MMM CLAIM GROUP: SOIL GEOCHEMISTRY
WHITEHORSE MINING DIVISION

MMM 1 to 20 (20 claims)
105F4 and 105C13
61° 00' N 133° 34' W

OWNER/OPERATOR:
Amoco Canada Petroleum Company Ltd.,
Mining Division,
656 - 409 Granville Street,
VANCOUVER, B.C.,
V6C 1T2.

Report Written by:
Paul Brown,
February 3, 1981.
This report has been examined by the Geological Evaluation Unit and is recommended to the Commissioner to be considered as representation work in the amount of $2,384.66.

[Signature]
 Acting Reg.

Resident Geologist or Resident Mining Engineer

Considered as representation work under Section 53 (4) Yukon Quartz Mining Act.

INTRODUCTION

During the 1980 field season Amoco Canada Petroleum Company Limited (Mining Division) conducted a reconnaissance stream sediment sampling and prospecting program over the western portion of the Big Salmon Range in south central Yukon. The primary objective of the program was to locate porphyry molybdenum mineralization.

A base camp was established on the southeast shore of North Loon Lake, 61° 11'N, 134° 12'W, and was serviced by float equipped Otter and Beaver type aircraft from Whitehorse, approximately 44 air miles to the southwest. Access to the project area from the base camp was by helicopter.

The MMM Claim Group consists of 20 contiguous claims staked on August 1st, 1980. The claim group is situated on the northeast side of Mt. Murphy 61° 00'N, 133° 34'W. Relief on the claim group is approximately 600 m and is accessible only by helicopter.

The entire MMM Claim Group is underlain by coarse-grained intrusive rocks of the Quiet Lake Batholith. These intrusive rocks consist of coarse-grained gray to brown biotite rich monzonite to granodiorite with disseminated pyrite.

Results of a geochemical soil sampling survey has
indicated the presence of anomalous concentrations of molybdenum in soil on the northeast portion of the MMM Claim Group.

GEOLOGY

The entire MMM Claim Group is underlain by coarse-grained intrusive rocks of the Quiet Lake Batholith. The Quiet Lake Batholith, located west and northwest of Quiet Lake, is a northwest trending body 40 miles long by 20 miles wide. The Batholith intrudes Palaeozoic ? Yukon Group sedimentary schist and gneiss and has been dated by K-Ar methods at 83.2 million years. This intrusive is predominately coarse-grained to porphyritic biotite granite with a more gneissic border phase. However, in the vicinity of the MMM Claim Group, the intrusive is composed of coarse-grained gray to brown biotite rich monzonite to granodiorite with disseminated pyrite. Many of the outcrops are fractured and gossans are abundant in the northern portion of the Claim Group. No quartz stockwork or felsic dyking were noted, however, one chloritic mafic dyke with a 2-3% pyrite was found.
SOIL GEOCHEMISTRY

Introduction

During the period August 2nd and 3rd, 1980, a total of 7 man-days were spent collecting soil samples on a grid covering the MMM Claim Group.

A chained and flagged baseline was established along the north boundary of claims YA 51065, YA 51066, YA 51083 and YT 51084. Six pace and compass traverses at 180° were conducted from this baseline at 300 m intervals. Soil samples were collected every 61 m (200') and a total of 216 soil samples were taken.

Soil samples were collected from depths of 5 cms to 20 cms with a mattock and stored in Kraft paper bags. The B horizon was sampled when present; otherwise, the soil beneath the zone of humus and vegetation was collected.

The Minus 80 mesh fraction of all samples was analyzed for Mo, Cu, Pb, Zn. Every 3rd sample was also analyzed for tungsten. All analysis were done by Min-En Laboratories of North Vancouver, B.C.

Interpretation

A moderate molybdenum soil anomaly is located on claims YA 51065, YA 51066 and YA 51083 at the northern end of the claim group. The anomaly is 1200 m by 400 m and is
open to the east. Molybdenum values range from 20 ppm to 377 ppm with the majority being in the 50 - 100 ppm range. Background values for molybdenum are in the 3 - 8 ppm range. A small molybdenum anomaly occurs on claim YA 51088. The anomaly is 300 m by 200 m and is open to the west. Molybdenum values are in the 24 to 54 ppm range.

