Face Property

SUMMARY

The Face property is located approximately 105 kilometers northwest of Dawson City, Yukon and 10 kilometers east of Eagle, Alaska. The Face claims, the subject of this report, consists of 94 (two post) Yukon Quartz claims. An additional 176 Quartz claims (Hood 1 - 176) were staked the fall of 2011 to the south and west of the Face claims to cover anomalous drainages identified by stream sediment geochemistry. Together the 270 contiguous Face and Hood claims make up the Face property and collectively cover an area of approximately 5630 hectares (2278 acres). The property is owned 100% by Radius Gold Inc.

Access to the property can be gained by helicopter based out of Dawson City. The nearest road is in Eagle, Alaska and the nearest road in Canada is at Clinton Creek approximately 25 kilometers to the south and it is passable by 2WD vehicles during the summer months.

Most of the Face property is underlain by Ordovician to Lower Devonian shale, argillite, chert, siltstone, limestone and conglomerate correlated with the Road River Group. An easterly trending fault in the Eagle Creek valley juxtaposes the above rocks against an approximate 3 km by 1 km sliver of Upper Cambrian to Lower Devonian dolostone, shale, limestone, and conglomerate. To the south siliciclastics of the Hyland Group are separated from the possible Road River Group by the easterly trending Coal Creek Fault. The Coal Creek Fault is sub-parallel to the Dawson Thrust Fault, a bounding fault to the Rackla Gold Belt located approximately 300 km to the ESE. The Coal Creek and other faults juxtapose units and provide possible fluid conduits for a possible hydrothermal system(s) as indicated by the anomalous stream sediment and soil samples.

A total of six rock samples, 31 stream sediment samples and 153 soil samples were collected in 2011. Results from the rock samples returned less than 4 ppb gold and 0.5 ppm silver. Soil and stream sediment samples contained anomalous values for gold (>12.5 ppb, up to 52 ppb) and silver (>500 ppb, up to 4161 ppb) and a number of other elements including molybdenum, copper, lead, zinc, nickel, antimony, mercury and arsenic. The poorly constrained soil sample anomaly indicates there is an east - west trending anomaly about 4 kilometers long and up to one kilometer wide. Several of the stream sediment samples contained anomalies similar to the soil samples and when taken in conjunction with the Geological Survey of Canada's regional geochemical survey, defines a regionally anomalous area that includes the Face property.

No mineralization was found on the property in 2011 but based on the geochemical results and geological setting a number of deposit types are possible including base metal stratiform, precious and base metal stratabound replacement and vein type deposits.

Proposed work consists of additional geochemical rock, soil and stream sediment surveys, geological mapping, prospecting and an airborne magnetic and radiometric survey. Anomalous areas should be tested by trenching, if possible, followed by diamond drilling if results are encouraging.

