INTRODUCTION

Expatriate Resources Ltd. has a 100% interest in the Goal Net property which protects a known mineral occurrence plus numerous previously unstaked targets selected from a regional geochemical data base documenting results of 1973 exploration by a joint venture managed by Archer, Cathro and Associates Ltd. The claims subject to this report (Goal 1-24 and Net 1-58) comprise only a small part of the Goal Net property which includes additional Goal and Net claims plus NHL, Blade and Goon claims.

The Net 1-34 claims were staked in September 1994 centred on ground previously staked as Sleeper and Lady Lee claims by Dodgex Limited. Work on the claims consisted of geochemical surveys and the mining of 317.5 kg of nephrite jade in 1989, followed by prospecting, geochemistry, VLF-EM surveys, hand trenching and pack sack drilling in 1990-91. Stratabound copper-lead-zinc float and outcrop occurrences were discovered returning up to 1.41% copper, 1.65% zinc and 0.48% lead (Dodgex Limited, 1990). The Goal 1-24 and Net 35-58 were staked in September 1994 and March 1995, respectively. Both cover previously unstaked soil geochemical anomalies for lead, zinc and copper.

Field exploration was conducted over the Goal 1-24 claims from June 29 to July 19 and on the Net 1-58 claims from August 1 to 29. It consisted of grid soil geochemistry, geological mapping and prospecting performed by two to four person crews working from fly camps on the claim blocks. The work was managed by Archer, Cathro & Associates (1981) Limited and supervised by the author. Appendix I contains the Author's Statement of Qualifications.

PROPERTY, LOCATION AND ACCESS

The property is located in southeast Yukon at latitude 61°36'N and longitude 130°55'W on NTS map sheet 105G7/8 (Figure 1). It is comprised of 960 contiguous mineral claims registered with the Watson Lake Mining Recorder in the name of Archer, Cathro & Associates (1981) Limited which holds them in trust for Expatriate Resources Ltd. Claim registration data for the subject claims is listed below and locations are illustrated in Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
Goal 1-24	YB56129-YB56152	March 17, 2000
Net 1-34	YB56095-YB56128	March 17, 2000
35-58	YB59119-YB59142	March 17, 2001

*Expiry date includes 1995 work filed for assessment credit but not yet accepted.

In 1995 the properties were accessed by helicopter from a logistical staging area at the Finlayson Airstrip at Km 246 on the Robert Campbell Highway. The airstrip lies 46 km north-northwest of the property and 260 km northeast of Whitehorse. Road access to the airstrip is from Ross River, 110 km to the northwest or Watson Lake, 260 km to the southeast. Helicopter support was provided by Bell 206B Jet Rangers operated by Trans North Air from its permanent base at Ross River or Frontier Helicopters which had a contract machine stationed at Westmin Resources Ltd.'s exploration camp on Wolverine Lake 23 km northeast of the property.

GEOMORPHOLOGY

The Goal Net property covers a series of ridges between North River and Money Creek in the central part of the Campbell Range within the Pelly Mountains. Creeks draining the property flow southward and eastward into tributaries of the Liard River watershed.

Elevations range from 1200 m in valley bottoms to 2320 m on ridge tops. Topographic relief is gentle between 1200 and 1450 m elevation, ranging between 10 and 15°. Steeper slopes are encountered beyond 1450 m, averaging 32° and up to 40°. Pleistocene valley glaciers deposited extensive glacial/fluvial till at lower elevations and lateral moraines in areas of gentle to moderate relief. Upland regions are marked with deeply incised drainages forming canyons ending in cirques surrounded by arêtes. Cirques and slopes, where cliffs are not prevalent, are largely occupied by rock glaciers and talus.

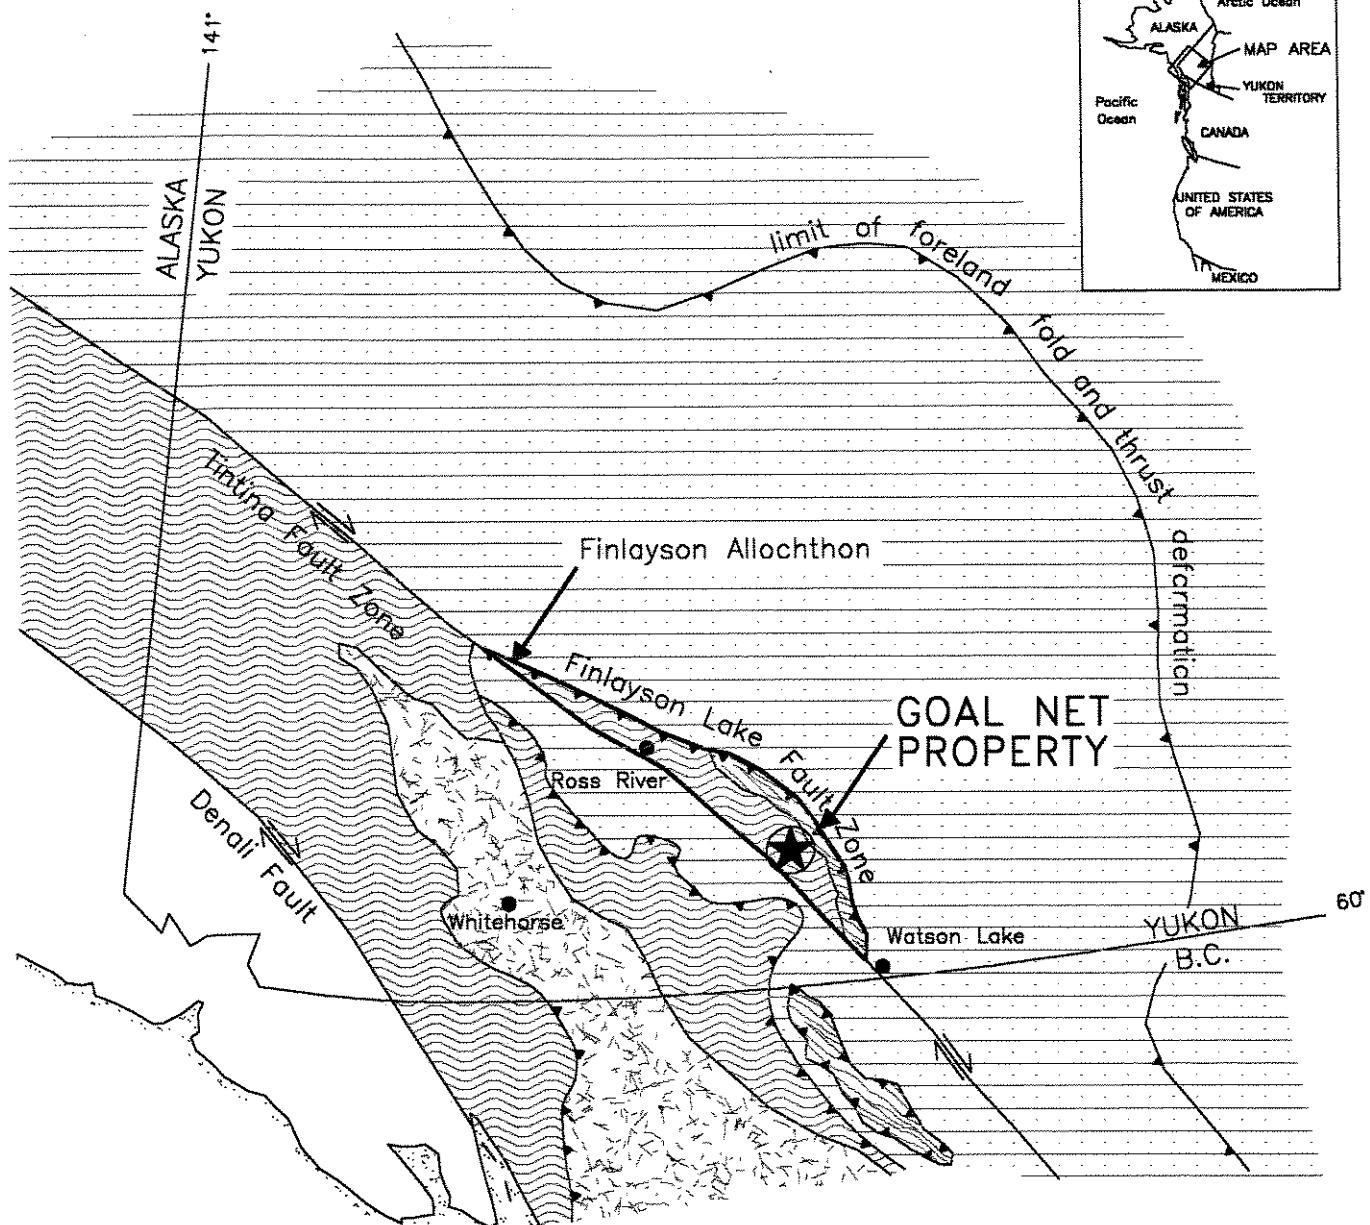

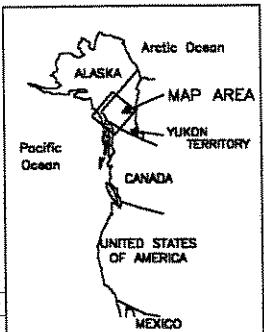

Vegetation consists of sparse stunted black spruce, alder and buckbrush at lower elevations (up to 1300 m) giving way to mosses, lichen and alpine grass.

