1.0 SUMMARY

This report describes the results of the 2010 soil sampling program undertaken by Equity Exploration Consultants Ltd. on the Yukon Gold property between the dates of September 16 – 23, 2010, and is based in large part upon the description by Perk (2009) of the 2009 exploration program on the same property. The Yukon Gold property lies immediately across the Yukon River from the White Gold property of Underworld Resources, and is underlain by similar rocks, suggesting the potential for a similar deposit. The Yukon Gold property is composed of over 200 km² of quartz claims held by six companies, situated in generally rolling hills with sparse vegetation. Access to the property was by helicopter based out of Dawson City for the duration of this program.

A 2009 ridge-and-spur soil sampling program identified several promising geochemical anomalies on the property. Previous to this work, there had been very little exploration done on the property. The 2009 program also validated regional geologic mapping which had shown the area to be largely underlain by pre- to late Devonian metamorphic rocks of the Nasina assemblage. The purpose of the 2010 program was to provide more information about these known anomalies and to potentially identify new zones of interest in previously un-sampled areas of the property.

435 soil samples were collected at 100 metre spacing along contour lines and ridge tops in 2010. Geochemical analysis of these samples confirms the existence of, and expands the scope of, two anomalous areas identified by the 2009 program. Two new areas of elevated Au-As concentrations were also identified. No detailed grid soil sampling or geologic mapping was conducted over the areas of interest; it is recommended that such work be undertaken as the next step in assessing the resource potential of the Yukon Gold property.

2.0 INTRODUCTION

Equity Exploration Consultants Ltd. (“Equity”) was contracted to carry out a soil sampling program on the Yukon Gold group of claims during September of 2010 by the group of companies consisting of Habanero Resources Inc., Brookemont Capital Corp., RockBridge Resources Inc., Encore Renaissance Resource Corp. and Bolero Resources Corp. The author supervised the collection of field samples and performed the data compilation and analysis requested by the above-detailed group of companies. The literature used in compiling this report consisted of assessment reports filed with the Yukon Ministry of Energy, Mines and Resources, government reports and maps, as well as the assessment report compiled by Neil Perk of Equity detailing the 2009 exploration program (Perk, 2009). The author worked on the Yukon Gold claim block during the 2010 soil sampling program and has first-hand knowledge of the property.

3.0 RELIANCE ON OTHER EXPERTS

The author has relied heavily upon the 2009 assessment report of work on the same claims by Perk (2009) for the records of historical work, property description, tenure information and description of 2009 work presented in this report.

4.0 PROPERTY DESCRIPTION AND LOCATION

The Yukon Gold property lies within the Whitehorse and Dawson Mining Districts, in the North Dawson Range of west-central Yukon, approximately 135 km south of Dawson City (Figure 1). It is centred at 63° 07' north latitude and 139° 39' west longitude.

The property can be accessed by helicopter from Dawson City, and staging areas for supplies can be flown to the Thistle airstrip along Thistle Creek, which lies 10-58 kilometers east of the Yukon Gold property.

Alternatively, several boat operators in Dawson City and a barge operating out of Minto Landing are available for hire to transport supplies to points along the Yukon and/or White River where they can be subsequently mobilized by helicopter to the property.

The topography of the area is characterized by rolling hills typical of the Dawson Ranges, with elevations ranging between 600 and 1250 m. Vegetation is sparse, with lower elevations covered by spruce, birch, aspen, alder and willow, whereas higher elevations have thick moss, grasses and scrub birch. Further south, hills are generally more subdued and more thickly vegetated with spruce on slopes and thick willow and alder in creek valleys. North-facing slopes locally exhibit permafrost, which complicates soil sampling. South-facing slopes are more typically vegetated by deciduous trees such as aspen and birch. Drainage systems vary from well channeled, discrete streams to swamps in broader, flat-bottomed valleys.

The area has a sub-arctic continental climate, with cold winters and cool, wet summers. Exploration can be carried out on the Yukon Gold property from June until October.