1.0 INTRODUCTION

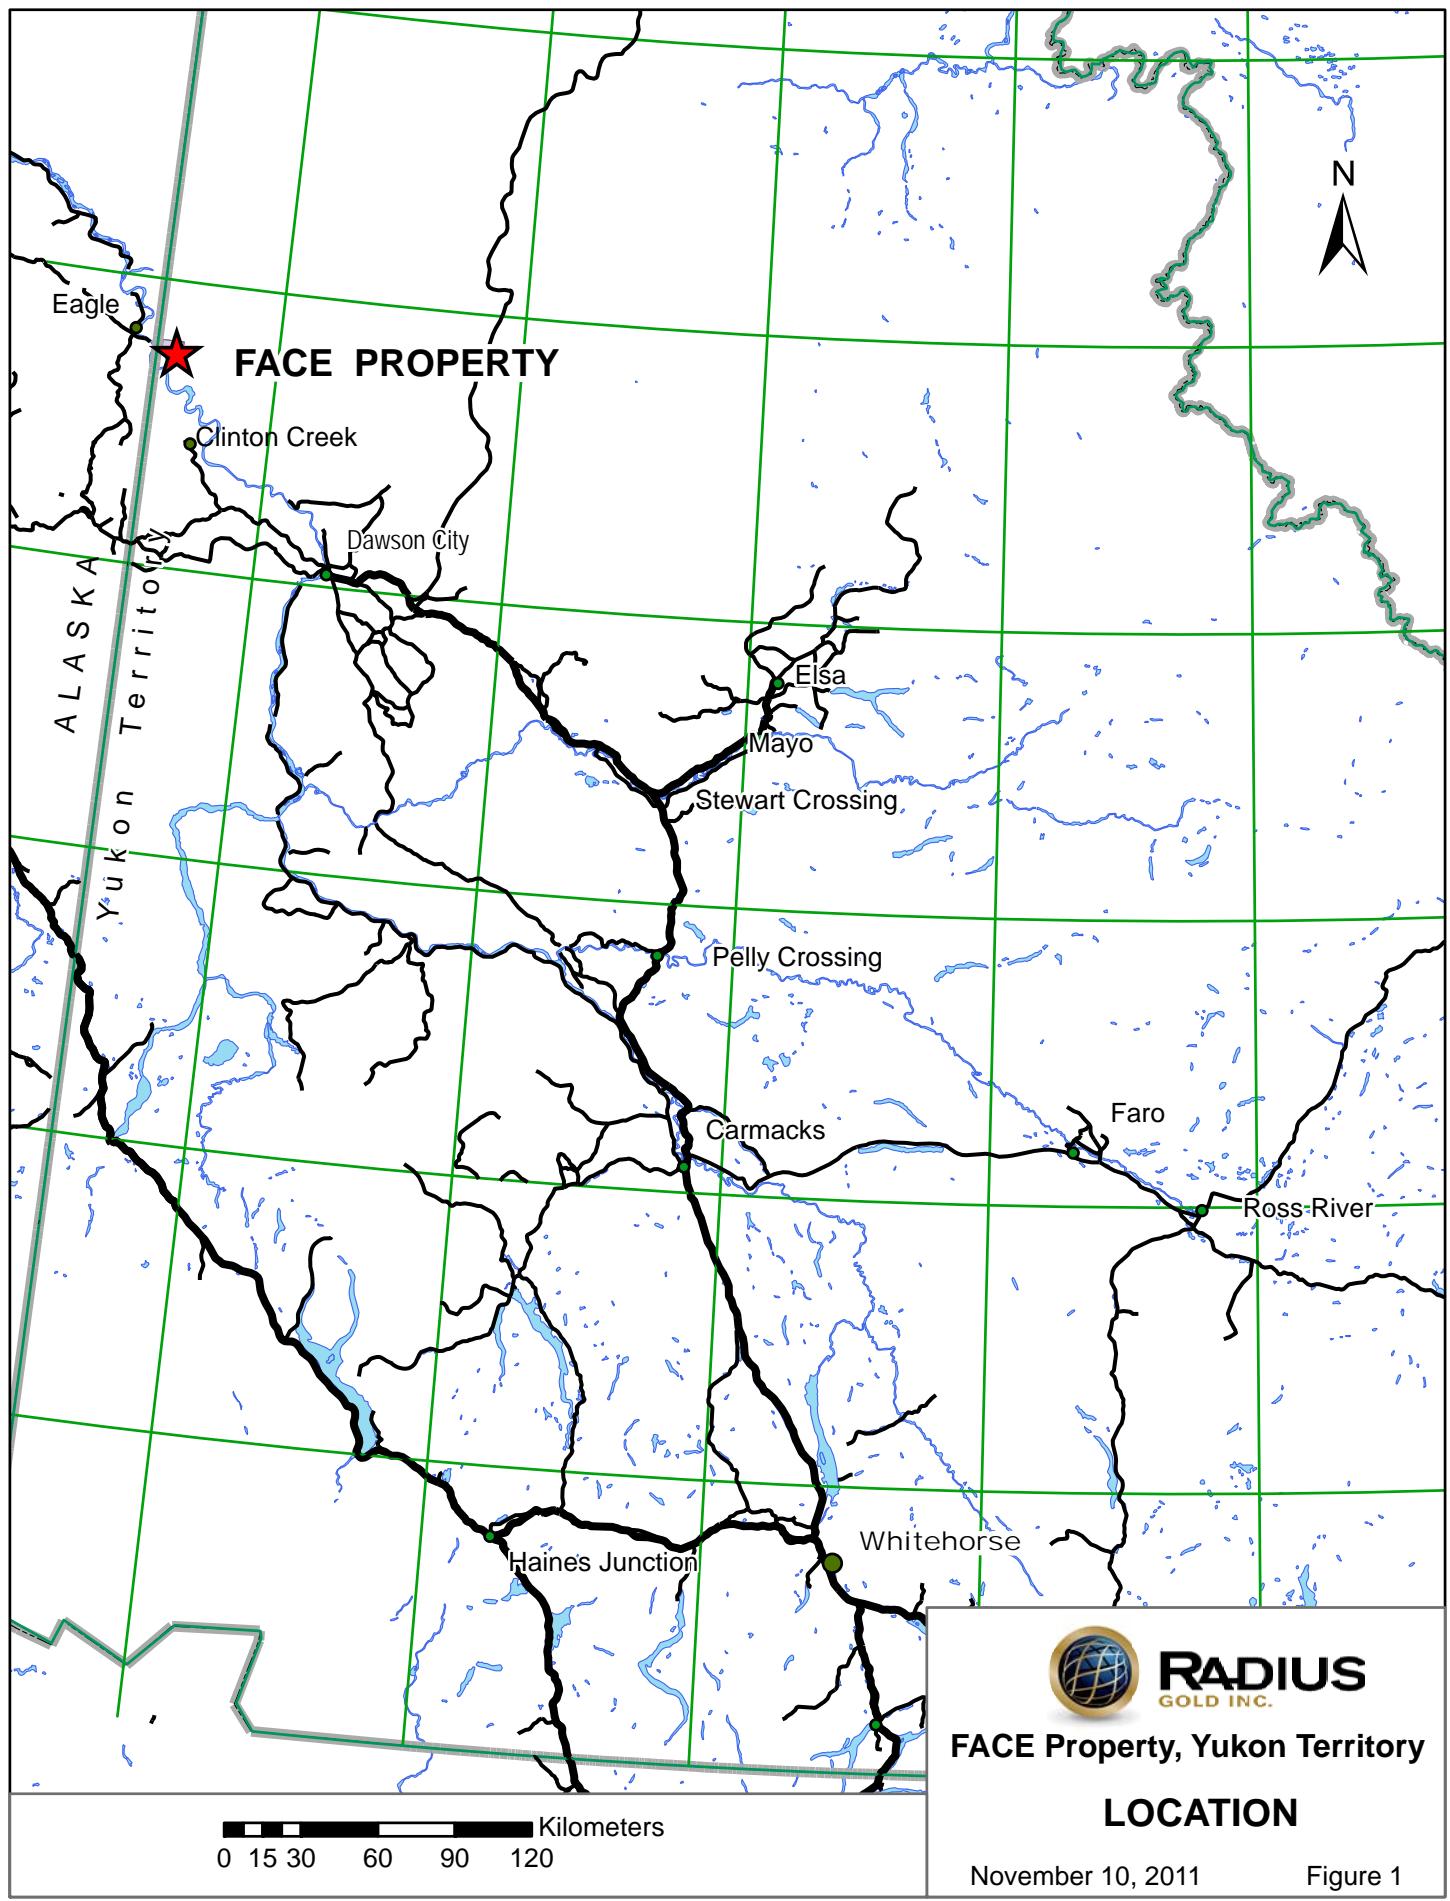

The purpose of this report on the Face 1 – 94 claims is to describe the 2011 work program and the results to fulfill Yukon assessment requirements. Work in July 2011 consisted of reconnaissance rock, stream sediment and soil sampling. Upon receipt of the anomalous geochemical results an additional 176 claims (Hood 1 – 176) were staked in September 2011. As of November 10, 2011 no work has taken place on the Hood claims. The report also describes the location, access, history and geological setting of the Face 1-94 claims and outlines a proposed exploration program to further explore the property for gold-silver and base metals.

1.1 Location and Access

The Face property is located approximately 105 kilometers northwest of Dawson City, Yukon and 10 kilometers east of Eagle, Alaska. The claims are located in the Dawson Mining District and cover a portion of the high ground north of the Yukon River to the easterly flowing Eagle Creek. The combined Face and Hood claims, collectively known as the Face Property, are located on map sheet NTS 116C/10 and 116C/15 (Figure 1).

Access to the property can be gained by helicopter based out of Dawson City. The nearest road is in Eagle, Alaska and the nearest road in Canada is the road to Clinton Creek, approximately 25 kilometers to the south. The Clinton Creek Road is passable by 2WD vehicles during the summer months. The Clinton Creek Road is posted and turns north off the Top of the World Highway (Hwy 11) at approximately kilometer 65.

Scheduled plane service can be gained in Dawson City to Whitehorse, where there is daily jet airplane service to Vancouver, British Columbia and other points south.

1.2 Topography, Vegetation and Climate

Topography in the region is typical of an incised peneplain with steep hillsides and rounded crests. The area was beyond the limits of the last two continental glacial events and minor evidence of glaciations in the region is a result of localized alpine glaciers. Alluvium in the valleys is mostly locally derived. Hillsides are covered with a veneer of colluvium also locally derived. Elevation ranges from a low of 300 meters in the Eagle Creek valley to approximately 950 meters on nearby ridges. In the valley bottom permafrost is not a consideration except near the well vegetated hillsides. On the hillsides and ridge spurs, particularly northerly facing slopes and poorly drained areas, permafrost (often as frozen black muck) is a serious hindrance to exploration.

Aside from some overgrown bulldozer tracks in Eagle Creek there is no evidence of roads, trails, trenches, test pits, etc., on the property.

Rock outcrop in the area is restricted to ridges, small cliffs and creek bottoms.

Vegetation in the valley bottoms consists of alder, dwarf birch, balsam fir, white and black spruce. Ground cover in areas of thin tree cover consists of alpine plants, 'buckbrush' (alder), dwarf willow and moss. Hillsides and ridges are covered with pine, spruce, birch and poplar on well drained slopes and stunted black spruce in areas of permafrost. Treeline is at approximately 4,000 feet. Vegetation is generally more abundant on east and south facing slopes and much of the vegetation has been burnt in a recent forest fire

Climate is characterized by low precipitation and a wide temperature range. Winters are cold and temperatures of -30°C to -45°C are common. Summers are moderately cool with daily highs of 10°C to 25°C . Thunders showers are a common occurrence. Smoke from forest fires can be thick at certain times. The seasonal window for prospecting is from June to mid September.

1.3 History

The area has presumably been explored for its placer gold potential as the property is located north of the historic Fortymile placer district, and most of the property is within 20 kilometers of Eagle, Alaska. The Yukon River, historically an important transportation route, is located less than 12 kilometers from the property. However no evidence of placer workings was seen on the property in 2011.

