithic lapilli in a quartz-muscovite matrix. Some 'fragments' could be ghosts of feldspar crystals and are sub rectangular. Abundant small (1-2mm) white, sub rounded to sub angular (subhedral diamond shaped) porphyroblasts (cordierite?) exist near the lower contact (within 50cm of contact).

207.30 209.85 SED undifferentiated Sediment grey-brown FMG

207.3 - 209.85: Brown to grey, foliated, fine grained, biotite schist/metapelite interbedded with a fine to medium grained quartz-muscovite schist/rhyolite lapilli tuff. Excellent examples of gradational contacts between a rhyolite lapilli tuff (down hole) grading up to an ash tuff and finally a biotite-rich metapelite.

209.85 213.55 RHYi Aphanitic Rhyolite (intrusion) light grey VFG

209.85 - 213.55: Light grey, weakly foliated to massive, very fine grained to aphanitic, siliceous, rhyolite intrusion (rhyolite flow? Or silicified ash tuff), gradational contacts seem to suggest silicified ash tuff. Possible gradational contact up hole into lapilli tuff. Rare 2-5mm ghosts of feldspar phenocrsyts.

<<Alt: 209.85 - 213.55 Weak-Moderate (Alt) Silicification>> pervasive silicification.

<<Struc: 210 - 210.1 Moderate (Alt) dominant foliation>>

213.55 214.70 SED undifferentiated Sediment brown FG

213.55 - 214.7: Brown, foliated, fine grained, biotite-quartz schist/metapelite. Gradational contacts with the rhyolite below.

214.70 224.30 RHYi Aphanitic Rhyolite (intrusion) light grey VFG

214.7 - 224.3: Light grey, massive, fine grained to aphanitic, rhyolite intrusion (flow? Silicified ash?). Gradational contacts.

<<Alt: 214.7 - 222.999 Weak-Moderate (Alt) Silicification>> pervasive silicification

224.30 226.15 RHYvl Lapilli tuff grey FMG

224.3 - 226.15: Grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Matrix supported, 1-2cm siliceous lithic lapilli in a fine quartz muscovite matrix with 2-5% biotite porphyroblasts. Gradational contact with the upper aphyric rhyolite.

226.15 227.60 SED undifferentiated Sediment brown FG

226.15 - 227.6: Brown, foliated, fine grained biotite schist/metapelite. Cut by occasional quartz-carbonate vein (up to 5cm).

227.60 231.80 RHYvl Lapilli tuff grey FMG

227.6 - 231.8: Grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Matrix supported, 1-2cm siliceous lithic lapilli in a fine quartz muscovite matrix with 1-2% biotite porphyroblasts.

231.80 232.90 SED undifferentiated Sediment brown FG

231.8 - 232.9: Brown, foliated, fine grained biotite schist/metapelite. Cut by occasional quartz-carbonate veins (up to 5cm).

<<Vein: 231.8 - 232.5 80% Quartz 80 deg. >> quartz veins.

232.90 239.60 RHYvl Lapilli tuff light grey FMG

232.9 - 239.6: Grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Matrix supported, 1-2cm siliceous lithic lapilli in a fine quartz muscovite matrix with 1-2% biotite porphyroblasts. 239.15-239.6 quartz vein with pyrite and pyrrhotite.

<<Vein: 239.15 - 239.6 90% Quartz 80 deg. >> quartz-pyrite-pyrrhotite.

239.60 245.65 SED undifferentiated Sediment brown FG

239.6 - 245.65: Brown, foliated, fine grained biotite schist/metapelite. Cut by occasional quartz-carbonate veins (up to 5cm).

245.65 254.60 SED undifferentiated Sediment grey-brown FG

245.65 - 254.6: Grey and brown, foliated, fine grained, biotite schist/metapelite interbedded with quartz-muscovite schist/rhyolite ash tuff. Several ~1m bands of metapelite interbedded with several ~1m bands of rhyolite ash tuff with up to 10% biotite.

254.60 259.50 RHYvl Lapilli tuff light grey FMG

254.6 - 259.5: Light grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff grading into rhyolite ash tuff. Abundant 1-2cm siliceous lithic lapilli in a fine grained quartz-muscovite ash matrix.

259.50 262.45 RHYvl Lapilli tuff light grey FG

259.5 - 262.45: Dominantly quartz vein in a light grey, altered rhyolite lapilli tuff.

<<Vein: 259.5 - 262.45 90% Quartz 20 deg. >> quartz vein

262.45 263.75 RHYvl Lapilli tuff light grey FMG

262.45 - 263.75: Light grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff.

263.75 270.00 RHYvl Lapilli tuff grey-brown FMG

263.75 - 270: Medium grey, foliated, banded, fine to medium grained, quartz-muscovite schist and quartz biotite schist. Banded rhyolite lapilli tuff and epiclastic sediments.

270.00 272.60 SED undifferentiated Sediment brown FG

270 - 272.6: Brown, foliated, fine grained, biotite schist/metapelite. Gradational lower contact. Cut by occasional quartz-carbonate veinlets.

272.60 281.45 RHYvl Lapilli tuff grey FMG

272.6 - 281.45: Grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff interbedded with small zones of rhyolite ash tuff and small zones of biotite-rich metapelite. The base of this unit is a densely packed coarse rhyolite lapilli tuff that grades up to an ash tuff over 1m.

From (m)	To (m)	Rocktype & Description			From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

281.45 291.55 RHYvx Quartz and/or feldspar crystal tuff grey FMG

281.45 - 291.55: Grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite crystal-lapilli tuff. Rare 2-4mm bluish quartz crystals, with abundant 1-5mm sub rectangular feldspar crystals in a fine quartz-muscovite-biotite matrix. Cut by occasional quartz veins. Fine grained disseminated pyrite and pyrrhotite in bands up to 5cm.

291.55 295.15 MDSc Carbonaceous dominant mudstone dark grey VFG

291.55 - 295.15: Dark grey, finely laminated, very fine grained, carbonaceous mudstone. Very fine bands (0.1-1cm) of carbonaceous material and more siliceous material.

295.15 295.50 RHYva Coarse grained to ash tuff cream VFG

295.15 - 295.5: Light grey to off white, finely laminated, very fine grained, aphanitic rhyolite ash tuff. Gradational upper contact with carbonaceous sediment and sharp lower contact.

295.50 303.50 RHYvl Lapilli tuff grey FMG

295.5 - 303.5: Grey, foliated, fine to medium grained, quartz-muscovite-biotite schist/epiclastic or sedimentary rock (wacke?). May still contain some lapilli but more 'primary' biotite than previous lapilli tuffs. Grades downhole to a lapilli tuff.

303.50 310.50 RHYvl Lapilli tuff beige FG

303.5 - 310.5: LIght grey to beige, weakly laminated, moderately to strongly altered, quartz-muscovite schist/altered rhyolite lapilli tuff and/or ash tuff. Alteration is moderte to strong, pervsive sericite-quartz-pyrite alteration, making the rock beige in color. Cut by several small (mm scale), concordant and discordant, pyrite veinlets and small (1-2cm) quartz veins. Small (2-5cm) fracture zones with clay alteration. Alteration starts as patchy zones with less altered patches of rhyolite lapilli tuff similar to th ebove unit.

<<Alt: 303.5 - 310.5 Moderate-Strong (Alt) Muscovite>> pervasive sericite-muscovite-pyrite alteration.

310.50 313.10 MDSc Carbonaceous dominant mudstone dark grey VFG

310.5 - 313.1: Dark grey, finely laminated, folded, very fine grained, carbonceous mudstone. 1-2% fien to medium grained disseminated pyrite and 1-2% narrow pyrite veinlets. Cut by occasional narrow quartz veins.

<<Min: 310.5 - 313.1 2% Min: Pyrite>> disseminated pyrite

313.10 314.45 RHYva Coarse grained to ash tuff light grey VFG

313.1 - 314.45: Light grey to beige, foliated, very fine grained, siliceous siltstone/rhyolite very fine ash tuff. Gradational upper contact, sharp lower contact. This unit fines upwards from coarse ash to very fine ash at the top. Cut by occasional narrow quartz veinlet. Weak pervasiove silicification.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

314.45 317.10 MDSc Carbonaceous dominant mudstone grey VFG

314.45 - 317.1: Light to medium grey, finely laminated, very fine grained, siliceous, carbonaceous mudstone. Silicification increases down hole towards abundant quartz veining.

<<Alt: 314.45 - 317.1 Moderate (Alt) Silicification>> pervasive silicification

317.10 318.20 SED undifferentiated Sediment green-brown FG

317.1 - 318.2: Light brown and green, foliated, altered, biotite-chlorite-carbonate schist. Dominantly biotite with narrow zones of chlorite, that could represent a mafic component in the pelite. Cut by abundant quartz veins (up to 10cm).

<<Alt: 317.1 - 318.2 Moderate-Strong (Alt) Silicification>> patchy silicification.

<<Vein: 317.1 - 318.2 50% Quartz-Carbonate 80 deg. >> quartz-carbonate veins

318.20 321.70 MDSc Carbonaceous dominant mudstone light grey VFG

318.2 - 321.7: Light grey, finely laminated, very fine grained, siliceous, carbonaceous mudstone. Silicification increases down hole.

<<Alt: 318.2 - 321.7 Moderate-Strong (Alt) Silicification>> pervasive silicification.

321.70 323.95 SED undifferentiated Sediment brown FG

321.7 - 323.95: Brown, foliated, fine grained, biotite schist. Cut by abundant, large (up to 30cm) deformed quartz veins.

<<Alt: 321.7 - 323.95 Moderate-Strong (Alt) Silicification>> patchy silicification.

<<Vein: 321.7 - 323.95 40% Quartz 80 deg. >> quartz veins

323.95 326.80 RHYvl Lapilli tuff light grey FMG

323.95 - 326.8: Light grey to white, foliated, stronlgly altered, quartz-muscovite schist/rhyolite lapilli tuff. Cut by quartz vein (80% of interval). Strongly sericite-quartz altered groundmass around quartz vein.

<<Alt: 323.95 - 326.8 Intense (Alt) Silicification>> intense solicitation and quartz veining.

<<Vein: 323.95 - 326.8 80% Quartz 80 deg. >> quartz veins

326.80 355.00 MDSc Carbonaceous dominant mudstone dark grey VFG

326.8 - 355: Dark to medium grey and light grey, finely laminated, very fine grained, carbonaceous mudstone interbedded with siliceous mudstone. Convolutly folded and disrupted beds. Abundant (up to 5%) fine grained, disseminated pyrite in the more carbonaceous bands. Cut by occasional brittle quartz-carbonate veins and stockwork with jigsaw fit breccia fragments of carbonaceous mudstone (349-351m).

<<Min: 326.8 - 355 5% Min: Pyrite>> disseminated pyrite

<<Alt: 326.8 - 328.6 Moderate-Strong (Alt) Silicification>> pervasive silicification.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

Local Elev. (m):						Purpose:	Resource/Met
						Parent Hole:	

Comments:

This hole is the parent hole of K15-266 (completed metallurgical hole), though it was abandoned due to intersecting a sub-parallel historic drillhole (K94-036) at 71.25m. Hole encountered similar geology as K15-266 with lenses of massive sulphide (OI and OB) uphole from main ABM massive sulphide. This hole was only quicklogged as it was redrilled as K15-271 from the same pad at -55 deg inclination. Hole not sampled.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	23-Sep-15
Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-267

Comments:

K15-270 was drilled as a metallurgical twin of K15-267, in order to collect samples of the MET3 and MET5 domains.
The hanging wall stratigraphy consists of mixed felsic and mafic volcanics/intrusives, from 12-136.1 m. Noticeable MU-alteration in the hanging wall occurred from ~64.9-136.3 m. Alteration increased to CL+CI near the MSXS. MSXS was encountered from 136.1-161.2 m, consisting of OJ, OB, OA, and OI. The footwall consists of volcaniclastic rhyolite from 161.2-161.9 m, with strong CL+CI alteration proximal to the MSXS. From 161.9-170 m (EOH) a CL-BI-CA schist (MAFi) was encountered. The MAFi was locally Mu-altered from 161.9-164.9 m.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	22-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	25-Sep-15
Local Elev. (m):						Purpose:	Resource Definition
						Parent Hole:	

Comments:

The target of this hole is eastern step out to extend ABM main lens. No massive sulphide was intersected but strong alteration, trace disseminated sphalerite and a 3m run with no core were intersected around the target depth of 195-200m. The hole deviated by 17 degrees from planned azimuth, the biggest deviation occuring around a zone of broken rock with associated core loss. The top of the hole alternated between carbonaceous argillite (MDSc) and mafic tuffs and or dykes till 32.65m, followed by a sequence of alternating RHYcw, vl and va with a few mafic units till 118.4. This includes a short siliceous, silicified, broken and veined section from 76-78m, associated with a short interval of RHYi dyke. From 118.4m to 193.65m, the sequence alternates between RHYcw, vl and va with a few mafic units, becomes very siliceous(or silicified?), and is logged mainly as RHYcw with increasing sericite alteration downhole and local fragmental or pseudo-fragmental textures. From 193-200, dark chl-sericite partings are interpreted as MDSw, and contain trace sp and cp on either side of the interval (195-198) where no core was recovered (possible friable mineralized horizon?). Strong muscovite- cordierite- chlorite alteration marks the footwall of this missing interval. The hole then continues in siliceous RHYc untill its lower contact with the footwall mafic intrusion at 242.6, with some disseminated sp and cp in foliaform stringers for 1-2 m intervals from 229 to 242m.

52.45 54.20 RHYvl Lapilli tuff

54.20 66.30 RHYva Coarse grained to ash tuff

54.2 - 66.3: few lapilli

66.30 68.40 MAFt Mafic Volcaniclastics

66.3 - 68.4: f.g. ash? Mafic? Sed?

68.40 72.00 RHYva Coarse grained to ash tuff

72.00 76.35 MAFt Mafic Volcaniclastics

72 - 76.35: banded, maroon. Lower contact strongly veined and altered (looks clayey).

<<Min: 72 - 76 10% Min: Calcite>>

<<Vein: 76 - 150 1% Quartz-Chlorite-Sulphide 20 deg. >>

76.35 77.45 RHYcw Curdy textured-flow banded (flows, subvolcanics)

76.35 - 77.45: Intense qtz veining and sericite alteration.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Alt: 76.35 - 82.3 Moderate (Alt) Muscovite>> ass w RHYi and qtz veining? Loc strong.

<<Alt: 76.35 - 85.6 Weak (Alt) Silicification>>

77.45 78.35 RHY undifferentiated rhyolite

77.45 - 78.35: strongly veined and broken, w srong khaki sericite altered-bands and broken qtz veins. Some qtz-tourm veining sub// to CA. Quartz in veins, as bands and as clasts? UC may include some bleached mafic tuff sections. Poore recovery.

<<Min: 77.5 - 82 2% Min: Calcite>>

<<Min: 78.3 - 82.3 0.5% Min: Pyrite>> in po-qtz bands.

<<Min: 78.3 - 82.3 1% Min: Pyrrhotite>> heavy diss in qtz-rich bands.

78.35 78.70 RHYi Aphanitic Rhyolite (intrusion)

78.35 - 78.7: crackled, veined and altered. Poor recovery.

78.70 82.55 RHYc Rhyolite coherant volcanics

78.7 - 82.55: poker chips partings w greenish sericite. Few lapilli or silica bands. Diss po in qtz-rich bands.

<<Min: 82 - 97.2 1% Min: Calcite>>

<<Min: 82.3 - 84.8 0.5% Min: Pyrite>>

82.55 83.50 RHYvl Lapilli tuff

82.55 - 83.5: silicified?

83.50 97.20 RHYva Coarse grained to ash tuff

83.5 - 97.2: w small tourmaline porphyroblasts

<<Alt: 90 - 97.2 Moderate (Alt) Muscovite>> dark greenish-blue hue

<<Alt: 96 - 96.5 Weak (Alt) Chlorite>>

<<Struc: 85.5 - 85.8 Moderate (Alt) Fault>> clay gouge

<<Struc: 87.5 - 87.6 Strong (Alt) Fault>> clay gouge, broken rock.

<<Struc: 89.85 - 89.86 dominant foliation>> NW/SE

<<Struc: 94.65 - 94.7 Moderate (Alt) Fault>> dicrete and competent clay gouge zone.

97.20 97.95 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

<<Min: 97.2 - 99.4 5% Min: Calcite>>

97.95 98.10 RHYvl Lapilli tuff

98.10 99.45 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

99.45 106.80 RHYvl Lapilli tuff

<<Min: 106.7 - 108.65 10% Min: Calcite>>

<<Alt: 101 - 106.8 Weak (Alt) Muscovite>>

<<Alt: 101 - 106.8 Weak (Alt) Chlorite>>

<<Alt: 105 - 106.8 Weak (Alt) Silicification>>

106.80 108.65 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

106.8 - 108.65: or MAFt?

108.65 118.40 RHYvl Lapilli tuff

108.65 - 118.4: w small tourmaline porphyroblasts

<<Min: 111.7 - 111.9 2% Min: Pyrite>> in vein and diss

<<Min: 117 - 129 0.5% Min: Calcite>>

<<Alt: 108.65 - 148 Moderate (Alt) Muscovite>>

118.40 119.75 RHYcw Curdy textured-flow banded (flows, subvolcanics)

118.4 - 119.75: or coarse and silicified lapilli tuff? Mottled,very siliceous, maroon and grey (biot-sericite alteration) w white silica blebs (dismembered lapilli or cw), w gradual appearance of dolom/ank crystals. Tourmaline porphyroblasts, diss po. Hornfels/altered from carb-bearing dyke below?

<<Min: 118.4 - 124 0.5% Min: Pyrite>>

<<Min: 118.4 - 124 0.5% Min: Pyrrhotite>>

<<Alt: 119.5 - 123.4 Moderate (Alt) Cordierite>> carbonat replacing cordierite?

119.75 124.65 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

119.75 - 124.65: strong pophyroblastic dolomite or ankerite replacing cordierite? Carbonate xtals in dk sericite- chlorite-biot groundmass. Intrusive texture. Chl loc greasy. Diss po. Chl-cordierite alteration zone or altered mafic dyke?

124.65 128.80 RHYvl Lapilli tuff grey

124.65 - 128.8: small tourmaline porphyroblasts.

128.80 136.30 RHYcw Curdy textured-flow banded (flows, subvolcanics)

128.8 - 136.3: gradual UC? Brownish grey sericite separates siliceous domains. Gets lumpy: lapilli?

<<Struc: 129.6 - 130.1 Moderate (Alt) Fault>> weak broken rx and fault gouge, discordant to foln.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

136.30 144.10 RHYvl Lapilli tuff

136.3 - 144.1: finer grained and darker matrix than above, more fragmental or pseudo-fragmental texture, could be RHYcw. Muscovite colour and intensity varies.

144.10 174.00 RHYc Rhyolite coherant volcanics

144.1 - 174: very siliceous, variably fragmental or pseudo-fragmental, some sections could be coarse lapilli. Few possible qtz xtals? Pervasive greenish sericite. Stronger fg ankerite alteration. 146-151 and 155-169.5 : dislocated py-po bands and blebs.

<<Min: 146.8 - 150.8 1% Min: Pyrite>> in qtz-rich bands

<<Min: 146.8 - 150.8 1% Min: Pyrrhotite>> in qtz-rich bands

<<Min: 155 - 159.5 2% Min: Pyrrhotite>> heavily disseminated in dislocated qtz-rich bands or blebs.

<<Min: 155 - 169.5 2% Min: Pyrite>> heavily disseminated in dislocated qtz-rich bands or blebs.

<<Alt: 148 - 187 Strong (Alt) Muscovite>> till end of boxes Thursday

<<Alt: 172.35 - 177 Weak (Alt) Chlorite>>

<<Struc: 160 - 165 Vein>> fracture sub// to CA

<<Struc: 161.9 - 161.91 dominant foliation>>

174.00 177.00 MAFt Mafic Volcaniclastics

174 - 177: Mafic tuff or chl-altered felsic tuff? Stripy maroon and green rx. More intense and pervasive sericite alteration?

177.00 187.20 RHYc Rhyolite coherant volcanics

177 - 187.2: loc lumpy (lapilli?). Some dark amorphous soft mineral interstitial to the sulphides in qtz-po bands (chloritoid).

<<Min: 177.2 - 186 2% Min: Pyrite>> heavily disseminated in dislocated qtz-rich bands or blebs.

<<Min: 177.2 - 186 1% Min: Pyrrhotite>> heavily disseminated in dislocated qtz-rich bands or blebs.

<<Min: 186 - 195 1% Min: Pyrite>>

<<Alt: 187 - 213 Intense (Alt) Muscovite>>

<<Struc: 185.9 - 185.91 dominant foliation>>

187.20 193.50 RHY undifferentiated rhyolite

187.2 - 193.5: Strongly sericite-altered cw (?) (lt grey, clayey on poker chips partings till 190.5m). Segregations between silica vs sericite bands increase downhole and poker chips decrease. Dk grey-green, loc bleached. Small squarish greenish soft mineral w fuzzy outline rimmed by ankerite (breakdown of py?) (chloritoid?).

<<Vein: 191.9 - 193.15 10% Quartz-Kspar-Sulphide 65 deg. >> w po

<<Vein: 192.35 - 208 0.5% Quartz 60 deg. >>

From (m)	To (m)	Rocktype & Description

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	22-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	23-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
						Parent Hole:	

Comments:

Parent hole to K15-266 (metallurgical HQ hole) and redrill of K15-269 (Abandoned). Orientation marks were found to be inconsistent throughout hole, with few consecutive orientation marks. When consecutive orientation marks were present, only one run was marked with a solid line (62-68m). Mafic dike near OI (41.7-51) and fault makes this twin significantly less representative of original HQ Met hole.

Downhole Surveys:

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-273

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	24-Sep-15
UTM Easting	415051.003	Core Size:	NQ3	Azimuth:	179.13	Date Logging Complete:	25-Sep-15
UTM Northing:	6815507.074	Casing Pulled?:	Yes	Dip:	-77	Drill Company:	Geotech
UTM Elev. (m):	1382.272	Casing Depth (m):	15	Length (m):	149	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	23-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	25-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

K15-273 was drilled to confirm the resource intercept of historic hole K95-070. Metallurgical twin hole K15-275 was drilled to collect samples of MET3, MET8, and MET8 domains. Overburden was encountered to a depth of 14.7 m. The hanging wall stratigraphy (14.7-91.2 m) consists of mixed felsic volcanics with one carbonaceous horizon. Moderate to strong MU alteration is present from 50-91.2 m and is associated with disseminated CI porphyroblasts proximal to the MSXS. MSXS was encountered from 91.2-111.4 m, consisting of OG, OA, OB, OI, OC, and OJ ore types. The CL-CA-BI schist (MAFi) occurs from 111.4-117.3 m. MAFi is MU-altered proximal to the MSXS and has local CL+PO+CP stringer zones from 116.6-117 m. The lower contact of the MAFi is MU+SI altered from the later RHYi, which is encountered from 117.3-149 m (EOH).