5.0 PROPERTY TENURE

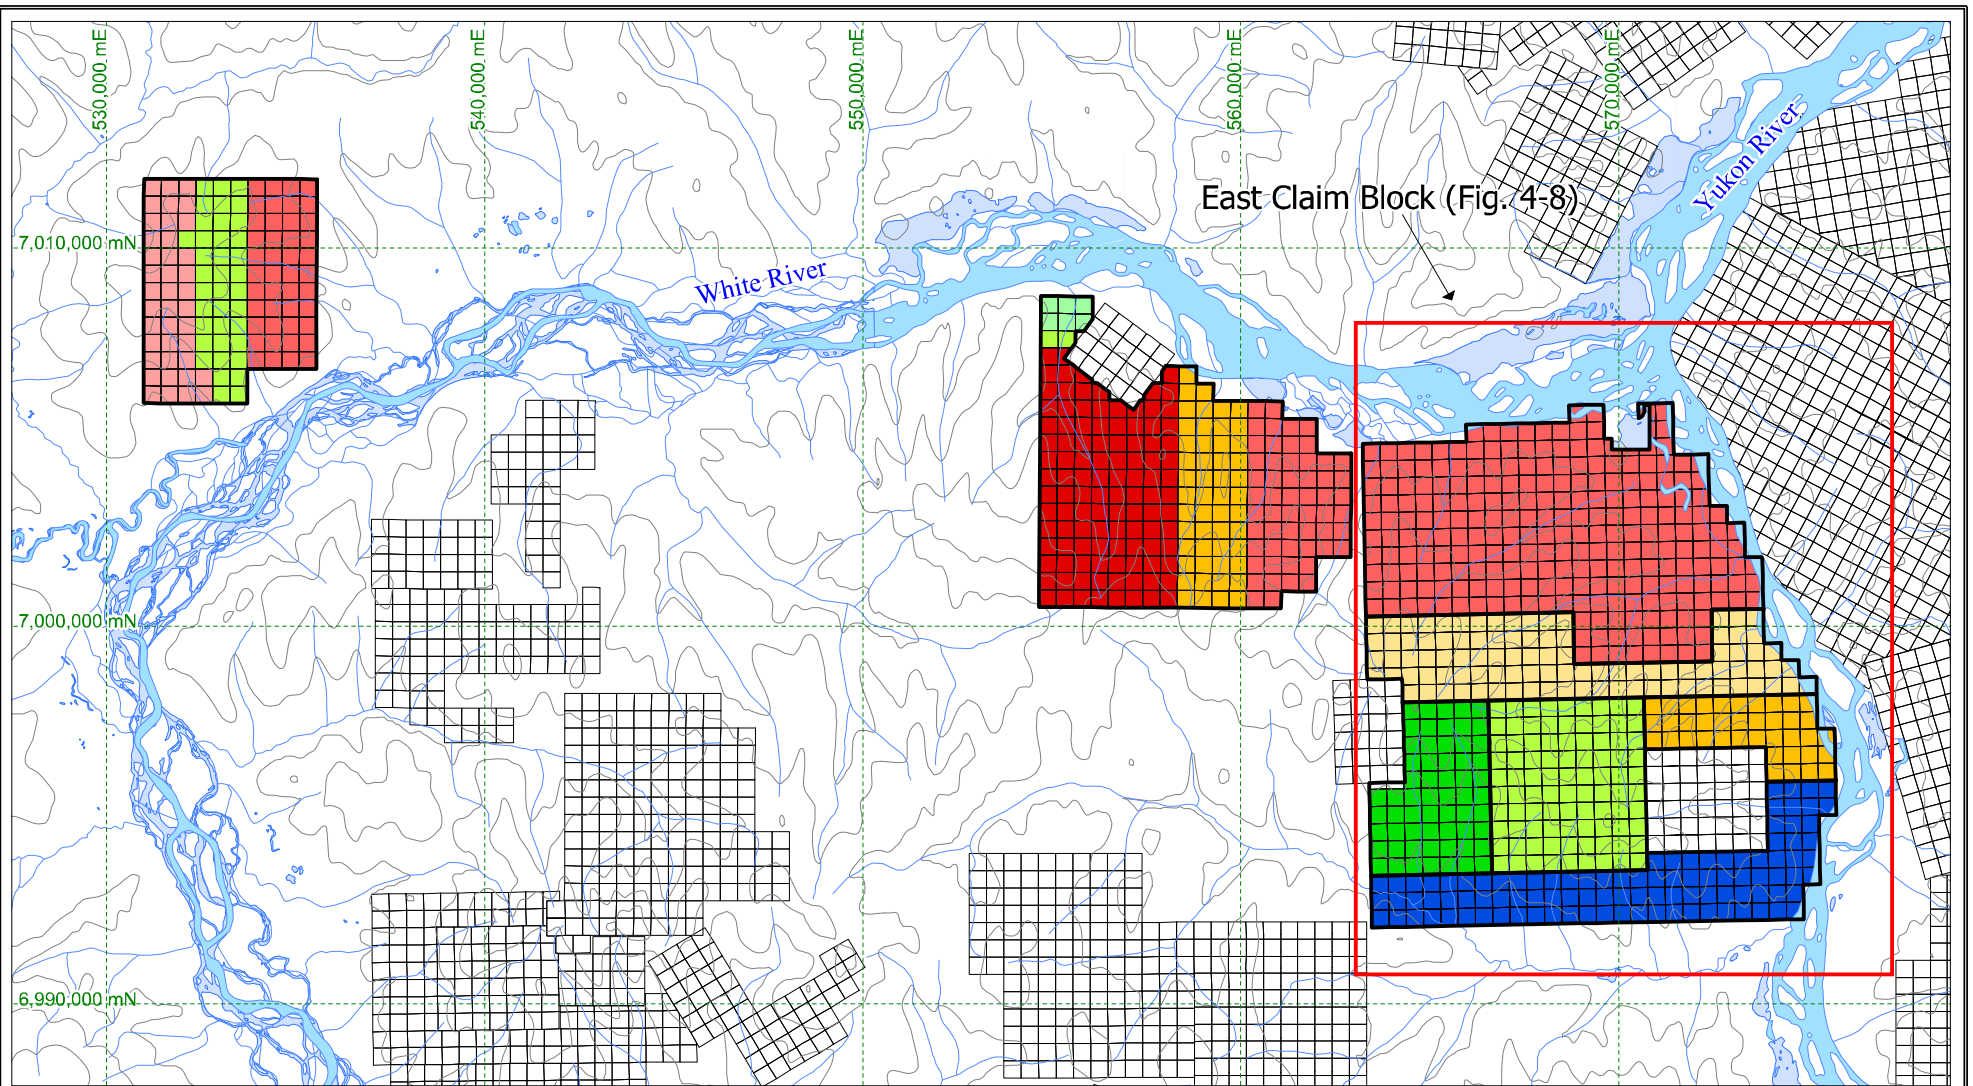

The Yukon Gold property consists of 979 quartz mineral claims covering 205 km² within three separate blocks of contiguous claims, as summarized in Appendix C (Figure 2). The claim boundaries are defined by the locations of claim posts on the ground, which have not been surveyed. Claim ownership information is provided in Appendix C. All exploration work in 2010 was carried out on the eastern block of claims.

Surface rights over the Yukon Gold property are owned by the Yukon Territory. No significant surface disturbance or any major environmental liabilities was noted during the author's field visits. Depending on the nature of the program, exploration permits may be required from the Yukon Department of Energy, Mines and Resources prior to carrying out further exploration on the property.

6.0 HISTORY

Very little is documented about the exploration history in the area of the Yukon Gold property. In 1970, a small sampling program was conducted on the Nick Claims (Findlay, 1970), which were located along the northern edge of the central claim block of the Yukon Gold property. A total of six soil and seven stream silt samples were collected during the program with no significant results noted.

The area came to prominence in 2007 when Underworld Resources Ltd. acquired the White Gold property and defined several gold-bearing showings within a 1.2 x 7.5 kilometre soil geochemical anomaly. Initial trenching and drilling results were encouraging and in May 2009, Underworld announced a drill hole with 104 metres grading 3.4 g/tonne Au. In the ensuing staking rush, the Yukon Gold claims were staked in June 2009 immediately west of Underworld's White Gold property.

Several current and historic placer gold operations occur near the Yukon Gold property including on Thistle and Kirkman creeks.

6.1 2009 Exploration Program

The 2009 exploration program on the Yukon Gold property consisted of soil sampling, prospecting and geologic mapping by Equity Exploration on behalf of several companies. A total of 1178 soil samples were collected and assayed for a broad suite of elements. A full report of the work performed is presented in Perk (2009). The interpretations made in that report formed part of the basis for the planning of the 2010 soil sampling program described in the following sections.