Along with the placer activity, lode prospecting of the district likely occurred during the same time period. Two Minfile occurrences, grouped under one description, Minfile 116C 149, are classified as unknown (Yukon MINFILE, 2011). Previous work consists of the staking of quartz claims by Dawson Eldorado Gold Exploration Ltd. with no further work being recorded.

The Face claim block fully surrounds 4 claims, Eye 1-4, staked in 2010 and held by Tarsis Resources Ltd. The Eye 1-4 claims and four other properties in the area constitute Tarsis's Dawson Gold project, where Tarsis "is exploring for carbonate hosted gold occurrences that are blind to surface, similar to that discovered by ATAC Resources Ltd. at its Rau project" (Tarsis Resources Ltd., 2011). In the same news release the company states, "The Company plans to carry out additional soil sampling and prospecting at its Dawson Gold project during 2011. Initial results from 2010 were generally below the Company's expectations; however, post-season review of trace element geochemistry has provided further insight and direction for future exploration."

Radius staked the Face 1-94 claims in September 2010 as a priority target after tracing the Dawson Thrust west from the Rau and Osisris gold discoveries where mineralization is hosted in limestones in close proximity to the Dawson Thrust (Yukon Geology Survey, 2011). Radius staked the adjoining Hood 1-176 claims in September 2011 following receipt of the encouraging geochemical results that are described in this report.

1.4 2011 Work Program

The 2011 geochemical exploration program was carried out by Casselman Geological Services Ltd. A five person field crew ably directed by Crew Chief Laurant Brault and including Radius employee Chris McKnight, geologist in training, was mobilized from Whitehorse on July 6th, 2011. The crew flew by helicopter to the Face property from a staging area on the road Clinton Creek Road and set up camp. From July 8th - 13th, 2011 the crew collected soil, rock and stream sediment samples for geochemical analysis and also did some prospecting. Soil sampling was consisted mostly of sampling ridges and spurs with a nominal spacing of 100 m between samples. The crew demobilized on July 14 and 15, 2011.

Following receipt of the encouraging geochemical results Radius contracted Casselman Geological Services Ltd. to stake the Hood 1-176 claims in September 2011. The Hood claims were staked primarily south of the Face claims to cover the headwaters of creeks that had anomalous geochemical stream sediment sample geochemical results.

Hand-held GPS receivers (Garmin GPSmap 60CSx) were used to plot locations of rock, stream sediment and soil samples, claim posts and other features (approximate +/-5m accuracy). Soil samples were shipped to Acme Analytical Laboratories (Vancouver) Ltd. preparation laboratory in Whitehorse and prepared pulps were analyzed for gold and 52 other elements in their Vancouver laboratory.

1.5 Claim Status

The Face property, consisting of 270 unsurveyed contiguous two-post Yukon 'Quartz' claims (Face 1-94 and Hood 1-176 claims) cover an area of approximately 5640 hectares (Figure 2). The claims were staked according to the Yukon Quartz Mining Act and are located in the Dawson Mining District. They are shown on claim sheet 116C/10 and 116C/15 and are available for viewing at the Dawson Mining Recorders Office. The claims listed below (Table 1) are registered in the name of Radius Gold Inc. and are owned one hundred percent by the company.