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-274

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Trevor Rabb
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	24-Sep-15
UTM Easting	414675.436	Core Size:	NQ3	Azimuth:	180.5	Date Logging Complete:	25-Sep-15
UTM Northing:	6815455.273	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1425.019	Casing Depth (m):	7.5	Length (m):	128	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	23-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	25-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

Parent hole for K15-276 (metallurgical twin hole). Upper portion of hole contains MDSw and MDSc and grades into RHYv and RHYc. Prior to intersecting the main ABM massive sulphide body, hole intersected perched lenses of massive sulphides and also stringer style mineralization (sub-economic?). MAFi was also intersected in footwall - similar to K15-272.

Downhole Surveys:

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-275

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	27-Sep-15
UTM Easting	415051.127	Core Size:	HQ3	Azimuth:	180.75	Date Logging Complete:	29-Sep-15
UTM Northing:	6815507.001	Casing Pulled?:	Yes	Dip:	-71.5	Drill Company:	Geotech
UTM Elev. (m):	1382.274	Casing Depth (m):	9	Length (m):	122	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	25-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	29-Sep-15
Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-273

Comments:

K15-275 was drilled as a metallurgical twin of K15-273 in order to collect samples of the MET8, MET3, and MET7 domains.
The hanging wall package (9.7-91.1 m) consists of mixed felsic volcanics with a mudstone horizon from 41.8-43.7 m. Strong MU-alteration became visible at ~47.5 m and graded into stronger CL+CI in the ore zone. MSXS was encountered from 91.1-109 m, consisting of OJ, OC, OA, OF, and OB. In the footwall there is a rhyolitic volcaniclastic unit from 109-110.4, a CL-CA-BI schist (MAFi) from 110.4-116.8 m, and RHYi from 116.8-122 m (EOH). A local band of CL-alteration with SP and PO+PY+CP stringers is present within the MAFi unit.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-276

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	26-Sep-15
UTM Easting	414675.458	Core Size:	HQ3	Azimuth:	180.22	Date Logging Complete:	28-Sep-15
UTM Northing:	6815453.463	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1425.014	Casing Depth (m):	7.5	Length (m):	110	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	25-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	26-Sep-15
Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-274

Comments:

This hole is a daughter hole for K15-274 (metallurgical twin hole). Upper portion of hole contains RHYc, RHYcw, MDSw and MDSc and grades into RHYc and RHYv. Prior to intersecting the main ABM massive sulphide body, hole intersected perched lenses of massive sulphides and stringer style mineralization. The two lenses of massive sulphide were separated by strongly CI, CL altered RHYcw. Below the perched lenses the hole intersected RHYv, and MDSt and MAFi.

Downhole Surveys:

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-277

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Daniele Heon
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	28-Sep-15
UTM Easting	415248.9	Core Size:	NQ3	Azimuth:	190	Date Logging Complete:	01-Oct-15
UTM Northing:	6815348.359	Casing Pulled?:	Yes	Dip:	-68	Drill Company:	Geotech
UTM Elev. (m):	1442.245	Casing Depth (m):	21	Length (m):	357.8	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	26-Sep-15
Local Northing:		Cemented?:	No	Core Storage Loc.:	KZK Camp	Drill Completed:	01-Oct-15
Local Elev. (m):						Purpose:	Exploration
						Parent Hole:	

Comments:

The target of this hole is a sulphide lens offset by a fault block.
The top of the hole intersected interbanded argillite and mafic dyke or tuff (both crenulated); core was very block with poor recovery. The argillite unit is very dark and carbonaceous, and is strongly folded and crenulated. Foliations are bent into brittle fault zones from 23 to 30m and 38 to 50m. Metaseds transition into a felsic volcaniclastic sequence from 83 to 97.5m below which thick RHYva is present down to160m, intruded and silicified by two RHYi units. From 160-202, the hole is mainly RHYva with some tuffaceous sections (either mafic or biot-carb altered felsic). From 302-303.4 the showed a flulted texture and stronger clay alteration. From 103.5-313.8 and 326-333.95 is semi-massive and massive sulphide, mostly OB,with some OJ. One section may be altered mafic tuff or intrusive. From 333.95 - 357.8 (EOH) is the footwall mafic intrusion, with the contact marked by 15cm of massive biotite underlain by 15cm of intense carbonate alteration, which is in turn underlain by units of gradually coarsening grain size. This zone includes two sections (total 30 cm) with heavy py-sp-cp associated with silicate gangue.

146.25 147.55 RHYi Aphanitic Rhyolite (intrusion)

146.25 - 147.55: cherty, featureless except few fractures. Could be/ or include veined and silicified va/ vl.

<<Min: 146.35 - 146.4 0.05% Min: Galena>>

147.55 149.90 RHYvl Lapilli tuff

147.55 - 149.9: siliceous, finely banded:stretched out lapilli or cw?

<<Struc: 148.9 - 149.91 dominant foliation>> shallow

149.90 160.34 RHYva Coarse grained to ash tuff

149.9 - 160.34: fine biotite porphyroblasts.

<<Min: 151.65 - 160.3 5% Min: Calcite>>

<<Min: 160.3 - 160.95 15% Min: Calcite>>

<<Struc: 154.2 - 154.35 Weak (Alt) Fault>> breccia gouge

<<Struc: 154.9 - 154.91 dominant foliation>> weak second foln? NW/NE.

160.34 166.28 MAFt Mafic Volcaniclastics

160.34 - 166.28: first 45 cm f.g. biot (pelitic sed?) grading into greenish, sl calcareous rx w small carbonate porphyroblasts and 0.5-1mm biot porphyroblasts of varying proportions. Slight greenish cast but mainly sericite in groundmass. Looks like mostly felsic composition but mapped as mafic tuff for consistency with other loggers. Some chl alt at contact w mafic dyke below.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 160.95 - 167.07 10% Min: Calcite>>

<<Alt: 161.3 - 163.8 Moderate (Alt) Biotite>> in area of biotite porphyroblasts, increase in size and abundance of porphyroblasts near carbonate veining.

<<Alt: 166 - 166.28 Moderate (Alt) Chlorite>>

<<Struc: 164.3 - 164.4 Strong (Alt) Fault>> broken rx, gouge, poor recovery.

<<Struc: 165.95 - 165.99 Strong (Alt) Fault>> clay gouge at bottom of blocky run.

166.28 169.07 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

166.28 - 169.07: f.g, green, weak biot porphyroblasts. Texture looks tuffaceous but sharp contacts.

<<Min: 167.07 - 168.3 2% Min: Calcite>>

<<Min: 168.3 - 184.5 5% Min: Calcite>>

169.07 172.35 RHYva Coarse grained to ash tuff

169.07 - 172.35: Greenish, sl calcareous rx w small carbonate pophyroblasts and 0.5-1mm biot porphyroblasts of varying proportions. Slight greenish cast but mainly sericite in groundmass. Looks like mostly felsic composition but mapped as mafic tuff for consistency. Size of carbonate pophyroblasts increase after 168m, and short sections show greener groundmass, sl chloritic alteration or more mafic intervals?

<<Alt: 170.1 - 171.2 Moderate (Alt) Biotite>> Increase in size and amount of biot porphyroblasts w increase in carbonate porphyroblasts and carbonate veining.

172.35 176.00 RHYvl Lapilli tuff

<<Vein: 173.95 - 174.35 50% Quartz-Tourmaline 0 deg. >>

176.00 176.90 RHYva Coarse grained to ash tuff

176.90 187.95 RHYvl Lapilli tuff

176.9 - 187.95: shear at top of interval

<<Min: 184.5 - 188.6 10% Min: Calcite>>

<<Vein: 180.2 - 181 0.1% Tourmaline 5 deg. >>

<<Struc: 176.9 - 178.2 Strong (Alt) Fault>> breccia/sheared fx

<<Struc: 185 - 185.1 dominant foliation>>

187.95 192.72 RHYva Coarse grained to ash tuff

187.95 - 192.72: w fine biot porphyroblasts.

<<Min: 188.6 - 191.5 3% Min: Calcite>>

<<Min: 191.5 - 202.05 15% Min: Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

192.72 199.85 MAFt Mafic Volcaniclastics

192.72 - 199.85: Reddish-brown porphyroblastic- biot-rich rx consisting of sericitic groundmass w varying proportion of augen-shaped carbonate porphyroblasts rimmed by biotite, loc coalescing into bands and/or veins. Biotote stronger around carbonate patches and veins. Mapped as mafic tuff for consistency but suggest felsic composition w strong biot-carb alteration. Sharp UC and gradational LC.

<<Min: 199 - 202 0.5% Min: Pyrite>> in carbonate veinlets

<<Alt: 192.72 - 199.85 Strong (Alt) Biotite>> Strong biotite associated with strong carbonate veining and augens (porphyroblasts). Biotite lines carbonate blebs and carbonate veins.

199.85 200.50 RHYva Coarse grained to ash tuff grey

200.50 202.05 MAFt Mafic Volcaniclastics

200.5 - 202.05: same rx as above (?) but with rapid increase in biotite porphyroblasts to give appearance of mafic tuff. Reddish-brown porphyroblastic- biot-rich rx consisting of sericitic groundmass w 25 cm of coarse augen-shaped carbonate porphyroblasts rimmed by biotite, loc coalescing into bands and/or veins. Biotote stronger around carbonate patches and veins. Mapped as mafic tuff for consistency but suggest felsic composition w strong biot-carb alteration. Rapid UC and sharp but broken LC.

<<Min: 202 - 218 0.5% Min: Pyrite>> f.g diss and in fine stringers and inqtz veins

202.05 211.00 RHYi Aphanitic Rhyolite (intrusion)

202.05 - 211: Siliceous, grey-green, massive, w irregular pyritic fractures. Internally "brecciated" and stronly-sericite-altered 207.8-208.6m. Includes total 2.95m of massive qtz veins, some // to CA. Rutile or sulphosalt needles in qtz vein.

<<Min: 202.05 - 209.5 3% Min: Calcite>>

<<Min: 206.6 - 207.2 0.01% Min: Sulphosalts>> fg metallic grey-blue needles,strited // to long axis, stibnite? Boulangerite?

<<Min: 209.5 - 218 0.01% Min: Calcite>>

<<Alt: 202.5 - 218 Strong (Alt) Silicification>> associated w RHYi

<<Alt: 202.5 - 218 Strong (Alt) Muscovite>> associated w RHYi

<<Vein: 206 - 207.45 100% Quartz-Carbonate-Sulphide 65 deg. >> associated w RHYi

<<Vein: 210.1 - 220.95 15% Quartz-Carbonate-Sulphide>> qtz veins from 2 cm to 0.7m, 0 to 80 deg CA, stockwork? Associated w RHYi dyke.

211.00 212.75 RHYv Rhyolite volcaniclastic

211 - 212.75: enclave of tuff in RHYi dyke and associated alteration and veining. Strongly sericite-altered. One 2cm qtz vein shows orange coating on fractures (?).

212.75 218.00 RHYi Aphanitic Rhyolite (intrusion)

212.75 - 218: probably includes strongly altered RHYv (for first 2m?)

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

218.00 219.25 RHYvl Lapilli tuff

218 - 219.25: w foliaform pyritic bands.

<<Min: 218 - 219.3 3% Min: Calcite>>

<<Min: 218 - 230 1% Min: Pyrite>> heavy disseminations in crenulated bands and in tabular foliaform bands.

<<Alt: 218 - 221.4 Moderate (Alt) Muscovite>> associated w RHYi?

<<Struc: 218.3 - 218.31 dominant foliation>>

219.25 221.40 RHY undifferentiated rhyolite

219.25 - 221.4: altered tuff and/or dyke, banded and mottled sericite alteration overprinted by patches of chloritic alteration, some very siliceous patches: RHYi or alteration from RHYi?

<<Min: 219.3 - 224.9 1% Min: Calcite>>

<<Alt: 219.25 - 221 Moderate (Alt) Chlorite>>

<<Alt: 219.25 - 221.4 Moderate (Alt) Silicification>> associated w RHYi?

<<Struc: 221.3 - 221.4 Moderate (Alt) Fault>> small sericite-clay altered gouge. Core loss.

221.40 239.00 RHYvl Lapilli tuff

221.4 - 239: mod to strong greenish sericite alteration, often clayey on partings, w rx strongly to intensely dissected by sericitic foliation/crenulation, loc creating brecciated textures (isolated siliceous domains in sericitic matrix). Fine grained, darker grey, undeformed, less chewed up 228-229.2 (more ash component or weaker sericite-alteration).

<<Min: 224.9 - 229.85 5% Min: Calcite>>

<<Min: 229.85 - 277.4 1% Min: Calcite>> end of boxes

<<Min: 230 - 257 5% Min: Pyrite>> heavly disseminated in folded and crenulated bands and finely diss throughout.

<<Min: 237 - 282.2 1% Min: Pyrrhotite>> diss and in small flat seams // to foln

<<Alt: 221.4 - 229 Weak (Alt) Muscovite>>

<<Alt: 229 - 259 Moderate (Alt) Muscovite>> greyish green, clayey.

<<Alt: 232 - 232.2 Weak (Alt) Chlorite>> some chloritized fx in small fault breccia

<<Struc: 222.7 - 222.9 Moderate (Alt) Fault>> clayey broken rx, gouge. Core loss.

<<Struc: 229.8 - 230.8 Strong (Alt) Fault>> clayey broken rx, clay gouge

<<Struc: 232 - 232.2 Strong (Alt) Fault>> breccia w siliceous fx in sericitic groundmass plus small interval of fault gouge.

<<Struc: 233.9 - 234.1 Moderate (Alt) Fault>> clayey breccia

<<Struc: 235.9 - 236.1 Moderate (Alt) Fault>> clayey broken rx, clay gouge

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-278

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	28-Sep-15
UTM Easting	414625.354	Core Size:	HQ3	Azimuth:	180.14	Date Logging Complete:	30-Sep-15
UTM Northing:	6815538.706	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1437.145	Casing Depth (m):	6.5	Length (m):	197.26	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	26-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	28-Sep-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

The purpose of this hole was to confirm the continuity of the lower sulphide lens (MET 4 Domain).
The upper portion of this hole contains RHYvl, RHYva, MAFt, MDSt, MDSc, and RHYcw intruded by MAFi. One major lens of massive sulphide was intersected between 131.95-145.38. OA and OJ ore types were intersected. RHYcw, RHYv, RHYvl, and RHYvx intruded by MAFi was intersected below the sulphide lens. Volcaniclastic rhyolites were intersected below the MAFi unit.
CI-CL zones were intersected above, within, and below the sulphide lens. CI-CL intersections were found at: 127.17-129.28m, 131.95-141.2m, 144.96-145.38m. Narrow AB zones were also intersected between 131.95-132.7m and 144.96-145.38m.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-278W1

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	30-Sep-15
UTM Easting	414625.354	Core Size:	HQ3	Azimuth:	180.14	Date Logging Complete:	01-Oct-15
UTM Northing:	6815538.706	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1437.145	Casing Depth (m):	6.5	Length (m):	161	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	28-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	29-Sep-15
Local Elev. (m):						Purpose:	Metallurgical Wedge
						Parent Hole:	K15-278

Comments:

The purpose of this hole was to sample the lower sulphide lens (MET 4 Domain) for metallurgical testing.

The upper portion of this hole contains MDSw and RHYcw. One major lens of massive sulphide was intersected between 132.17-145.81 m. OA and OJ ore types were intersected. RHYcw intruded by MAFi was intersected below the sulphide lens.

CI-CL alteration zones were intersected above, within, and below the sulphide lens. CI-CL intersections were found at: 126.2-133.85m, 141.37-141.54m, 145.3-145.81m. A narrow AB zone was also intersected between 132.15-133.1m.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	29-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	02-Oct-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

The purpose of this hole is to confirm a historic sulphide intercept in K95-076 and investigate the potential of a hanging wall stockwork feeder zone.
Drilling confirms existence of the sulphide intercept in K95-076 and encounters rocks that could potentially represent a stockwork feeder zone at the top of the sulphide intercept. The structural hanging wall is composed of a package of intercalated coherent/volcaniclastic felsic rocks and carbonaceous mudstones. Massive sulphide is present from 121.36m to 132.87m (OI, OG, OA, OH ore types respectively), 134.72m to 135.2m (OF, OI, OB, OI, OF ore types respectively), 144.81m to 168m (OB, OH, OB, OA, OC, OB ore types respectively), 169.16m to 175.04m (OI, OB ore types respectively) and from 191.52m to 193.6m (OI ore type). The structural footwall is composed of a package of volcaniclastic felsic rocks adjacent to the massive sulphides, underlain by chlorite altered mafics (MAFi unit) and a silicified rhyolite dike (unit RHYi), followed by a 3m fault zone underlain by MAFi, and a package of weakly chlorite altered RHYvl rocks.
Muscovite alteration intensifies towards the massive sulphide lenses in both the structural hanging wall and foot wall rocks. Chlorite alteration is pervasive in the MET 8 domain (top of massive sulphide lens) and in the foot wall mafics. Cordierite porphyroblasts occur throughout the massive sulphide lenses as well as proximal in the immediate hanging wall and footwall felsic rock packages. The RHYi unit is strongly silicified and rocks proximal to the RHYi unit exhibit moderate to weak silicification.
This hole is significant due to well developed CP mineralization throughout the massive sulphide lenses proximally in altered/quartz veined rock packages.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	04-Oct-15
Local Elev. (m):						Purpose:	Exploration
						Parent Hole:	

Comments:

This hole was drilled to test the north-east extension of the GP4F horizon. Familiar GP4F stratigraphy is present, progressing from sediment/mafic/felsic layers at the top through a broad section of rhyolite, lapilli and quartz eye tuff to coherent flow, and the mineralized sequence of hanging wall QE tuff to altered and mineralized felsic tuff to footwall lapilli tuff (FP porphyry). Mineralization likely equivalent to the GP4F horizon was encountered from about 275 to 287 m. A second mineralized interval, narrow and higher grade, was hit between 364 and 366 m. The lower interval was associated with strong cordierite mineralization that extended well into the footwall (~380 m). This alteration was acommpanied by MU and talc alteration (retrograde?). The hole was pushed to the carbonaceous sediments in the footwall seen in K95-261.

Overall, the mineralization encountered was not significant although the zone at 364-366 is possibly ore grade. It appears that the GP4F does not extend into this area.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

0 - 9.5: Overburden - pelitic metasediment, rhyolite, and granite boulders.

9.50 21.00 RHYva Coarse grained to ash tuff grey-brown FG

9.5 - 21: Brown and grey, partially oxidized to locally completely oxidized, foliated, fine grained, quartz-muscovite(-biotite) schist/rhyolite ash tuff. Locally contains up to 5% porphyroblastic biotite. Interbedded with narrow (5-10cm) zones of biotite rich pelitic metasediments. Narrow zones (10-30cm) contain up to 10% lapilli sized fragments. Oxidation seems to prefer quartz-muscovite zones. 8-9m broken core.

<<Struc: 12 - 13 Moderate (Alt) Fault>>

21.00 23.90 RHYif feldspar and quartz porphyry intrusions grey FMG

21 - 23.9: Light grey, massive, fine to medium grained, quartz-feldspar porphyry. Several 1-2mm bluish quartz crystals, with abundant 1-2mm feldspar crystals. No lapilli fragments interpreted. Sharp upper contact with possible alteration halo, broken core at lower contact.

<<Struc: 21 - 21.1 Moderate (Alt) dominant foliation>>

23.90 32.45 RHYv Rhyolite volcaniclastic grey-brown FMG

23.9 - 32.45: Dark grey to greenish grey, foliated, fine to medium grained, heterogeneous, biotite-quartz-chlorite schist/epiclastic rock with minor felsic component. Narrow (1-10cm) zones with higher chlorite content could be mafic tuffaceous material. Bottom 50cm are biotite rich and could be pelitic sediment dominated.

<<Struc: 30 - 30.1 Moderate (Alt) dominant foliation>>

<<Struc: 30.6 - 31 Moderate (Alt) Fault>>

32.45 36.70 MAFta Coarse grained to ash tuff brown FMG

32.45 - 36.7: Green, grey, and brown, foliated and mottled, fine to medium grained, biotite-quartz-chlorite-schist/mafic tuff interbedded with minor metapelite. Could be peperite textures. This unit looks more fragmental towards the margins and more massive and irregular in the core.

36.70 38.10 RHYvl Lapilli tuff grey-brown FMG

36.7 - 38.1: Grey to brownish grey, foliated, fine to medium grained, quartz-biotite-muscovite schist/felsic fragmental?. Dominantly siliceous fragments with thin (<1mm) wispy biotite bands between fragments.

38.10 44.30 SED undifferentiated Sediment grey-brown FG

38.1 - 44.3: Grey to greenish grey, foliated, fine grained, biotite schist/pelitic metasediment. Locally up to 5% tufaceous component. Locally weakly carbonaceous associated with the finest grained beds.

44.30 46.98 MAFta Coarse grained to ash tuff green-brown FG

44.3 - 46.98: Green, brown, and grey, foliated with irregular, mottled banding, fine grained, chlorite-biotite-carbonate schist/mafic tuff interbedded with pelitic sediments.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

46.98 48.25 RHYvl Lapilli tuff grey FMG

46.98 - 48.25: Grey, weakly foliated, fine to medium grained, feldspar-quartz-biotite schist/rhyolite feldspar crystal lapilli tuff with up to 10% fine grained foliated biotite.

48.25 81.10 SED undifferentiated Sediment grey-brown FG

48.25 - 81.1: Light grey, and brown, foliated and banded, fine grained, quartz-biotite schist/metapelite. Small zones (up to 30cm) with higher chlorite content, which may have a mafic component. Locally weakly carbonaceous in the finer grained bands. Locally weakly siliceous. Cut by occasional quartz vein.

<<Vein: 51.35 - 51.45 90% Quartz 70 deg. >> quartz vein

<<Vein: 54.1 - 54.2 90% Quartz 70 deg. >> quartz vein

<<Vein: 70.5 - 70.7 90% Quartz 80 deg. >> quartz vein

81.10 86.20 RHYva Coarse grained to ash tuff light grey MG

81.1 - 86.2: Light grey, massive to weakly foliated, equigranular, quartz-muscovite-biotite ash crystal tuff (?) with small (~1-2mm) quartz eyes. Sharp lower contact, gradational upper contact. Very massive, homogeneous, medium grained unit. Could be intrusion, since it is medium grained.

86.20 86.90 SED undifferentiated Sediment green-brown FG

86.2 - 86.9: Green, brown, and grey, foliated and banded, fine grained, chlorite-biotite-carbonate schist/pelitic sediment with mafic tuffaceous component.

86.90 92.80 MAFta Coarse grained to ash tuff green-brown FG

86.9 - 92.8: Green and brown, foliated and weakly banded, fine grained, biotite-chlorite-actinolite schist/mafic tuff. Small (<2mm) actinolite porphyroblasts.

92.80 104.80 RHYva Coarse grained to ash tuff light grey FG

92.8 - 104.8: Light grey, weakly foliated to massive, fine grained, quartz-muscovite schist/rhyolite ash tuff with rare, small (1mm) bluish quartz crystals. Very similar composition to the above felsic unit although finer grained.

<<Vein: 95 - 96 10% Quartz 5 deg. >> quartz-tourmaline vein

104.80 105.65 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown FG

104.8 - 105.65: Brown, foliated, fine grained, biotite schist/mafic intrusion. Sharp upper and lower contacts and the lower contact appears to altered the unit below.

105.65 114.20 RHYvl Lapilli tuff light grey FMG

105.65 - 114.2: Light to medium grey, weakly foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli and ash tuff. Abundant 2-4cm flat elongated siliceous lapilli in a fine grained, quartz-muscovite matrix. May contain feldspar crystals but no quartz eyes. Several bands of interbedded fine grained ash.