Conclusions and Recommendations:

It appears the soil anomalies are related to the underlying gossaniferous bedrock. The area covering both anomalies should be soil sampled and rock chip sampled in detail to further define the anomalies. The grid covering the anomaly on claims YA 51065, YA 51066 and YA 51083 should be extended further to the northeast and the grid covering the anomaly on claim YA 51088 should be extended further west.
SURVEY COST

Assay Charges:
A total of 216 soil samples were collected on claims YA 51065 to YA 51072 and YA 51081 to YA 51092 and analyzed for Mo, Cu, Pb, Zn @ $4.60 per sample.
64 of the above mentioned samples were also analyzed for tungsten @ $3.75 per sample

\[
\begin{align*}
216 \text{ samples} & \times \$4.60/\text{sample} = \$993.60 \\
64 \text{ samples} & \times \$3.75/\text{sample} = \$240.00 \\
\text{Total Assay Charges} & = \$1,233.60
\end{align*}
\]

Salaries:
- Paul Brown 1 man-day @ $65.80/day = $65.80
- Jim Cuttle 2 man-days @ $57.40/day = $114.80
- Bryan Mills 2 man-days @ $34.26/day = $68.52
- Tim Canam 2 man-days @ $45.37/day = $90.74

\[
\begin{align*}
\text{Total Salaries} & = \$339.86
\end{align*}
\]

Meals: 7 man-days @ $12.00/man-day = $84.00

Transportation: Helicopter 1.2 hrs @ $356.00/hr = $427.20

Cost of Report Preparation:

\[
\begin{align*}
\text{TOTAL} & = \$2,384.66
\end{align*}
\]
APPORTIONMENT OF EXPENSES

The total cost of the survey $2,384.66 is to be distributed over the twenty claims as indicated below:

APPENDIX I

Fee Schedule

Geochemical analyses were done by:

Min-En Laboratories Ltd.,
705 West 15th Street,
North Vancouver, B.C.
V7M 1T2.

Geochemical analyses:

Mo, Cu, Pb, Zn $4.00/sample
Sample preparation $0.60/sample

$4.60/sample

Tungsten $3.75/sample
ANALYTICAL PROCEDURE REPORTS FOR ASSESSMENT WORK

PROCEDURES FOR: Cu, Mo, Cd, Pb, Mn, Ni, Ag, Zn

Samples are processed by Min-En Laboratories Ltd., at 705 W. 15th St., North Vancouver Laboratory employing the following procedures.

After drying the samples at 95°C soil and stream sediment samples are screened by 80 mesh sieve to obtain the minus 80 mesh fraction for analysis. The rock samples are crushed by jaw crusher and pulverized by ceramic plated pulverizer.

1.0 gram of the samples are digested for 6 hours with HNO₃ and HClO₄ mixture.

After cooling the samples are diluted to standard volume. The solutions are analysed by Atomic Absorption Spectrophotometers.

Copper, Lead, Zinc, Silver, Cadmium, Cobalt, Nickel and Manganese are analysed using the CH₄H₂-Air Flame combination but the Molybdenum determination is carried out by C₂H₂-N₂O gas mixture directly or indirectly (depending on the sensitivity and detection limit required) on these sample solutions.

Background corrections for Pb, Ag, Cd upon request are completed.
0.5 gram of prepared samples are weighed into nickel crucibles and fluxed with 1:4 times with carbonate flux in a temperature controlled furnace.

Samples than are dissolved and suitable aliquots are taken for colorimetric procedures.

The interferring elements are reduced from the solutions by a 10% SnCl₂ solution before the test is carried out by the Zinc Dithol reagent.

The coloured complex is extracted with Kerosene oil to obtain pure and more easily discriminated blue color.

Samples are measured against a suitable suit of standards which are carried through the same manner as the samples.