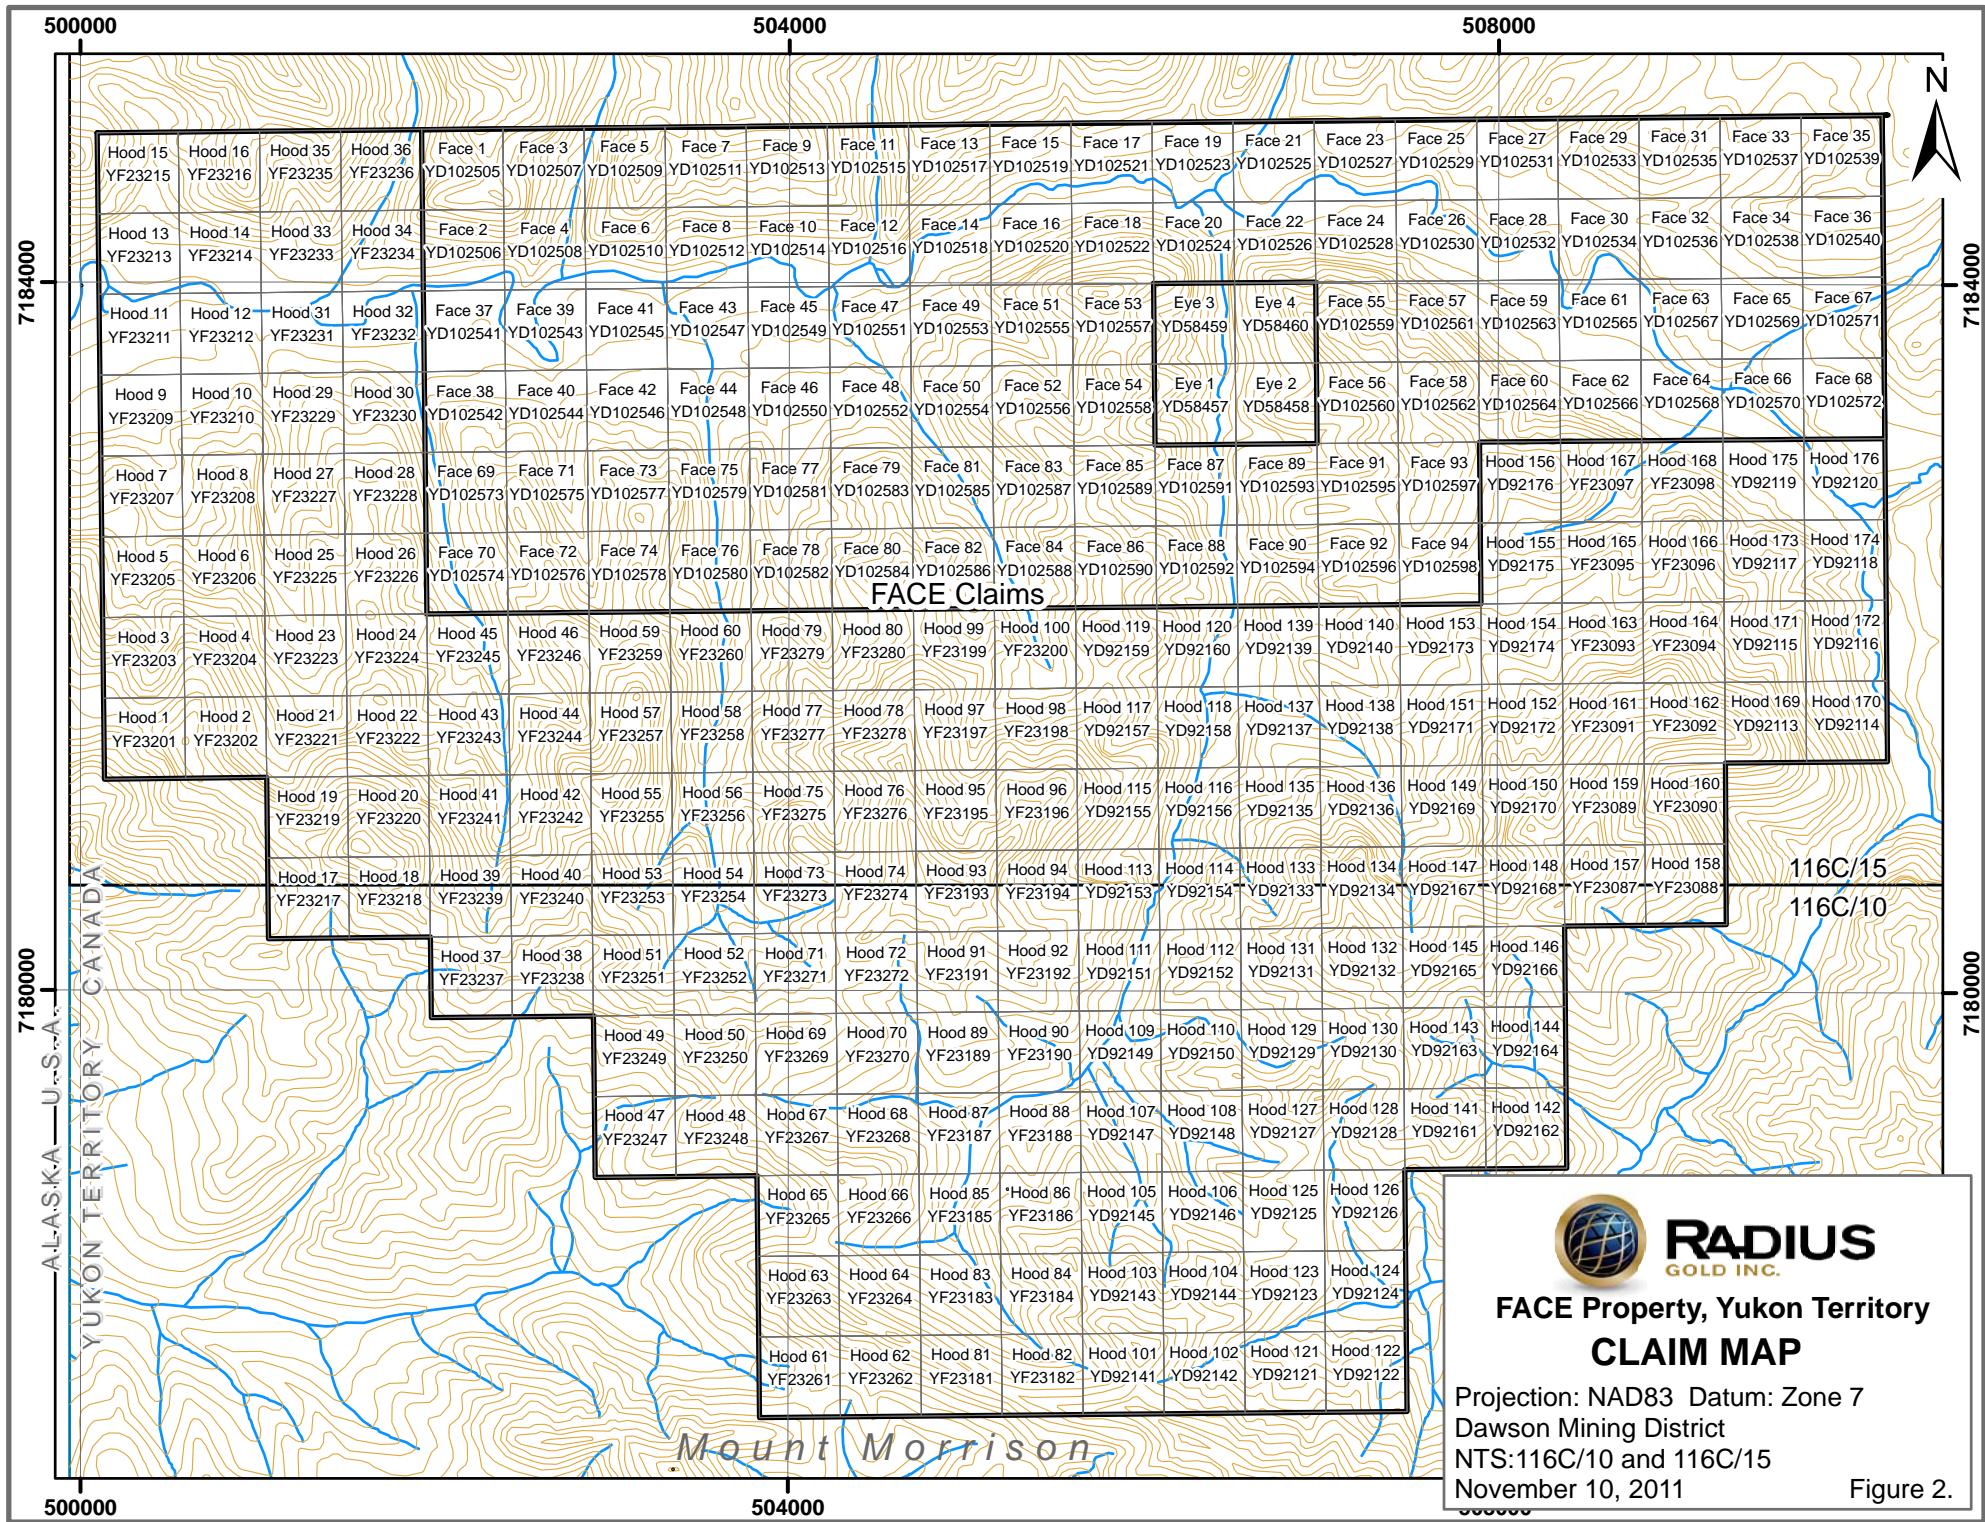

The Face 1-94 were staked in September 2010 and the Hood 1-176 in September 2011.

Table 1. List of Claims

Claim Name	Grant Number	Expiry Date
Face 1 - 94	YD102505 - YD102598	March 27, 2016*
Hood 1 - 80	YF23201 - YF23280	September 12, 2012
Hood 81 - 100	YF23181 - YF23200	September 12, 2012
Hood 101 - 120	YD92141 - YD92160	September 12, 2012
Hood 121 - 140	YD92121 - YD92140	September 12, 2012
Hood 141 - 156	YD92161 - YD92176	September 12, 2012
Hood 157 - 168	YF23087 - YF23098	September 12, 2012
Hood 169 - 176	YD92113 - YD92120	September 12, 2012

*Subject to acceptance of this report.

The claims shown on Figure 2 are plotted as per coordinates obtained by a GPS receiver (Garmin GPSmap 60CSx) with an estimated +/- 5 m accuracy.