REGIONAL GEOLOGY

The Goal Net property lies within the 380 km long, up to 60 km wide Finlayson Allochthon which consists of rocks belonging to the Yukon-Tanana and Slide Mountain Terranes (Figure 3). The southwest side of the allochthon is defined by the Tintina Fault Zone, a series of subparallel transcurrent faults which have produced approximately 450 km of dextral offset in Late Cretaceous and/or Early Tertiary times (Tempelman-Kluit et al, 1976). The northeast edge is a broad arc marking the surface trace of the Finlayson Lake Fault Zone, a complex mixture of thrust and high angle faults. Both fault zones juxtapose the allochthonous rocks with autochthonous rocks of the North American miogeocline.

The Yukon-Tanana and Slide Mountain Terranes are composed largely of Late Paleozoic arc stratigraphy of uncertain origin (Hansen, 1990 and Mortensen, 1992). Yukon-Tanana is more metamorphosed and contains more plutons while Slide Mountain is distinguished by the presence of ophiolitic rocks. A number of thrust faults associated with the Finlayson Lake Fault Zone have imbricated Yukon-Tanana and Slide Mountain assemblages frequently repeating various parts of the stratigraphy. All of the main volcanogenic massive sulphide occurrences in the Finlayson Lake area are hosted by Late Devonian to Mid-Mississippian metavolcanic and metasedimentary rocks of Yukon-Tanana Terrane (Johnston and Mortensen, 1994).

Geology in the vicinity of the Goal Net property was mapped at 1:250,000 scale in the 1970's by the Geological Survey of Canada (Tempelman-Kluit, 1977) and reinterpreted at approximately 1:500,000 scale by industry geologists in the early 1980's (Mortensen and Jilson,

TECTONIC SETTING

GOAL NET PROPERTY EXPATRIATE RESOURCES LTD.

0 100 200 300 400
KILOMETRES

1985). The following geological summary is based primarily on the work of Mortensen and Jilson and, for consistency, their nomenclature and unit descriptions are used throughout the remainder of this report.