From (m)	To (m)	Rocktype & Description			From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

114.20 114.50 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown FG

114.2 - 114.5: Brown, foliated, fine grained, biotite schist/mafic intrusion(?).

114.50 115.50 RHYvl Lapilli tuff light grey FMG

114.5 - 115.5: Light to medium grey, weakly foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli and ash tuff. Abundant 2-4cm flat elongated siliceous lapilli in a fine grained, quartz-muscovite matrix. May contain feldspar crystals but no quartz eyes.

115.50 117.10 RHYvx Quartz and/or feldspar crystal tuff light grey FG

115.5 - 117.1: Light grey, weakly foliated, fine to medium grained, quartz-muscovite schist/rhyolite quartz-feldspar crystal tuff with common small 1-2mm bluish quartz eyes.

117.10 117.90 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green-brown FG

117.1 - 117.9: Greenish-brown, foliated, fine grained, biotite-actinolite schist/mafic dyke.

117.90 122.80 RHYva Coarse grained to ash tuff grey FG

117.9 - 122.8: Grey, weakly foliated, fine grained, quartz-muscovite schist/rhyolite ash tuff. The base of this unit is a lapilli tuff that fines up hole to ash tuff that is overlain (with a narrow structural contact) by weakly carbonaceous schist (pelitic sediment).

122.80 126.00 MAFta Coarse grained to ash tuff green-brown FG

122.8 - 126: Brown to greenish brown, weakly foliated to massive, biotite-chlorite schist/mafic intrusion. Narrow bands (1-5cm) are chlorite-rich. Sharp upper and lower contact. Cut by occasional quartz carbonate veins.

<<Vein: 125.47 - 125.61 100% Quartz 70 deg. >> quartz vein

126.00 130.20 RHYvx Quartz and/or feldspar crystal tuff grey FMG

126 - 130.2: Grey, weakly foliated, fine to medium grained, quartz-muscovite schist/rhyolite feldspar crystal lapilli tuff. Abundant 1-2cm flat stretched lapilli with abundant <1cm blocky feldspar crystals in a fine quartz-muscovite-biotite matrix.

130.20 131.90 SED undifferentiated Sediment brown FG

130.2 - 131.9: Brown, foliated, fine grained, quartz-biotite schist/metapelite or mafic dyke.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

131.90 138.80 RHYvx Quartz and/or feldspar crystal tuff grey FMG

131.9 - 138.8: Grey, weakly foliated, fine to medium grained, quartz-muscovite schist/rhyolite feldspar crystal, lapilli tuff. Abundant 1-2cm flat stretched lapilli with abundant <1cm blocky feldspar crystals in a fine quartz-muscovite-biotite matrix.

<<Struc: 135.4 - 138 Moderate-Strong (Alt) Fault>> fault zone with minor gouge development

138.80 139.60 SED undifferentiated Sediment brown FG

138.8 - 139.6: Brown, foliated, fine grained, biotite schist/metapelite.

139.60 149.60 RHYvl Lapilli tuff grey FMG

139.6 - 149.6: Grey, foliated, fine to medium grained, quartz-muscovite-biotite schist/rhyolite lapilli tuff with minor pelitic component. Several beds (20-50cm) of biotite rich pelitic sediments interbedded with rhyolite lapilli tuff. Some of the tuffaceous horizons are very biotite rich. Moderately sericite altered zone associated with small fault zone (49.0-40.5m)

<<Alt: 149 - 149.6 Moderate (Alt) Muscovite>> fault hosted sericite alteration.

<<Struc: 149 - 149.6 Moderate-Strong (Alt) Fault>> sericite altered fault zone.

149.60 154.10 RHYvl Lapilli tuff grey-green FMG

149.6 - 154.1: Greenish grey, weakly foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Abundant small (<1cm), locally densely packed, siliceous, lapilli within a weakly altered quartz-muscovite (sericite) matrix. Light green color to this unit could be weak pervasive, sericite (or very weak chlorite) alteration. Cut by occasional very narrow (1mm), fine grained, pyrite veinlets. Abundant fractures at 30-40o ca.

<<Alt: 149.6 - 154.1 Weak-Moderate (Alt) Muscovite>> fault hosted sericite alteration.

154.10 154.80 SED undifferentiated Sediment brown FG

154.1 - 154.8: Brown, foliated, fine grained biotite schist/metapelite. Cut by abundant quartz veins.

154.80 156.80 RHYvl Lapilli tuff grey FMG

154.8 - 156.8: Grey, foliated, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Cut by occasional quartz veins.

156.80 157.30 SED undifferentiated Sediment brown FG

156.8 - 157.3: Brown, foliated, fine grained biotite schist/metapelite. Cut by narrow carbonate veins.

157.30 171.37 RHYvl Lapilli tuff grey FMG

157.3 - 171.37: Grey, foliated, weakly altered, fine to medium grained, quartz-muscovite schist/rhyolite lapilli tuff. Alteration is weak, pervasive sericite alteration with rare, narrow (1-2cm) bands with fine grained disseminated pyrite. Cut by occasional (10-20cm) quartz veins with trace pyrite.

<<Alt: 157.3 - 171.37 Weak-Moderate (Alt) Muscovite>> weak pervasive sericite alteration

From (m)	To (m)	Rocktype & Description

From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

From (m)	To (m)	Rocktype & Description

<<Alt: 268.9 - 277.8 Strong (Alt) Muscovite>> generally strong, locally intense, so much MU in bands that they are soft, almost gouge-like. What was weathere out? There appars to be the possibility of a yellowy green overprint (MS or EP?) patches, bleaches the BI-rich sections

<<Struc: 273.2 - 273.21 Moderate (Alt) Foliation>>

276.73 293.20 RHYvl Lapilli tuff grey-green FG

276.73 - 293.2: still mixed section, ash, lapilli tuff and SED/MAFi, faulting picks up in lower half, heavy MU makes the core soft and friable locally, sx content strong.

Late(?) overprint of EP(?) gives yellowish green colour, some SI associated, in bands and around veins, fractures, seems to reduce the sulphide content.CA is present through most of the section.

<<Min: 277.8 - 282 3% Min: Sphalerite>> in bands, veinlets, stringers

<<Min: 277.8 - 282 10% Min: Pyrite>> bands and lenses

<<Min: 277.8 - 282 1% Min: Galena>> with SP, PY

<<Min: 282 - 283.75 5% Min: Sphalerite>> bands, masses, 3 cm wide massive band at 283.5

<<Min: 282 - 283.75 15% Min: Pyrite>> bands, lenses

<<Min: 282 - 283.75 3% Min: Pyrrhotite>> small masses, diss'd lenses

<<Min: 282 - 283.75 3% Min: Galena>> blebs, wisps in sx bands, veins

<<Min: 283.75 - 287.37 3% Min: Sphalerite>> lenses, bands, wisps

<<Min: 283.75 - 287.37 5% Min: Pyrite>> in groundmass, blebs and pods in veins, fractures, faults

<<Min: 283.75 - 287.37 3% Min: Pyrrhotite>> throughout, wisps

<<Min: 283.75 - 287.37 1% Min: Galena>> in veins, diss'ns in groundmass

<<Min: 287.37 - 293.2 3% Min: Sphalerite>> and diss'd lenses

<<Min: 287.37 - 293.2 5% Min: Pyrite>> diss'd bands, blebs, small masses in veins, MU zones

<<Min: 287.37 - 293.2 0.5% Min: Galena>> with SP

<<Alt: 277.8 - 293.2 Strong (Alt) Chlorite>> narrow bands and patches in groundmass, usually with PY, minor SP, GL. Not pervasive like strong proximal alt'n. BI usually present.

<<Alt: 277.8 - 297.2 Intense (Alt) Muscovite>> possibly overprint, too, with EP? In the soft intervals, MU dominates in faults gouge, glitters!, minor CL as well

<<Vein: 285.25 - 285.5 20% Quartz-Sulphide 10 deg. >> 2 cm wide QZ-Sx vein with GL, PY, SP blebs, in fractures

<<Struc: 279.9 - 280.2 Weak (Alt) Fault>> 1.5 cm CA vein/bx included

<<Struc: 280.58 - 280.65 Weak (Alt) Fault>> gouge, broken core

<<Struc: 285.25 - 285.5 Moderate (Alt) Vein>> hosted by fault

<<Struc: 287.7 - 287.94 Strong (Alt) Fault>> gouge, broken core

<<Struc: 291.2 - 293.3 Moderate (Alt) Fault>> measured in gouge

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-281

Prospect:	ABM	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Cooper Campbell	Date Logging Start:	01-Oct-15
UTM Easting	414594	Core Size:	HQ3	Azimuth:	181.38	Date Logging Complete:	04-Oct-15
UTM Northing:	6815656	Casing Pulled?:	Yes	Dip:	-55	Drill Company:	Geotech
UTM Elev. (m):	1447.51	Casing Depth (m):	4.5	Length (m):	260	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	29-Sep-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	03-Oct-15
Local Elev. (m):						Purpose:	Resource/Met
						Parent Hole:	

Comments:

The purpose of this hole was to sample the lower Pb poor magnetite sulphide lens (MET 4 Domain).

The upper portion of this hole contains RHYcw, RHYvx, RHYv, and RHYvl intruded by MAFi. One major lens of massive sulphide was intersected between 179.27-183.23 m. OA, OC, and OJ ore types were intersected. An interval of OJ was intersected from 192.31-193.87 m. RHYcw, and RHYvl sit structurally below the sulphide zone and are intruded by RHYi and MAFi. RHYvx, MDSt, and RHYvl were intersected below the RHYi and MAFi unit.

CI-CL zones were intersected above, within, and below the sulphide lens. Albite alteration was intersected in the structural hanging wall.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-281W1

Prospect:	ABM	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Cooper Campbell	Date Logging Start:	04-Oct-15
UTM Easting	414594	Core Size:	HQ3	Azimuth:	180	Date Logging Complete:	05-Oct-15
UTM Northing:	6815656	Casing Pulled?:	Yes	Dip:	-55	Drill Company:	Geotech
UTM Elev. (m):	1447.51	Casing Depth (m):	4.5	Length (m):	199.6	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	03-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	04-Oct-15
Local Elev. (m):						Purpose:	Metallurgical Wedge
						Parent Hole:	K15-281

Comments:

The purpose of this hole was to sample the lower Pb poor magnetite sulphide lens (MET 4 Domain) for metallurgical testing.

The upper portion of this hole contains RHYvx, and RHYc. One major lens of massive sulphide was intersected between 178.63-183.56 m. OA, OC, and OJ ore types were intersected. Two intervals of OJ were intersected from 192.23-194.1 m and 195.32-196.64 m. RHYcw, and RHYvl sit structurally below the sulphide zone.

CI-CL zones were intersected above, within, and below the sulphide lens.

The drill bit completely wore out at 199.6 m. Instructed drill crew to pull out and replace bit. Upon reaming during re-entry the reaming shoe broke. The hole was terminated after the attempted re-entry.

UTM Elev. (m):	1440.363	Casing Depth (m):	9	Length (m):	340	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	01-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	06-Oct-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

Hole K15-282 is an exploration hole drilled to test the continuity of the lens intersected in K97-173 and to look for proximal alteration suggesting vicinity to sulphide lens.
The upper units of this hole are composed of mafic tuff and mudstone underlain by rhyolite crosscut by aphanitic felsic and intermediate mafic dykes.
The hole intersects a lens of massive sulphide zone from 243.72 to 245.37m, containing MG-PY-CP-SP-GL, OB and OA domains. The hole shows progressive muscovite alteration surrounding the mineralization from 197.58 to 256.73m. At this depth, the hole is cut by a mafic intrusion.
From 299.30 to 314.40m, two massive sulphide lenses, separated by a 1.66m interval of mafic rock, are intersected. No proximal chlorite alteration is observed.
The hole ends in the mafic intrusion at 340m.
Note: due to a combination of run block errors, zones of poor recovery and general lackof diligence during the drilling, the massive sulfide core boxes had to be reorganized and rebuilt. There is a high level of confidence in the accuraccy of this rebuilding.

9.00 12.80 MAFt Mafic Volcaniclastics grey-green

9 - 12.8: Few BI, CA veinlets, locally argiliic

<<Min: 9 - 32.5 8% Min: Calcite>>

<<Min: 9 - 65 2% Min: Pyrite>>

<<Min: 9 - 65 2% Min: Pyrrhotite>> Elongated and veinlets

<<Alt: 9 - 64 Weak (Alt) Chlorite>>

<<Alt: 9 - 65 Trace (Alt) Muscovite>>

<<Vein: 9 - 32.5 Calcite>> CA veinlets associated with mafic rock.

<<Struc: 9 - 35 Trace (Alt) Fault>> Rubble, broken zone. Poor recovery and highly fractured.

12.80 19.55 MDSc Carbonaceous dominant mudstone black

12.8 - 19.55: CA veining, vuggy texture locally.

19.55 25.00 MAFt Mafic Volcaniclastics green-brown

19.55 - 25: Weak chlorite, weak muscovite

25.00 37.00 MDSc Carbonaceous dominant mudstone black

<<Min: 32.5 - 71 4% Min: Calcite>>

<<Alt: 34.5 - 36.5 Moderate (Alt) Silicification>> In MDSc, probably associated with QZ veins

<<Vein: 32.5 - 38.5 Quartz>> QZ veins, 3cm to 50 cm, deformed.

37.00 71.22 RHYva Coarse grained to ash tuff light grey

37 - 71.22: Highly fractured, fault gaoue from 55 to 55.6m.

<<Min: 65 - 122 0.5% Min: Pyrrhotite>>

<<Min: 65 - 129.5 0.5% Min: Pyrite>> And patch.

<<Alt: 65 - 129.82 Weak (Alt) Muscovite>> Locally moderate.

<<Alt: 71 - 72.66 Moderate (Alt) Silicification>> Green-grey alterationassociated with RHYi.

<<Struc: 54.9 - 55.5 Moderate (Alt) Fault>> Fault gouge contaning grey clay, Qz clasts, CA.

71.22 86.89 RHYi Aphanitic Rhyolite (intrusion) beige

71.22 - 86.89: Brecciated upper contact, stockwork texture, PY veining at lower contact. Probably albite in foliation at upper contact, flow aspect.

<<Min: 84.2 - 126.62 5% Min: Calcite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Alt: 84.2 - 97.42 Moderate (Alt) Silicification>> Green-grey alteration, bleeched.

86.89 106.27 RHYv Rhyolite volcaniclastic grey-green

86.89 - 106.27: Few QZ eyes. Dominantly ash, bleech alteration patchy due to RHYi proximity,BI patch from 96.70 to 97.90m. AK or dolomite replacing lapili.

<<Alt: 96.7 - 97.9 Weak (Alt) Biotite>>

106.27 110.52 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

106.27 - 110.52: Dyke. Brown mica, CA contrated at lower contact.

110.52 126.60 RHYv Rhyolite volcaniclastic grey-green

110.52 - 126.6: Few QE at upper contact, dominantly ash.

<<Min: 122 - 178.64 1% Min: Pyrrhotite>>

<<Vein: 112.8 - 112.9 Quartz>> QZ vein.

<<Struc: 122 - 124 Weak (Alt) Shear>> Shear zone, crenulation with QZ veining or local flow banding.

126.60 129.50 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

126.6 - 129.5: Dyke. Few PO, CA. BI phenoblasts at lower contact, chill margin at upper contact.

<<Min: 126.62 - 129.5 8% Min: Calcite>> In MAFi.

<<Struc: 127 - 164 Weak (Alt) Fault>> Multiple minor fault accentuated by fragmental texture and muscovite alteration.

129.50 136.00 RHYvx Quartz and/or feldspar crystal tuff grey-green

129.5 - 136: porphyritic texture. Foliaition well marked locally with felspar (?) flow texture. Ash in matrix. Could be felspar crystal or fragments. Locally QZ rich-veining.

<<Min: 129.5 - 157.81 2% Min: Calcite>> and replacement.

<<Min: 129.5 - 178.64 1% Min: Pyrite>> Associated with QZ.

<<Alt: 129.82 - 197.58 Moderate (Alt) Muscovite>> Locally strong alteration.

136.00 139.50 RHYva Coarse grained to ash tuff light grey

136 - 139.5: Local flow could be large clasts. QZ veins.

139.50 157.81 RHYvx Quartz and/or feldspar crystal tuff grey-green

139.5 - 157.81: Crystal tuff, locally lapilitic rich. Ash in soft matrix. AK or dolomite replacing clasts.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Alt: 146.65 - 160 Weak (Alt) Chlorite>>

<<Vein: 140.25 - 140.8 Quartz-Chlorite>> multiple 10 cm wide QZ-CL veins.

157.81 167.80 RHYvl Lapilli tuff grey-green

157.81 - 167.8: With local fragmental zone.

<<Min: 157.81 - 178.64 1% Min: Calcite>>

167.80 178.64 RHY undifferentiated rhyolite grey-green

167.8 - 178.64: Banded dark QZ/MU, PY associated with QZ bands. Texture obscured by green-grey alteration.

<<Alt: 170 - 196 Moderate (Alt) Silicification>> Green-grey alteration, QZ dyke proximity (?).

178.64 182.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

178.64 - 182: Dyke, unfoliated, containing CA, PY and PO patch, maybe MG. The dyke in crosscut by QZ and RHYi (probably xenolith).

<<Min: 178.64 - 182 5% Min: Pyrite>> and patchy.

<<Min: 178.64 - 182 5% Min: Pyrrhotite>> in Mafi dyke.

<<Min: 178.64 - 182 15% Min: Calcite>> In MAFi dyke.

182.00 191.58 RHYi Aphanitic Rhyolite (intrusion) beige

182 - 191.58: Large QZ vein containing RHYi xenolith.

<<Min: 182 - 243.72 1% Min: Pyrite>>

<<Min: 182 - 243.72 1% Min: Pyrrhotite>>

<<Vein: 184.9 - 191 Quartz-Chlorite>> Massive QZ vein associated with RHYi intruding MAFi dyke, .

<<Struc: 182 - 194.2 Strong (Alt) Shear>> Sheared and broken zone. QZ-RHYi intruding mafic dyke. Fractured massive QZ vein,filled by TML. Strongly sheared at lower contact.

191.58 193.13 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

191.58 - 193.13: Sheared lower contact of the dyke intruded by QZ vein and/or RHYi.

193.13 199.38 RHY undifferentiated rhyolite grey-green

193.13 - 199.38: Strongly altered RHY probably RHYv.

<<Min: 193.13 - 243.72 1% Min: Calcite>>

<<Alt: 197.58 - 243.72 Strong (Alt) Muscovite>> Less marked in the MUDt.

<<Vein: 194.24 - 194.26 Tourmaline>> TML veinpenetrating foliation, shallow angle

From (m)	To (m)	Rocktype & Description			From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %
199.38	**211.00**	**RHY**	**undifferentiated rhyolite**	**grey-green**									

199.38 - 211: Strongly altered RHY, could be RHYcw dislocated or volcaniclastic fragmental. SI rich.

<<Vein: 200 - 208 Quartz-Sulphide>> Dark QZ veining or bands, 3/10cm, PY associated.

<<Struc: 205.4 - 218 Weak (Alt) Shear>> Highly broken zone due to nature of rock and strong MU alteration.

211.00	**235.90**	**MDSt**	**Rhyolite tuff dominant mudstone**	**light grey**									

211 - 235.9: Probably ash dominant. Gradational contact, interbedding. PO needle and few PY disseminated.

<<Struc: 230 - 235 Moderate (Alt) Shear>>

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-283

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	David Nuttal
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Challenger_Survey	Date Logging Start:	04-Oct-15
UTM Easting	415026.341	Core Size:	HQ3	Azimuth:	340	Date Logging Complete:	06-Oct-15
UTM Northing:	6815454.157	Casing Pulled?:	Yes	Dip:	-50	Drill Company:	Geotech
UTM Elev. (m):	1382.958	Casing Depth (m):	16.25	Length (m):	190.7	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	03-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	05-Oct-15
Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-279

Comments:

This hole was drilled as a twin of K15-279 to collect sample of MET8 & MET7 Domains.
The structural footwall is composed of a package of RHYc and MDSw. Sulphide intercepts are 111.45m to 115.1m (OI, OJ, OC, OG ore types within MET7 and MET8 domains), 116.34m to 119.25m (OI, OJ, OB, OG ore types within MET6, MET7 and MET8 domains), 145.41m to 160.83m (OA, OB, OJ ore types within MET3, MET4, MET7 and MET8 domains), and from 163.87m to 169.52m (OA, OB, OI ore types within MET4, MET6, MET7, MET8 domains. The structural footwall is composed of felsic volcaniclastics. Muscovite and chlorite alteration intensifies towards the sulphide lenses.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-284

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	05-Oct-15
UTM Easting	414653.695	Core Size:	HQ3	Azimuth:	180.1	Date Logging Complete:	09-Oct-15
UTM Northing:	6815652.409	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1430.397	Casing Depth (m):	6.5	Length (m):	224	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	04-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	07-Oct-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

The purpose of this hole was to provide resource information for the space between historic holes K94-006 and K94-024. This hole was also designed to sample rocks of the MET 4 domain. This hole seemed like it may be verging on MET 2 but it seems the Pb mineralization appears to be in the form of remobilized galena in veins. This mineralization is not representative of the zone. Mineralization in this hole is characteristic of MET 4 domain.

The upper portion of this hole contains minor RHYcw and RHYvl intruded by MAFi. A unit of MDSt separates these rocks from a package of RHYcw with lesser RHYvl and RHYva. The MDSt intersected at 66.02 m suggests continuity of the upper PY MU MDS horizon depicted on the 414650 mE cross section. This package has also been intruded by MAFi. Below this MDSt, MDSw, and RHYcw were intersected. One major lens of massive sulphide was intersected between 167.26-182.61m. OA, OC, and OJ ore types were intersected. RHYcw, and RHYvl sit structurally below the sulphide zone and are intruded by MAFi and minor RHYi. A quartz eye RHY sits below the MAFi footwall unit.

CI-CL zones were intersected above, within, and below the sulphide lens.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-284W1

Prospect:	ABM	Hole Type:	DD	Survey Type:	RTK DGPS	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Challenger_Survey	Date Logging Start:	09-Oct-15
UTM Easting	414653.695	Core Size:	HQ3	Azimuth:	180.1	Date Logging Complete:	10-Oct-15
UTM Northing:	6815652.409	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1430.397	Casing Depth (m):	6.5	Length (m):	191	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	07-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	07-Oct-15
Local Elev. (m):						Purpose:	Metallurgical Wedge
						Parent Hole:	K15-284

Comments:

The purpose of this hole was to collect rock from the MET4 domain for metallurgical testing and to increase MET spatial coverage. This hole had less Pb mineralization than the parent hole, which further solidifies its place in the MET4 domain. Mineralization in this hole is characteristic of MET 4 domain.

The upper portion of this hole contains RHYcw and MDSt. One major lens of massive sulphide was intersected between 167.72-184.29m. OA, OC, OF ,and OJ ore types were intersected. RHYcw, and RHY(protolith obscured by alteration) sit structurally below the sulphide zone.