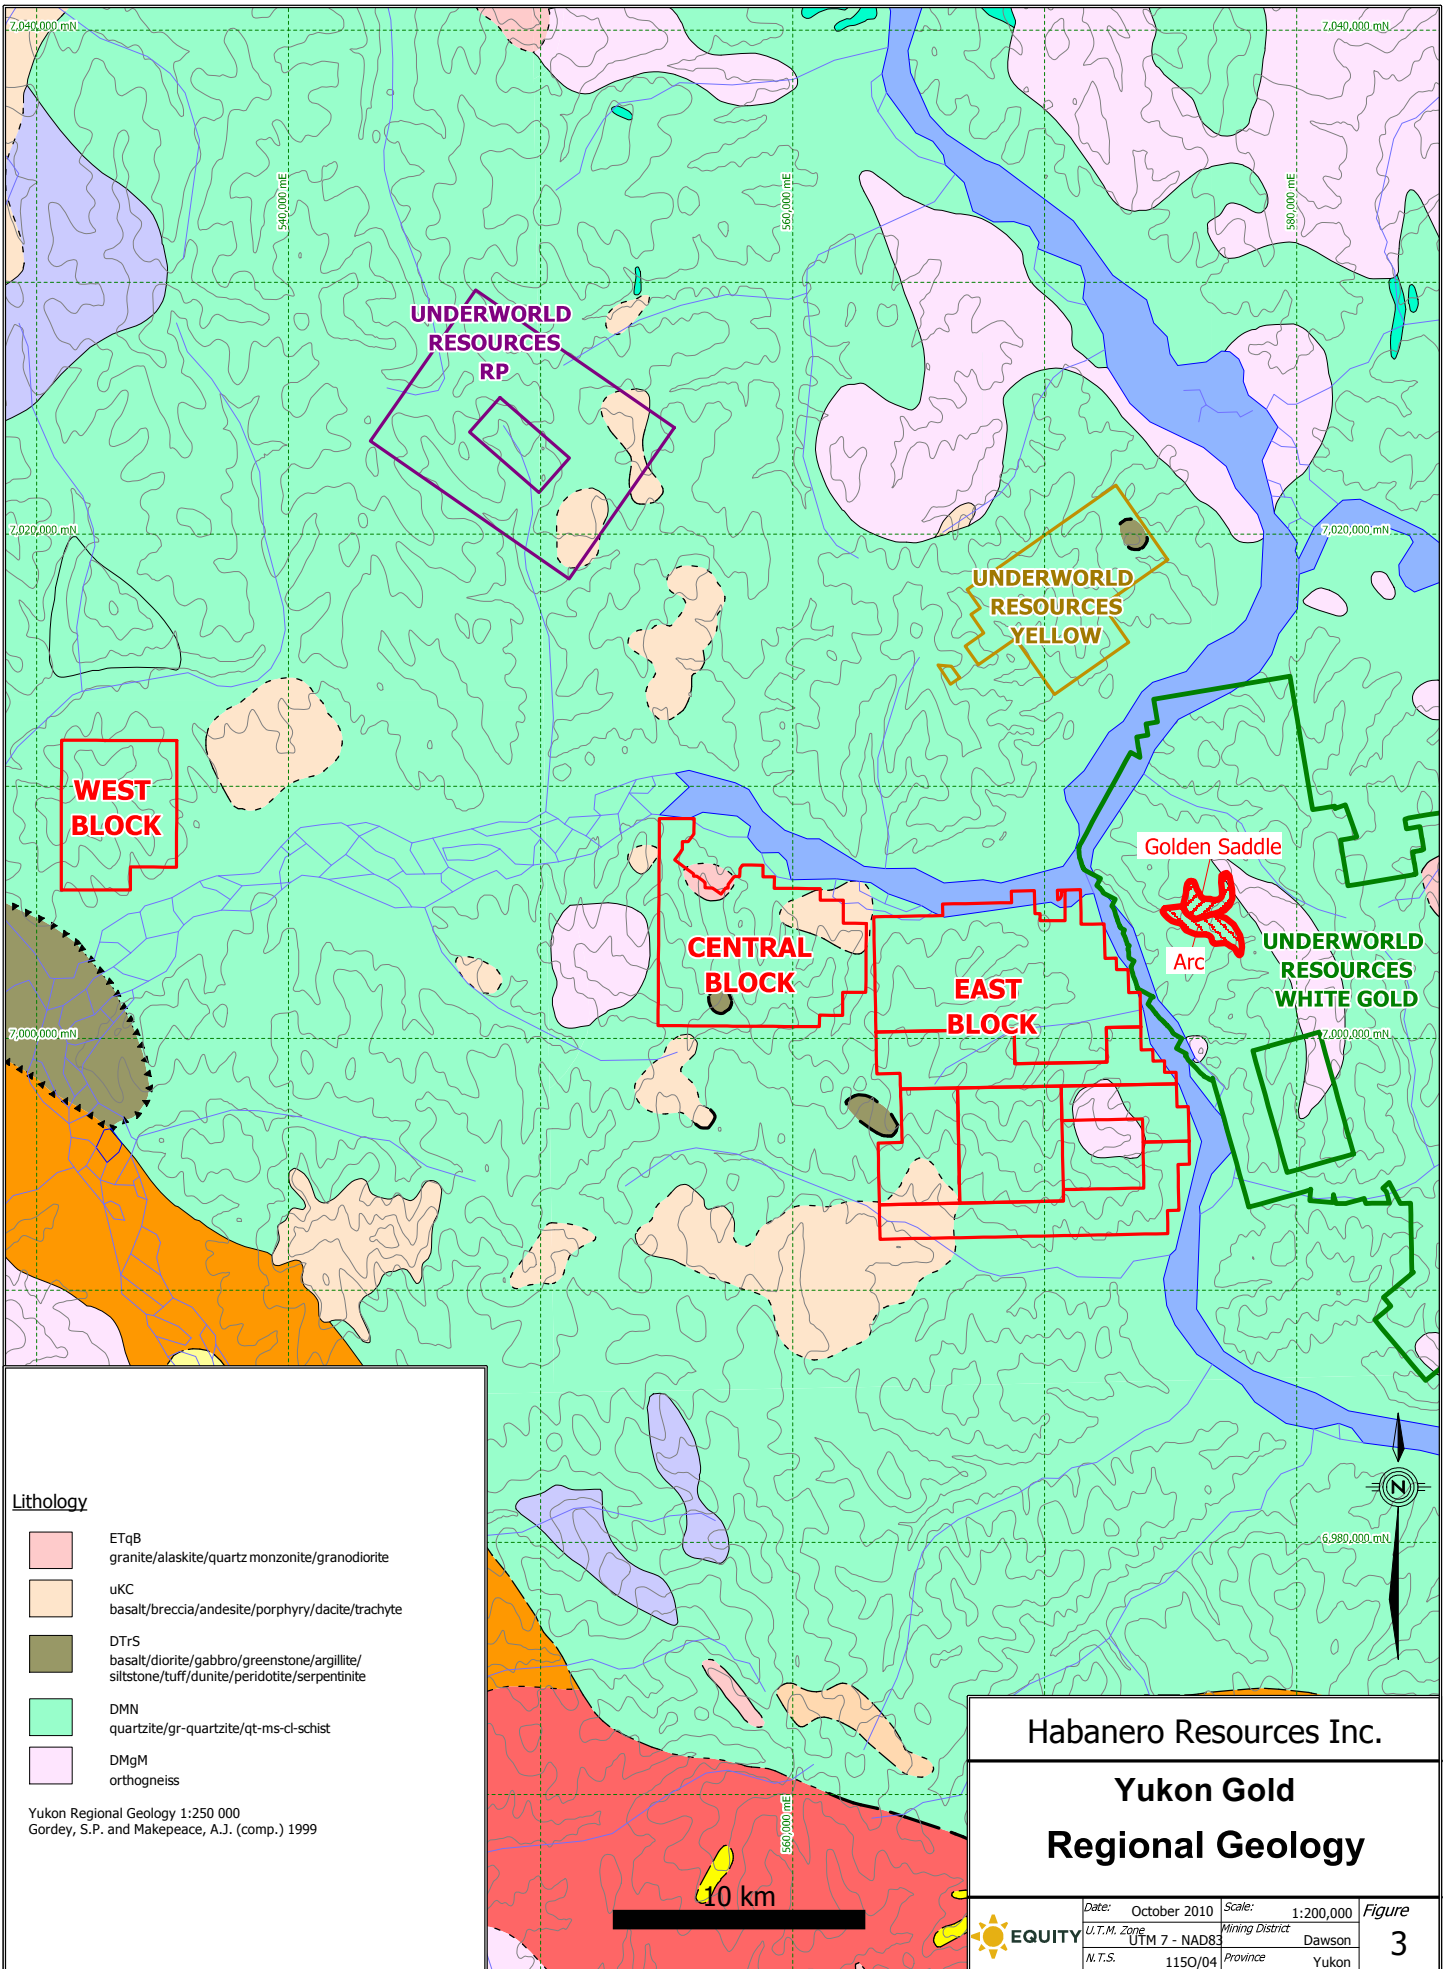

6.2 2010 Soil Sampling Program

The 2010 soil sampling program aimed to continue the reconnaissance-stage assessment of the Yukon Gold property for gold potential that was begun in 2009. Work was restricted to the eastern claim block (Figure 2). The current program sought to enhance data resolution over two of the soil anomalies identified in the 2009 program as well as to achieve coverage of areas of the eastern claim block which had not been previously sampled. Also taken into account when designing the program were the relative financial contributions to the program and quantity of previous work on the claim blocks of each individual company. Samples were taken at 100m spacing along mostly contour and (where appropriate) ridge lines.

The work was based out of Dawson City, with daily transport to and from the site via helicopter. A total of 435 soil samples (including blanks and duplicates) were collected and submitted to ALS Chemex Labs for geochemical analysis. Sample sites were located with a hand-held GPS, and marked in the field by means of flagging tape and tyvex tags with the sample number written on them in permanent marker. Samples were delivered to the ALS Chemex Laboratories preparation facility in Whitehorse, Yukon. The samples were analyzed for gold by fire assay with an Atomic Absorption Spectrometry finish (ALS code Au-AA23) and a multi-element suite by Inductively Coupled Plasma Atomic Emission Spectrometry (ALS code ME-ICP41). Certificates of analysis are presented in Appendix D. Approximately 5% QA/QC samples (in addition to internal QA/QC procedures at ALS Chemex) were collected; results are summarized in Appendix E. Maps and UTM coordinates presented in this report are referenced to the 1983 North American Datum (NAD83), Zone 7.

7.0 REGIONAL GEOLOGY