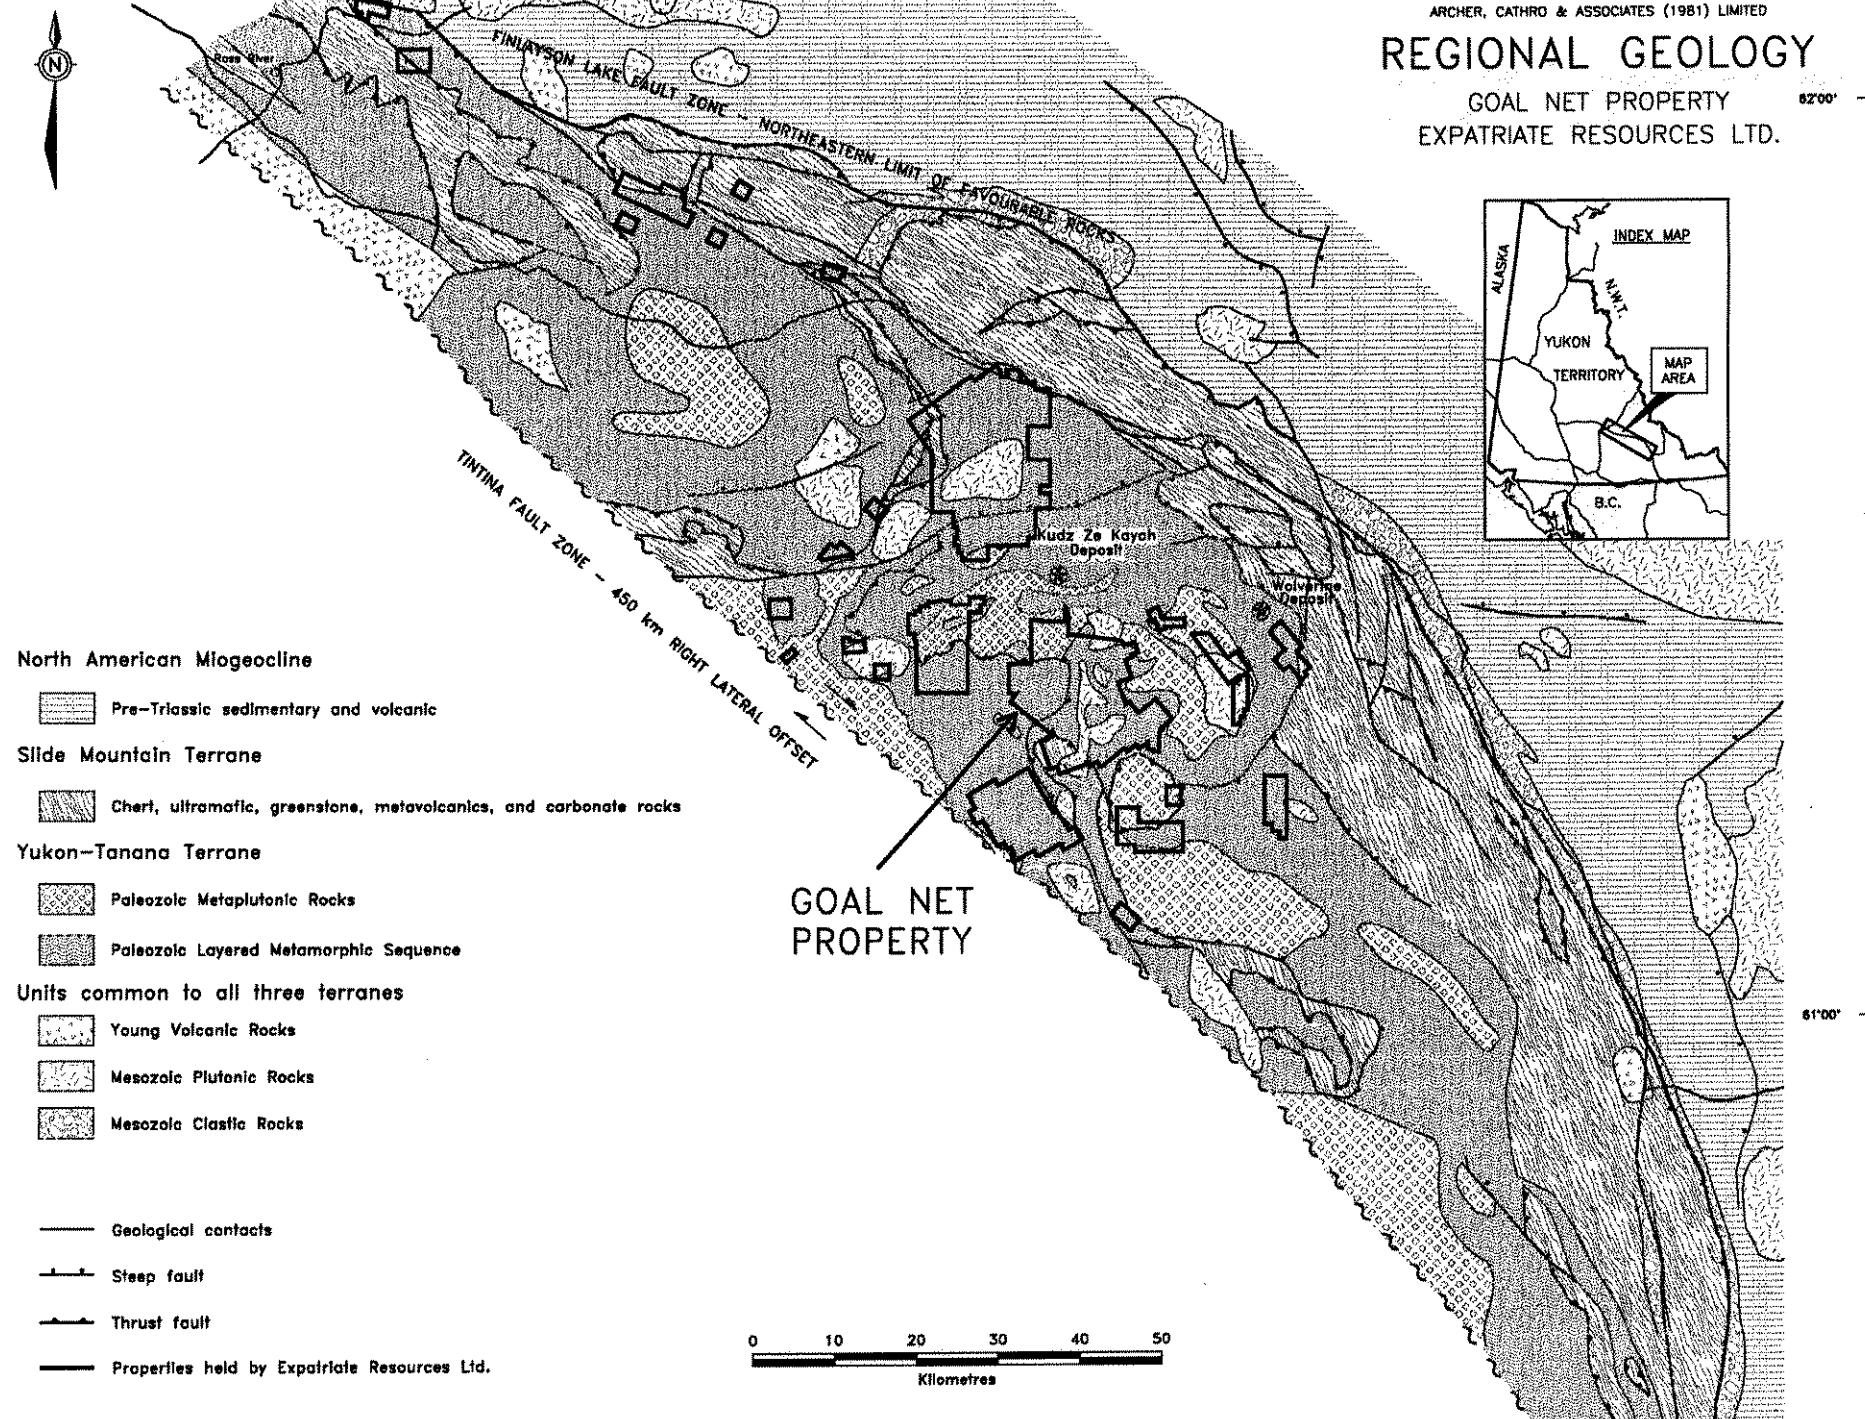

Six principal lithological packages have been identified within the allochthonous rocks in the Finlayson Lake area (Figure 4). They include two metamorphic assemblages that comprise the bulk of Yukon-Tanana Terrane, a relatively unmetamorphosed package belonging to Slide Mountain Terrane and three younger units that intrude or overlie both terranes.

Paleozoic Layered Metamorphic Sequence is the oldest and most abundant lithological package within Yukon-Tanana Terrane. It consists of three distinct stratigraphic units with a total thickness of approximately 3 km. The lowest unit contains pre-Late Devonian, micaceous feldspathic quartzite with minor marble. The middle unit is Late Devonian to Mid-Mississippian in age and is the focus of volcanogenic massive sulphide exploration in the Finlayson Lake area. It consists of dark siliceous phyllite that is increasingly carbonaceous toward the base of the section where it is interfingered with widespread mafic metavolcanic schist. Localized felsic metavolcanic centres are found throughout the section. The uppermost unit contains Early Pennsylvanian to Early Permian white carbonate and quartzite.

Paleozoic Metaplutonic Rocks are also confined to Yukon-Tanana Terrane. They are subdivided into three suites, all of which are coarse grained and have yielded Mid-Mississippian age dates (340 to 359 Ma). The quartz monzonitic to quartz dioritic Simpson Range plutonic suite is slightly older than the augen orthogneiss (leucogranite) and monzonitic orthogneiss

REGIONAL GEOLOGY

GOAL NET PROPERTY
EXPATRIATE RESOURCES LTD.

(quartz monzonite). Most contacts between metaplutonic rocks and the Layered Metamorphic Sequence are foliaform.

Both the Layered Metamorphic Sequence and the metaplutonic rocks were intensely deformed (F1) during Permian or Early Triassic time. This event resulted in pervasive foliation that usually parallels subhorizontal or shallow-dipping compositional layering. The F1 deformation was accompanied by middle greenschist to middle amphibolite facies regional metamorphism. A second phase of deformation (F2) is observed locally but appears to have been a relatively minor event.

Slide Mountain Terrane consists of ophiilitic assemblages that are most abundant within the Campbell Range Belt but also appears as imbricate slices along thrust faults elsewhere in the allochthon. The Campbell Range Belt is up to 25 km wide and forms the northeastern edge of the allochthon. It contains relatively unmetamorphosed but strongly folded and imbricated cherts with mafic and felsic volcanics, massive greenstone and serpentinite. Thrust slices elsewhere in the allochthon are also unmetamorphosed but typically contain a higher proportion of mafic to ultramafic plutonic rocks. Fossils in the cherts have been dated as Late Pennsylvanian to Early Permian while the mafic and ultramafic rocks are Late Devonian. Slide Mountain rocks do not exhibit the F1 foliation characteristic of the Yukon-Tanana Layered Metamorphic Sequence and metaplutonic rocks.

The remaining three units are all younger and unmetamorphosed. They are found in both Yukon-Tanana and Slide Mountain Terranes. Mesozoic Clastic Rocks are Late Triassic immature sediments containing cobbles derived from both Yukon-Tanana and Slide Mountain. Mesozoic Plutonic Rocks include a number of Early Jurassic mafic to intermediate plutons plus scattered Late Cretaceous quartz monzonite stocks. Major thrust faults in the district post-date the Early Jurassic plutons but pre-date the Late Cretaceous quartz monzonite. This structural event is believed to have occurred during accretion of the allochthon to the North American craton because the thrusts cut the miogeoclinal rocks as well as the allochthonous rocks. Transcurrent movement on the Tintina Fault Zone occurred soon after the thrust faults. Young Volcanic Rocks unconformably overlie the other units and consist of Late Cretaceous to Tertiary felsic volcanic flows and volcaniclastic deposits. They are usually found in close proximity to the Tintina Fault Zone.

REGIONAL MINERALIZATION

A total of fifty-one mineral occurrences have been reported within the Finlayson Allochthon (DIAND, 1994). Of these, twenty-one are known or suspected to be volcanogenic in origin while veins, skarns and asbestos occurrences comprise most of the remainder. Although the better known volcanogenic occurrences are thought to be of the Kuroko-type, some Besshi-type mineralization may also be present (Morin, 1981 and Johnston and Mortensen, 1994). Two occurrences have definite economic potential, Kudz Ze Kayah and Wolverine (Figure 4). These occurrences are "type-deposits" for Expatriate's exploration elsewhere in the district and are briefly described below.

The Kudz Ze Kayah (ABM) Deposit lies within Yukon-Tanana Terrane near the centre of the allochthon (Cominco Exploration, 1995; Whiteway, 1995) some 18 km north-northwest of the Goal Net property. It is a volcanogenic massive sulphide deposit hosted by felsic pyroclastics, aphanitic massive rhyolites and metasiliclastic rocks belonging to the middle unit of the Layered Metamorphic Sequence. Although both the sulphides and wallrocks are highly strained and exhibit pervasive schistosity, compositional layering in the vicinity of the deposit is relatively undeformed with a consistent, shallow northerly dip. Sphalerite, chalcopyrite and galena are the main economic minerals while the gangue includes various mixtures of magnetite, barite, pyrrhotite, pyrite and carbonate. The deposit averages about 18 m thick and has been traced 700 m along strike and up to 400 m downdip. Open pit mineable ore reserves are reported to be 11 million tonnes grading 5.9% zinc, 0.9% copper, 1.5% lead, 130 g/t silver and 1.3 g/t gold

(Schultze, 1996). Preliminary studies suggest that satisfactory lead, zinc and copper concentrates can be produced using conventional flotation processes (Cominco Exploration, 1995). The mineralization responds well to magnetic and electromagnetic surveys but geochemical response is somewhat erratic because the entire deposit is covered by 2 to 10 m of glacial till.