CI-CL zones were intersected above, within, and below the sulphide lens.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-285

Prospect:	GP4F	Hole Type:	DD	Survey Type:	APS	Logged By:	Murray Jones
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Murray Jones	Date Logging Start:	06-Oct-15
UTM Easting	419650	Core Size:	HQ3	Azimuth:	179	Date Logging Complete:	11-Oct-15
UTM Northing:	6813355	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1320	Casing Depth (m):	8	Length (m):	306	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	05-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	11-Oct-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

This hole was drilled to fill in a gap on Section 419650E; it is a step out 170 m east of 1998 Section 9450E.

The hole intersected mineralization equivalent to the GP4F horizon but did not intersect significant massive sulphides. The stratigraphy is fairly typical of the GP4F section, an upper felsic volcanic and sediment section followed by the mineralized sequence with quartz porphyry overlying RHYva. Mineralization was encountered from 225 to 243 consisting of a few bands of massive SP-PO-PY-GL-CP up to 20 cm wide along with widely dispersed stringers and wisps of SP-PY-GL. The mineralization is associated with patchy MU and CL-BI-GA alteration. A second significant mineralized zone was encountered from about 280-281.4 m, consisting of a semi-massive PO with SP-CP-GL-PY and associated with CL-BI-GA alteration with stringer CP mineralization to 302 m. Downhole EM did not indicate a significant conductor below the hole.

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-286 is a resource infill hole drilled between historic K15-015 and K15-134.
The upper units are made up of rhyolitic volcaniclastic units crosscut by mafic dykes.
The hole intersects a lens of massive sulfide zone from 123.92 to 157.50m, containing PY-CP-SP-GL, dominantly OG, OA and OB domains. The hole shows progressive muscovite alteration surrounding the mineralization from 54.65m to 170m with green grey alteration (MU-SI) under the mineralization. The hanging-wall consists in mineralized rhyolite(CP-PO, OI domains) followed by proximal CL alteration and moderate cordierite alteration. The footwall shows muscovite alteration in rhyolitic unit. The mafic intrusion intersected at 154.44m is locally altered MU-SI suggesting the proximity of a rhyolitic aphanitic dyke.
The hole ends on the mafic intrusion at 200m.
Note: between the woodblocks 125m to 128m, 1.07m of core is measured. There is no evidence of core loss and the pieces seem to match together therefore there might be something wrong in the marker position. However, a rod count asked at 179m was correct. 179m is a depth we can trust but we have to figure out how to recover the right depth of the massive sulfide and its width (overestimated if we maintain the block where they are now). The run between 128m and 131m is also short (1.48m) which lead me to consider that marker 128 is definitely at the wrong place. No shoulder samples have been taken above the mineralization due to poor recovery but sampling can be done later if required.

UTM Elev. (m):	1400.207	Casing Depth (m):	6	Length (m):	131	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	06-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	08-Oct-15
Local Elev. (m):						Purpose:	Resource/Met
Comments:						Parent Hole:	

This hole is designed to be resource infill between historic holes K94-045 & K94-041.
The structural hanging wall is composed of RHYc, RHYvl and MDSt intervals. Massive sulphide is present in small lenses intercalated with host schists from 30.5m to 67.32m (predominantly OA with OB and OI ore types within MET3 and MET7 domains). The structural footwall is composed of the MAFi unit. Mu alteration intensifies towards sulphide mineralization/quartz veins. Chlorite alteration is moderate to strong in mafics and patchy within the massive sulphides. Green/grey alteration (green muscovite with silicification) is present in large portions of the MAFi unit.

UTM Northing:	6815436.95	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1400.507	Casing Depth (m):	6	Length (m):	86	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	08-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	09-Oct-15
Local Elev. (m):						Purpose:	Metallurgical Twin
						Parent Hole:	K15-287

Comments:

This hole is a twin of K15-287 to collect sample of MET3 & MET7 Domains.
The structural hanging wall is composed of RHYc, MDSw and MDSc intervals. Massive sulphide occurs in lenses intercalated with host schists from 28.63m to 55.52m and from 62.5m to 65.95m (predominantly OA with OB and OI ore types within MET3 and MET7 domains). The structural footwall is composed of a package of RHYv, RHYi, MAFi, and small lenses of OI. Mu alteration intensifies towards sulphide mineralization/quartz veins. Chlorite alteration is patchy within the massive sulphides.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-289

Prospect:	ABM	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Cooper Campbell	Date Logging Start:	11-Oct-15
UTM Easting	414598	Core Size:	NQ3	Azimuth:	180.7	Date Logging Complete:	13-Oct-15
UTM Northing:	6815652	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1445.64	Casing Depth (m):	4.5	Length (m):	236	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	08-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	10-Oct-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The purpose of this hole was to test the continuity/extension of the lower MET 4 magnetite sulphide lens. No significant sulphide lens was intersected in this hole.

The upper portion of this hole consists primarily of intercalated RHYcw, RHYvx, and RHYvl intruded by MAFi. The upper package of volcaniclastics and flows grades into MDSt, MDSc, and MDSw . A major lens of massive sulphide was not intersected. RHYi was intersected from 181.65-194.28m. This is where the massive sulphide zone was anticipated. A very thin unit of MAFi was intersected below RHYi. Two narrow (<21cm) semi-massive sulphide intervals were intersected below RHYi. Weak SP mineralization was logged over these intervals. RHYc, MDSc, RHYcw, RHYvx, and RHYvl were intersected below the MAFi unit.

A small zone of what is interpreted as a weak CI-CL zone was intersected above RHYi. A weak CL zone straddles the weakly mineralized zone below RHYi.

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-290 is a resource infill hole drilled between historic holes K94-015 and K95-134.
The top of the hole is made up of rhyolitic units, dominantly volcaniclastic ashes, and carbonaceous mudstone. The hole intersects mineralization from 75.00 to 89.90m (massive and semi massive sulfide). The ore zone consists in OA, OB and OI domains containing PY-SP-MG-GL-CP.
The hanging-wall shows a progressive muscovite alteration (moderate to strong from 54.85m to 75.00m) followed by a narrow moderate CL-CI proximal alteration (0.8 metre). The footwall consists of mafic CL-CA-BI schist.
At 137.80m, a rhyolitic aphanitic dyke is intersected. The hole ends at 142.00m on this unit.
K15-290 does not show the green-grey alteration usually associated with the RHYi; sulfide assemblages are observed in the mafic sill (PY-GL-SP-CP trace, PO trace) as well as rhyolitic xenoliths.

Comments:

This hole was planned to test the continuity/extension of massive sulphide lens.
Drilling of hole K15-291 was successful in intersecting massive sulphide intervals, which confirm continuity/extension of the massive sulphide lens, down dip towards the north from previous intersections. The structural hanging wall is composed of a package of felsic volcaniclastic/coherent rocks, graphitic tuffaceous/coherent mudstones and foliation parallel mafic intrusives. Massive sulphide occurs from 218.34m to 221.24m (OB and OI style mineralization). The massive sulphide lens and hanging-wall shoulder lithologies are anomolously high in sphalerite content. The structural footwall is composed of felsic volcaniclastic/coherent rocks (adjacent to MXSX) underlain by chlorite altered mafics. Muscovite alteration intensifies towards the massive sulphide lens, though the intensity was not observed to reach strong or intense (6 - 7 on intensity scale). Chlorite alteration is trace to weak and is ubiquitously patchy throughout the hanging wall felsic volcaniclastic and mudstone units. Chlorite alteration is moderate (4) in mafic footwall.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-292

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Jerome de Pasquale
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Jerome de Pasquale	Date Logging Start:	12-Oct-15
UTM Easting	415157	Core Size:	HQ3	Azimuth:	219.81	Date Logging Complete:	16-Oct-15
UTM Northing:	6815158	Casing Pulled?:	Yes	Dip:	-80	Drill Company:	Geotech
UTM Elev. (m):	1411.79	Casing Depth (m):	18	Length (m):	312	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	10-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	15-Oct-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

K15-292 (fault block) was drilled in order to target TTK4 and EM conductor.
The upper units are made up of volcaniclastic rhyolite crosscut by mafic and intermediate dykes. From 124.12m to 170.48m, the hole intercepted a fault and shear zone. This major structure is followed two massive sulfide lens (OB domains, from 170.48m to 171.48m and 174.64m to 176.50m). The footwall consists of folded muscovite altered rhyolite followed by a CL-BI-CA altered mafic sill at 181.13m.
In the mafic unit, the drill hole intercepts a third massive sulfide lens, mineralized PY-SP-CP-GL-MG, from 217.15m to 243.00m (OA, OB, OG, and OI domains) and a narrow one from 247.25m to 248.41m (OB and OF domains) immediately followed by a felsic sequence (rhyolite).
A fault is encountered approximately where the intercept of the upper lens of hole K15-282 was projected. The two upper massive sulfide lenses could be the same one, crosscut twice due to offset (repetition of the sequence).
The interval in between the upper and the lower lenses in K15-292 is about the same than observed in K15-282 (around 50 metres).

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-293

Prospect:	ABM	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Cooper Campbell
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Cooper Campbell	Date Logging Start:	14-Oct-15
UTM Easting	414598	Core Size:	NQ3	Azimuth:	180.7	Date Logging Complete:	16-Oct-15
UTM Northing:	6815652	Casing Pulled?:	Yes	Dip:	-86	Drill Company:	Geotech
UTM Elev. (m):	1445.64	Casing Depth (m):	3.7	Length (m):	239	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	11-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	13-Oct-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The purpose of this hole was to test the continuity/extension of the lower MET 4 magnetite sulphide lens. No significant sulphide lens was intersected in this hole. Low grade OI and OJ ore types were intercepted.

The upper portion of this hole consists primarily of intercalated RHYcw, RHYvx, RHYva, and RHYvl intruded by MAFi. The mudstone units intersected in ABM4 (K15-289) become very narrow in this hole and consist only of MDSt. A major lens of massive sulphide was not intersected. Low grade OI and OJ was intersected from 147.09-148.10m, and 149.23-155.3m. RHYi was intersected from 180.7-198.15m. This is close to where the massive sulphide zone was anticipated. The weakly mineralized zone of OI, and OJ could represent the down dip expression of the massive sulphide zone. RHYc, RHYcw, and RHYvl were intersected below the weakly mineralized zone.

A small zone of weak to moderate CI-CL zone was intersected above RHYi. There was associated pervasive MU-alteration surrounding the occurrences of heavily disseminated sulphide.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	16-Oct-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

This hole was designed fill in a gap on Section 9450E. No massive sulphide was encountered but lesser sulphide mineralization was intersected at the GP4F horizon.

K15-294 intersected a dark sedimentary unit over the first 12m and then primarily felsic volcanic rocks, rhyolite lapilli tuff and coherenet rhyolite commonly with bluish quartz eyes, with minor MAFi and sediment to about 294 m depth. A short stretch of darkly coloured, BI-rich sediment occurs in a fault zone at the bottom of the hole but it is difficult to determine if this is the carbonaceous sediments seen at depth in hole K15-261 and K15-280.

Moderate to intense chlorite, biotite, cordierite and garnet alteration is present from approximately 223 to 254 m. This is accompanied by pyrrhotite-pyrite and strong stringer to wispy-style sphalerite-galena and chalcopyrite mineralization from 226m to 246 metres. Another zone of primarily pyrrhotite-pyrite mineralization occurs from 267 to 269 m, along with cordierite-biotite alteration.

0.30 12.00 SED undifferentiated Sediment dark grey

0.3 - 12: ragged laminated black and lt grey coloured SED, not carbonaceous, quartzose in lenses, contorted locally, lt brown laminae after BI, cut by BIAC MAFi, CA lenses and wisps t/o

<<Min: 0.3 - 12 10% Min: Calcite>> CA in lenses with QZ? Interlayered with BI-rich layers in meta-sediment

12.00 13.88 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown

12 - 13.88: faulted, gouge

<<Struc: 12 - 13.75 Moderate (Alt) Fault>> mostly gouge, fault hosts MAFi

13.88 51.61 RHYvx Quartz and/or feldspar crystal tuff dark grey FMG

13.88 - 51.61: dark grey to tan-green locally, RHYv with 1-4mm crystals of QZ and possibly FP (small, blocky), very dark locally due to varying BI content, BI as speckles and pervasive in groundmass, also as envelopes to fractures, BI-rich clasts locally, groundmass is well indurated, tan to grey, feldspathic, leucoxene(?) locally as well.

Unit is somewhat variable volcaniclastic rhyolite, with varying amounts of lapilli t/o, generally low concentrations, lt coloured, and small phenos present normally. Dark BI-rich clasts occur locally, e.g. between 31 and 35 m.

<<Min: 40.27 - 42.38 5% Min: Calcite>> in fractures, groundmass

<<Alt: 13.88 - 24 Weak (Alt) Silicification>> bleaching of groundmass around fractures

<<Alt: 50.3 - 51.61 Moderate (Alt) Silicification>> fractured zone a lower contact of RHYv

<<Alt: 50.3 - 51.61 Moderate (Alt) Muscovite>> bleaches rock

<<Alt: 50.3 - 51.61 Weak (Alt) Chlorite>> patchy in groundmass

<<Struc: 23.8 - 25.6 Moderate (Alt) Fault>> mostly broken, weathered core, minor gouge mixed in

51.61 55.08 MAFi Mafic Intrusions (primarily footwall mafic intrusion) green-brown MCG

51.61 - 55.08: BI to BI-AC rich, unit, strongly faulted and weathered, CA focused in weathered sections

55.08 67.66 RHYvx Quartz and/or feldspar crystal tuff grey FG

55.08 - 67.66: small bluish QE, continues from section above dyke, lapili appear at base below 66.9, in and out of unit

<<Min: 60 - 65.5 3% Min: Calcite>> or fractures and small patches

<<Min: 60 - 67.66 0.01% Min: Pyrite>> fine diss'ns

<<Min: 65.5 - 76.3 1% Min: Calcite>>

<<Alt: 60 - 65.7 Moderate (Alt) Muscovite>> almost silvery grey in sections

From (m)	To (m)	Rocktype & Description

<<Struc: 58.65 - 58.9 Moderate (Alt) Fault>> narrow gouge zone, overall not badly broken

<<Struc: 61.1 - 63.1 Moderate (Alt) Fault>> measured on QZ vein, oxidized section, hosts Dyke

67.66 80.10 RHYvl Lapilli tuff grey-green

67.66 - 80.1: scattered intervals of lapilli, generally <2 cm long, altered around large fault in lower half

<<Min: 67.66 - 80.1 0.5% Min: Pyrite>> and in fractures

<<Alt: 72.43 - 76.8 Moderate (Alt) Muscovite>> schistose partings more prevalent

<<Alt: 73.9 - 77.2 Moderate (Alt) Chlorite>> and bands, fades at fault boundary

<<Alt: 76.8 - 77.2 Moderate (Alt) Silicification>>

<<Alt: 76.8 - 79.75 Strong (Alt) Muscovite>> locally intense in fault between 77.20 and 79.75

<<Alt: 79.75 - 80.4 Weak (Alt) Garnet>> scattered pblasts adjacent to alt'n in fault zone

<<Struc: 69 - 70.8 Moderate (Alt) Fault>> about 1.2 m lost core

<<Struc: 77.2 - 79.75 Strong (Alt) Fault>> low angle fault, results in wide zone of alt'n in fault envelope

80.10 87.90 SEDc calcareous Sediment grey

80.1 - 87.9: patchy, speckled with TO pblast, greenish patches with calc-silicate(?), possible AC, minor RHYvl intervals, variable appearance partly due to proxiity of altered fault zone, and MAFI that wanders in an out of the core trace e.g. at bottom of section

<<Min: 80.1 - 87.9 0.5% Min: Pyrrhotite>> scattered

<<Struc: 81.6 - 81.8 Moderate (Alt) Vein>> TO vnlt with wide bleached alt'n envelope

87.90 115.38 RHYvl Lapilli tuff grey-brown MG

87.9 - 115.38: variable texture from conc'd lapilli to scattered lapilli to ash(?) locally, minor leucoxene locally, RHYc appears, disaggregated silicic bands from 104 to 110.4

<<Min: 87.9 - 106.61 0.5% Min: Pyrite>> minor fine diss'ns

<<Min: 104.1 - 106.61 1% Min: Pyrrhotite>> scattered, small diss'd patches

<<Min: 106.61 - 112.44 3% Min: Pyrite>> and in fractures

<<Min: 106.61 - 112.44 0.5% Min: Pyrrhotite>> in PY bands but local

<<Alt: 104.1 - 109.22 Moderate (Alt) Muscovite>> waxes and wanes a bit, stronger around QV's

<<Alt: 106.61 - 108.2 Moderate (Alt) Chlorite>> in fractures, discolours QV

<<Alt: 107.52 - 109.22 Moderate (Alt) Biotite>> fractures and with CL

<<Alt: 108.2 - 109.22 Strong (Alt) Chlorite>> with BI

<<Alt: 109.22 - 110.38 Strong (Alt) Muscovite>>

<<Alt: 110.38 - 112.44 Moderate (Alt) Muscovite>>

<<Alt: 110.38 - 112.44 Strong (Alt) Chlorite>> with BI

<<Alt: 110.38 - 112.44 Moderate (Alt) Biotite>> with CL

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	12-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	15-Oct-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

This hole is intended as a resource infill between historic holes K95-071 & K94-033.
The structural hanging wall is composed of a package of RHYvl / RHYc and foliation parallel MAFi, underlain by MDSt, RHYv and RHYc units. The hole lacks a massive sulphide intercept, though abundant disseminated sulphides are present between 134m to 150m in rocks with strong muscovite, chlorite and cordierite alteration. The structural footwall is composed of a package of RHYv / RHYc and MDSt, underlain by MAFi and RHYi. Intensity of muscovite, chlorite and cordierite alteration increases towards interval of heavily disseminated sulphide mineralization. Silicification is present at contact between MAFi and RHYi in footwall rocks. Green grey (Mu + Si alteration) is absent in contact between MAFi and RHYi.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-296

Prospect:	ABM	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	75.7	Survey By:	Cooper Campbell	Date Logging Start:	17-Oct-15
UTM Easting	414840	Core Size:	NQ3	Azimuth:	180.02	Date Logging Complete:	17-Oct-15
UTM Northing:	6815378	Casing Pulled?:	Yes	Dip:	-70	Drill Company:	Geotech
UTM Elev. (m):	1394.75	Casing Depth (m):	3.7	Length (m):	62	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	14-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	15-Oct-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-296 was collared directly into MSXS (OB) from 3.7-5.3 m. Below this RHYi occurs from 5.3-17.1 m, where semi-massive sulphide (OI) occurs from 17.1-17.6 m. From 17.6-18.6 m a MU-altered coherent rhyolite occurs. MSXS was intercepted again from 18.6-25.2, consiting of OI, OA, and OB. The footwall package consists of MU-altered volcaniclastic rhyolite, underlain by RHYi, and interlayered volcaniclastic rhyolite and CL-CA-BI MAFi.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-297

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Sean Suttie	Date Logging Start:	17-Oct-15
UTM Easting	415055	Core Size:	HQ3	Azimuth:	144.97	Date Logging Complete:	21-Oct-15
UTM Northing:	6815303	Casing Pulled?:	Yes	Dip:	-45	Drill Company:	Geotech
UTM Elev. (m):	1386.07	Casing Depth (m):	15	Length (m):	350	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	15-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	20-Oct-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

K15-297 was drilled to test the up-dip resource extension of the ABM deposit, gain geotechnical and structural data from the East fault, as well as test the resource extension of the newly discovered mafic-hosted/associated massive sulphide lens.
K15-297 drilled through the main ABM deposit, consisting of OJ, OA, OI, and OB, from 104-17.3 m. The ABM deposit was overlain by MU-altered rhyolite from 10.9-14 m. The footwall of the ABM deposit (17.3-96 m) consists of MU-altered rhyolite, followed by mixed MAFi, RHYcw, and RHYi. From 96-101.4 m the East fault was encountered, characterized by ~5 m of fault breccia. The structural footwall of the East fault consisted of MU-altered rhyolite from 101.4-208.5 m, where heavily disseminated to massive sulphide (~40 cm lenses) were encountered sporadically to a depth of 229.15 m. These sulphide occurrences were hosted within MU-altered rhyolite. Below this MAFi was encountered from 229.15-285.1 m, directly followed by massive sulphide, consisting of OA, OI, and OB. The mafic showed a bleached contact from ~284.7-285.1 m. Below the massive sulphide occurrence, another MAFi occurs from 302.7-309.7 m. Followed by another 2 m occurrence of massive sulphide, consisting of OA and OF. The footwall of this lowest sulphide lens consists of progressively less MU-altered rhyolite, from 311.7-350 m (EOH).

Comments:

K15-298 is a resource infill drill hole between historic holes K95-121 and 94-028.
The hanging-wall is made up of moderate to strongly muscovite altered rhyolite and mudstone.
The ore zone (PY-SP-GL-CP-MG), is intercepted from 54.40m to 67.20m (OB, OA and OI domains).
The footwall consists of a mafic sill (CL-CA-BI) which shows close-spaced variations in the orientation of foliation.

Local Elev. (m):						Purpose:	Resource Confirmation
Comments:						Parent Hole:	

This hole was drilled as resource confirmation of sulphide intercept in historic hole K94-014.
The structural hanging wall is composed of a package of RHYc, RHYv and MDS (t/c) with foliation parallel MAFi intrusives. Massive sulphide is observed from 99.08m to 124.8m (composed mostly of OA (dmg) and OB ore types; high amounts of CP are noted from 113.23m to 114.53m). The structural footwall is composed of a package of undifferentiated RHY and carbonaceous sediments (MDS) underlain by MAFi and RHYi. A 33cm interval of OB is present at the contact between MDS and MAFi (140.28m depth). Muscovite, chlorite and cordierite alteration intensify proximally to the sulphide body. Chlorite alteration is moderate in the footwall MAFi unit, and Si alteration is moderate to strong throughout the RHYi interval.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-300

Prospect:	ABM	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Jerome de Pasquale
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Sean Suttie	Date Logging Start:	18-Oct-15
UTM Easting	415250	Core Size:	HQ3	Azimuth:	125.25	Date Logging Complete:	21-Oct-15
UTM Northing:	6815495	Casing Pulled?:	Yes	Dip:	-45	Drill Company:	Geotech
UTM Elev. (m):	1447.67	Casing Depth (m):	3	Length (m):	200.1	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	17-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	20-Oct-15
Local Elev. (m):						Purpose:	Geotech
Comments:						Parent Hole:	

K15-300 was drilled in order to collect geotechnical data on the east side of the ABM deposit.
The upper units of K15-300 are made up of a felsic sequence (coherent and volcaniclastic rhyolite) crosscut by mafic dykes until the hole intercepts a fault from 131.10m to 143.66m (fault gouge, fault breccia and shearing).
The structure is underlain by a strongly foliated and QZ-CA veined graphitic mudstone.
The hole ends at 200.1m in highly fractured graphitic mudstone.

73.26 74.48 MAFt Mafic Volcaniclastics

73.26 - 74.48: Maybe ash. Look volcaniclastic but could be intrusive.

74.48 75.57 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

74.48 - 75.57: Silica rich.

75.57 78.46 RHYva Coarse grained to ash tuff grey-green

75.57 - 78.46: MU rich, locally flow banded, peperitic texture, QE aggregated.

<<Struc: 75.87 - 75.88 dominant foliation>>

78.46 79.44 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

78.46 - 79.44: CA rich.