2.0 REGIONAL GEOLOGY AND MINERALIZATION

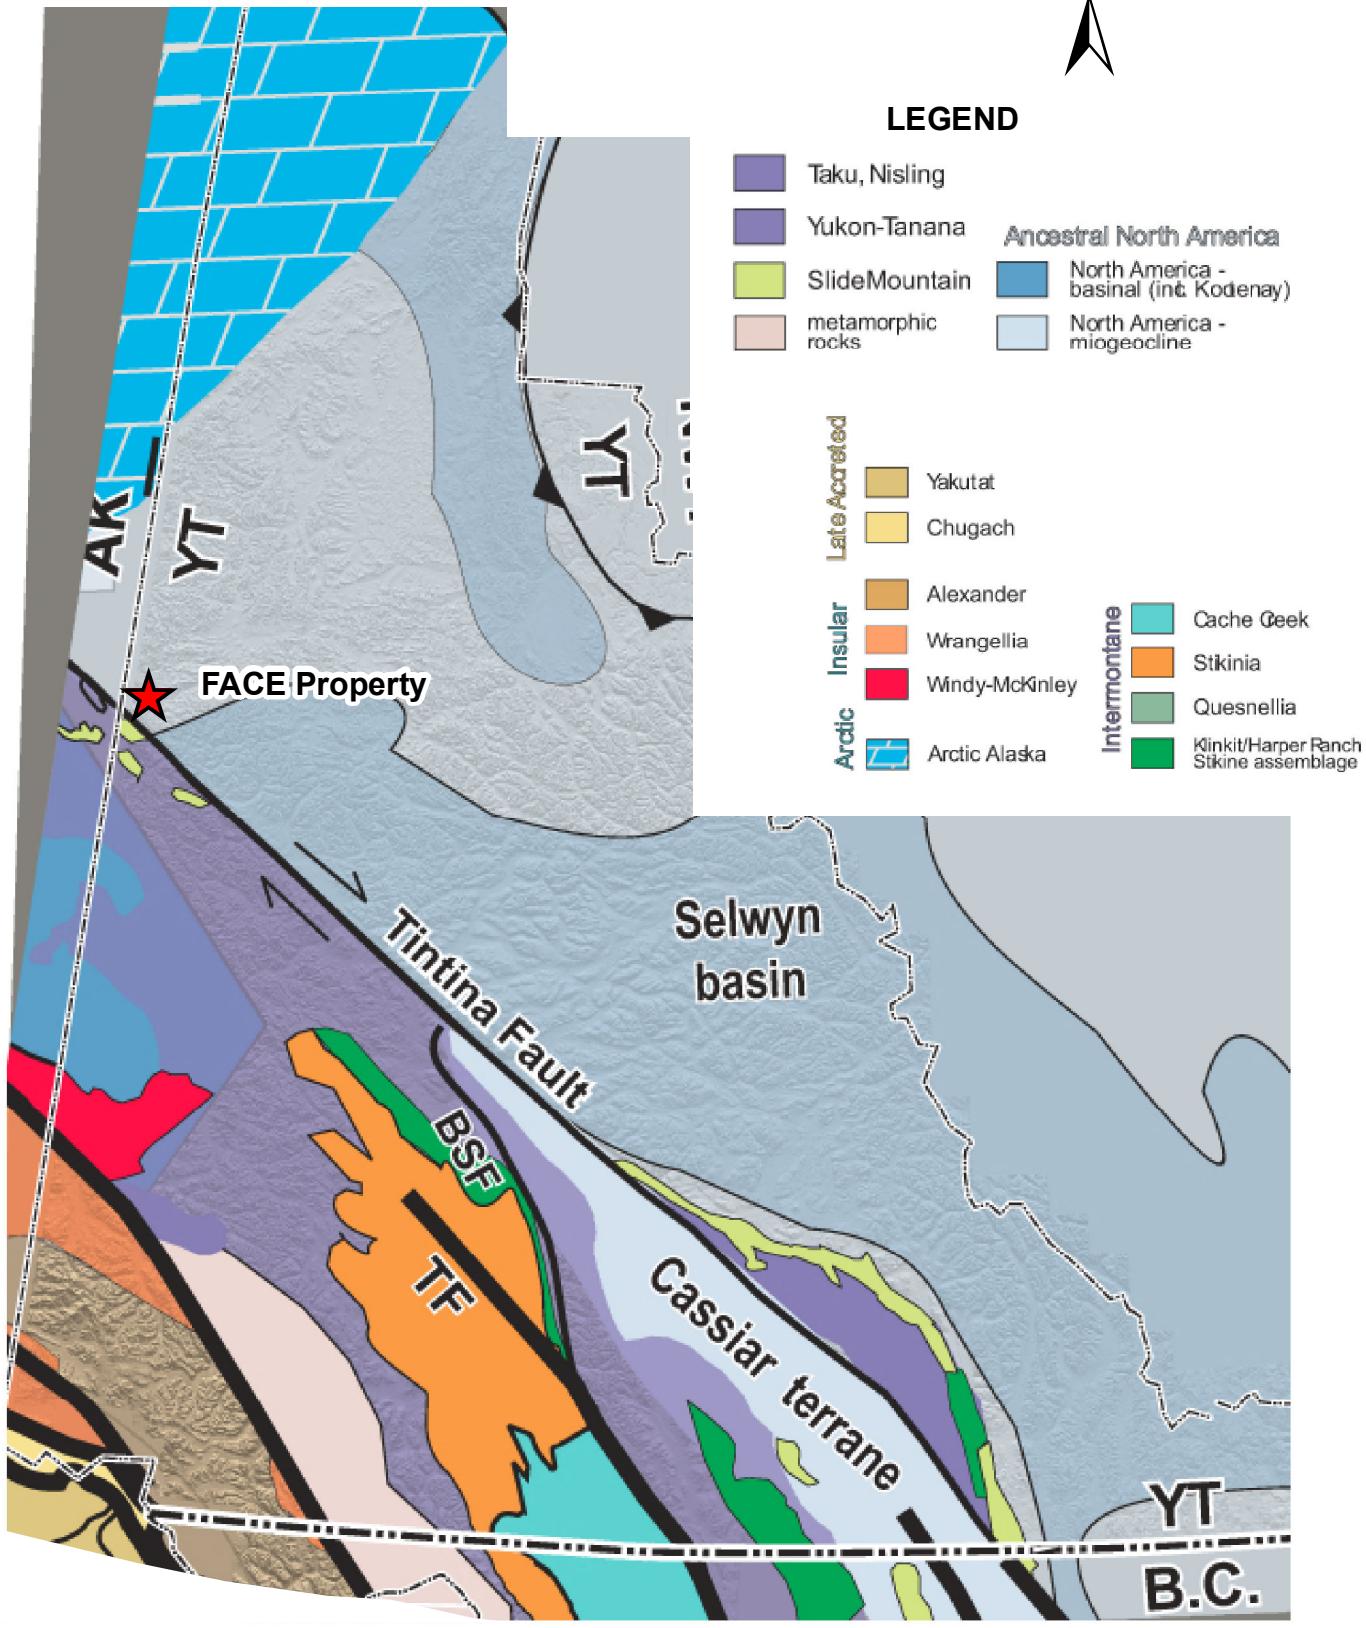

The Face property lies on the north side of the Tintina Fault and is underlain by ancestral North American platformal rocks and rocks units of the Selwyn Basin (Yukon Geology Survey, 2011) (Figure 3). These two terranes are in fault contact and this fault contact is part of, or an extension of, the Dawson Thrust Fault that extends easterly across the Yukon. This thrust fault marks the southern boundary of the informally named Rackla Gold Belt northeast of Mayo where a number of sediment hosted gold deposits (Rau and Ossirus) and occurrences have recently been discovered.

The oldest rocks on the property are Upper Proterozoic deep water clastics of the Selwyn Basin deposited west of ancestral North America. Similarly Upper Proterozoic platformal shallow water limestone units and younger Upper Cambrian to Upper Devonian volcanic, volcaniclastic, clastic and limestone rocks from the were deposited on the western margin of ancestral North America. All these rocks are assumed to have been part of a west to southwest facing marine passive margin.

The northwest striking Tintina Fault lies approximately four kilometers southwest of the property and is a major physiographic and geologic feature of the Yukon. It is a dextral strike-slip fault with about 430 km of Paleogene displacement (Yukon Geology Survey, 2011). In the area of the Face property it separates rocks of Ancestral North America affinity to the northeast from those of the allochthonous Yukon – Tanana and Slide Mountain Terranes to the southwest.

Cretaceous and younger plutonic suites intruding the Ancestral North America rocks represent a succession of continental magmatic arcs and related back arc environments that record the convergence of various terranes. Although these igneous rocks have not been mapped in the area of the Face claims they have proved to be associated with gold, silver and base metal deposits and occurrences about 100 km to the southeast.