The Wolverine Deposit is located 25 km east of Kudz Ze Kayah and 23 km northeast of the Goal Net property near a contact between Yukon-Tanana and overlying Slide Mountain rocks. It also lies within the middle unit of the Layered Metamorphic Sequence and is hosted by rhyolitic metavolcanics and argillites and consists primarily of semi-massive to massive sulphides. Pyrite and sphalerite occur with varying amounts of galena, chalcopyrite, tetrahedrite and native gold. The surface expression of the deposit is marked by a vegetation kill zone containing weakly malachite-stained schist. Westmin has intersected the deposit in fifteen consecutive diamond drill holes, tracing it 400 m along strike and up to 250 m downdip. It averages 6.2 m thick and dips shallowly to the north. Although the deposit is blind to surface it is open downdip and along strike in both directions. Wolverine contains significantly more zinc and precious metals than Kudz Ze Kayah. The weighted average grade for intersections reported to date is 11.82% zinc, 1.05% copper, 1.53% lead, 442.8 g/t silver and 2.48 g/t gold (Westmin News Release, November 30, 1995). Soil geochemistry outlined weakly to moderately anomalous values along the projected surface trace of the deposit while magnetic surveys easily traced a laterally extensive, banded iron formation which occurs about 80 m up-section from the massive sulphide horizon. Interpretation of electromagnetic results is complicated by the presence of graphite within the argillite.

REGIONAL GEOCHEMISTRY

Published geochemical data for the Finlayson Lake area is limited to reconnaissance-scale stream sediment sampling conducted in the late 1980's by the Geological Survey of Canada (Hornbrook and Friske, 1988 and Friske et al, 1990). The sampling was done at an approximate density of one sample per 10 sq. km. Each sample was analyzed for twenty elements including such common indicator elements for volcanogenic massive sulphide deposits as copper, lead, zinc, silver and arsenic. Anomalous results were obtained from creeks draining some previously known volcanogenic massive sulphide occurrences (Yukon Minfile 105G/32, 34 and 40) but many others, including the streams draining the Wolverine Deposit, produced near background values. Anomalous results were also obtained from several drainages where there were no known mineral occurrences. Follow-up exploration has since located showings in many of the anomalous creeks, with the most significant discovery to date being the Kudz Ze Kayah Deposit.

Expatriate was able to supplement the published reports with private data summarizing results of 1973 exploration managed by Archer Cathro on behalf of a joint venture (Cathro, 1973). The reconnaissance prospecting and geochemical sampling program explored for lead-zinc mineralization in the lower unit of the Layered Metamorphic Sequence but because the data provides relatively uniform coverage over the entire region, it is also suitable for evaluating areas underlain by the favourable middle unit. The Archer Cathro samples included approximately 5000 soils and stream sediments collected at a density of approximately one sample per sq. km. They were all analyzed for lead, zinc, copper and molybdenum. As might be expected, this closer-spaced sampling outlined many more areas of anomalous geochemical response than the

government survey. Almost all of the known volcanogenic occurrences showed up as anomalies on this survey, including Kudz Ze Kayah and Wolverine.

The Goal Net property was staked to protect numerous targets selected from the Archer Cathro data. The following illustrates regional geochemical background for the metals and anomalous thresholds used for target selection.

GEOCHEMICAL BACKGROUNDS AND ANOMALOUS THRESHOLDS

	<u>Background</u> (ppm)	Anomalous Thresholds			<u>Peak</u> <u>Value</u> (ppm)
		<u>Weak</u> (ppm)	<u>Moderate</u> (ppm)	<u>Strong</u> (ppm)	
Copper	25	50	100	200	1720
Lead	30	50	100	200	>4000
Zinc	80	200	500	1000	>4000
Molybdenum	<1	2	5	10	65

Copper, lead and zinc are major metals in most volcanogenic massive sulphide occurrences in the Finlayson Lake area and are obvious indicator elements. Molybdenum is present in anomalous quantities in the banded iron formation overlying the Wolverine Deposit (H. Meade, pers. comm., 1995) and appears to be slightly enriched in the felsic metavolcanic rocks. Based on the geochemical signature in the vicinity of known occurrences, its presence can be used to distinguish copper anomalies associated with volcanogenic mineralization from those derived from ultramafic rocks.

REGIONAL GEOPHYSICS

The only published geophysical data for the Finlayson Lake area resulted from airborne magnetic surveys conducted in 1961 by the Geological Survey of Canada on behalf of the Department of Mines and Technical Surveys. The surveys were flown with fixed-wing aircraft at a nominal elevation of 300 m above ground level on east-west lines spaced approximately 1.6 km apart. Results are presented on a 1:250,000 scale map (DMTS, 1961) and in more detail on a series of 1:50,000 maps.

The largest, most intense areas of positive magnetic response are associated with obducted ultramafic rocks belonging to the Slide Mountain Terrane. Within the Campbell Range Belt where dips are usually moderate to steep, the anomalies are narrow and elongate while in the remainder of the allochthon where the ultramafic rocks occur along shallowly-dipping thrust faults, they are much broader.

A series of secondary positive anomalies were also recorded over Yukon-Tanana rocks but until recently they had no obvious explanation. Prospecting and mapping have now shown that magnetite occurs locally within schists of the middle unit of the Layered Metamorphic Sequence. The greatest documented concentration of magnetite is found in the hanging wall of the Wolverine Deposit where it forms several thin horizons approximately 80 m up-section from the massive sulphide mineralization. Magnetite is also a significant constituent of the mineralization at Kudz Ze Kayah. The Goal Net property covers several moderate and strong elongate aeromagnetic anomalies of intensity comparable to the anomaly over the Wolverine Deposit.