79.44 81.31 RHYva Coarse grained to ash tuff grey-green

79.44 - 81.31: Lapilli, silica rich.

81.31 84.59 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

81.31 - 84.59: QZ vein at lower contact.

<<Vein: 84.5 - 84.64 Quartz>> QZ vein at lower contact of MAFi

84.59 87.78 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

84.59 - 87.78: MU/SI banded, PY/QZ veining, folded/crenulations.

87.78 92.22 RHYvl Lapilli tuff grey-green

87.78 - 92.22: or RHYcf, MU altered.

<<Min: 87.78 - 131 1% Min: Calcite>>

<<Struc: 87.78 - 87.79 dominant foliation>>

<<Struc: 88 - 88.01 dominant foliation>>

From (m)	To (m)	Rocktype & Description		From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

92.22 93.14 RHYva Coarse grained to ash tuff grey-green

92.22 - 93.14: MU/QZ/PY banded.

93.14 93.49 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey

93.14 - 93.49: CA rich

<<Struc: 93.4 - 95 Weak (Alt) Fault>> Accentuated by MU alteration.

93.49 111.41 RHY undifferentiated rhyolite grey-green

93.49 - 111.41: RHYvl with fragment of lapilli but SI rich and texture of RHYc with possibly xtl. Could also be identify as RHYvx. QE heterogeneous.

<<Struc: 94 - 94.01 Vein>> CA.

<<Struc: 94.85 - 94.86 dominant foliation>>

<<Struc: 95 - 95.01 Fault>> Fault gouge.

<<Struc: 96.8 - 96.81 Vein>> PY?

<<Struc: 97.5 - 97.51 dominant foliation>>

<<Struc: 100.3 - 100.31 dominant foliation>>

<<Struc: 104 - 104.01 dominant foliation>>

<<Struc: 107 - 107.01 dominant foliation>>

111.41 112.27 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

111.41 - 112.27: Could be clastic (MAFt).

<<Struc: 111.5 - 111.75 Weak (Alt) Fault>> Fault gouge.

112.27 113.02 RHYvl Lapilli tuff grey-green

<<Struc: 112.85 - 112.86 Vein>> CA fracture filling.

113.02 113.83 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey

113.02 - 113.83: Or ashes.

<<Min: 113.02 - 131 0.5% Min: Pyrite>>

<<Struc: 113.7 - 117.71 Weak (Alt) Fault>> Fault gouge.

From (m)	To (m)	Rocktype & Description		From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

113.83 116.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

113.83 - 116: CA rich.

116.00 117.15 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

116 - 117.15: Locally flow banded, maybe xtl fragments.

117.15 118.86 RHYva Coarse grained to ash tuff grey-green

117.15 - 118.86: With lapilli.

<<Struc: 117.6 - 117.61 Weak (Alt) Fault>> Cemented joints.

118.86 122.00 RHYvl Lapilli tuff grey-green

118.86 - 122: Peperitic texture at lower contact. Angular clasts (fragments?), heterogeneous.

<<Struc: 120.6 - 120.61 dominant foliation>>

122.00 124.80 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

122 - 124.8: Curdy texture.

124.80 131.10 RHYvl Lapilli tuff grey-green

124.8 - 131.1: Angular fragments (or xtl). Brecciated texture.

131.10 135.52 FBX Fault Breccia

131.1 - 135.52: Fault gouge (grey clay) and QZ vein up to 40 cm. Clasts of MAFt (?).

<<Vein: 131.4 - 134 Quartz>> QZ vein preserved in fault zone.

<<Struc: 131.1 - 135.52 Strong (Alt) Fault>> Fault gouge, rubble zone.

135.52 137.51 FBX Fault Breccia

135.52 - 137.51: Fault breccia with clasts (1mm to 10 cm). QZ/CA and RHY.

<<Struc: 135.52 - 137.51 Strong (Alt) Fault>> Fault breccia.

137.51 139.50 MAFi Mafic Intrusions (primarily footwall mafic intrusion) light grey

137.51 - 139.5: Or MAFt or ashes. Highly fractured.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

139.50 143.66 FBX Fault Breccia light grey

139.5 - 143.66: Fault breccia containing QZ vein, PY clasts (vein?), locally silicified (from 142 to 143m). Subangular fragments.

<<Struc: 139.5 - 143.66 Strong (Alt) Shear>> and fault breccia.

143.66 148.84 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

143.66 - 148.84: Strongly graphitic. CA veinlets, fractured. QZ veins up to 10cm wide).

<<Min: 143.66 - 200.1 0.5% Min: Pyrite>> Euhedral in highly graphitic zone.

<<Min: 143.66 - 200.1 0.1% Min: Pyrrhotite>>

<<Min: 143.66 - 200.1 2% Min: Calcite>>

148.84 152.23 RHY undifferentiated rhyolite light grey

148.84 - 152.23: Highly silicified., could be aplitic or ashes. PY veins.

<<Alt: 149.7 - 157 Strong (Alt) Silicification>>

<<Struc: 151.6 - 151.61 dominant foliation>>

152.23 159.84 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

152.23 - 159.84: Strongly graphitic. QZ/CA veinlets set. Locally fault gouge. Strong sericite. PY in vein and fracture. QZ vein at lower contact. Strong foliation, shallow angle.

<<Alt: 157 - 200.1 Moderate (Alt) Muscovite>>

<<Vein: 159.4 - 159.84 Quartz-Carbonate>> QZ vein in MDS.

<<Struc: 158 - 158.01 dominant foliation>>

159.84 172.30 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

159.84 - 172.3: Strongly graphitic. Highly graphitic, highly foliated. QZ/CA veinlets set. Foliation along the core axis.

<<Vein: 163.67 - 164 Quartz-Carbonate>> QZ-CA vein.

<<Vein: 169 - 177 Calcite>> Strong CA veining.

<<Struc: 166.95 - 166.96 dominant foliation>>

<<Struc: 167.75 - 167.76 dominant foliation>>

172.30 174.08 MAFt Mafic Volcaniclastics light grey

172.3 - 174.08: Greenish color. Fractured, strong QZ/CA veining.

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

This hole is designed to infil the gap and confirm resource between historic hole K95-088 & K94-013.
The structural hanging wall is composed of a package of RHYc/RHYcw and MDSw/MDSc units. Massive sulphide interception is from 78.1m to 90.9m. Additional sulphide mineralization is present, heavily disseminated within a package of strongly altered (muscovite, chlorite, cordierite) felsic volcaniclastic rocks beneath the main sulphide lens and above the footwall MAFi. The structural foot wall is composed of MAFi truncated by RHYi. Muscovite, chlorite and cordierite intensify in proximity to the massive sulphide ore body. Silicification is present in proximity to the RHYi unit. Heavily disseminated sulphides observed beneath the main sulphide ore body are not present in adjacent historic holes K95-088 and K94-013.

						Parent Hole:	

Comments:

Collar location not surveyed by Challenger, spotted after survey completed.

The hole started near the top of the upper felsic sequence, cutting rhyolite lapilli tuff and coherent rhyolite with minor sediment and mafic dykes. The mineralized sequence starts at 135.68 with a quartz eye rhyolite followed by rhyolite tuff from 143.53 to 155.15. The GP4F mineralized zone occurs from 145.61 to 155.15 associated with strong chlorite-biotite-garnet-cordierite alteration. Several small sections of semi-massive pyrrhotite-pyrite-sphalerite are interspersed with stringer and blebby sphalerite-galena-chalcopyriote mineralization. The hole continued into the footwall, with another quartz porphyry lapilli tuff unit and rhyolite tuff. A weaker mineralized zone was encountered from 189 to 195 m, although core recovery in this interval was quite bad. This zone contains only a few percent of sphalerite and chalcopyrite with narrow bands of pyrrhotite and pyrite in biotite-garnet altered tuff.

Overall, a good intersection of GP4F style mineralization was intersected but the lower mineralized zone was much weaker here than in hole K98-196, down dip.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	23-Oct-15
Local Elev. (m):						Purpose:	Exploration
						Parent Hole:	

Comments:

The purpose of DDH K15-303 was to test for the up-dip extension of the recently discovered Krakatoa sulfide lens hosted in Mafi.
DDH K15-303 was succeeded in cutting the lens from 198.0-219.25m (21.75m core width) which consists of mostly OB with several sphalerite rich (20%+) sections and several smaller more discrete Cu rich (OI, OG) sections. In addition, almost continuous massive sulphide lenses were intersected from 134.0 -142.7m (8.7m core width) and two thin MSX horizons between 154.9-158.1m of similar type mineralization. Two smaller horizons of OJ were encountered at 148.7 - 149.8m and 232.30-234.05m, both located between MAFi and RHY contact zones. Nearby DDH K15-304 intersected a similar mineralized stratigraphic sequence. Nearby DDH K15-305 also intersected a similar stratigraphic - mineralized package down to the Krakatoa lens, below it, where the lower OJ horizon would lie (in K15-303), a thicker massive sulphide lens (of OI and OB?) was intersected. This might indicate that mineralization thickens to the SE (at least for the lower lens). Of note, in K15-303, compared to the mineralization and wallrock at the ABM deposit, mineralization and wallrock at the Krakatowa lens is calcite rich. Alteration is mostly subtle, usual muscovite in hanging wall of upper lens and below the lowermost OJ horizon. Prominent chlorite alteration is restricted to OJ horizons and MAFi unit above lowermost OJ horizon. DDH K15-303 succeeded in extending the sulphide lens(s) updip.
A summary of the intersected mineralized stratigraphic package follows.
0-4.5m OVBN
4.5-132.4m RHY volcanic package, minor mafic(?) dykes
132.4-134.0m No Core except for 7cm of OA
134.0-142.7m MSX and minor RHY
142.7-148.7m MAFi
148.7-149.8m OJ
149.8-154.9m RHY
154.9-158.1m MSX and RHY
158.1-198.0m MAFi
198.0-219.25m MSX
219.25-232.3m MAFi
232.3-234.05m OJ
234.05-247.8m RHY
EOH

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-304

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Sean Suttie	Date Logging Start:	21-Oct-15
UTM Easting	415149	Core Size:	HQ3	Azimuth:	234.72	Date Logging Complete:	24-Oct-15
UTM Northing:	6815074	Casing Pulled?:	Yes	Dip:	-60	Drill Company:	Geotech
UTM Elev. (m):	1406.33	Casing Depth (m):	6	Length (m):	254	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	20-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	23-Oct-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

K15-304 was drilled as an exploration hole to test the continuity of the down-dropped and mafic hosted/associated massive sulphide lenses (Krakatoa lens).
The hanging wall package (4.9-125 m) consisted of mixed rhyolite, RHYi, BI+CA schists (dykes?), and a minor mudstone horizon. MU-alteration becomes apparent at 85.5 m and increases in intensity toward the upper massive sulphide lens at 125 m. The upper lens (125-127.8 m) consists of OA ore type. Below this lens MU-altered rhyolite continues to a depth of 130.6 m. From 130.6-161.8 m a CL+BI+/-CA schist (MAFi) occurs, with no apparent alteration near either contact. Below the mafic unit, MSXS occurs from 161.8-171.6 m, consisting of OA and OB ore types. The footwall of this lens consists of strongly MU-altered rhyolite cross-cut by RHYi. From 203-206.25 m, there is another CL+BI+CA schist, with ~.5 m of OJ mineralization below (Lowest lens). The footwall of this lowest lens consists of MU-altered rhyolites to the end of the hole (254 m).

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	20-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	25-Oct-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

K15-305 is an exploration hole drilled in order to intersect two massive sulfide lenses, including the Krakatoa ore body.
The upper units are made up of volcaniclastic rhyolite crosscut by mafic and intermediate dykes. The hole intercepts two major structures marked by fault breccia and shear zones from 78.00m to 102.00m and 138.00m to 146.00m.
The first mineralized zone is intersected from 182.65m to 197.30m, containing OB domains (PY-SP-GL-CP and MG locally) followed by a rhyolitic unit and a narrow massive sulfide lens (0.63 metre) at contact with the mafic sill unit. The hanging wall shows a strong pervasive muscovite alteration.
A second lens is intersected from 228.80m to 246.98m containing PY-SP-GL-CP-MG (OB, OA, OI, and OD). Note that even though classified as OI, this classification does not really match with the observations. It contains about 25 percent of laminated sulfide and a dominant matrix probably BA rich (to be confirmed by the assay results) and magnetite. The host rock has not yet been determined.
Below this unit, a minor fault zone is observed showing strongly altered rhyolite (possibly green-grey alteration), massive QZ vein and aphanitic rhyolite.
A third lens mineralized PY-SP-GL-CP-MG-PO is intersected from 258.50m to 264.50m (OA, OB, OI, OG domains) followed by felsic units. The hole ends at 300.00m.

7.50 20.50 RHY undifferentiated rhyolite grey-green

7.5 - 20.5: Gouge in fracture, fault breccia and cemented fractures in RHY.

<<Struc: 9 - 20.5 Weak (Alt) Fault>> Subsurface cimented fractures.

20.50 48.00 RHYva Coarse grained to ash tuff grey-green

20.5 - 48: Lapilli CA replacement. From 44.7 to xxx, cemented fractures and QZ veins.

<<Min: 32 - 66.45 3% Min: Calcite>> Lapilli replacement.

<<Min: 32 - 102.6 0.1% Min: Pyrrhotite>>

<<Min: 32 - 103.6 0.1% Min: Pyrite>> and rare veinlets.

<<Vein: 44.3 - 47.7 Quartz-Carbonate>> QZ-CA vein, brecciated, cimented in muscovite altered ash matrix.

48.00 51.70 RHYvl Lapilli tuff grey-green

48 - 51.7: Locally flow banded with crenulations.

51.70 52.81 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey-brown

51.7 - 52.81: Could be clastic. CA.

52.81 58.80 RHYvl Lapilli tuff grey-green

52.81 - 58.8: With ashes.

<<Struc: 53.95 - 53.96 dominant foliation>>

58.80 61.50 MAFi Mafic Intrusions (primarily footwall mafic intrusion) grey-brown

58.8 - 61.5: BI, CA. Faulted lower contact.

61.50 66.45 RHYva Coarse grained to ash tuff grey-green

61.5 - 66.45: and some lapilli.

66.45 77.00 RHY undifferentiated rhyolite beige

66.45 - 77: QZ vein at upper contact. Faulted RHY, fault gouge, probably mafic dyke interbedded.

<<Min: 66.45 - 182.65 1% Min: Calcite>> Locally patchy in MAFi clasts.

<<Vein: 66.45 - 66.95 Quartz 30 deg. >> Cimenetd QZ vein at upper contact with fault zone.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

77.00 102.60 FBX Fault Breccia beige

77 - 102.6: Fault breccia and sheared RHY, few PY veinlets. Sericitic. Average foliation about 40 degrees. PY clasts or vein relics. CA composition in fault clay fault gouge. Folded/crenulated RHY at lower contact.

<<Alt: 78 - 141.2 Weak (Alt) Muscovite>> In fault zone.

<<Struc: 78 - 102 Strong (Alt) Fault>> Alpha angle estimated from upper QZ vein contact. Containing fault breccia and fault gouge.as well as sheared zone of RHY. MDS at lower contact.

102.60 105.79 MDS Carbonaceous Mudstone & Tuffaceous Mudstone black

102.6 - 105.79: With clasts.

<<Min: 102.6 - 105.79 2% Min: Pyrite>> or stringers.

<<Min: 102.6 - 105.79 0.1% Min: Pyrrhotite>> Associated with PY

<<Struc: 102.6 - 102.61 Contact>>

105.79 130.06 RHY undifferentiated rhyolite grey-green

105.79 - 130.06: Shear zone. No strong evidence to argue between volcaniclastic or coherent rhyolite. Mafic dykes crosscutting the units tend to confirm that it is the felsic sequence.

<<Min: 105.79 - 144 0.5% Min: Pyrite>>

<<Min: 105.79 - 182.65 0.5% Min: Pyrrhotite>> and associated with MAFi.

<<Struc: 122.48 - 123.85 Moderate (Alt) Shear>> Alpha angle drifting from 42 to 25 degres,and back to 54.

<<Struc: 124.7 - 124.71 dominant foliation>>

<<Struc: 125.5 - 125.51 dominant foliation>> Fold nose in between those 124.5m to 126m measurements.

<<Struc: 125.9 - 125.91 dominant foliation>>

130.06 133.53 RHYi Aphanitic Rhyolite (intrusion) beige

130.06 - 133.53: Aphanitic texture, mixed with schist and late QZ vein.

<<Struc: 132.5 - 133.53 Strong (Alt) Crenulation cleavage>> QZ vein, PY-TML veinlets,

133.53 134.48 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

134.48 138.41 RHY undifferentiated rhyolite grey-green

134.48 - 138.41: Sheared, locally fault gouge. Sheared,

<<Struc: 136 - 138.21 Strong (Alt) Shear>> Sheared with locally fault gouge.

<<Struc: 138.21 - 140.8 Strong (Alt) Shear>> Shear zone including MAFi dyke sheared alog the core axis. QZ veinsand chorite aletration, britle locally.

0.00 8.75 OVBN Overburden

0 - 8.75: Mixed lithologies to 8.75, start of consistent core pieces, fit together

8.75 59.70 RHYva Coarse grained to ash tuff dark grey FG

8.75 - 59.7: relatively massive, variable and mottled colouring, RHYv, ash primarily, or flow banded, crystals not readily apparent as in updip hole, TO pblast present, QZ-TO veinlets, MAFi usually in faulted ground, bleaching occurs around faults as well, with MU(?), CA, CA veining, sporadic QZ veining in host is quite planar, not stronglyschistose,

<<Min: 8.75 - 19.35 5% Min: Calcite>> pervasive, diss'ns, fractures

<<Min: 8.75 - 51.9 0.01% Min: Pyrite>> minor in fractures, QV's

<<Min: 11.71 - 127.3 3% Min: Pyrrhotite>> diss'd bands, lenses common, also scattered in groundmass

<<Min: 19.35 - 28.3 1% Min: Calcite>>

<<Min: 28.3 - 38.5 5% Min: Calcite>> pervasive, fractures

From (m)	To (m)	Rocktype & Description

From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 51.9 - 81 1% Min: Pyrite>> small masses locally

<<Min: 57 - 63.75 1% Min: Calcite>>

<<Struc: 27.25 - 27.35 Weak (Alt) Vein>> QZ-TO veinlet, bleaching associated

<<Struc: 28.5 - 28.51 Moderate (Alt) Contact>> contact of MAFi dykelet

<<Struc: 33 - 34.6 Weak (Alt) Fault>> hosts dyke

<<Struc: 38.5 - 40.2 Weak (Alt) Fault>> broken core, minimal gouge

<<Struc: 54.8 - 56.7 Moderate (Alt) Fault>> broken, gouge, lost core

59.70 81.00 RHYc Rhyolite coherant volcanics grey-green VFG

59.7 - 81: massive, aphanitic, RHYc, aphyric?, fractures marked by CL, alt'n zone dominates. Focused on CY alt'n zone frm 81m. Locally, this rock is glassy, looks like RHYi, and the alteration is simialr to grey-green alteration possibly.

<<Min: 61.4 - 81 0.5% Min: Pyrrhotite>> wisps and fine diss'ns throughout

<<Alt: 61.4 - 81 Moderate (Alt) Muscovite>> core is bleached, irregularly, increasing slightly in intensity downhole,

<<Alt: 70.05 - 81 Moderate (Alt) Chlorite>> conc'd in fractures, patches/clots associated with QZ-CB veins, seems to be hand-in-hand with MU

<<Vein: 64 - 64.6 95% Quartz>> QZ vn, CL-TO-PY in fracs,

<<Struc: 79.5 - 81 Strong (Alt) Fault>> mostly broken, lost core, gouge locally, contact between alt'n zones,

81.00 92.42 RHYc Rhyolite coherant volcanics cream FG

81 - 92.42: dyke?, looks very CY altered, tiny QE's (<1 mm) in groundmass. CL on fractures, diss'd PY, altered margins

<<Min: 81 - 91.67 3% Min: Pyrite>> small masses, in fractures

<<Min: 81 - 92.75 3% Min: Calcite>> patches and fractures

<<Alt: 81 - 92.75 Moderate (Alt) Muscovite>> CY after MU?, bleached white, still hard, 1 mm QZ eyes scattered in groundmass

<<Alt: 81 - 92.75 Weak (Alt) Chlorite>> fractures

92.42 111.71 RHYvl Lapilli tuff grey-brown FMG

92.42 - 111.71: heterogeneous unit, widely scattered QE's, local ash layers?, lapilli generally rounded, scattered, locally conc'd, cut by numerous MAFi dykes, local bleaching, gradational lower contact to ash tuff.

<<Min: 92.75 - 96 3% Min: Calcite>> minor lenses

<<Min: 96 - 101.8 10% Min: Calcite>> pervasive in dykes, fractures, lenses elsewhere

<<Min: 101.8 - 111.71 1% Min: Pyrrhotite>> minor lenses, bands

<<Min: 105.65 - 107.55 10% Min: Calcite>> in groundmass, CA veins

<<Alt: 92.75 - 96 Moderate (Alt) Chlorite>>

<<Alt: 96.3 - 199 Moderate (Alt) Garnet>> in bands with BI

<<Alt: 96.3 - 199 Moderate (Alt) Biotite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Struc: 93 - 98.14 Strong (Alt) Fault>> gouge, broken and lost core, especially between 93 and 96, dykes

111.71 127.30 RHYva Coarse grained to ash tuff grey-brown FG

111.71 - 127.3: minor lapilli locally, QE scattered, BI rich locally, more than RHYvl above, MAFi included

<<Min: 111.71 - 127.3 0.5% Min: Pyrite>> diss'd blebs

<<Min: 111.71 - 127.3 3% Min: Pyrrhotite>> lenses, bands,

<<Min: 111.71 - 127.3 1% Min: Calcite>> diss'ns

<<Alt: 126.98 - 131.81 Moderate (Alt) Muscovite>>

<<Struc: 115.7 - 117.5 Strong (Alt) Fault>> mostly gouge, breccia

127.30 148.67 RHYva Coarse grained to ash tuff grey-green FG

130.00	131.50	1.50	B00269411	1.5	-0.005	-0.01	0.03	0.2

127.3 - 148.67: lapilli in and out, scattered, flattened more in ths unit?

<<Min: 127.3 - 131.81 3% Min: Pyrite>> in bands, fractures

<<Min: 127.3 - 152.5 0.5% Min: Calcite>>

<<Min: 130 - 131.81 1% Min: Sphalerite>> stringers, veinlets, wisps, diss'ns, scattered

<<Min: 131.81 - 143.7 3% Min: Pyrite>> scattered blebs, diss'ns, fractures

<<Min: 131.81 - 143.7 0.5% Min: Pyrrhotite>> scattered

<<Min: 143.7 - 148.67 3% Min: Pyrrhotite>> in groundmass, blebs, in veins

<<Alt: 137.98 - 143.7 Moderate (Alt) Muscovite>> pervasive but also in conc'd bands, soft, weathered?

