GEOLOGY REPORT
1974 FIELD WORK
DIDLO CLAIM GROUP

INTRODUCTION

The Didlo claims were staked on a galena-sphalerite showing which was discovered as a result of a regional stream sediment survey carried out during 1974. Old claim posts found on the property proved that the showing had previously been staked as the Siliya claims in 1963. A small program of prospecting and geologic mapping was carried out on the Didlo claims shortly after they were staked in June 1974.

CONCLUSIONS AND RECOMMENDATIONS

The showing on the Didlo claims does not appear to be large enough to warrant much more work. A limited program of hand trenching and sampling is proposed and, if this work does not outline any significant widths or grades of mineralization, the claims should be allowed to lapse.

LOCATION AND ACCESS

The Didlo claims are located three miles west of the Dempster Highway at the northern boundary of N.T.S. Map Sheet 116-B-16. The co-ordinates are latitude $65^{\circ}00'N$ at $138^{\circ}18'W$. Access is by helicopter or by foot from the Dempster Highway.

GEOLOGY

The Didlo claims lie in the Ogilvie Mountains in an area underlain by Proterozoic and Paleozoic sediments. The proterozoic strata have been strongly folded but have not been metamorphosed. They are overlain unconformably by Paleozoic carbonate formations which are nearly flat-lying.

Table of Formations

| <u>Formations</u> (after G.S.C.) | <u>Age</u> | <u>Description</u> |
|-------------------------------------|---------------------|--|
| Unit 8 | Ordovician-Silurian | Massive grey dolomite, cherty sections, cliff-forming. Few fossils |
| | - Unconformity - | |
| Unit 1 | Proterozoic | Dark weathering, thin bedded flinty shales. Weathers resistantly to form sharp ridges. |

Property Geology (See Figure 3)

The unconformity between Unit 1 and Unit 8 on the Didlo claims is nearly flat-lying. The bedding within Unit 8 is poorly defined due to the extensive talus cover and the massive character of the dolomite, but it appears to be approximately flat-lying as well. Bedding within Unit 1 varies over short distances but is generally steep. No faults were observed on the property.

Mineral Showing

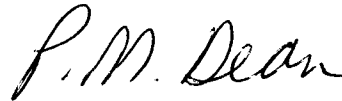

Galena, sphalerite and pyrite occur in a strongly silicified, somewhat skarny appearing breccia zone within Unit 1 at the contact with Unit 8. Coarsely crystalline siderite is a prominent alteration mineral in the mineralized zone. Traces of sphalerite were observed in the unaltered dolomites immediately

above the showing and galena occurs in quartz veins within Unit 1 at a creek junction 3500 feet south of the main showing. None of the mineralization observed on the property is of economic grade; the best chunks of float from the talus slope below the showing are estimated to contain only 2 to 4% combined lead and zinc.

PROPOSED EXPLORATION

The showing appears to be too small and too low grade to have any economic potential. However, it is poorly exposed due to the talus cover and, therefore, it cannot be safely written off without some additional work. An attempt should be made to clear a trench across the showing in order to get a meaningful assay from in-place bedrock mineralization, and soil sampling should be carried out down-slope from the unconformity over the entire claim group to determine if other, possibly more significant, showings suboutcrops under overburden. If this limited amount of additional work does not produce favourable results, the claims should be allowed to lapse.

Respectfully submitted,

Peter M. Dean

February, 1975

AFFIDAVIT SUPPORTING SUMMARY OF COSTS

I, PETER M. DEAN, Geologist, Dynasty Explorations Limited, of Vancouver, British Columbia, do hereby state that, to the best of my knowledge and belief, the statement of costs presented in this report (Geology Report - 1974 Field Work - Didlo Claim Group) is both correct and true.