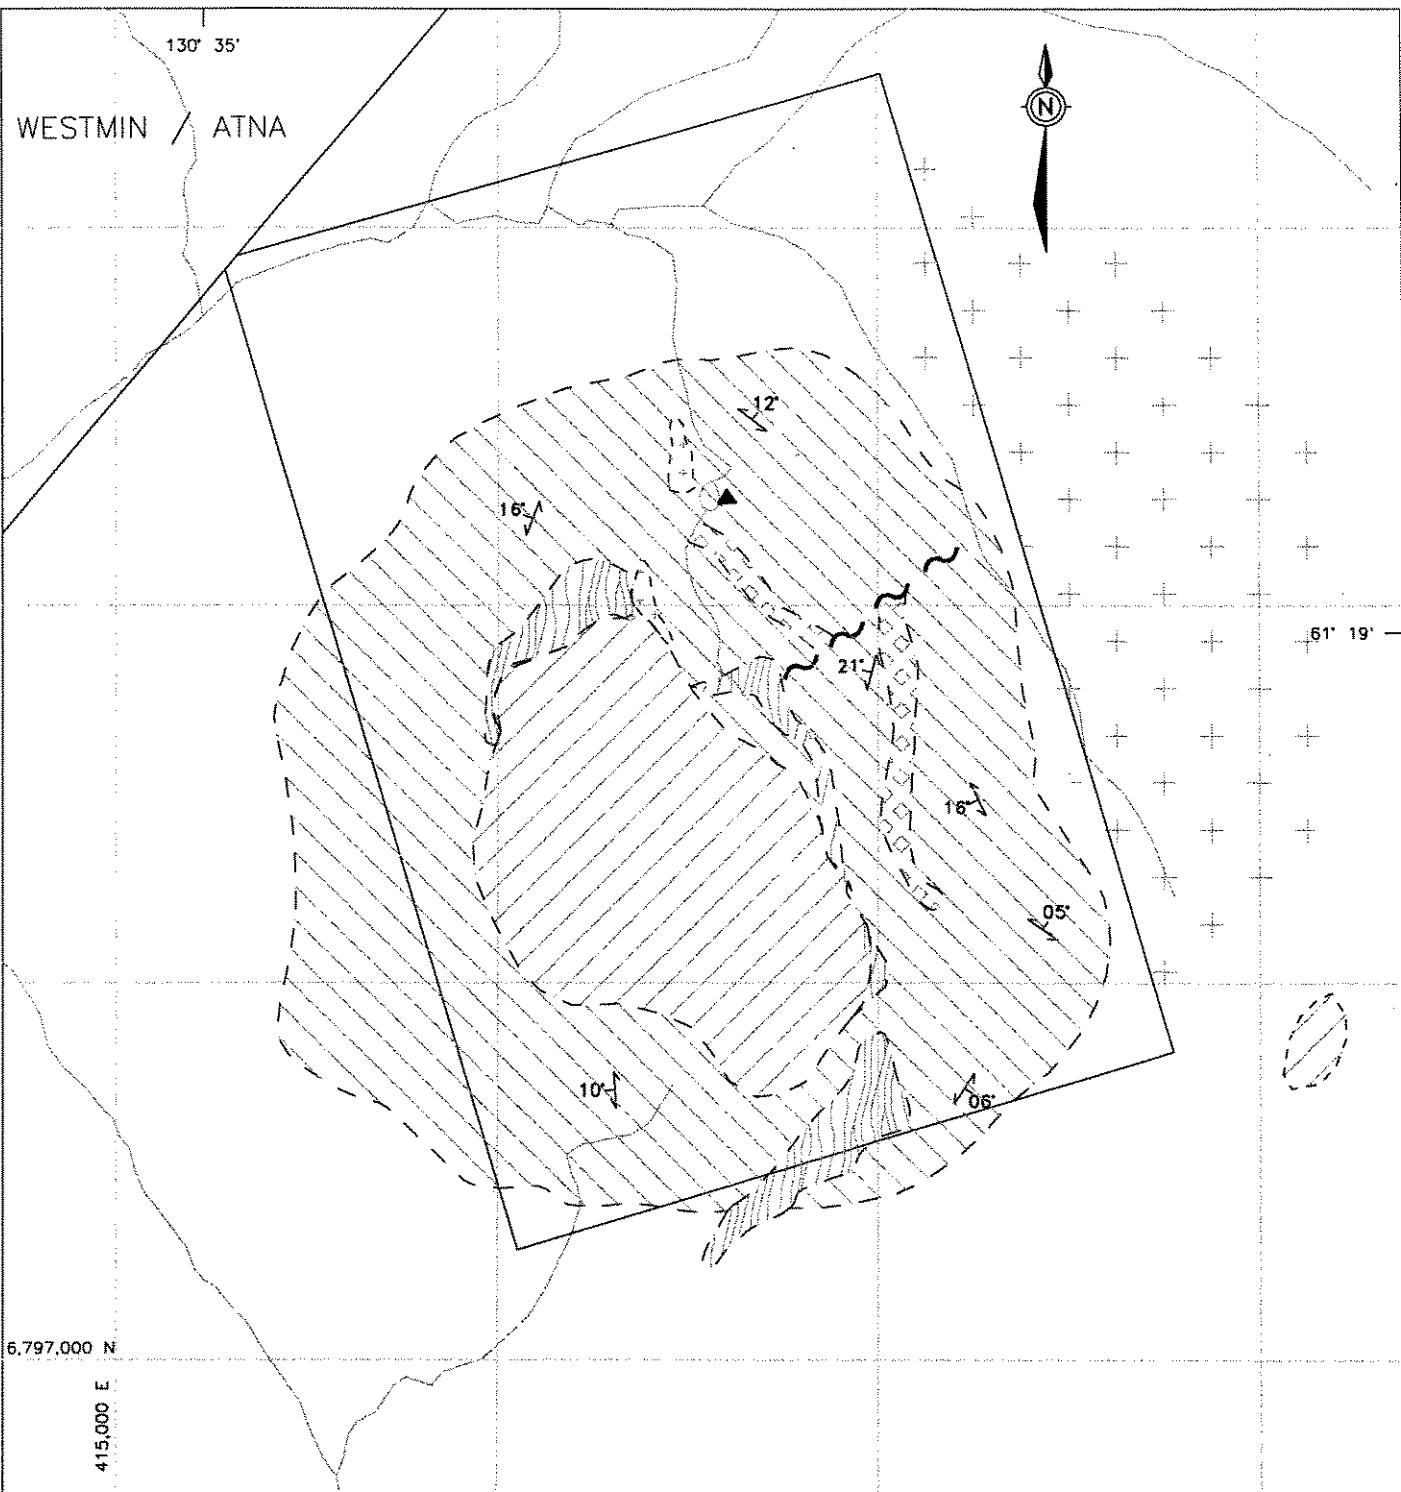

PROPERTY GEOLOGY AND MINERALIZATION

Goal 1-24 Claims

Bedrock exposure in cirques near the 1995 campsite (Figure 5) is moderate to good as much of this area is comprised of cliff-forming outcrops. Rocks are weakly to moderately foliated and relatively flat-lying, dipping between 0 and 60°, averaging 17°. Five main rock types recognized on the property are described below. The first two are part of the Paleozoic Layered Metamorphic Sequence while the third belongs to the Paleozoic Metaplutonic Suite. The remaining rock types are younger stocks, dykes and sills intruding and cutting older strata.

Undifferentiated paraschists are brown, buff, grey and rusty weathering interbanded mafic and felsic phyllites and schists locally grading up to gneiss. Buff, fine-grained granular quartz bands ± biotite are common. Medium-grained, moderately foliated buff to grey-brown quartz muscovite schists and fine-grained, green to grey-green biotite chlorite ± amphibole phyllite are also interbanded within this sequence. The latter two lithotypes are weakly to moderately cut by quartz veins and quartz feldspar muscovite dykes and sills. Pyrrhotite, pyrite, galena, sphalerite and chalcopyrite occur in trace amounts throughout the section.

Biotite chlorite ± quartz schist is dark green to grey to black weathering, fine-grained and thinly foliated. Locally, very fine-grained feldspar and rarer quartz grains occur along foliation. Pyrite and pyrrhotite where observed are disseminated up to 1%. The felsic end member of this unit is typically sucrosic in appearance and moderately foliated. Mineralization consists of disseminated pyrrhotite and pyrite up to 3% with rare, finely crystalline galena, sphalerite and chalcopyrite.

0 100 200 300 400 500 600 700 800 900 1000 m

Several narrow bands of amphibole schist were noted within this assemblage. It is light green-grey weathering, moderately foliated and dark green on fresh surface. Biotite, chlorite and epidote are minor constituents. Micro fractures perpendicular to foliation are weakly calcareous.