<<Struc: 127.3 - 130 Moderate (Alt) Fault>> gouge, broken

<<Struc: 144.2 - 145.2 Moderate (Alt) Fault>> gouge parallel fol'n

<<Struc: 145.86 - 145.87 Moderate (Alt) Foliation>> BI band

148.67 157.56 RHYvl Lapilli tuff grey-brown FCG

148.67	149.67	1.00	B00269412	1	0.017	0.04	-0.01	0.05

148.67 - 157.56: abundant QE's in this unit, locally >10%, sharp contacts with fine grained RHYv at top and bottom with no mixing of QE's, lapilli coarsen and get more conc'd downhole, to being mixed with RHYc below154m,weak MU locally.

Is this unit a sill? Weak alteration within it only means it came before the mineralization.

<<Min: 148.67 - 152.7 1% Min: Sphalerite>> stringers, with PY

149.67	151.00	1.33	B00269413	5.2	0.017	0.07	0.28	0.52

<<Min: 148.67 - 152.7 1% Min: Chalcopyrite>> scattered in fractures, weak CL zones

151.00	152.50	1.50	B00269414	3.3	0.008	0.05	0.23	0.34

<<Min: 148.67 - 157.56 0.5% Min: Pyrite>>

<<Min: 148.67 - 157.56 1% Min: Pyrrhotite>> in lenses, bands,

<<Min: 152.5 - 157.56 3% Min: Calcite>> and fracture

<<Alt: 148.67 - 151.5 Moderate (Alt) Chlorite>> original?, dyke at upper contact, seems to be darkening of core associated with dyke in general

<<Alt: 156.91 - 158.2 Moderate (Alt) Chlorite>> locally pervasive near contact, related to stringer of proximal alt'n?

228.60 236.20 RHYvl Lapilli tuff grey-brown MCG

228.6 - 236.2: variable text ranges from fine grained massive QZ-BI schist to lapilli/porphyry-like texture with 30-40% white-light green felsic lapilli (feldspars?) with diffuse boundaries (fuzzy). Potentially a feldspar porphyry. Variable strain causes flattening and streaking of the lapilli texture to create a more massive and featureless schist

236.20 237.30 MAFi Mafic Intrusions (primarily footwall mafic intrusion) FG

237.30 243.10 RHYvl Lapilli tuff grey-brown MCG

237.3 - 243.1: same unit as above dyke

243.10 246.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion) FG

						Parent Hole:	

Comments:

APS unit used for UTM N & E. LiDAR DEM used for elevation. Handheld UTM coordinates standing within 1m of collar are:415081E/6815122N.
DDH K15-307 was successful in intersecting the Krakatoa sulfide lens. The stratigraphic section above the Krakatoa is similar to that intersected by other nearby drill holes. The hanging wall to the Krakatoa lens consists of a felsic volcanigenic package with two thin mudstone units and two OB sulfide horizons (at 131.3 - 133.28m and 136.45 - 138.80m) which are overlain and separated by RHYcw. The Krakatoa lens at 182.75 - 203.0 (20.25m) is overlain by 36.25m of MAFi and has a footwall of FBX and sheared RHY from 203.0m to 212.05m followed by a thin unit of OB and minor internal rhyolite (212.05 - 214.05). The Krakatoa lens consists of OB from 182.75-193.0m with 5-15% sphalerite, minor galena and chalcopyrite (<5%) followed by OA to 189.9 with <5% sphalerite, up to 5% galena - possible sulphosalts. The OA is followed by OB from 189.9 - 203.0m. The remainder of the hole consists of felsic rocks with RHYc from 214.05 to 217.2m and RHY and RHYvl to EOH. In the upper part of the DDH significant faulting was encountered at 37.0-46.5m and 66.4-93.25m. Drill Hole lithology summary:
0 – 7.5m Casing
7.5 – 37.0m RHY/MAFi dykes
37.0m – 46.5m FBX, RHY and lesser Mafi clasts
46.5 – 49.4m RHY
49.4 – 53.0m MDSt & MDSc
53.0 – 66.4m RHY
66.4 – 93.25m FBX (composed of mostly RHY and gouge) & lesser sections of more competent RHY
93.25 – 115.0m RHY
115.0 – 116.78m MDSt and MDSc
116.78 – 127.5m RH
127.5 – 131.3m RHYcw
131.3 – 133.28m OB, 10-20% sphalerite
133.28 – 136.45m RHYcw
136.45 – 138.80m OB locally 10-20 sphalerite and minor disseminated magnetite
138.8 – 146.5m RHY with moderate chlorite alteration and minor disseminated sulfides.
146.5 - 193m OB 10-15+% sphalerite
199 - 203.2m OA galena bearing
203.2 - 212.1m FBX (mainly sheared RHY and some MAFi clasts)
212.1 - 214.05m OB, includes some minor massive Pyrrhotite sections
214.05 - 217.2m RHYc
217.2 - 246.0m RHY likely is RHYva
246.0 – 269.4m RHYvl
269.4 – 273.45m RHYvl (Bi-Chl alt)
273.45 – 276.75m MAFi and lessor RHYvl
276.75 – 277.0m RHYvl

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	23-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	26-Oct-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-308 was drilled to test the up-dip extension of the Krakatoa lenses. Rods became stuck at ~194 m. ~60 m of the drill string was left down the hole, including the core barrel.
K15-308 drilled into a felsic hanging wall sequence, consisting of rhyolitic volcaniclastics, with minor ~1-5 m BI+CA schist layers, an apahanitic rhyolite intrusion, and a mudstone horizon from 88.9-90.5 m. Weak muscovite alteration became apparent at ~80 m. At ~94.7 m there was a major fault structure encountered that persisted to the end of the hole (194 m), with clasts and blocks of rhyolite, MAFi, and RHYi.

Local Elev. (m):						Purpose:	Resource Definition
						Parent Hole:	

Comments:

This hole was drilled to test up dip continuity of Krakatoa lens from K15-292.
Drilling succesfully intersected upper lens (DT block) and lower krakatoa lens hosted with the mafic sill. Total mineralized width is ~17.6m. Unusual upper and lower contact wall rocks look similar to fine grained RHY, although intensely altered and hard to discern. Massive sulphide is dominated by OB, with abundant gangue throughout, including calcite, quartz, chlorite, dolomite and quartz +/- barite, +/- albite. Sulphide modal percentages are estimated within both lenses. Hole kept going because of extensive mafic sill in footwall, and patchy, uneconomic disseminated sulphides. Quartz eye bearing RHY in the footwall is consistent with other Krak holes and could be considered a lower marker horizon. Hangingwall succsession is consistent with that of ABM with MAFi interbedded with RHYv+RHYc, with a gradation into more flow (RHYcw) dominated subunits downhole within proximity to the host MAFi.

9.00 12.00 FBX Fault Breccia

9 - 12: Oxydized until 10.75m, QZ vein and heterogeneous RHY clasts.

<<Struc: 9 - 12 Strong (Alt) Fault>> Fault breccia, oxidized.

12.00 19.00 RHYva Coarse grained to ash tuff grey-green

19.00 23.36 RHY undifferentiated rhyolite grey-green

19 - 23.36: RHYva/RHYcw interbedded. Folded flow bands (crenulations), lapilli , peperitic texture. Repeated sequence.

23.36 33.32 RHYva Coarse grained to ash tuff grey-green

23.36 - 33.32: and lapilli. Narrow MAFi dyke from 39.30 to 29.54m, more lapillitic from 27.80 to 28.60 (weakly crenulated). QZ-CA vein, PY in fracture.

<<Min: 23.36 - 57.38 0.5% Min: Pyrite>> and few patch.

<<Min: 23.36 - 57.38 0.5% Min: Pyrrhotite>>

<<Struc: 24.72 - 27.4 Moderate (Alt) Fault>> Multiple minor faults with clay gouge, poor recovery.

33.32 38.40 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

33.32 - 38.4: Few QE. Folded, deformed, probably peperitic.

38.40 39.54 RHYvl Lapilli tuff grey-green

38.4 - 39.54: Strained,deformed. QZ veins.

39.54 43.70 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey-green

39.54 - 43.7: Fractured, PY veinlets fracture filled.

43.70 45.37 RHYva Coarse grained to ash tuff grey-green

43.7 - 45.37: Few lapilli.

45.37 46.37 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

45.37 - 46.37: Dyke. BI phenos.

46.37 47.48 RHYva Coarse grained to ash tuff grey-green

46.37 - 47.48: Few lapilli.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

47.48 49.54 MAFi Mafic Intrusions (primarily footwall mafic intrusion)

47.48 - 49.54: BI, probably same composition than dyke at 45.37m.

49.54 57.38 RHYvl Lapilli tuff grey-green

49.54 - 57.38: with ashes, CA replacement. Possibly RHYc, xtl locally (from 50 to 51.05m. QZ vein at lower contact.

57.38 62.00 RHY undifferentiated rhyolite

57.38 - 62: RHY clasts. Fault gouge (grey clay), mostly gouge.

<<Struc: 57.38 - 60.77 Strong (Alt) Fault>> Fault gouge, fault breccia, dominantly RHY clasts.

62.00 64.87 RHYva Coarse grained to ash tuff grey-green

62 - 64.87: Few fault gouge..

<<Struc: 64.67 - 71 Strong (Alt) Fault>> Fault breccia. MU/CL.

<<Struc: 64.8 - 64.81 Vein>> Calcite vein.

64.87 89.75 RHY undifferentiated rhyolite

64.87 - 89.75: Fault gouge and fault breccia, dominantly RHY. Mafic dyke preserved. Very fine grain PY vein. Brecciated RHY at upper contact. Could be silicic banded from 80.50 to 84.50m.

<<Struc: 65 - 65.01 Crenulation cleavage>> Dominante fracture above major fault.

<<Struc: 71 - 79.8 Strong (Alt) Fault>> Fault gouge dominantly.

<<Struc: 79.8 - 86.2 Strong (Alt) Fault>> Fault breccia.

<<Struc: 86.2 - 88.3 Strong (Alt) Fault>> Fault gouge.

<<Struc: 88.3 - 89.75 Moderate (Alt) Fault>> Brecciated RHY.

89.75 94.64 RHYva Coarse grained to ash tuff grey-green

89.75 - 94.64: Containing narrow mafic dyke CA rich. CA lapilli replacement. And in fracture.

94.64 96.64 MDSt Rhyolite tuff dominant mudstone

94.64 - 96.64: Weakly carbonaceous.

<<Min: 94.64 - 140.72 0.5% Min: Pyrite>>

<<Min: 94.64 - 140.72 0.5% Min: Pyrrhotite>>

<<Struc: 96.25 - 102 Weak (Alt) Fault>> Multiple minor faults and narrow gouge.

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-310 was drilled to test the up-dip continuity of the Krakatoa lenses.
K15-310 encountered the felsic hanging wall package to a depth of ~88.5 m, consisting of mixed volcaniclastic and coherent rhyolites and BI+CA schists. Strong faulting begins at 88.5 m and carries throughout the remainder of the hole (to 191 m), with the exception of two lesser faulted blocks within the larger fault structure. The first block was from ~120 m to ~125 m, consisting of CL+BI+CA schist with a small lens of massive sulphide from 123.9-124.9 m. The bottom of this massive sulphide was strongly brecciated and faulted. The second block was from ~144 m to ~170 m, consisting of rhyolite from 144-159.6 m, massive sulphide from 159.6-160.8 m, and argillitic mudstone to ~170 m. Below this block, intense faulting began again, displayed as a polymictic fault gouge breccia.

UTM Northing:	6815051	Casing Pulled?:	Yes	Dip:	-80	Drill Company:	Geotech
UTM Elev. (m):	1406.21	Casing Depth (m):	6	Length (m):	263	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	30-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	02-Nov-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-311 was drilled as an exploration hole to test the continuity of the Krakatoa zone to the south east. Mineralization was anticipated to occur at ~170, ~195, and ~210 m.
K15-311 intersected the felsic hanging wall package to a depth of ~99 m, consisting of mixed volcanic rhyolites, BI+CA schists, and rhyolite intrusions. From 99.2-160.8 m, there was strong faulting, mainly composed of faulted rhyolite. Below this fault, a less faulted CL+BI+CA schist (MAFi) occur to a depth of 237.2 m. This unit was followed by strongly MU-altered rhyolite to a depth of 261.1 m, where a fault breccia occurs the end of hole (263 m).

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-312

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Roger Hulstein
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Roger Hulstein	Date Logging Start:	01-Nov-15
UTM Easting	415036.1	Core Size:	HQ3	Azimuth:	209.97	Date Logging Complete:	03-Nov-15
UTM Northing:	6814952	Casing Pulled?:	Yes	Dip:	-48	Drill Company:	Geotech
UTM Elev. (m):	1387.217	Casing Depth (m):	39	Length (m):	110	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	30-Oct-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	02-Nov-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The purpose of the drill hole was to test for the presence of the up dip extension of the Krakatoa lens on cross section SE1.
The drill hole was successful in intersecting the Krakatoa lens, consisting of three separate bodies of OB type mineralization from 58.46 – 68.43m totalling 4.87 m of sulphides separated by muscovite – sericite altered Mafi (or possibly RHY?) and RHYi. The RHYi and later quartz veining 65.2 – 67.33 m may possibly displace or replace the sulphides. Mineralization is not strong with only a few narrow sections containing >10% sphalerite with chalcopyrite and galena percentages being generally low. The middle and lower Krakatoa lens are estimated to contain up to 25% and 10% barite respectively as gangue. Below the lower Krakatoa lens (from 67.33 m) the drill hole intersected RHYi with lesser sections of silicified RHY to EOH at 110m. From 99.3-104.9 a fault zone with sheared and altered RHYi, possible RHY and gouge zones were intersected.

Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-313 was drilled to test the up-dip extent of the Krakatoa target on section NW2.
The hole collared into MAFi, and partially (50 cm intersection) intersecting the Krakatoa masssive sulphide lens at 43.13 m. The intersection is thought to represent the lower-most lens in the MAFi-hosted massive sulphide. The upper lens hosted in RHYv was not intersected and is most likely subcrops downdip (to the NE) within the Krakatoa target. Significantly thicker overburden (24m) was also encountered. Footwall lithological sequence was tested and the hole was extended to completely intersect RHYi at the lower contact of the massive sulphides. The RHYi has a thickness of ~60m. At the lower contact of RHYi is MAFi that hosts two separate, thin (<50cm) lenses of massive sulphides. Below the subeconomic massive sulphide lenses is a mudstone. The sequence is similar to ABM section 415050mE, 414800mE and 414900mE. 12m of casing was left stuck in the hole.

50.67 - 64: Brownish, medium to coarse grained MAFi, strongly foliated and biotite altered (coarse flakes composed the matrix). Also weak chlorite altered (pervasive), moderately from 55.2 to 59m. Strong CA associated with thin concordant veinlets and blebs/clots.
62.45-64m: Strong SI alteration (pervasive, MAFi bleached) associated with MU.

<<Min: 50.67 - 64 0.5% Min: Pyrrhotite>>

<<Min: 62.45 - 125.15 0.5% Min: Calcite>> Mainly associated with qtz veins/veinlets.

<<Struc: 56.3 - 57.2 Strong (Alt) Fault>> Fault Gouge (breccia). CL filled.

From (m)	To (m)	Rocktype & Description			
64.00	**125.15**	**RHYi**	**Aphanitic Rhyolite (intrusion)**	**grey**	**VFG**

64 - 125.15: Large unit of RHYi, grey to light grey, aphanitic to very fine grained, fractured unit and also locally micro cracked (consolidate), heterogeneous texture. From 64 to 66m, banded texture marked by parallel leucocratic bands. Mostly, the texture is more massive, homogeneous, with aphanitic matrix. QE, mm, disseminated within matrix. Locally, interval marked by diffused hematite. Mineralized, 1-2 % of py, occurring as thin stringers, filling fractures and also disseminated. Locally crosscut by grey qtz veins, irregular oriented, "stockwerk".

<<Min: 64 - 125.15 1% Min: Pyrite>> 1-2 % of py, occuring as thin stringers, filling fractures and also disseminated

<<Alt: 124.65 - 128.6 Moderate (Alt) Muscovite>> Marked by fracture surfaces. Associated with strong foliation.

<<Vein: 74.7 - 75 80% Quartz>> Massive grey qtz vein, discordant.

<<Vein: 120.65 - 122.6 20% Quartz>> Interval comprising multiple grey qtz veins, 1-3 cm cm, irregular oriented, weakly associated with CA. "stockwerk"

<<Struc: 68.7 - 69 Strong (Alt) Fault>> Fault Gouge (breccia), RHYi clasts.

<<Struc: 96.7 - 97.5 Moderate (Alt) Fault>> Interval strongly fractured associated with fault gouge.

<<Struc: 102.6 - 104 Weak (Alt) Fault>> Interval comprising multiple short faults.

<<Struc: 108.6 - 109.15 Strong (Alt) Fault>> Fault Gouge (breccia), RHYi clasts.

From (m)	To (m)	Rocktype & Description

Comments:						Parent Hole:	

This hole hole collared into portions of the upper Krakatoa lens before encountering the lower lens. It continued through isolated MXSX lenses that have limited width between thick sequences of RHYi. Hole was extended to test the lower permissive contact of RHYi where hole K15-316 encountered MXSX. Geology encountered indicates that smaller, poorly developed lenses (<0.6m) as strongly disseminated sulphides (OI) exist between two well-formed massive sulphide lenses (>0.5m). The well formed massive sulphide lenses occur interleaved between thick intervals of RHYi. An unusual marker horizon of OI (143.71 - 149.60), which exists as interstitial or matrix replacement of py-gl-cpy-sph within a calcareous (?) or calcite rich breccia (with clasts of RHY and sulphide + calcite matrix. From 171.7 to 177.7 exists footwall-style alteration (chlorite-cordierite) associated with gl+sph (<3%). Remainder of hole was fine grained RHYv(a,l) with portions of strongly disseminated stratiform sulphides.

From (m)	To (m)	Rocktype & Description			
154.40	**156.10**	**MAFi**	**Mafic Intrusions (primarily footwall mafic intrusion)**	**green**	**FMG**

154.4 - 156.1: Interval of mafic unit, moderately/strongly foliated (DFOL ~ 55 ac). Porphyroblast of biotite (from 154.4 to 154.7m) , mm to cm, distributed and oriented within fine grained matrix moderately chlorite altered. Strong calcite alteration, occuring as thin subconcordant veinlets and porphyroblats/blebs. Also comprising minor faults gouge.

<<Min: 154.4 - 156.1 0.5% Min: Pyrite>>

<<Min: 154.4 - 156.1 10% Min: Calcite>> Blebs/veinlets

<<Alt: 154.4 - 154.7 Moderate (Alt) Biotite>>

<<Alt: 154.4 - 156.1 Strong (Alt) Chlorite>> Original?

<<Struc: 154.4 - 154.41 Contact>> Sharp lower contact between OI and MAFi.

<<Struc: 155.5 - 155.51 Strong (Alt) dominant foliation>>

From (m)	To (m)	Rocktype & Description			
156.10	**156.70**	**OG**	**Chalcopyrite rich sulphides**		**FCG**

156.1 - 156.7: Interval of massive sulphide, MAFi hosted, Cp rich, essentially mineralized at the lower part of the unit as aggregates. Porphyroblats of cordierite are distributed within the mxsx and at the margins.

<<Min: 156.1 - 156.7 4% Min: Sphalerite>>

<<Min: 156.1 - 156.7 70% Min: Pyrite>> OG, medium to coarse grained (At the margins)

<<Min: 156.1 - 156.7 3% Min: Galena>>

<<Min: 156.1 - 156.7 10% Min: Chalcopyrite>> Concentrated at the margins of the mxsx as aggregates/patch.

<<Min: 156.1 - 195 1% Min: Calcite>> Locally associated with veinlets.

<<Alt: 156.1 - 156.7 Weak (Alt) Cordierite>> Small CI porphyroblasts distributed within mxsx and at the margins.

From (m)	To (m)	Rocktype & Description			
156.70	**157.70**	**RHYcw**	**Curdy textured-flow banded (flows, subvolcanics)**	**light grey**	

156.7 - 157.7: Short sequence of RHY cw, flow banded texture well conserved. Strongly MU altered associated with strong foliation.

<<Min: 156.7 - 160 0.5% Min: Pyrite>>

<<Min: 156.7 - 160 3% Min: Pyrrhotite>> Small wisps of PO distributed within the matrix, oriented.

<<Alt: 156.7 - 171.7 Strong (Alt) Muscovite>> Original alteration?

<<Struc: 156.7 - 156.71 Contact>> Sharp lower contact between OG and RHY.

<<Struc: 156.7 - 157.7 Weak (Alt) Fault>> Strong foliation associated with minor fault gouge.

From (m)	To (m)	Rocktype & Description			
157.70	**180.20**	**RHYv**	**Rhyolite volcaniclastic**	**light grey**	**MCG**

157.7 - 180.2: Light grey, medium to coarse grained, +/- homogeneous texture. Unit strongly MU altered (original), associated with strong foliation. Locally, we observe dismembered bands/lapilli? Volcanoclastic sequence, coarse grained ash tuff with trace of lapilli?. 1-2 % of Po (wisps).

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	02-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	06-Nov-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-315 was drilled as an exploration hole to confirm the continuity and extent of the Krakatoa zone.
K15-315 encountered a felsic hanging wall package, consisting of mixed volcaniclastic and coherent rhyolite, as well as narrow BI+CA schist horizons, to a depth of 98.8 m. Strong muscovite alteration begins at ~69 m and persists to the first massive sulphide lens (98.8-104 m), which consists of OJ, OA, and OB, respectively. Below the first MSXS lens, there is strongly muscovite altered rhyolite to 107 m, followed by MAFi to 122.8 m. From 122.8-122.9 m there is an intersection of OJ mineralization, followed by strongly muscovite altered rhyolite to 128.7 m. MAFi is encountered from 128.7-133.9 m. Below this MAFi a second (mafic-hosted) MSXS lens occurs from 133.9-144.4 m, consisting of OA, OB, and OI. RHYi with MU+QZ schists on either side, occurs from 144.4-177.6 m. Another MSXS lens occurs from 177.6-183.1 m, consisting OA, OJ, and OC, and a ~.5 m section of MAFi. The hanging wall package of the lowest sulphide lens consists of strongly muscovite altered, volcaniclastic and coherent rhyolites to a final depth of 210 m (E.O.H.).