The Yukon Gold claims are located within the Yukon-Tanana terrane (Figure 3) in west-central Yukon (Colpron et al., 2006), a pericratonic terrane of continental affinity that occupies a position between the ancestral continental margin of North America and outboard accreted terranes. The pericratonic terranes were accreted in the Early Jurassic, while subsequent outboard exotic terranes began accreting in the Early to mid-Cretaceous. At this time, the pericratonic package was intruded by a voluminous, northwest-to southeast-trending plutonic suite, referred to as the Dawson Range plutonic belt by Hart et al. (2004) (Klotassin batholith of Tempelman-Kluit and Wanless, 1975), which lies south of the Yukon Gold property.

Yukon Gold

Regional Geology

EQUITY	Date: October 2010	Scale: 1:200,000	Figure 3
	U.T.M. Zone UTM 7 - NAD83	Mining District Dawson	
	N.T.S. 1150/04	Province Yukon	

Regional-scale geological compilation maps (Gordey and Makepeace, 1999) show that the Yukon Gold claims are underlain by undivided metamorphic rocks of the Nasina sub-terrane that include pre- to late-Devonian rocks of the continental margin. The Nasina Assemblage consists of graphitic quartzite and muscovite quartz rich, \pm chlorite, \pm feldspar augen, schist.

Examples of regional mineralization styles observed on the White Gold property include: quartz veins, hydrothermal breccias and disseminated sulphide targets. The main mineralization style at the Golden Saddle zone is described as quartz, albite, carbonate breccias with low volumes of disseminated pyrite while at the Arc zone mineralization consists of breccias with a matrix of sulphides including pyrite and arsenopyrite. Soil geochemical surveys provide an effective exploration method with Au \pm As \pm Mo \pm Sb useful pathfinder elements.

8.0 PROPERTY GEOLOGY

Minor reconnaissance mapping conducted during the 2009 exploration program confirmed the published regional geology described in section 6.0 and indicated the property is underlain by metamorphic rock units likely belonging to the Nasina Assemblage. These units are dominantly quartz-muscovite and chlorite-muscovite schist. A small unit of unfoliated intermediate volcanic rocks likely belonging to Nisling Range Suite is present in the north central portion of the middle claim block, near the White River (Perk 2009).