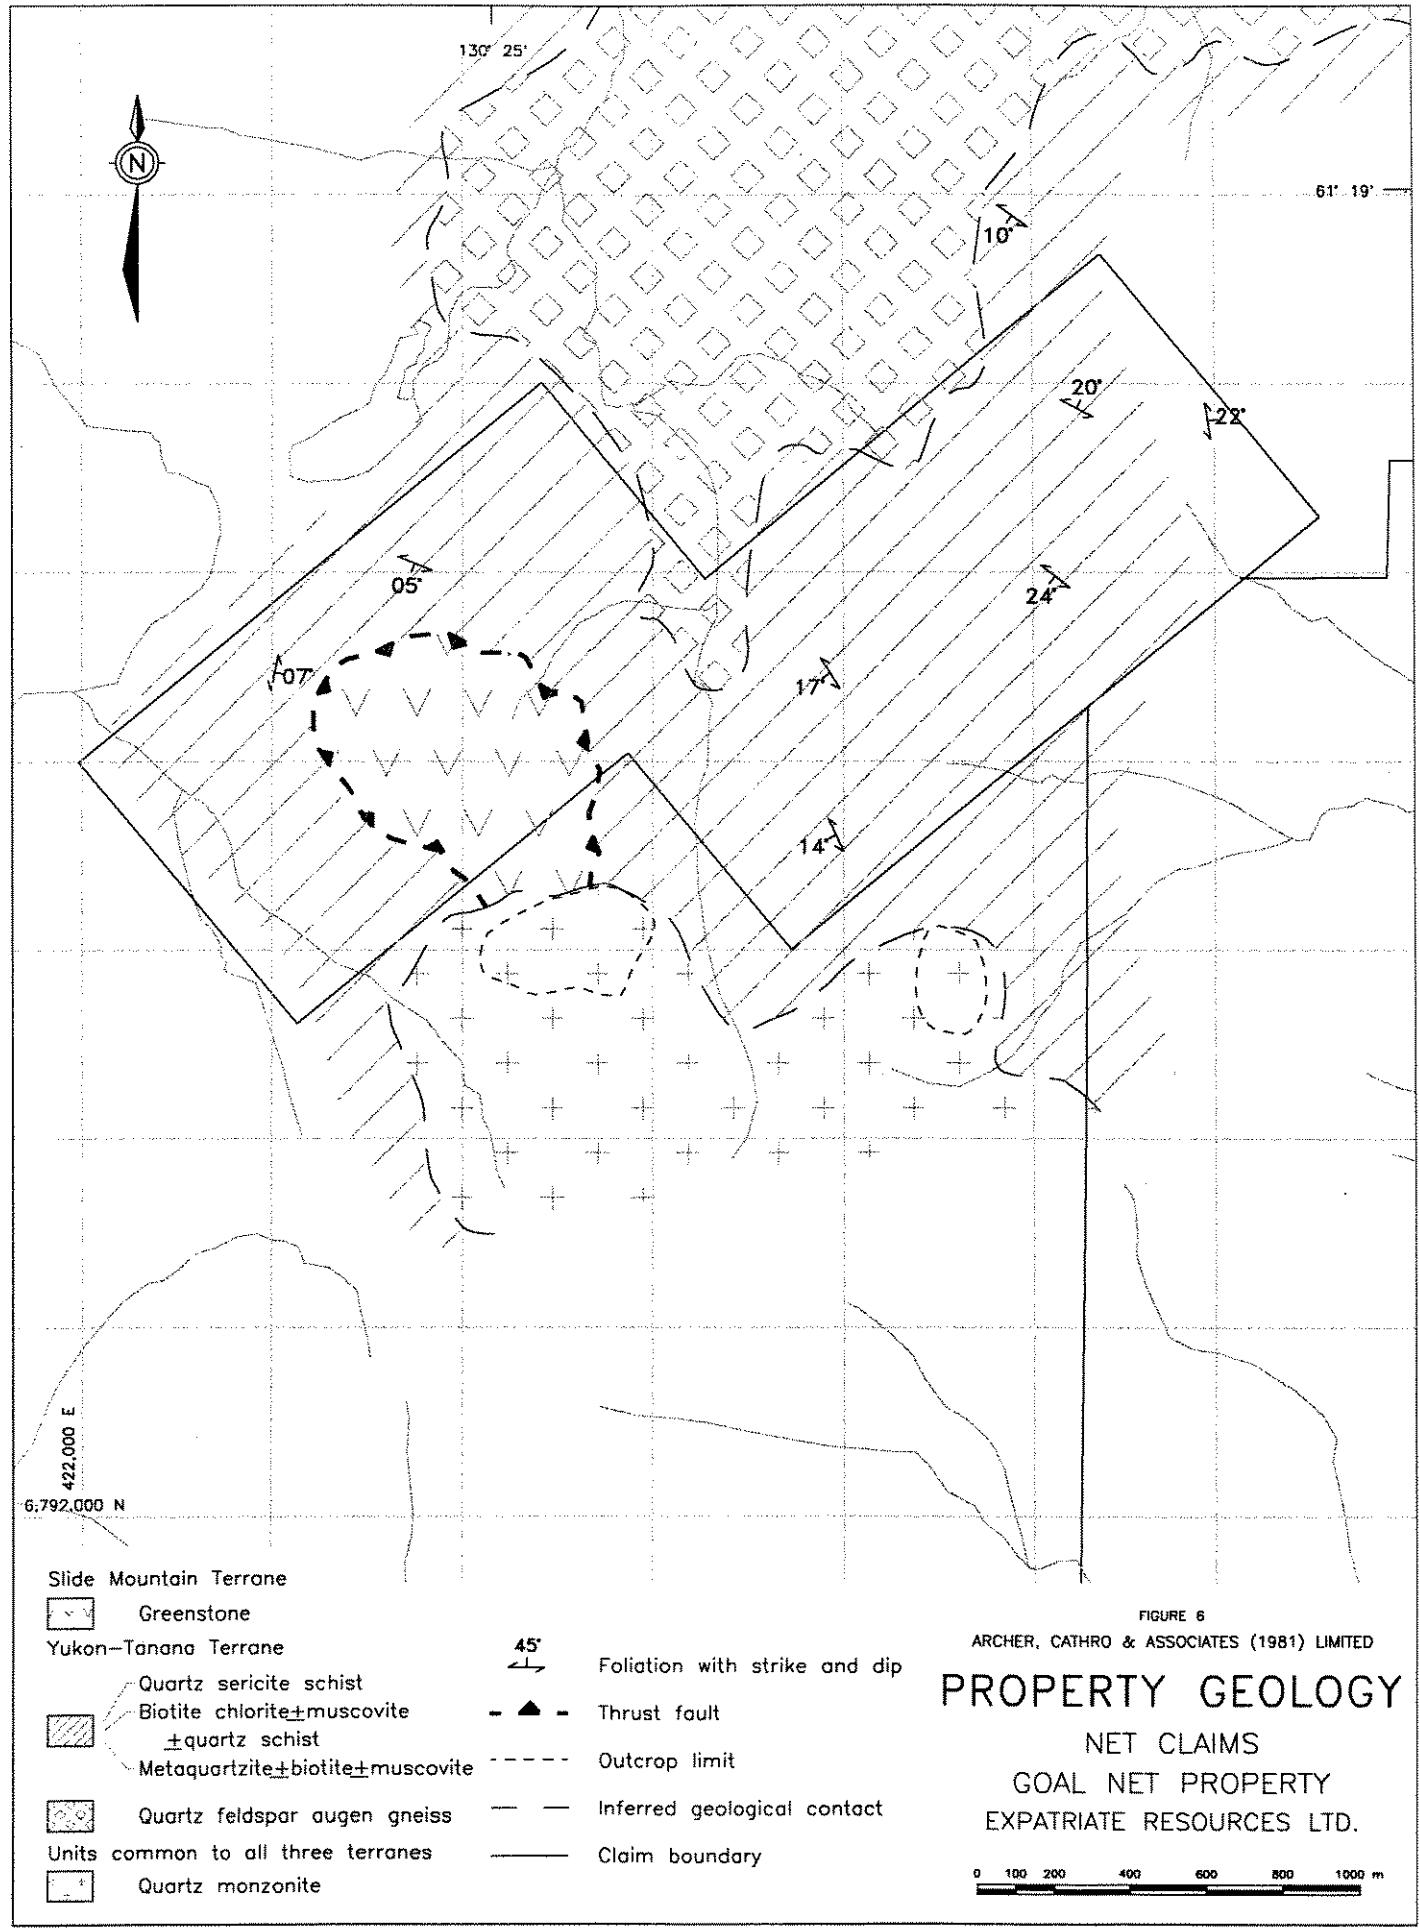

Paragneiss is light blue-grey to brown, fine-grained and weakly to moderately foliated. Mineral composition ranges from 40 to 80% quartz, 10 to 40% biotite, 0 to 20% feldspar, 0 to 10% amphibole and 0 to 5% garnet. Foliation is defined by mineral segregation rather than biotite planes.

Quartz monzonite is light grey to pale orange weathering, massive to weakly foliated and grey to buff on fresh surfaces. Mineral composition ranges from 10 to 30% quartz, 10 to 20% muscovite and 10 to 30% biotite.

Ultramafic rocks of the Slide Mountain Terrane occur as lenses along the contact between overlying paraschists and underlying biotite chlorite ± quartz schists. Blastomylonite, muscovite quartz porphyry and feldspar porphyry are noted as narrow dykes and sills predominantly within biotite chlorite ± quartz schist.