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-316

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Roger Hulstein
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Roger Hulstein	Date Logging Start:	04-Nov-15
UTM Easting	414988.8	Core Size:	HQ3	Azimuth:	210.15	Date Logging Complete:	07-Nov-15
UTM Northing:	6814983.2	Casing Pulled?:	Yes	Dip:	-55	Drill Company:	Geotech
UTM Elev. (m):	1386.656	Casing Depth (m):	31	Length (m):	181	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	02-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	06-Nov-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The purpose of DDH K15-316 on section NW1 is to test up-dip continuity of the Krakatoa target.
The Krakatoa sulphide horizon was intersected at 52.46 - 55.12 m (2.66 m of OB and OJ) which was within 3 m of the predicted depth. The hole collared in MAFi and the Krakatoa sulphide horizon was intersected at 52.46 - 55.12 m (2.66 m of OB and OJ) which was within 3 m of the predicted depth. An additional OB sulphide horizon was intersected at 119.3 – 120.08m in the footwall felsic package below 57 m of RHYi that appears to displace or expand the stratigraphic package. This DDH correlates well with nearby drill holes (ie. K15-312, K15-313, K15-315) where similar lithological sequences were intersected. Of note in this DDH is a correlatable MDSc at 130.8 – 131.6 m. A pyrrhotite bearing cordierite, chlorite altered zone in RHY centered over 138.6 – 139.4 m in a broader zone of chlorite alteration may represent the distal portion of a sulphide horizon.
Summary of the stratigraphic package is as follows;
0 – 31 m: Casing
31 – 44.35 m: MAFi
44.35 – 48.5 m: RHY, muscovite – sericite altered (possibly altered MAFI)
48.5 – 52.46 m: OB (approx. 15% sphalerite)
52.46 – 55.12 m: OJ (<1% CP, 3% sphalerite)
55.12 – 61.5 m: MAFi
61.5 – 118.6 m: RHYi
118.6 – 119.3 m: RHY
119.3 – 120.08 m: OB
120.08 – 130.8 m: RHYc and RHY
130.8 – 131.6 m: MDSc
131.6 – 136.9 m: RHY (muscovite – sericite – clay altered)
136 – 139.4 m RHY and possible MAFI, Chlorite altered with cordierite, pyrrhotite and silicification.
139.4 -181.0m RHY (including RHYv, RHYvl, RHYva, minor MAFi dykes
(EOH)

UTM Elev. (m):	1387.368	Casing Depth (m):	31.5	Length (m):	170.6	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	06-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	08-Nov-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The purpose of the drill hole was to test Krakatoa sulphide horizon and the sulphide lens above the Krakatoa (in the hanging wall RHY volcaniclastics) between drill holes K15-312 and K15-315. DDH K15-317 was successful in hitting the targets just below casing depth (set at 31.5m) with the upper sulfide lens intercepted at 32.0 - 35.97m (OB and minor OI) and the Krakatoa at 76.75 - 92.04 m (OJ, OA and OB mineralization). In addition a lower lens, on the footwall contact of the MAFi was cut at 132.82 – 133.35 m(OB) and at 135.52 – 138.95 m (OJ). A 40.3 m thick RHYi body with minor RHY separates the Krakatoa from the lower lens. The dominant foliation and banded sulfides are a consistent 35-45 degrees to core axis throughout the DDH. Below the lower OJ zone is a package of sericite - muscovite altered RHY and a MDSc unit from 140.93 - 141.85 m. Alteration is most intense (Chlorite after cordierite) for about 4 m below the MDSc and alteration decreases in intensity downhole. This lower OB and OJ mineralization, MDSc and altered zone correlates very well with a similar section in DDH K15-316 (on section NW1, 50 m to the north).

Comments:						Parent Hole:	

K15-318 was drilled as a monitoring well.
K15-318 encountered felsic volcaniclastics and coherent flows, locally cross-cut by BI+CA schists.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	10-Nov-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

Hole collared into portions of RHY (Mu schist) before encountering the upper Krakatoa lens right at the contact with MAFi. The lower Krakatoa lens (OB, MAFi hosted) was encountered at 106.7 m. From 167.2 m to 196.8 m, the hole encountered the OI horizon (encountered in the K15-314, from 143.71 to 149.60m), which exists as interstitial or matrix replacement of py-gl-cpy-sph within a calcareous (?) or calcite rich breccia (with clasts of RHY and sulphide + calcite matrix), ~ 29.6 m of thickness. Followed by another OB lens 3 m below (~ 2.9 m of thickness, MAFi hosted). From 202.9 to 219.8m, Fault breccia interval, intercalated by mudstone unit (which was missing in the K15-314) and RHYcw. Remainder of hole was fine grained RHYv(a,l) with portions of moderately/strongly disseminated stratiform sulphides.

<<Struc: 230.65 - 230.8 Strong (Alt) Fault>> Fault gouge

231.50 254.00 RHYva Coarse grained to ash tuff light grey MCG

231.5 - 254: Light grey, medium to coarse grained, +/- homogeneous, moderately foliated (regular cleavage). We observe <5 % of stretched siliceous fragments, deformed, lapilli relics? After 339.15m, Pervasive CL alteration appears associated with mineralisation (po/py). QE locally observed, distributed within the matrix. 1-2 % of Po/Py disseminated, occurring as wisps/stringers. Probably ash tuff with lapilli intervals.

236-239.15m: Lapillis tuff interval?

<<Min: 231.5 - 238.1 2% Min: Pyrrhotite>> Associated with CL alteration (original?)

<<Min: 238.1 - 247.3 4% Min: Pyrrhotite>> Associated with CL alteration (original?)

<<Min: 247.3 - 254 2% Min: Pyrrhotite>> Associated with CL alteration (original?)

<<Alt: 231.5 - 254 Moderate (Alt) Muscovite>> Original?

<<Alt: 239.15 - 254 Weak (Alt) Chlorite>> Pervasive/patchy and locally occuring as bands. Associated with mineralisation (po/py)

<<Struc: 233 - 233.01 Moderate (Alt) Foliation>>

<<Struc: 242 - 242.01 Moderate (Alt) Foliation>>

<<Struc: 253.5 - 253.51 Moderate (Alt) Foliation>>

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-320

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Dillon Hume	Date Logging Start:	08-Nov-15
UTM Easting	415076	Core Size:	HQ3	Azimuth:	210.5	Date Logging Complete:	11-Nov-15
UTM Northing:	6815121	Casing Pulled?:	Yes	Dip:	-46.5	Drill Company:	Geotech
UTM Elev. (m):	1385.285	Casing Depth (m):	9	Length (m):	269	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	07-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	10-Nov-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-320 was drilled to confirm and define the resource along section NW1.
K15-320 encountered overburden to 12.5 m depth, followed by a felsic hanging wall package to 128.5 m. This hanging wall package consists of mixed volcaniclastic rhyolites, BI+CA schists, coherent rhyolites, and two OB massive sulphide lenses from 120.5-121 m and 122.1-123.2 m. Strong muscovite alteration became apparent around 99.5 m. Below this hanging wall sequence, a CL+BI+CA schist (MAFi) occurs to 150 m (with minor rhyolitic material within), where another massive sulphide lens is encountered. This mafic-hosted massive sulphide lens persists to a depth of 163.7 m, consisting of OB and OA mineralization. RHYi is encountered from 163.7-202.9 m, with sharp contacts, suggesting it intruded the massive sulphide lens. Below the RHYi, OB mineralization occurs from 202.9-203.2 m, followed by another CL+BI+CA schist (MAFi). Below this MAFi there is a final massive sulphide lens, from 207.7-210.2 m, consisting of OA mineralization. The footwall package consists of argillitic mudstone and volcaniclastic rhyolites, with decreasing alteration intensity down the hole.

GeoSpark Logger ~ Drill Log

Project: KZK **Hole Number:** K15-321

Prospect:	Krakatoa	Hole Type:	DD	Survey Type:	APS-Lidar	Logged By:	Dillon Hume
Grid:	NAD83_Z9	Hole Diameter:	96	Survey By:	Dillon Hume	Date Logging Start:	12-Nov-15
UTM Easting	415076	Core Size:	HQ3	Azimuth:	211.1	Date Logging Complete:	15-Nov-15
UTM Northing:	6815225	Casing Pulled?:	Yes	Dip:	-45	Drill Company:	Geotech
UTM Elev. (m):	1388.445	Casing Depth (m):	24	Length (m):	308	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	10-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	14-Nov-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

K15-321 was drilled to test the resource extension of the Krakatoa zone to the north near the East Fault.
K15-321 encountered 22.7 m of overburden, followed by a felsic hanging wall package, consisting of QZ+FD porphyritic glassy rhyolite, volcaniclastic rhyolites, coherent rhyolites, and BI+CA+/-CL schists, to a depth of 139.1 m. From 139.1-195.2 m, a CL+BI+CA schist (MAFi) was encountered, with massive sulphide occurring within from 179.4-180.5 m (OB and OI mineralization) and 183.9-184.7 m (OB mineralization). The MAFi unit was followed by massive sulphide (195.2-198.8 m), consisting of OB mineralization. Below the massive sulphide is strongly altered rhyolite, followed by a faulted zone of rhyolite, RHYi, and fault breccia, to a depth of 218.3 m. Below this fault zone another CL+BI+CA schist (MAFi) occurs to a depth of 226.4 m. Below this massive sulphide is encountered (226.4-246.6 m) with horizons of MAFi (228.7-230.6 m) and faulted rhyolite (246.6-248.3 m) within . This sulphide lens consists of OB, OA, OI, and OD mineralization. Below this final sulphide lens a unit of faulted rhyolite occurs to a depth of 155.8 m, followed by unaltered felsic volcaniclastics to the end of the hole (308 m).

UTM Northing:	6814977.6	Casing Pulled?:	Yes	Dip:	-82	Drill Company:	Geotech
UTM Elev. (m):	1387.022	Casing Depth (m):	23	Length (m):	197	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	11-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	15-Nov-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The purpose of DDH K15-322 is to test the Krakatoa sulphide horizon on section NW1 between DDH K15-316 and K15-320.
The drill hole collared in RHY at 25.34 m and a upper sulphide unit (OI and OB) was intersected at 39.4 – 42.25 m(2.85 m thickness), followed by MAFi and minor RHY from 42.25 – 68.25 m.
The top of the Krakatoa sulphide horizon was intersected at 68.25 m, about 14 m above where it was expected (at about 82 m). The Krakatoa consists of an upper OB horizon from 68.25 m to 74.15 m (5.9 m), followed by 10.18 m of RHY and minor MAFi to 84.33 m. A lower OB sulphide horizon was cut from 84.33 – 91.25 m (6.92 m). This section appears to contain minor barite. Both sulphide horizons are not particularly well mineralized with an estimated average of about 10% disseminated sphalerite and 1-2% disseminated galena and visible chalcopyrite restricted to narrow zones and averaging <2%. Other than intersecting the Krakatoa a little higher than expected and consisting of two lenses, the zone correlates well with adjacent drill holes on section NW1.
Below the Krakatoa lens is altered – bleached and quartz veined (30-40%) MAFi from 91.25 – 103.0 m, basically a transitional contact, followed by RHYi from 103.0 to 148.1 m and MAFi from 148.1 – 153.0 m followed by a two meter horizon of OB & OF from 153.0 – 155.0 m. The 0.7 m section of OF contains about 20% chalcopyrite and the OB contains an average of about 10% sphalerite. Below the sulphide horizon variably weakly chloritized and pyritized RHY and RHYvl were cut to EOH.

Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK camp	Drill Completed:	15-Nov-15
Local Elev. (m):						Purpose:	Resource Definition
Comments:						Parent Hole:	

The hole K15-323 was drilled from the same pad as holes K15-314 and K15-319. The target was to get structural informations about potential East fault in this area and also confirmed the K15-319's ore intercepts. Hole collared into thick MAFI unit, which was expected to host the Krakatoa lens, which was missing in this hole (along with the upper lens). The first 97 m are characterized by alternation of MAFi and RHY(cw) intervals before encountered a thick RHYi unit, aphanitic, strongly SI, which hosted two massive sulphide lenses at 108.6 m (OA,OB, ~4m of thickness) and the second at 147.35m (OI, ~3.4m of thickness). The East fault was encountered at 171.43m, marked by ~ 10 m of fault breccia/gouge interval, comprising polygenetic fragments (RHY/MDS/MXSX, RHY dominant). The remainder of hole was fine grained RHYv(a,l) with portions of pervasive chlorite alteration associated with disseminated biotite.

From (m)	To (m)	Rocktype & Description

<<Min: 149.64 - 150.75 40% Min: Pyrite>> Coarse grained.

<<Min: 149.64 - 150.75 5% Min: Calcite>> Fracture filling and pervasive

<<Min: 150.64 - 151.58 4% Min: Pyrite>> Large aggregates diss within matrix.

150.75 158.00 MAFi Mafic Intrusions (primarily footwall mafic intrusion) FCG

150.75 - 158: Light grey to greenish, strongly foliated and altered MAFI unit, fine to coarse grained. 150.75m to 154.4m, strong pervasive MU alteration, following by the overprinted CL. Moderate to strong Ca alteration (blebs/veinlets).

<<Min: 150.75 - 158 7% Min: Calcite>> Blebs/stringers.

<<Min: 151.58 - 158 1% Min: Pyrite>>

<<Alt: 150.75 - 154.4 Strong (Alt) Muscovite>> MAFi altered

<<Alt: 154.4 - 158 Moderate (Alt) Chlorite>> MAFi

<<Vein: 153 - 154.4 60% Quartz>> Interval comprising irregular and deformed qtz-+/-Ca veins, decimetric.

<<Struc: 150.75 - 150.76 Contact>> Lower contact of massive sulphide (sharp).

<<Struc: 150.75 - 150.93 Strong (Alt) Fault>> Fault gouge

<<Struc: 154.4 - 155.35 Strong (Alt) Fault>> Fault gouge

<<Struc: 156.5 - 156.51 Strong (Alt) Foliation>>

158.00 170.25 RHY undifferentiated rhyolite light grey FMG

158 - 170.25: Light grey, fine to medium grained, strongly foliated associated with strong MU alteration. Homogeneous unit, comprising locally siliceous bands, concordant. Could be RHY volcanoclastic, Ash?
162-162.2m: Short MDS interval, bedding texture.

<<Min: 158 - 169.38 0.5% Min: Pyrite>>

<<Min: 158 - 169.38 1% Min: Pyrrhotite>>

<<Min: 158 - 171.43 1% Min: Calcite>>

<<Min: 169.38 - 170.25 3% Min: Pyrrhotite>> Also thin stringers

<<Alt: 158 - 169.38 Strong (Alt) Muscovite>> Original alteration?

<<Alt: 169.38 - 170.53 Strong (Alt) Chlorite>> Strong CL associated with MU? Py disseminated.

<<Struc: 158 - 159.2 Strong (Alt) Fault>> Fault gouge

<<Struc: 163 - 163.01 Strong (Alt) Foliation>>

<<Struc: 166 - 166.01 Strong (Alt) Foliation>>

170.25 171.43 MDS Carbonaceous Mudstone & Tuffaceous Mudstone dark grey FG

170.25 - 171.43: Mudstone unit, strongly fractured/foliated, MU altered. Comprising fault gouge.

From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 170.25 - 170.52 7% Min: Pyrite>> Occuring as bands/aggregates and also disseminated. Associated with Cl alteration (original?)

<<Min: 170.25 - 170.52 2% Min: Pyrrhotite>> Associated with Cl alteration (original?)

<<Struc: 171 - 171.1 Strong (Alt) Foliation>>

171.43 181.65 FBX Fault Breccia

171.43 - 181.65: Fault breccia interval, comprising polygenetic fragments (RHY/MDS/MXSX, RHY dominant) within MU/SR matrix, heteregeneous, cm size. Probably the East fault.

<<Vein: 179.65 - 181.3 30% Quartz>> Grey qtz veins, fractured/fragmented, centimetric, unmineralized.

<<Struc: 171.43 - 181.65 Intense (Alt) Fault>> Fault gouge. East fault

181.65 187.45 RHYva Coarse grained to ash tuff grey FMG

181.65 - 187.45: Greyish, fine to medium grained, homogeneous, foliated. Marked by Cl alteration, pervasive/patchy, and also MU in fracture surface. Very small QE distributed within matrix. Could be a fine grained ash tuff.

<<Min: 181.65 - 189.17 10% Min: Calcite>> Blebs/stringers/fracture filling

<<Min: 181.65 - 229.8 0.5% Min: Pyrite>> Interval weakly mineralised.

<<Alt: 181.65 - 187.45 Weak (Alt) Chlorite>> Pervasive/patchy

<<Struc: 182.5 - 182.51 Moderate (Alt) Foliation>>

187.45 189.17 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown FG

187.45 - 189.17: Brownish, fine grained, homogeneous, Bi altered. Strongly Ca altered (pervasive/blebs/ deformed veinlets). Sharp contacts. Mafic intrusive?

<<Alt: 187.45 - 189.17 Moderate (Alt) Biotite>> Matrix altered (MAFi)

<<Struc: 189 - 189.01 Moderate (Alt) Foliation>>

189.17 229.80 RHYva Coarse grained to ash tuff grey FMG

189.17 - 229.8: Greyish, fine to medium grained, heterogeneous, strongly foliated. Comprising multiple fault intervals/breccia (locally fault gouge). After 220m, Small BI porphyroblasts appears, disseminated within weak cl altered matrix. MU in fracture surface. < 5% of small QE (blue) distributed within matrix. The CL alteration is locally patchy, similar to fragment/clast Cl altered. Comprising irregular Qtz-Ca-TL vein/veinlet (trace). Probably fine grained ash tuff.

198.75-201.7m: Qtz/Felspar crystal within matrix, subheudral, crystal tuff interval?

<<Min: 189.17 - 229.8 4% Min: Calcite>> Occuring as blebs/fracture filling and thin veinlets. Locally weakly pervasive.

<<Alt: 189.17 - 215.75 Strong (Alt) Muscovite>> Associated with intense foliation.

<<Alt: 220.82 - 229.8 Weak (Alt) Chlorite>> Original? Also patchy.

<<Alt: 220.82 - 229.8 Weak (Alt) Biotite>> Small BI porphyroblasts appears (flakes mm), disseminated within weak cl altered matrix

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %
		<<Vein: 227 - 227.7 15% Tourmaline>> Group of thin QTZ-TL vein/veinlet, discordant, weakly folded.									
		<<Struc: 189.35 - 195 Strong (Alt) Fault>> Interval fractured/brecciated. Comprising fault gouge.									
		<<Struc: 197.85 - 215.75 Strong (Alt) Fault>> Interval fractured/brecciated. Comprising fault gouge.

UTM Elev. (m):	1385.985	Casing Depth (m):	16.5	Length (m):	362	Drill Rig:	Zinex A5
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	15-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK camp	Drill Completed:	20-Nov-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

K15-324 targetted mafic hosted Krakatoa type mineralization beneath the main ABM deposit. No significant mineralization and alteration have been encountered in the footwall. After 305 m, remainder of hole was fine grained RHYv(a,l) with portions of pervasive chlorite alteration associated with biotite disseminated (porphyroblasts/flakes).

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

17.70 18.95 RHYcw Curdy textured-flow banded (flows, subvolcanics) grey

17.7 - 18.95: Grey, moderately foliated, Mu altered (moderate) associated with weak chlorite alteration (pervasive). Comprising thin siliceous bands, deformed, moderately folded/dismembered, marked a banded texture. Probably RHYcw.

<<Min: 17.7 - 18.95 2% Min: Calcite>>

<<Min: 17.7 - 30.4 1% Min: Pyrrhotite>> Disseminated, locally occuring as small wisps.

18.95 19.40 MAFi Mafic Intrusions (primarily footwall mafic intrusion) brown FG

18.95 - 19.4: Brownish, fine grained, homogeneous. Matrix moderately biotite altered, pervasive. Strong pervasive calcite, also occuring as thin bands/veinlets. Gradual/diffused contacts. MAFi?

<<Min: 18.95 - 19.4 8% Min: Calcite>> Pervasive and occuring as blebs/veinlets.

<<Alt: 18.95 - 19.4 Moderate (Alt) Biotite>> Matrix moderately Bi altered.

19.40 38.72 RHYvl Lapilli tuff light grey MCG

19.4 - 38.72: Light grey, fine to medium grained, homogeneous, moderately foliated. Comprising fragments/lapilli, cm size, siliceous, deformed, distributed within fine grained matrix (MU altered). 1-2 % of PO/Py disseminated. Volcanoclastic unit, probably RHYvl.

<<Min: 19.4 - 83 3% Min: Calcite>>

<<Min: 30.4 - 38.72 2% Min: Pyrite>> Occuring as small wisps and folded/dismembered bands, also disseminated.

<<Min: 30.4 - 38.72 0.5% Min: Pyrrhotite>>

<<Vein: 26.2 - 30.4 20% Quartz>> Interval of veining, grey qtz veins,boudinaged, strongly deformed, 2-20 m wide, margins chlorite altered.

38.72 40.43 RHYcw Curdy textured-flow banded (flows, subvolcanics) light grey

38.72 - 40.43: Light grey, characterized by siliceous bands, folded, locally dismembered, flow banded/curdy texture. Interval of RHYcw.

<<Min: 38.72 - 39.28 4% Min: Pyrite>> Occuring as deformed bands, coarse grained. Also wisps.

<<Min: 39.28 - 41.22 1% Min: Pyrite>> Also disseminated.

<<Min: 39.28 - 41.22 1% Min: Pyrrhotite>> Also disseminated.

40.43 64.85 RHYvl Lapilli tuff light grey MCG

40.43 - 64.85: Light grey, fine to medium grained, homogeneous, moderately foliated. Comprising fragments/lapilli, cm size, siliceous, deformed, distributed within fine grained matrix (MU altered). Locally banded texture marked by siliceous bands/stretched fragment, irregular and deformed. 1-2 % of PO/Py disseminated. Volcanoclastic unit, probably RHYvl.

Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	15-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	23-Nov-15
Local Elev. (m):						Purpose:	Exploration
Comments:						Parent Hole:	

K15-325 was drilled to test the Fault Creek fault as well as explore for any down-dropped mineralization.
K15-325 encountered a felsic rock package from 6-85.9 m, consisting of volcaniclastic and coherent rhyolites, BI+CA schists, and aphanitic rhyolite. Below this unit is strongly faulted rhyolite from 85.9-119.3 m. From 119.3-135 a moderately faulted and locally altered block of CL+BI+CA schist occurs (MAFi). Below the MAFi an intense fault zone occurs to a depth of 164.6 m, consisting of a polymictic gouge-supported fault breccia. The package of rocks on the opposite side of the fault consist of intercalated mafic intrusions and felsic volcaniclastics. Calcite, pyrite, pyrrhotite, and minor sphalerite mineralization are pervasive throughout the felsic rock units on the south side of the fault. Chlorite alteration is weak and patchy through nearly all rock units south of the fault. Two zones of heavily disseminated sulphides occur from 319m to 320m (PY,PO,SP,GL) and from 398.16m to 399.26m (PY,SP). This hole appears to show signs of being in proximity to more mineralization.

<<Alt: 134.4 - 135 Strong (Alt) Chlorite>>

<<Alt: 134.4 - 135 Moderate (Alt) Biotite>>

<<Vein: 122.35 - 122.5 80% Calcite>> Massive QZ+CA vein

<<Struc: 125.2 - 126.1 Weak (Alt) Fault>> Minor fault surfaces and alteration associated with them

<<Struc: 129.9 - 130.8 Strong (Alt) Fault>> Local fault gouge breccia to ductile shearing of MAFi, with associated MU-alteration.

<<Struc: 133.5 - 134.4 Strong (Alt) Fault>> Local fault gouge breccia to ductile shearing of MAFi, with associated MU-alteration.

<<Struc: 134.4 - 164.6 Intense (Alt) Fault>> Intensely faulted unit. Polymictic clasts supported in gouge matrix.

135.00 164.60 FBX Fault Breccia

135 - 164.6: Gouge-supported fault breccia, with clasts consisting of RHY,QZ-vein, MAF, MDS, and MSXS, and gouge consisting of sericite, quartz (?), chlorite, and argillitic material.

<<Min: 135 - 164.6 2% Min: Pyrite>> Clasts of massive PY within fault zone

<<Min: 135 - 164.6 5% Min: Calcite>> Clasts of CA-bearing rocks

<<Alt: 135 - 207.2 Moderate (Alt) Muscovite>>

<<Vein: 148.3 - 148.7 100% Quartz>> Clasts of massive QZ vein within fault

164.60 173.30 RHYv Rhyolite volcaniclastic

164.6 - 173.3: QZ-MS coarse-grained, fisile, felsic volcaniclastic rock (interval is pervasive with minor faults).