The nearest significant mineralization is located approximately 18 km to the southeast of the Face property at the Shell Creek property, currently held by Logan Resources Ltd. It covers Yukon MINFILE occurrence 116C 029 (Yukon MINFILE, 2011) and a coincident prominent gravity and magnetic high and Late Precambrian to Early Cambrian clastic, carbonate and volcaniclastic rocks, stratigraphy similar to that on the Face property. A banded iron formation found within this package of rocks appears to be the locus of anomalous gold, copper, nickel, cobalt, lead and zinc geochemistry (Logan Resources Ltd., 2011). Prospecting identified gold in quartz – carbonate veins, possibly saddle reef – type, in the hanging wall of the iron formation. (Yukon MINFILE, 2011).

RADIUS
GOLD INC.

FACE Property, Yukon Territory
REGIONAL GEOLOGY

November 10, 2011

Figure 3.

In addition to the nearby Shell Creek banded iron formation occurrence other mineral deposit types that might be expected to occur in the above setting includes precious and base metal replacement type deposits, sediment hosted gold deposits, Mississippi Valley type deposits, other base metal deposits and vein – fault mineralization.

3.0 PROPERTY GEOLOGY

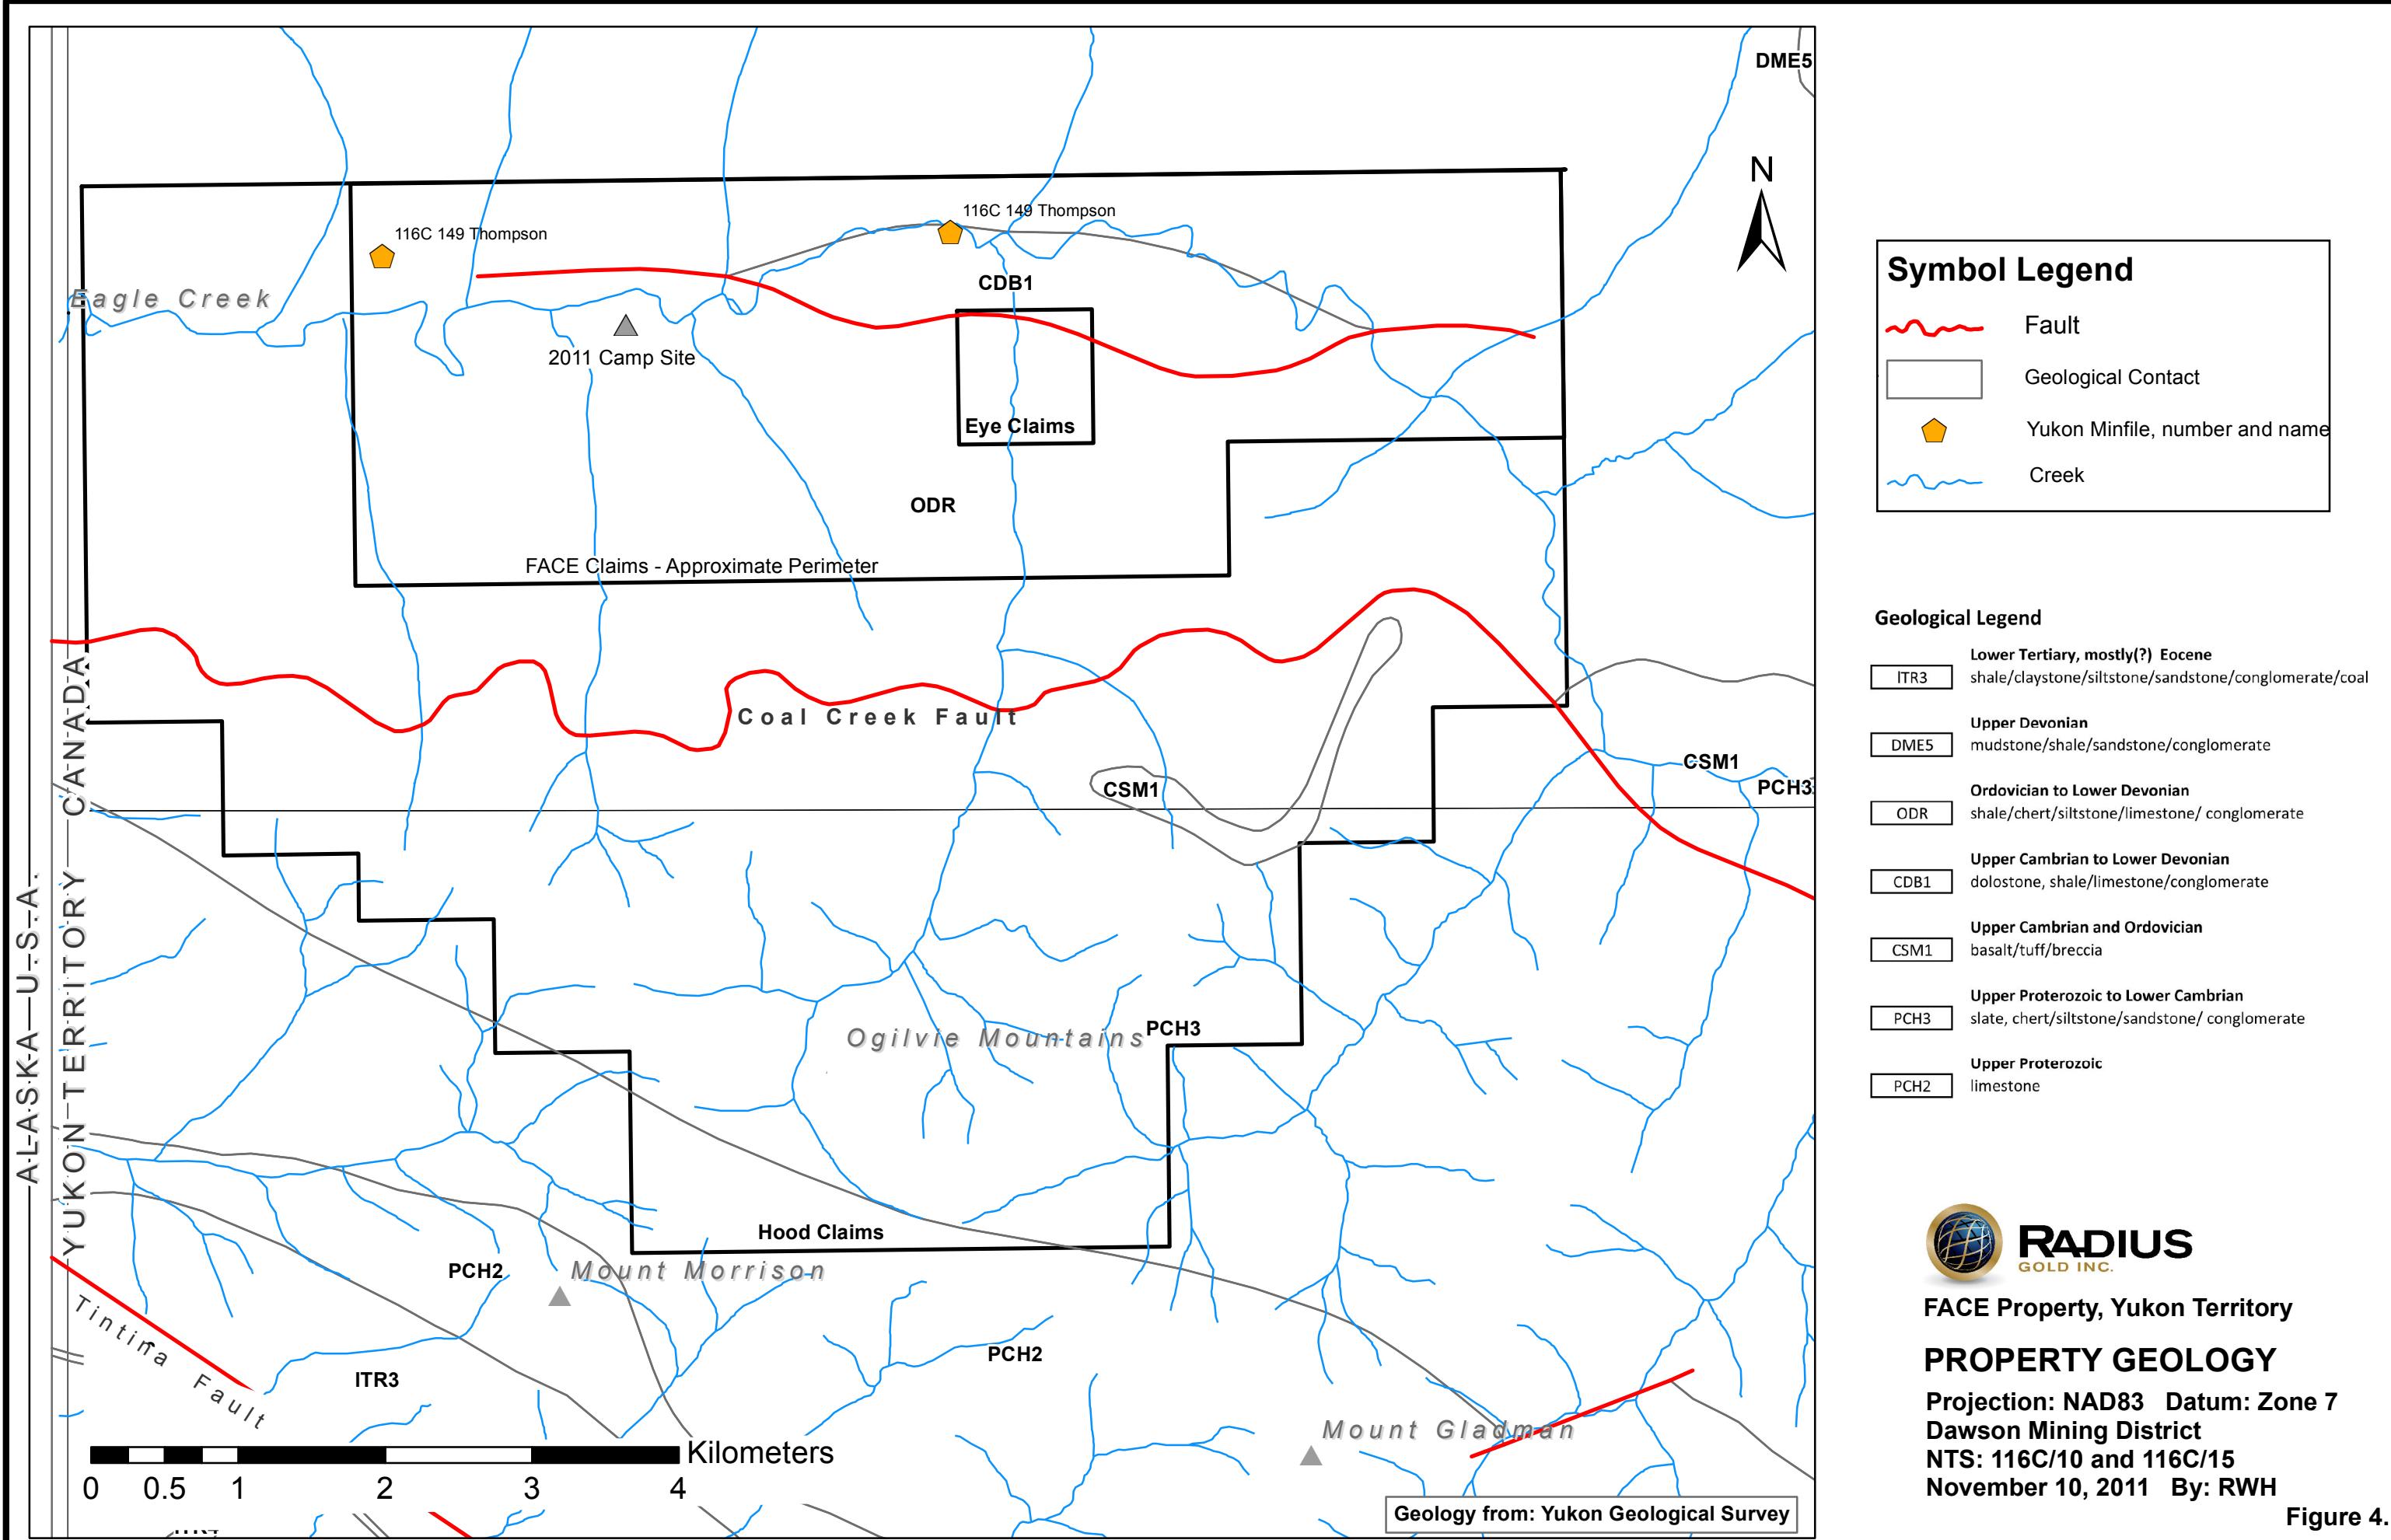

The Face property has not been geologically mapped by Radius Gold. The property geology map, Figure 4, is derived from Yukon Geological Survey sources (Yukon Geology Survey, 2011). The regional geology was compiled by the GSC in 1995 (Thompson, 1995). The earliest mapping was by the GSC in 1911 and 1912 (Cairns, 1915) as part of the Yukon – Alaska International Boundary survey. This mapping included only the easternmost side of the Face claims but does show a small mafic intrusive body on the north side of Eagle Creek that is not shown on the current geology map or Thompson's compilation map (Thompson, 1995).