Net 1-58 Claims

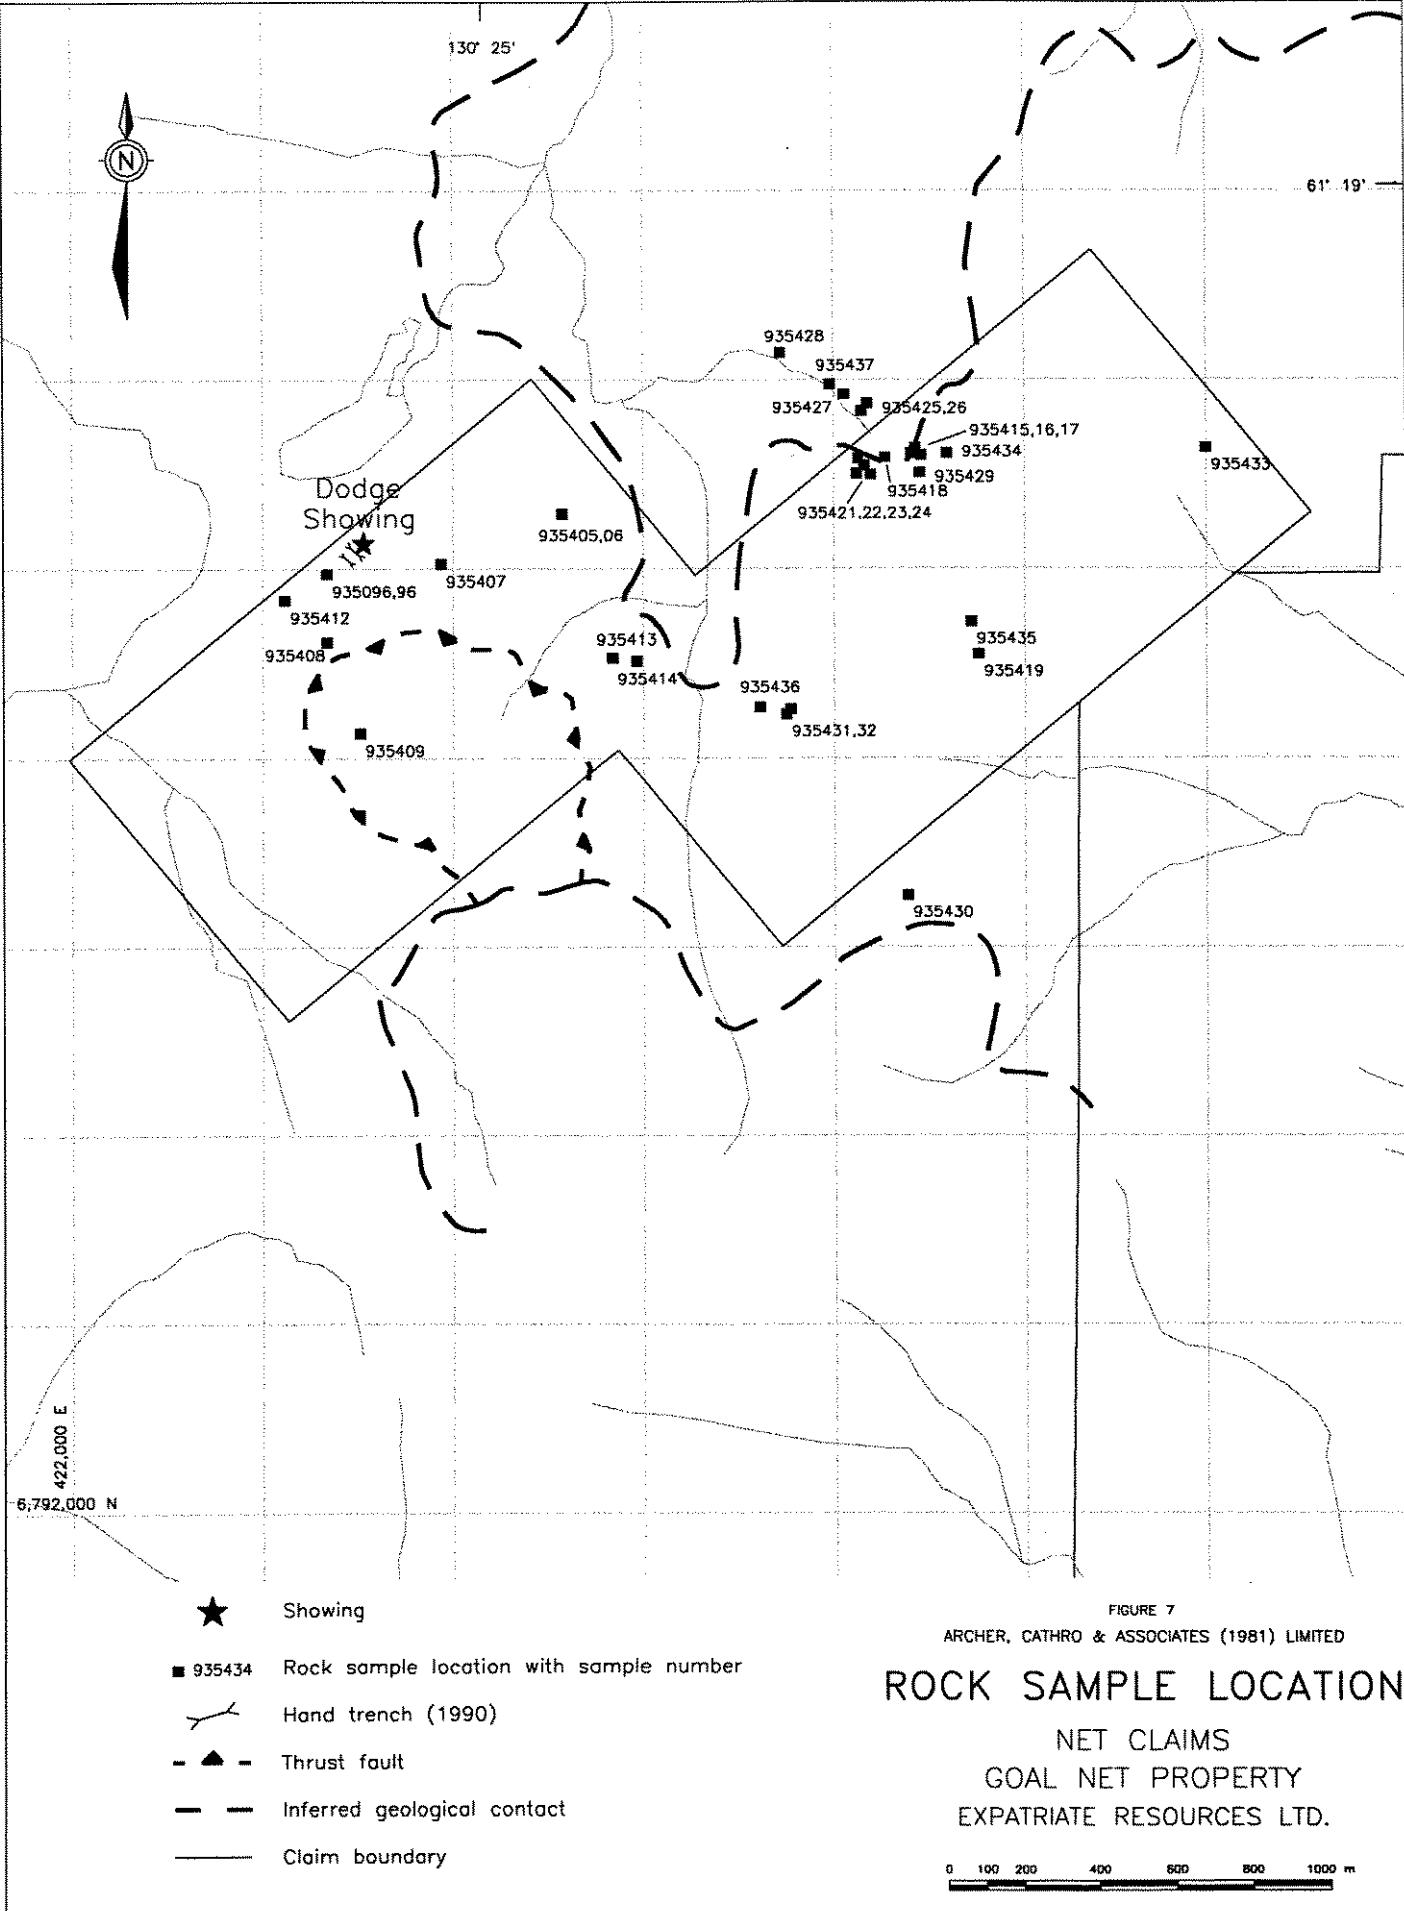

Bedrock exposure is restricted to areas above 1500 m elevation and where slopes exceed 30°. Most rocks are moderately to well foliated and dip shallowly to the southwest at 10 to 15°. Six rock types observed on the claim block are described below. Three of the units belong to the Paleozoic Layered Metamorphic Sequence and are underlain by a fourth which is part of the Palaeozoic Metaplutonic Suite. The remaining two units comprise an overlying thrust bound slice of Slide Mountain rocks and intrusions of the Mesozoic Plutonic Suite (Figure 6).

Quartz sericite schist is well foliated, tan to rusty weathering and contains disseminated and foliaform pyrite up to 10% with occasional disseminated, fine-grained galena and chalcopyrite. Very quartzose samples are moderately foliated with sucrosic texture. Micro fractures parallel and perpendicular to foliation are weakly calcareous. Sulphides consist of varying amounts of foliaform pyrite, sphalerite, galena and chalcopyrite. Select float specimens of this particular style of mineralization (Figure 7) were sent to Chemex Labs Ltd. and analyzed for 32 elements geochemically by Induced Coupled Plasma technique (ICP). Pulps from samples exceeding upper limits to ICP were further analyzed for economic metals and returned up to 5.98% zinc, 1.55% lead, 83 g/t silver, 0.86 g/t gold and weakly anomalous values for copper. Certificates of Analysis are listed in Appendix II.

Biotite chlorite ± muscovite ± quartz schist is dark green to grey to rusty weathering and well foliated. Quartz-deficient samples mineralized with disseminated pyrite, galena, chalcopyrite and sphalerite (up to 2% combined) were only weakly anomalous for all economic metals. Magnetite was also noted in several samples. Felsic varieties contain up to 10% disseminated chalcopyrite, sphalerite and galena combined. Float specimens returned values up to 0.57% copper, 0.02% lead, 1.32% zinc and 7 g/t silver.

Metaquartzite ± biotite ± muscovite is tan to rusty weathering, grey to white on fresh surface and moderately foliated. This unit is strongly interbanded within the schist units described above. Local manganese staining and foliaform quartz floods are common. Pyrite occurs as disseminations up to 1% and sphalerite and galena were noted along fractures oblique to foliation.