<<Min: 164.6 - 169.2 3% Min: Calcite>>

<<Min: 164.6 - 186.93 1% Min: Pyrite>>

<<Min: 169.2 - 193.42 5% Min: Calcite>>

<<Struc: 164.6 - 169 Weak (Alt) Fault>> Interval of several minor faults spaced less than 50cm apart

<<Struc: 170 - 173.3 Moderate (Alt) Fault>> Faulted interval with only small portions (all less than 30cm) of coherent rock.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

173.30 179.20 FBX Fault Breccia

173.3 - 179.2: Gouge-supported (pebble, sand and clay) fault breccia, with clasts of RHY, QZ and MDS. Matrix is of similar composition to clasts.

<<Struc: 173.3 - 179.2 Intense (Alt) Fault>> Polymictic fault zone with gravel, sand and clay gouge. Fault breccia

179.20 193.42 RHYv Rhyolite volcaniclastic

179.2 - 193.42: QZ-MU-MS-PY coarse-grained to lapilli felsic volcaniclastic rock. Local high concentration of PY (~5% FD) from 186.9 - 189.69m)

<<Min: 186.93 - 189.69 5% Min: Pyrite>> Local high concentration of finely disseminated pyrite.

<<Min: 189.69 - 209 1% Min: Pyrite>>

<<Struc: 179.2 - 191.33 Weak (Alt) Fault>> Interval adjacent to high intensity fault up-hole. Interval pervasively contains foliation parallel, minor faults spaced less than 50cm apart. Fault gouge is pebble-sand-clay sized. All faults are less than 10cm wide.

193.42 195.83 MDSt Rhyolite tuff dominant mudstone medium grey FG

193.42 - 195.83: Thinly laminated (micaceous laminae are thinly spaced), fissile, carbon/argillitic, carbonate and pyhrrotite bearing felsic volcaniclastic tuff.

<<Min: 193.42 - 202.03 3% Min: Calcite>>

<<Struc: 195.62 - 195.71 Weak (Alt) Fault>> Minor fault, foliation parallel with gravel-clay gouge.

195.83 207.20 RHYv Rhyolite volcaniclastic

195.83 - 207.2: QZ-MS-MU coarse grained felsic volcaniclastic rock with finely disseminated carbonate and QZ-BI-PY-CL-CB lapilli. Cl and MU are considered as overprinted alteration. Pyrrhotite is present as wisps and clots ~1-2%.

<<Min: 202.03 - 202.21 15% Min: Calcite>>

<<Min: 202.21 - 209 5% Min: Calcite>>

<<Struc: 199.9 - 199.9 Foliation>>

<<Struc: 204.9 - 205.03 Weak (Alt) Fault>> Minor fault, foliation parallel with gravel-clay gouge.

207.20 226.78 RHYvl Lapilli tuff

207.2 - 226.78: Qz-MS volaniclastic rock with BI-CL-PY-CB lapilli. Calcite is finely disseminated pervasively throughout interval. Foliation is sub-perpendicular to core-axis. Rock is dark brown-green due to concentration of BI-CL-PY.

<<Min: 207.2 - 226.78 1% Min: Pyrrhotite>>

<<Min: 209 - 226.78 8% Min: Calcite>>

<<Min: 209 - 238.01 2% Min: Pyrite>>

<<Alt: 207.2 - 226.78 Weak (Alt) Muscovite>>

<<Alt: 207.2 - 226.78 Weak (Alt) Chlorite>>

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Alt: 207.2 - 226.78 Moderate (Alt) Biotite>>

<<Alt: 221 - 222 Strong (Alt) Muscovite>> Intensity decreases from qz vein (221.44-221.55)

<<Vein: 217.24 - 218.12 Quarzt-Biotite-Sulphides>> Qz-tourmaline vein; perpendicular to foliation. Hair-line veins branch off from main vein and tourmaline mineralization occupies dominant rock foliation.

<<Vein: 221.44 - 221.55 Quartz>> White quartz vein, sub-parallel to foliation. Muscovite concentration increases towards quartz vein.

<<Struc: 208.95 - 208.95 dominant foliation>>

<<Struc: 213.46 - 213.51 Weak (Alt) Fault>> Minor fault, foliation parallel with gravel-clay gouge.

<<Struc: 216 - 216 dominant foliation>>

<<Struc: 220.5 - 220.5 dominant foliation>>

<<Struc: 223.8 - 223.8 dominant foliation>>

226.78 229.35 MAFi Mafic Intrusions (primarily melanocratic footwall mafic intrusion)

226.78 - 229.35: BI-CL-CB fine-grained mafic shist with thin, foliation parallel calcite bands.

<<Min: 226.78 - 229.35 12% Min: Calcite>>

<<Alt: 226.78 - 229.35 Moderate (Alt) Chlorite>>

<<Alt: 226.78 - 229.35 Strong (Alt) Biotite>>

<<Vein: 226.93 - 227.07 Quartz>> Translucent to white QZ-MU-PY-PO vein, sub-parallel to foliation.

<<Struc: 227.3 - 227.3 dominant foliation>>

229.35 243.30 RHYvl Lapilli tuff

229.35 - 243.3: Qz-MS volaniclastic rock with BI-CL-PY-CB lapilli. Calcite is finely disseminated pervasively throughout interval. Foliation is sub-perpendicular to core-axis. Rock is dark brown-green due to concentration of BI-CL-PY.

<<Min: 229.35 - 250 5% Min: Calcite>>

<<Min: 238.01 - 245 0.25% Min: Pyrrhotite>>

<<Min: 238.01 - 250 1% Min: Pyrite>>

<<Alt: 229.35 - 240 Weak (Alt) Chlorite>>

<<Alt: 229.35 - 240 Moderate (Alt) Biotite>>

<<Alt: 229.35 - 250 Weak (Alt) Muscovite>>

<<Vein: 235.28 - 235.34 Quartz>> White-translucent quartz, pyrite, tourmaline vein; discordant to foliation.

<<Vein: 237.35 - 237.44 Quartz>> White QZ-MU vein. Muscovite concentration/intensity increases towards vein within RHYvl host unit.

<<Vein: 242.48 - 243.3 Quartz>> Massive white quartz vein

<<Struc: 232.95 - 232.95 dominant foliation>>

<<Struc: 235.45 - 235.5 Weak (Alt) Fault>> Minor fault, foliation parallel with clay gouge.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Struc: 238.9 - 238.9 dominant foliation>>

<<Struc: 241.7 - 241.7 dominant foliation>>

243.30 250.03 RHYvl Lapilli tuff

243.3 - 250.03: Siliceous Quartz-eye bearing volcaniclastic QZ-MU schist with lapilli sized quartz-rich sub-rounded to round clasts set in fine-grained siliceous matrix.

<<Min: 250 - 283.78 5% Min: Pyrite>>

<<Min: 250 - 288.7 3% Min: Calcite>>

<<Alt: 250 - 255 Moderate (Alt) Silicification>>

<<Alt: 250 - 255 Moderate (Alt) Muscovite>>

<<Struc: 246.17 - 246.4 Weak (Alt) Fault>>

250.03 283.78 RHYi Aphanitic Rhyolite (intrusion)

250.03 - 283.78: Siliceous/Albitized, Quartz-eye bearing RHYi with white lapilli sized quartz rich sub-rounded clasts pervasive through interval. RHYi rock unit exhibits potential to be intense silicification/albitization alteration of adjacent RHYvl rather than being a coherent body intrusive body of rhyolite. Fractures are pervasive and infilled with quartz and a high concentration of pyrite. (some pyrite grains exhibit a nucleus pyrite grain from which additional pyrite grew around the nucleus).

<<Alt: 255 - 275 Strong (Alt) Silicification>>

<<Alt: 255 - 288.77 Weak (Alt) Muscovite>>

<<Alt: 275 - 283.78 Moderate (Alt) Silicification>>

<<Struc: 253.8 - 253.8 dominant foliation>>

<<Struc: 270.3 - 270.5 Weak (Alt) Fault>> Minor fault with clay to sand gouge.

283.78 288.77 RHYvl Lapilli tuff

283.78 - 288.77: Medium gray, siliceous quartz-eye bearing QZ-MU schist with trachitic, whte, lapilli sized quartz-rich rounded clasts pervasive through unit.

<<Min: 283.78 - 288.77 2% Min: Pyrite>>

<<Min: 288.7 - 291.2 12% Min: Calcite>>

<<Struc: 284.2 - 284.2 dominant foliation>>

<<Struc: 286.11 - 286.19 Weak (Alt) Fault>> minor fault with clay-sand gouge.

<<Struc: 287.1 - 287.1 dominant foliation>>

288.77 291.92 MAFi Mafic Intrusions (primarily black footwall mafic intrusion)

288.77 - 291.92: Melanocratic, coarse-grained, inequigranular BI-CA-MS schist. Abundant carbonate porphyroblasts as well as carbonate bands and trachytic biotite. Finely disseminated pyrite <1mm grains.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

UTM Elev. (m):	1442.119	Casing Depth (m):	21	Length (m):	443	Drill Rig:	Hydracore
Local Easting:		Stored?:	Yes	Claims Title		Drill Started:	15-Nov-15
Local Northing:		Cemented?:	Yes	Core Storage Loc.:	KZK Camp	Drill Completed:	24-Nov-15
Local Elev. (m):						Purpose:	Exploration
						Parent Hole:	

Comments:

K15-326 was drilled to test the extension of the Krakatoa lens on the east side of the deposit. The objective was to pass through the mafic unit where K15-282, K15-277 and historical hole K97-173 were stopped.
The upper units are made up of mudstone and mafic tuff followed by volcaniclastic rhyolite intruded by aphanitic and narrow mafic dykes.
First mineralization zone (OB and OI domains) is intersected from 295.4m to 298.00m. The second lens (OB domain from 308.45m to 313.44m) sits on the top of chlorite-biotite-calcite poor mafic sill. The third sulfide lens (1.56m of OA domains over 2.53m) is observed at the bottom of this unit at 379.94m. The lower units consist of volcaniclastic rhyolite.
The hanging-wall shows strong muscovite alteration from 278.05m to 295.43m. Similar alteration is seen from 382.66m to 395.75m underneath the Krakatoa lens.
The hole ends at 443.00m on weakly muscovite altered volcaniclastic rhyolite.

0.00 21.00 OVBN Overburden

21.00 28.80 MDU carbonaceous mudstone light grey
upper sequence

21 - 28.8: Dominantly mudstone with MAFt layers chloritized (or MAFi intruding an unconsolidated mudstone). CA veinlets and in matrix, locally folded.

<<Min: 21 - 62 0.5% Min: Pyrrhotite>>

<<Min: 21 - 78 15% Min: Calcite>> And in matrix when associated with MAFt.

<<Min: 21 - 191.37 0.1% Min: Pyrite>>

<<Alt: 21 - 94.3 Moderate (Alt) Chlorite>> Associated with dykes.

<<Vein: 21 - 92 Calcite>> CA veinlets.

28.80 30.37 MAFt Mafic Volcaniclastics grey-green

28.8 - 30.37: Chloritized, calcite in matrix. Could be MAFi but regarding to the texture it is probably tuffaceous. Mixed with MDS locally, calcite veinlets crenulated.

<<Vein: 28.8 - 51.04 Quartz-Carbonate>> QZ/CA veins mostly associated with MAFt.

30.37 38.00 MDU carbonaceous mudstone black
upper sequence

30.37 - 38: Calcite veinlets, strong foliation.

38.00 42.83 MAFt Mafic Volcaniclastics grey-green

38 - 42.83: Chloritized, CA veined. Sharpe contacts, could be MAFi dyke.

42.83 46.86 MDU carbonaceous mudstone black
upper sequence

42.83 - 46.86: Calcite veinlets, locally sheared.

<<Struc: 43.8 - 44.5 Moderate (Alt) Shear>> Brecciated, sheared, minor.

46.86 51.04 MAFt Mafic Volcaniclastics grey-green

46.86 - 51.04: Local massive QZ-CA veins.

<<Struc: 47 - 50 Weak (Alt) Fault>> Multiple narrow fault gouge zones, minor.

51.04 69.88 MDU carbonaceous mudstone black
upper sequence

51.04 - 69.88: Strong foliation, CA in foliation, locally folded/crenulated. Minor Dyke (MAFi). QZ/CA veins.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 62 - 92 1% Min: Pyrrhotite>> And veinlets. Elongated crosscutting a primary foliation.

<<Struc: 55 - 55.01 dominant foliation>> Average.

69.88 72.10 MAFt Mafic Volcaniclastics grey-green

69.88 - 72.1: Chloritized, CA veinlets and in matrix.

72.10 78.90 MDU carbonaceous mudstone upper sequence black

72.1 - 78.9: CA veinlets foliation oriented. Locally moderately sheared.

<<Min: 78 - 94 3% Min: Calcite>>

<<Vein: 78 - 94 Quartz-Carbonate>> QZ/CA veins, 10 to 30 cm wide, associated with lithology changes.

<<Struc: 72.24 - 73 Weak (Alt) Fault>> Fault gouge.

78.90 80.32 RHY undifferentiated rhyolite grey-green

78.9 - 80.32: Silicic banded. Progressive contact with MDS. Could be flow or interpreted as MDSw.

80.32 85.13 MDU carbonaceous mudstone upper sequence black

80.32 - 85.13: Locally silicic banded. 2 foliations.

85.13 86.56 MAFt Mafic Volcaniclastics grey-green

85.13 - 86.56: CA veinlets.

86.56 87.97 MDU carbonaceous mudstone upper sequence black

86.56 - 87.97: QZ-CA vein.

87.97 90.40 MDSw Coherent rhyolite flow with carbonaceous content grey

87.97 - 90.4: Could be RHYcw with progressive contact. Local QZ/TML rich, QZ veins. Silicic banded.

<<Alt: 87.97 - 116 Weak (Alt) Muscovite>>

90.40 92.00 MDU carbonaceous mudstone upper sequence black

90.4 - 92: CA in foliation and fracture filled.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

92.00 109.04 RHYvl Lapilli tuff grey-green

92 - 109.04: Chlorite replacing lapilli. Thin foliation. Maybe dyke from 100.70m to 101.55m (AK/CL rich with chill margin at lower and upper contact-intermediate composition). Few BI patch.

<<Min: 92 - 154 0.5% Min: Pyrrhotite>> Locally concentrated.

<<Min: 94 - 181 1% Min: Calcite>> Or replacement.

<<Alt: 94.3 - 109 Weak (Alt) Chlorite>>

<<Struc: 92 - 116 Weak (Alt) Fault>> Multiple narrow fault gouge zones (2 to 10 cm wide)and minor folding. Accentuated by MU composition. Minor

<<Struc: 100 - 100.01 dominant foliation>> Average.

109.04 112.70 RHYva Coarse grained to ash tuff grey-green

109.04 - 112.7: Locally MU altered (greenish color), banded with PO.

112.70 115.15 RHYvl Lapilli tuff grey-green

112.7 - 115.15: Moderately MU altered.

115.15 129.77 RHYva Coarse grained to ash tuff grey-green

115.15 - 129.77: Dark color due to CL/BI (?). Few lapilli aggregated.

<<Vein: 127.54 - 127.95 Quartz>> QZ vein, few CL.

<<Struc: 120 - 120.01 dominant foliation>> Average.

129.77 133.07 RHYi Aphanitic Rhyolite (intrusion) beige

129.77 - 133.07: Stockwork texture at upper contact. PY and probably TML veinlets. Could be albitization.

133.07 133.90 RHY undifferentiated rhyolite grey-green

133.07 - 133.9: Foliated. PY in foliation.

133.90 139.00 RHYi Aphanitic Rhyolite (intrusion) beige

133.9 - 139: Classified as RHYi because of aphanitic texture. Interval including large massive QZ vein, fractured, brittled, might be strongly silicified RHY.

<<Alt: 133.9 - 139 Strong (Alt) Silicification>> Log as RHYi regarding to the texture. Large QZ veins containing schist, few CL.

<<Vein: 135.23 - 137.22 Quartz-Carbonate>> QZ-CA vein surrounded by SI alteration, containing schist and few CL. Brittled.

<<Struc: 138.8 - 139.25 Moderate (Alt) Fault>> Lower contact between silicified zone and RHY. Fault gouge.

From (m)	To (m)	Rocktype & Description		From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

139.00 140.17 RHYvl Lapilli tuff grey-green

139 - 140.17: Silicic banded.

140.17 143.18 RHYi Aphanitic Rhyolite (intrusion) beige

140.17 - 143.18: Albitization?

<<Alt: 142.64 - 143.18 Moderate (Alt) Silicification>> Could be albitization.

143.18 149.59 RHYvl Lapilli tuff grey-green

143.18 - 149.59: Silicic banded at upper contact. Locally planar thin lamination. Few BI porphyroblasts.

<<Alt: 143.18 - 236 Weak (Alt) Muscovite>> Locally moderate.

149.59 150.05 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

149.59 - 150.05: Unaltered AK, BI, soft matrix.

<<Struc: 150 - 150.05 Weak (Alt) Fault>> At lower contact between MAFi dyke and RHYvl.

150.05 153.75 RHYvl Lapilli tuff grey-green

<<Alt: 150.05 - 153.75 Moderate (Alt) Chlorite>>

153.75 156.28 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

153.75 - 156.28: Could be volcaniclastic. CA veinlets. 2 foliations observed.

<<Min: 154 - 161.46 1% Min: Pyrrhotite>> Eloganted in the foliation.

156.28 157.14 RHYva Coarse grained to ash tuff

157.14 159.40 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

157.14 - 159.4: Could be MAFi. Gradual contact.

159.40 160.49 RHYva Coarse grained to ash tuff grey-green

159.4 - 160.49: Few BI

160.49 161.46 MAFi Mafic Intrusions (primarily footwall mafic intrusion) dark grey

161.46 167.03 RHYvl Lapilli tuff grey-green

161.46 - 167.03: Few BI.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

<<Min: 161.46 - 244 0.5% Min: Pyrrhotite>>

<<Struc: 163.2 - 163.8 Foliation>>

<<Struc: 163.2 - 163.8 dominant foliation>> Mid strained lapilli.

167.03 173.57 RHY undifferentiated rhyolite grey-green

167.03 - 173.57: Silicic bands, probably RHYvl. Locally silicified (RHYi?).

<<Alt: 171 - 173.57 Moderate (Alt) Silicification>> Could be albitization

<<Vein: 168.5 - 168.51 Undifferentiated/Unknown/Other>> Late fracture, brown mineral filled. Bleaching halo over 1 cm on each side.

<<Vein: 173.2 - 173.47 Quartz>> QZ vein.

173.57 182.40 RHYvl Lapilli tuff grey-green

173.57 - 182.4: Silicified. BI locally aggregated, could be narrow dyke or MAFi enclave.

<<Min: 181 - 191.37 3% Min: Calcite>> and lapilli replacement.

<<Alt: 174.15 - 175.35 Weak (Alt) Chlorite>> Associated with fault/shear zone.

<<Alt: 176.83 - 181.37 Moderate (Alt) Silicification>>

<<Struc: 174.59 - 176 Moderate (Alt) Fault>> and sheared. CL/MU, QZ/CA.

<<Struc: 176.5 - 176.51 dominant foliation>>

<<Struc: 176.8 - 177.1 Weak (Alt) Fault>> Evidence of micro-faulting (truncated shallow angle veinlets).

182.40 188.17 RHY undifferentiated rhyolite grey-green

182.4 - 188.17: Silicic bands. Locally glassy. Few minor faults (gouge).

<<Alt: 182.76 - 186.07 Moderate (Alt) Silicification>>

<<Struc: 187 - 187.4 Weak (Alt) Fault>> Fault gouge containing QZ vein relic.

188.17 191.17 RHYvl Lapilli tuff grey-green

188.17 - 191.17: Progressive lower contact with silicified unit.

<<Alt: 190.43 - 206.84 Moderate (Alt) Silicification>> Locally strong. Log as RHYi but could be albitization.

<<Struc: 189 - 189.01 dominant foliation>>

191.17 206.84 RHYi Aphanitic Rhyolite (intrusion) beige

191.17 - 206.84: Classified as RHYi due to aphanitic texture. Albite and/or silicic alteration (?). Gradual upper contact, texture preserved on the edge. Fractured, MU/PY filling. PY disseminated. Interval including massive QZ vein from 200m to 201.60m. Folded at lower contact. Sericite alteration banded .

<<Min: 191.37 - 234 0.5% Min: Pyrite>> And few veinlets.

<<Vein: 200 - 201.65 Quartz>> QZ vein.

From (m)	To (m)	Rocktype & Description	From (m)	To (m)	Width	Sample	Ag PPM	Au PPM	Cu %	Pb %	Zn %

206.84 208.23 RHYv Rhyolite volcaniclastic grey-green

<<Min: 206.84 - 257 3% Min: Calcite>>

208.23 210.18 RHYvx Quartz and/or feldspar crystal tuff grey-green

208.23 - 210.18: Feldspar shaped phenos up to 1 cm long. Lapillitic.

210.18 216.03 RHYv Rhyolite volcaniclastic grey-green

210.18 - 216.03: Interval including sorting sequence from 212.47m to 213.18m showing sharp contacts.

<<Struc: 214 - 218 Weak (Alt) Fault>> Multiple minor faults with clay gouge.

216.03 243.70 RHYva Coarse grained to ash tuff grey-green

216.03 - 243.7: Massive QZ vein intruding fine grain layer (ash?) containing QZ eyes-or chill margin-from 224.80m to 226.69m. Narrow MAFi (BI/CA) from 223.88m to 224.28m, euhedral PY at upper contact.

<<Min: 234 - 244 1% Min: Pyrite>> Small patch or deformed stringers.

<<Alt: 236 - 257 Weak (Alt) Muscovite>>

<<Vein: 224.8 - 225.8 Quartz-Carbonate>> QZ vein, CA/CL and talc patch.

<<Struc: 224.5 - 224.8 Weak (Alt) Shear>> Minor shear zone containing sandy/clay gouge.

<<Struc: 233.55 - 233.65 Weak (Alt) Fault>> Minor fault.

243.70 272.45 RHY undifferentiated rhyolite grey-green

243.7 - 272.45: PY patch, PO disseminated, blurry texture. Dark sericite or carbonaceous composition from 253.80m to 256.26m..

<<Min: 244 - 260.1 5% Min: Pyrite>> Deformed veins or patch, associated with QZ, dark color.

<<Min: 244 - 278 2% Min: Pyrrhotite>> Elongated, foliation oriented.

<<Min: 260.1 - 278 1% Min: Pyrite>>

<<Alt: 257 - 278.05 Moderate (Alt) Muscovite>>

<<Struc: 252.2 - 255.2 Weak (Alt) Fault>> Multiple minor fault showing clay gouge.

<<Struc: 261.55 - 263 Moderate (Alt) Fault>> Breccia gouge.

<<Struc: 270.2 - 272 Strong (Alt) Fault>> Core loss. Considered as strong regarding to the recovery, the size of the interval and the clay composition.

272.45 276.80 RHY undifferentiated rhyolite grey-green

272.45 - 276.8: Interpreted as high density of strained lapilli but could be flow banded.

<<Struc: 276.5 - 276.8 Weak (Alt) Fault>> Fault gouge.