9.0 SOIL GEOCHEMISTRY

A total of 435 soil samples (including blanks and duplicates) were taken during the 2010 program. Samples were taken at 100m spacing, mostly along contour lines, though some previously un-sampled ridges and spurs were also sampled. Where permafrost permitted, samples were taken from the B-horizon at depths of 5 – 70 cm. Locations are shown overlain on a tenure map in Figure 4. Analytical percentiles for Au, Ag, As, Sb, Cu, Mo, Pb and Zn, using both 2009 data from the eastern claim block and new data from 2010, are shown in Table 1; Figures 5 – 8 show Au, As, Sb and Mo concentrations grouped by these divisions and plotted by location on a geology map of the property. Note that gold levels are generally low on the entire property, with the 98th percentile of the data falling only slightly higher than three times the lower detection limit. This suggests that gold anomalies alone may not present an accurate picture of anomalous zones on the property. A true anomaly should therefore exhibit not only multiple high gold values but anomalous levels of pathfinder elements as well. Arsenic is the most attractive choice, given its association with other gold deposits in the region (such as White Gold) and relatively high maximum concentrations on the Yukon Gold property. Outlined on the maps (Figs. 5 – 8) are four broadly delineated multi-element soil anomalies, described in more detail below. The present geological mapping does not provide an explanation for the size and/or location of these anomalies.

Table 1: Soil Geochemistry Percentiles

	Au (ppb)	Ag (ppm)	As (ppm)	Sb (ppm)	Cu (ppm)	Mo (ppm)	Pb (ppm)	Zn (ppm)
50th	<5	<0.2	7	<2	20	<1	7	47
75th	<5	0.3	10	<2	33	1	9	64
90th	7	0.5	14	2	49	2	10	95
95th	11	0.6	22	3	62	2	12	122
98th	17	0.8	50	4	80	3	15	157
Max Value	45	2.3	425	13	226	7	28	519
Population	1124	1124	1124	1124	1124	1124	1124	1124

A correlation matrix measuring the co-variance of Au, Ag, As, Sb, Cu, Mo, Pb, and Zn is shown in Table 2. The best correlation is between As and Sb, with moderate degrees of correlation for Zn:Cu, Zn:Sb

and Cu:Sb. None of the elements show even moderate correlation with gold, suggesting that elements which have been used as pathfinders elsewhere in the region (As, Sb and Mo) may not provide useful information in this system. Alternatively, the lack of correlation may be an artefact of the relatively small dataset under consideration or of differential mobility of elements in this geochemical environment.

Table 2: Soil Geochemistry Correlation Matrix

	Au_ppb	Ag_ppm	As_ppm	Sb_ppm	Cu_ppm	Mo_ppm	Pb_ppm	Zn_ppm
Au_ppb								
Ag_ppm	0.23							
As_ppm	0.14	0.18						
Sb_ppm	0.18	0.24	0.63					
Cu_ppm	0.07	0.10	0.16	0.42				
Mo_ppm	0.02	0.19	0.22	0.23	0.26			
Pb_ppm	0.06	0.37	0.34	0.27	0.00	0.17		
Zn_ppm	0.00	0.38	0.26	0.46	0.49	0.38	0.27	

Soil anomaly 3 (Figs. 5 – 8) was originally defined by Perk (2009) and lies mainly on ground controlled by Bolero. The area was the focus of two long contour lines during this year's program, the results of which confirm that there is indeed a significant multi-element anomaly in the area. This southeastern end of the anomaly contains the largest sustained gold anomaly on the property, with values above 10 ppb for over 1 km of contour line and the two highest gold values found during this year's program, at 42 and 45 ppb. The anomaly continues for several kilometres to the northwest, with scattered samples yielding gold values among the highest encountered during the program. Particularly at the eastern end, these are accompanied by elevated As and spotty Sb and Mo values.

Anomaly 4, first identified by Perk (2009) on the western bank of the Yukon River on claims owned by Habanero, was extended considerably by the 2010 sampling to cover an area of 2 km x 1 km. This year's samples show the elevated gold values that Perk (2009) speculated to be present based on the presence of pathfinder elements and proximity to the White Gold deposit across the river. Gold values range up to 39 ppb, with 4 samples in the 98th percentile. In addition, there are significant highs in As (up to 375 ppm with 8 samples above the 98th percentile), Sb and Mo, all of which are thought to be pathfinder elements in a White Gold type system.

Anomaly 5 occurs along the same escarpment as Anomaly 4, further south along the bank of the Yukon River on claims controlled by RockBridge. It is less well defined than anomalies 3 or 4, with anomalous assays scattered over a wide area rather than in a confined zone, making it a slightly less attractive target for future work. Nevertheless, there are several significant highs of Au and Mo, and the entire escarpment shows minor anomalous levels of Au, As, Sb and Mo unevenly distributed over an area of 3 km x 2 km.

Anomaly 6 is a previously undocumented Au-As-Mo high along a short spur in the south-central area of the claim block on ground controlled by Encore. The majority of samples along the line have elevated gold levels though only one sample falls above the 98th percentile, with 23 ppb Au. The most interesting aspect of this 2 km x 1 km anomaly is its elevated molybdenum values; 3 are above the 98th percentile and a further 7 exceed the 90th out of a total of 23.

Table 3 summarizes the most pertinent features of the anomalies described above.

Table 3: Summary of Soil Geochemical Anomalies

Anomaly	Area (km)	Maximum Values				Number of samples >98 th percentile			
		Au (ppb)	As (ppm)	Sb (ppm)	Mo (ppm)	Au	As	Sb	Mo
3	4 x 2	45	425	9	3	14	8	6	1
4	2 x 1	39	375	13	5	4	8	10	7
5	3 x 2	26	66	4	3	3	1	1	3
6	2 x 1	23	50	2	4	1	1	0	3

10.0 INTERPRETATION AND CONCLUSIONS

The Yukon Gold property is situated directly across the Yukon River from the White Gold property of Kinross (formerly Underworld Resources). The claims are underlain by the same quartz-muscovite and chlorite-muscovite schist of the Nasina Assemblage that hosts the deposits on the White Gold property, presenting an attractive exploration target. The 2009 exploration program identified several zones of interest, two of which, located on the eastern block of claims, were followed up with additional soil lines during this year's program. Additional reconnaissance soil lines were also run through previously untested areas.