According to Yukon Geological Survey (2011) the oldest unit underlying the Face claims are dolostone, shale, limestone, and conglomerate rocks (Figure 4, unit CDB1). This unit is in fault contact to the south with younger Ordovician – Devonian shales, cherts, siltstone, limestone and conglomerate rocks (Figure 4, unit ODR) correlated with the Road River Group. The east – west trending sliver of unit CDB1 to the north is apparently in conformable contact with unit ODR.

The mafic intrusive body mapped by Cairn's (1915) is located on the northwest corner of the Face claims in the vicinity of the western plotted Minfile Occurrence 116C 149.

Rocks underlying the Hood claims to the south consist dominantly of Upper Proterozoic to Lower Cambrian Hyland Group maroon, green and grey slate - argillite, chert , siltstone and conglomerate (Figure 4, unit PCH3). The Hyland Group is in thrust fault contact with the Road River rocks to the north. A small unit of Upper Cambrian and Ordovician basalt, tuff and breccia is in conformable contact with Hyland Group rocks on the south east side of the Hood claims.

Units generally trend northwest, approximately parallel to the Tintina Fault, the general trend of rocks in west Yukon. The Coal Creek Thrust Fault trends easterly and may be related to the parallel Dawson Thrust, found approximately 15 km to the east that extends across the Yukon and forms a boundary fault to the informally named Rackla Gold Belt.