Quartz feldspar augen gneiss is overlain by the schist assemblages and is generally observed as blocky grey weathering talus on most slopes in the northern part of the claim block. It is moderately foliated with quartz and feldspar augens up to 5 mm in diameter.

Greenstones are restricted to the southern part of the property where they occupy the upper portion of the section in thrust contact with lower-lying schists. This unit is dark green to purple to brown-grey and massive. Cross cutting calcite veins are common with associated concentrations of epidote. Local pillow structures are observed near the basal contact.

Quartz monzonite is massive and grey to pink weathering. Mineral composition ranges from 10 to 25% quartz, 5 to 10% muscovite, 5 to 10% hornblende and 10 to 25% biotite.

PROPERTY GEOCHEMISTRY

Grid soil sampling was conducted over the Goal 1-24 and Net 1-58 claims between June 29 and July 19 and August 1 and 29, 1995, respectively. Compass-controlled baselines were established approximately paralleling claim lines. Baselines were slope-corrected and marked at 100 m intervals with 1 m lath bearing aluminum tags inscribed with grid coordinates and sample numbers. Soil sample lines were run perpendicular to the baseline and marked with 0.5 m lath in the same fashion as baseline stations.

Goal 1-24

A total of 441 soil samples (Figure 8) was taken and sent to Chemex Labs Ltd. where they were screened to -80 mesh, digested in nitric-aqua regia and geochemically analyzed for 32 elements using the ICP technique. All pulps are in the process of being analyzed for gold by atomic absorption. Certificates of Analysis are listed in Appendix II. Results for eight indicator elements are plotted on Figures 9 to 16 while anomalous thresholds and peak values are as follows.

ANOMALOUS THRESHOLDS AND PEAK VALUES

Greater than 50% of the samples taken were at least weakly anomalous for zinc and copper. The strongest geochemical anomaly outlines a 2000 x 600 m northwest-trending zone of strongly coincident moderately anomalous zinc and copper response over the central part of the property. Lead, manganese and molybdenum also occur within this trend but are of lesser intensity and size. The zone appears to be associated with both undifferentiated paraschists and biotite chlorite± quartz schists of the Layered Metamorphic Sequence. Arsenic, antimony and silver response is relatively subdued. A second anomaly of less intensity and size is located downslope near the north edge of the grid. Zinc, lead and molybdenum are moderately coincident within a moderately anomalous east-west trending zone approximately 500 x 200 m wide. Silver, copper, manganese, arsenic and antimony response is subdued.

Net 1-58

A total of 638 soil samples was taken from two grids on the property (3 km apart) and sent to Chemex Labs Ltd. where they were screened to -80 mesh, digested in nitric-aqua regia and geochemically analyzed for 32 elements using the ICP technique. Twenty-seven soils from various parts of both grids were also analyzed for gold by atomic absorption. Certificates of Analysis are listed in Appendix II. Anomalous thresholds and peak values from both grids are as follows.

ANOMALOUS THRESHOLDS AND PEAK VALUES

<u>Element</u>	Threshold Values (ppm)			<u>Peak Value (ppm)</u>
	<u>Weak</u>	<u>Moderate</u>	<u>Strong</u>	
Copper	50	100	200	210
Lead	50	100	200	572
Zinc	200	500	1000	3760
Silver	1	NA*	NA*	<2
Molybdenum	2	5	10	11
Arsenic	20	50	100	258
Antimony	2	5	NA*	8
Manganese	1000	2000	5000	6610
Gold	**	**	**	

*NA = not applicable

** = insufficient number of samples analyzed

Grid 1

Soil sample locations are illustrated on Figure 17 while results for nine indicator elements are plotted on Figures 18 to 26.

The majority of anomalous response from the southern grid is restricted to lower elevations near the valley bottom in the vicinity of Layered Metamorphic Sequence rocks. Zinc, copper, lead and arsenic values are moderately to strongly coincident within a weakly to moderately anomalous zone some 1500 m along the northwest edge of the grid. Peak values for copper and zinc coincide with the mineral occurrence previously discovered by J. Dodge in this area. The anomaly extends off the existing grid both northeast and southwest toward the valley floor. Molybdenum values in this area are weakly to moderately anomalous but only weakly coincident with the elements mentioned above.

Moderately to strongly anomalous lead and zinc values locally form spot highs within the overlying greenstones. Molybdenum response is weak with occasional values exceeding moderate thresholds. Silver, antimony and gold are subdued everywhere on the grid while manganese response is weak to moderate in most areas. All selected samples analyzed for gold returned values below the detection limit.

Grid 2

Samples locations are shown on Figure 27 while results for nine indicator elements are plotted on Figure 28 to 36.

Two anomalies, best defined by zinc response, are located over the central and west areas of the grid. The anomaly to the west outlines a north-trending moderately anomalous zone of zinc and lead response coupled with weakly anomalous copper values over a strike length of 1600 m. This zone is open along strike and to the west. The central anomaly is a parallel zone located 700 m to the east. Moderately anomalous zinc response extends some 1500 m diagonally across the grid with widths varying from 150 to 600 m. Strongly coincident lead and copper values are confined within a 600 by 200 m area of the main zinc anomaly.

Molybdenum and manganese are weakly anomalous over most of the grid while antimony response is dominantly constrained to the southeast section. Silver, arsenic and gold values are subdued everywhere on the grid.

DISCUSSION AND CONCLUSIONS

The Goal Net property is largely underlain by favourable rocks of the Layered Metamorphic Sequence which hosts the Kudz Ze Kayah and Wolverine Deposits. Strong multi-element geochemical anomalies were obtained from three separate grids on the property. Anomalies over the Net grids coincide with previous and newly discovered stratabound mineralization, float specimens of which returned up to 5.98% zinc, 1.55% lead, 83 g/t silver and 0.86 g/t gold.

Expatriate has scheduled a helicopter-borne geophysical survey to commence in late February which will include the entire Goal Net property. This will be carried out in conjunction with a ground geophysical survey (magnetic and Maxmin) over the Net Grid 1 anomaly between February and April. Pending favourable results, detailed prospecting followed by a 500 m diamond drill program consisting of three or four holes should be carried out to test coincident geochemical and geophysical anomalies.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

AUTHOR'S STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

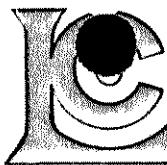

I, William A. Wengzynowski, geological engineer, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Vancouver, British Columbia, do hereby certify that:

1. I graduated from the University of British Columbia in 1993 with a B.A.Sc. in geological engineering, option 1, mineral and fuel exploration.
2. From 1983 to present, I have been actively engaged in mineral exploration in the Yukon Territory and am presently employed with Archer, Cathro & Associates (1981) Limited.
3. I have personally participated in and supervised the field work reported herein.

W.A. Wengzynowski, B.A.Sc.

9. CHARGES

- 9.1 Fixed mobilization/demobilization cost to the camp \$20,000.00
- 9.2 Estimated survey costs for each property, quoted by property name are given in Table II below:

Table II: Estimated Survey Costs for Each Property

Area Name	Total Number of Line Kilometres (km)	Total Estimated Charges per Property* (\$)	Estimated Fuel Requirements by Property (drums)
Shutout	135	10,665	6
Hattrick	415	32,785	17
Slap Shot	410	32,390	17
League	145	11,455	6
Goal Net	625	49,375	26
Totals	1,730	136,670	72

* The total estimated charges per property are calculated using a line kilometre rate of \$79.00/line kilometre.

- 9.3 Survey charges including all helicopter charges (excluding fuel) and the acquisition and presentation of Electromagnetic and Magnetic data as described in Appendix "B" for a minimum of approximately

1,730 line kilometres @ \$79.00/line km \$136,670.00

NOTE:

- 1) **Expatriate will provide room, board and aviation fuel for the field operations from a base camp located at the Finlayson Lake airstrip. This will consist of two motor homes, a 14' x 16' wall tent with oil stove for spares and equipment and a minimum 5 KVA gasoline generator to heat the aircraft.**

**10. PAYMENT SCHEDULE**

10.1 Upon Signing of Contract	\$78,335.00
10.2 Upon Completion of Flying	\$39,167.50
10.3 Upon Delivery of Final Report	Balance

Data Processing and report costs are due upon submission and acceptance of the final report and products. Terms of payment will be net 30 days.

Any applicable GST will be charged in addition to the above prices. **Aerodat's** Registration Number for GST is R 100067024, which will be quoted on all the invoices.

Dated this 26th day of October, 1995.