In addition to confirming the existence of and expanding two previously identified anomalies (3 and 4), the 2010 soil sampling program identified two more multi-element anomalies (5 and 6) which are worthy of further exploration. The levels for Au and Mo used to define anomalies on the Yukon Gold property are not high and the data does not show the level of correlation between Au, As, Sb and Mo that might be expected if these anomalies were the result of a White Gold type system. However, given the significant gold discoveries made in recent years near the Yukon Gold property within similar rocks, these anomalies should not be ignored. Based on the current broad-scale geologic mapping, the structural and/or lithological controls on the presumed mineralization which caused the anomalies are unknown. The two most attractive targets for future work are Anomalies 3 and 4, both of which have large gold/multi-element highs. Grid soil sampling combined with detailed geologic mapping and prospecting over these anomalies is recommended to search for their source mineralization and to evaluate its nature and extent.

Respectfully submitted,

David Swanton

CERTIFICATE WH10136582

Project: HAO10-01
 P.O. No.:
 This report is for 200 Soil samples submitted to our lab in Whitehorse, YT, Canada on 23-SEP-2010.
 The following have access to data associated with this certificate:
 EQUITY ENG E-MAIL MURRAY JONES NEIL PERK

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both
LOG-24	Pulp Login - Rcd w/o Barcode

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: EQUITY EXPLORATION CONSULTANTS LTD.
 ATTN: MURRAY JONES
 SUITE 200, 900 WEST HASTINGS STREET
 VANCOUVER BC V6C 1E5

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS WH10136583

Method	CERTIFICATE COMMENTS
ALL METHODS	NSS is non-sufficient sample.

Appendix E: Quality Control / Quality
Assurance

QUALITY CONTROL / QUALITY ASSURANCE

I Chain of Custody

All samples were packed in rice sacks and sealed with uniquely-numbered non-resealable security straps. Rice sacks were delivered by Equity Exploration personnel to ALS Chemex Laboratories Ltd in Whitehorse, Yukon, an ISO 9001 registered laboratory. ALS Chemex reported that all bags were received in good condition, with all security straps intact, and with no evidence of tampering.

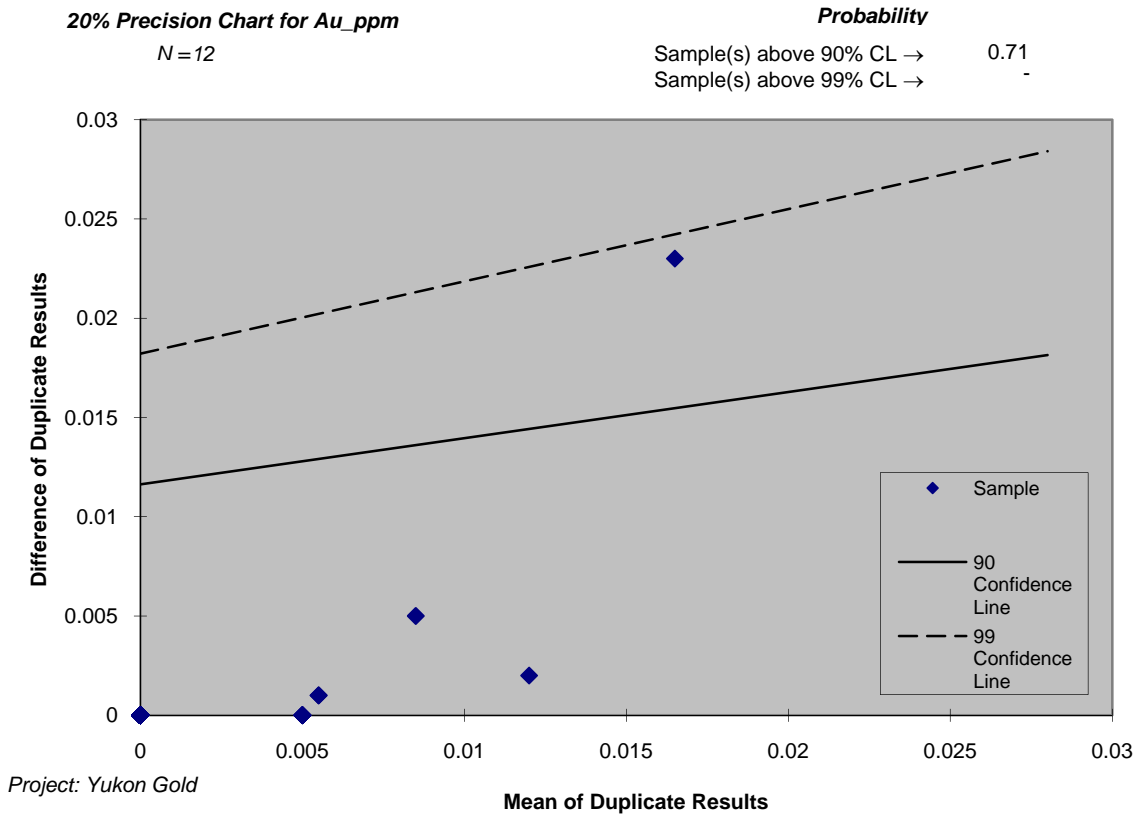

II Blanks

Blanks are samples which are known to be barren of mineralization and are inserted into the sample stream in the field to determine whether contamination has occurred after sample collection. A total of 13 soil blanks were inserted into the sample sequence (approximately every 40th sample) and submitted for analysis. Blank material for the program comprised commercially available silica silt from the same company that supplies ALS Chemex Labs with their blank material. Low analytical values indicate no contamination within the lab and no tampering of the samples.

Sample Number	Au (ppm)	Ag (ppm)	As (ppm)	Cu (ppm)	Mo (ppm)	Ni (ppm)	Pb (ppm)	Sb (ppm)	Zn (ppm)

G0668760	<0.005	<0.2	<2	<1	<1	<1	2	<2	3
G0668776	0.008	<0.2	<2	<1	<1	<1	<2	<2	<2

III Field Duplicate Analysis

Field duplicates are collection and analysis of two separate samples from the same field location. They are used to measure the reproducibility of sampling, which includes both laboratory variation and sample variation. Duplicate samples were collected from 12 sites during the 2010 soil sampling program. Results are generally good, with 20% reproducibility for Au, Ag, As, Mo, Sb, 15% for Zn and 35% for Cu.

The above graph shows an example for the reproducibility of Au with all samples falling below the 99% confidence line for 20% precision.

VI Conclusions

- There is no evidence of tampering with the samples between collection and the laboratory.
- Low analytical values for the blank material submitted indicate no contamination within the lab for soil samples.
- Field duplicate analysis show generally good reproducibility for the elements of interest.
- ALS Chemex carries out their own in-house laboratory QA/QC program, including blanks, duplicates and standards, and ensures that laboratory QA/QC is satisfactory prior to certifying their analyses.

GEOLOGIST'S CERTIFICATE

David Swanton
402-1595 East 6th Ave.
Vancouver, BC, Canada
daves@equityexploration.com

I, David Swanton, do hereby certify that:

- I am a Project Geologist with Equity Exploration Consultants Ltd, with offices at Suite 200-900 West Hastings St., Vancouver, British Columbia.
- I am a graduate of the University of British Columbia (2004) with a Bachelor of Science degree and of Acadia University (2010) with a Master of Science degree in Geology.
- I have been involved in the mineral exploration industry since 2006.
- I supervised the 2010 soil sampling program on the Yukon Gold property and have first-hand field knowledge of said property.

Dated at Vancouver, British Columbia, this 19 day of Nov., 2010.

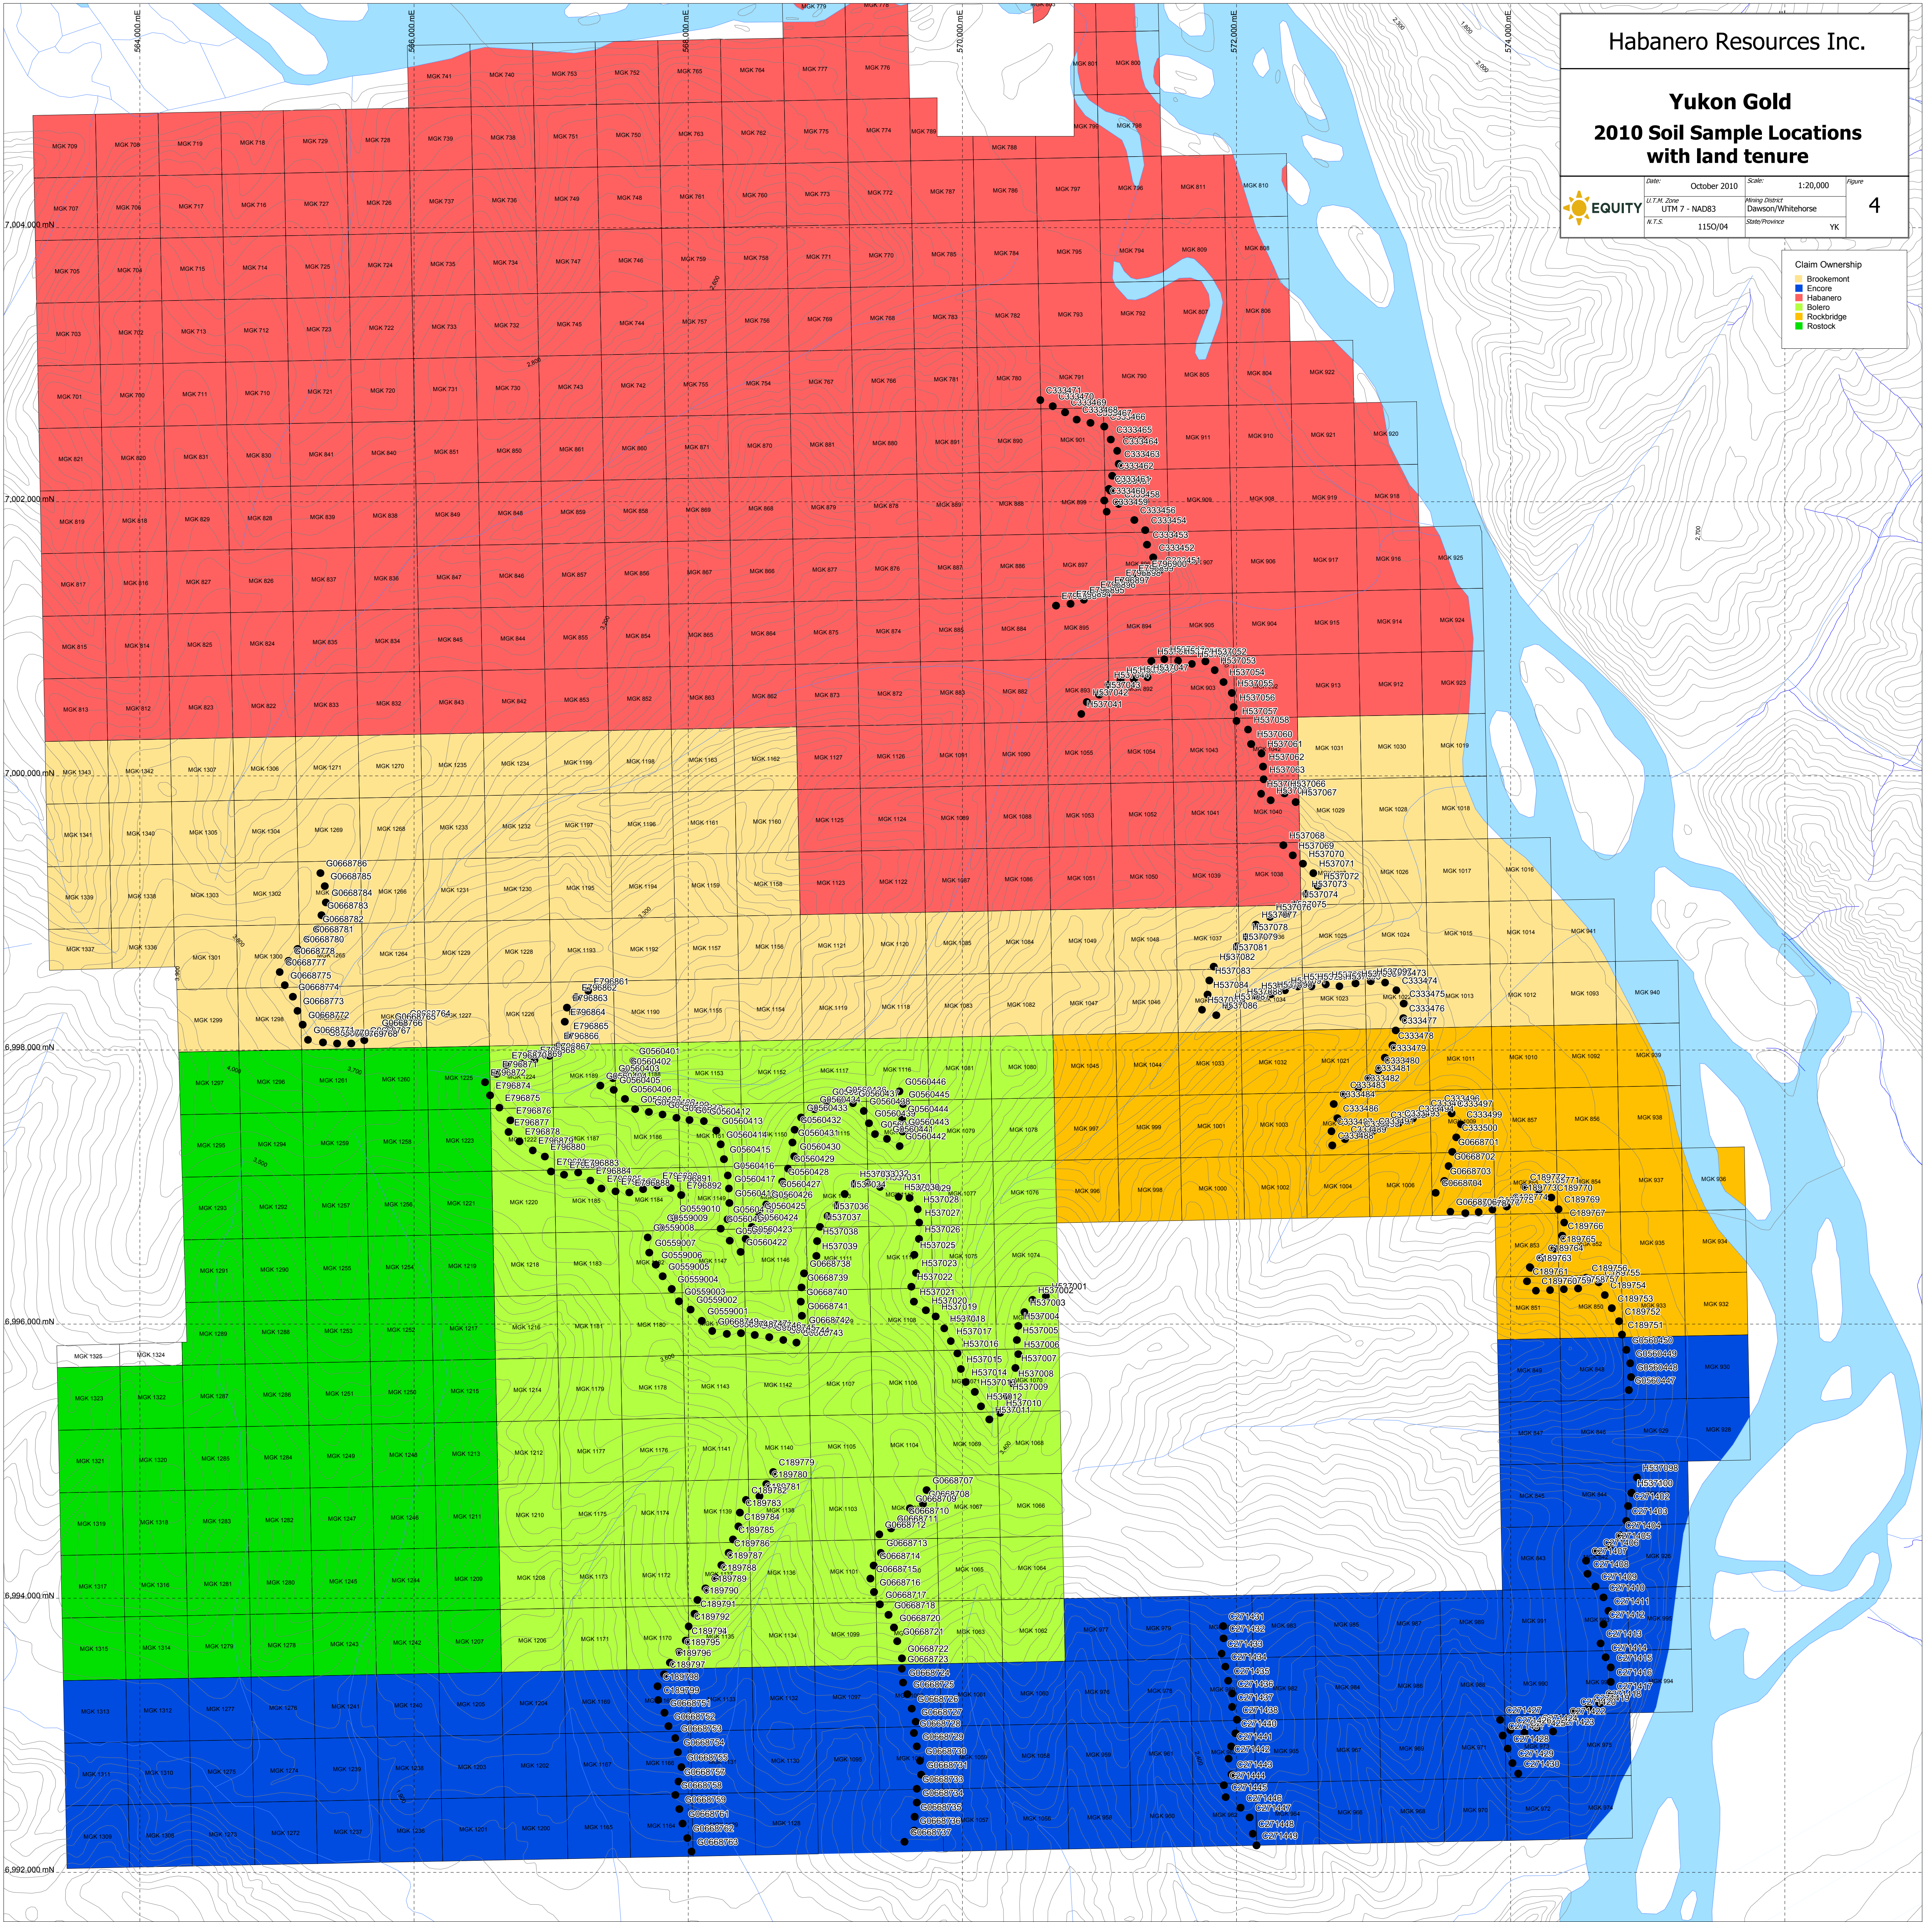

David Swanton, M.Sc.