3.1 Alteration and Mineralization

There is no known mineralization on the property. The Yukon Minfile Occurrence, number 116C 149 – Thompson, is plotted at two locations about 3.5 kilometers apart on or near Eagle Creek. The description is short; claims were staked at both locations by Mr. Ken Thompson on behalf of Dawson Eldorado Gold Exploration Limited. Both claim groups covered a thrust fault that separates a Devono – Mississippian clastic sequence to the north from a Cambro – Ordovician limestone and older volcanic and clastic sedimentary rocks to the south (Yukon MINFILE, 2011).

Prospecting in 2011 noted that the creek partly covered by the Eye claims has a reddish orange color anomaly. This color persists to the south, beyond the Eye claims, onto the Face and Hood claims. Eagle Creek on the east side of the Face claims as well as the two smaller creeks west of the Eye claims also had anomalous looking iron oxide coloration. The cause of this reddish – orange coloration remains unexplained.

4.0 GEOCHEMISTRY

A total of six rock samples, 31 stream sediment samples and 153 soil samples were collected in 2011 and were analyzed by Acme Analytical Laboratories (Vancouver) Ltd. in Vancouver, B.C. Samples were prepared for analysis at Acme's preparation laboratory located in Whitehorse, Yukon. Samples collected on the property were transported by Radius personnel, or contractors, to the Whitehorse laboratory.

Rock samples were crushed and a 250 g split pulverized to minus 200 mesh. A 30 gram sub sample was fire assayed and a gold determination made by atomic absorption. An additional 28 elements were analyzed by aqua regia ICP-ES. An additional 36 elements were analyzed by ICP-MS following a 0.5 gram sample undergoing aqua regia digestion. The analytical certificates are presented in Appendix A and sample locations and analytical results in Appendix B. Rock sample locations are shown on Figure 5 and results on Figures 7 to 8.

The rock samples returned less than 4 ppb Au, 0.5 ppm Ag, 26.9 ppm Cu, 14.2 ppm Pb and 93 ppm Zn. One iron rich sample, number 119505; contained 12.68% Fe, 58.3 ppm As, 27.5 ppm Sb and 65.1 ppm Mo with results for other elements of interest being low to background. Notes with sample descriptions were lost and therefore unavailable.

A total of 153 soil samples were collected, screened to -80 mesh with a 15 gram split digested by aqua regia and analyzed by ultratrace ICP-MS for gold and an additional 52 elements. The analytical certificate is presented in Appendix A and sample locations and analytical results in Appendix C. Soil sample locations are shown on Figure 6 and results on Figures 6 to 8. The soil samples were collected by grub hoe – pick axe, generally from an approximate depth of 0.3 m. Soil samples were collected on ridges and spurs and on a small grid with sample spacing 100 m by 200 m in the central portion of the property.

Analytical results from soil samples yielded a number of significant anomalous values for gold, copper, lead, zinc, silver, antimony and arsenic. A number of samples from ridges on the south side of the Face claims contained anomalous gold values greater than 12.5 ppb. Most of these anomalous samples also contain anomalous values for silver, copper, lead, zinc, iron, mercury and arsenic (Figures 7 & 8). Most anomalous silver values of greater than 500 ppb, with a highest value of 4161 ppb, also contain anomalous values for gold, molybdenum, copper, lead, zinc, iron, mercury and arsenic. Although the reconnaissance sampling was wide spread, the samples with anomalous gold – silver and related elements mentioned above, indicate an anomaly about four kilometers long from east to west and up to one kilometer wide north – south.

A total of 31 stream sediment samples were collected, screened to -150 mesh, with a 30 gram and a 50 gram subsamples being analyzed separately. The 30 gram sample

was digested by aqua regia and analyzed by ultratrace ICP-MS for gold and an additional 36 elements (method 1F30). The 50 gram sub sample underwent a lead collection fire assay followed by an ICP-ES analysis for gold (method 3B-50). Stream sediment samples were collected by shovel from traps such as bars and plunge pools, wet sieved at the sample site to minus 2 mm with care being taken to minimize loss of fines, placed in plastic bags, water decanted after settling and shipped to the lab while still wet or damp. Initial sieved sample weights varied between one and 3 kilograms. Stream sediment sample locations are shown on Figure 5 and results on Figures 7 and 8.

A total of 5 stream sediment samples contained gold. Three of the samples analyzed for gold by method 3B-50 returned between 11 and 40 ppb gold (and less than 2.5 ppb by method 1F30) and are shown on Figure 5. Two of the samples (numbers 119602 and 119753) analyzed by method 1F30 returned 13.4 and 21.3 respectively (and less than 3.6 ppb by method 3B-50). Only the results for method 3B-50 are shown on Figure 5. The lack of discrepancy between the two methods is attributed to the nugget effect of the gold particles. Method 3B-50 is considered more reliable for gold analysis due to the larger, 50 gram, sample size.

Samples with anomalous gold values (> 11 ppb) generally have anomalous values for Mo, Pb, Zn, and Ni. Samples with anomalous silver values (>500 ppb Ag) generally correlate very strongly with anomalous values for; Mo, Cu, Pb, Zn, Ni, Sb, Cd, Tl, Hg, Se and less strongly for Co, Mn, As, U, Cd. The lack of correlation between anomalous gold and silver values and their differing attendant populations of anomalous elements indicate possibly different sources for gold and silver.

The regional geochemical stream sampling program carried out by the Geological Survey of Canada identified anomalous gold values in the central drainage on the Face property that is also covered by the Eye claims. Sample 116C775135 (Figure 5) contained 26 ppb gold (Yukon Geology Survey, 2011). Other samples from creeks draining the property and in the immediate area are anomalous in zinc, antimony, molybdenum and mercury and together define a regionally anomalous area.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Results from the Geological Survey of Canada's regional geochemical survey and Radius's 2011 geochemical sampling program on the Face property identified a widespread multi-element anomaly including gold, silver, molybdenum, zinc, antimony, iron, mercury and arsenic. Underlying the property area is a package of rocks ranging in age from Upper Proterozoic to Lower Devonian that includes limestone, dolostone, mafic volcanics and siliciclastics. The property is cut by the regional easterly trending Coal Creek Fault and a parallel unnamed fault in Eagle Creek. These faults are sub-parallel to the Dawson Thrust Fault; a bounding fault to the Rackla Gold Belt located approximately 300 km to the ESE. The Coal Creek and other faults juxtapose units and provide possible fluid conduits for a possible hydrothermal system(s) as indicated by the anomalous stream sediment and soil samples.

The 2011 analytical results may indicate the presence of a significant precious metal - base metal hydrothermal system focused in and around the regional thrust faults. No mineralization was found in 2011 but based on the geochemical results and geological setting a number of deposit types are possible including base metal stratiform, precious and base metal stratabound replacement and vein type deposits.

Additional rock, soil and stream sediment geochemical surveys, along with geological mapping, prospecting and an airborne magnetic and radiometric survey are recommended to both better define the existing anomalies and to explore the surrounding areas not surveyed in 2011.

All of the above work should be directed towards defining precious and base metal targets for trenching and diamond drilling.

6.0 STATEMENT OF COSTS

The following costs were incurred on the Face 1- 94 claims in 2011.

2011 FACE Estimated Expenditures				
Item	number	\$cost/number		
Geochemistry	191 samples	\$28/sample	\$	5,348
Helicopter	13.3 hours	1200/hour	\$	15,960
Labour	50 mandays		\$	19,550
truck & camp			\$	3,000
Report			\$	3,000
		TOTAL	\$	46,858

Respectfully submitted,

November 10, 2011

Roger Hulstein, B.Sc., P.Geo.

7.0 STATEMENT OF QUALIFICATIONS

I, Roger W. Hulstein, of:

106 Wilson Drive
Whitehorse, Yukon Territory
Y1A 0C9,

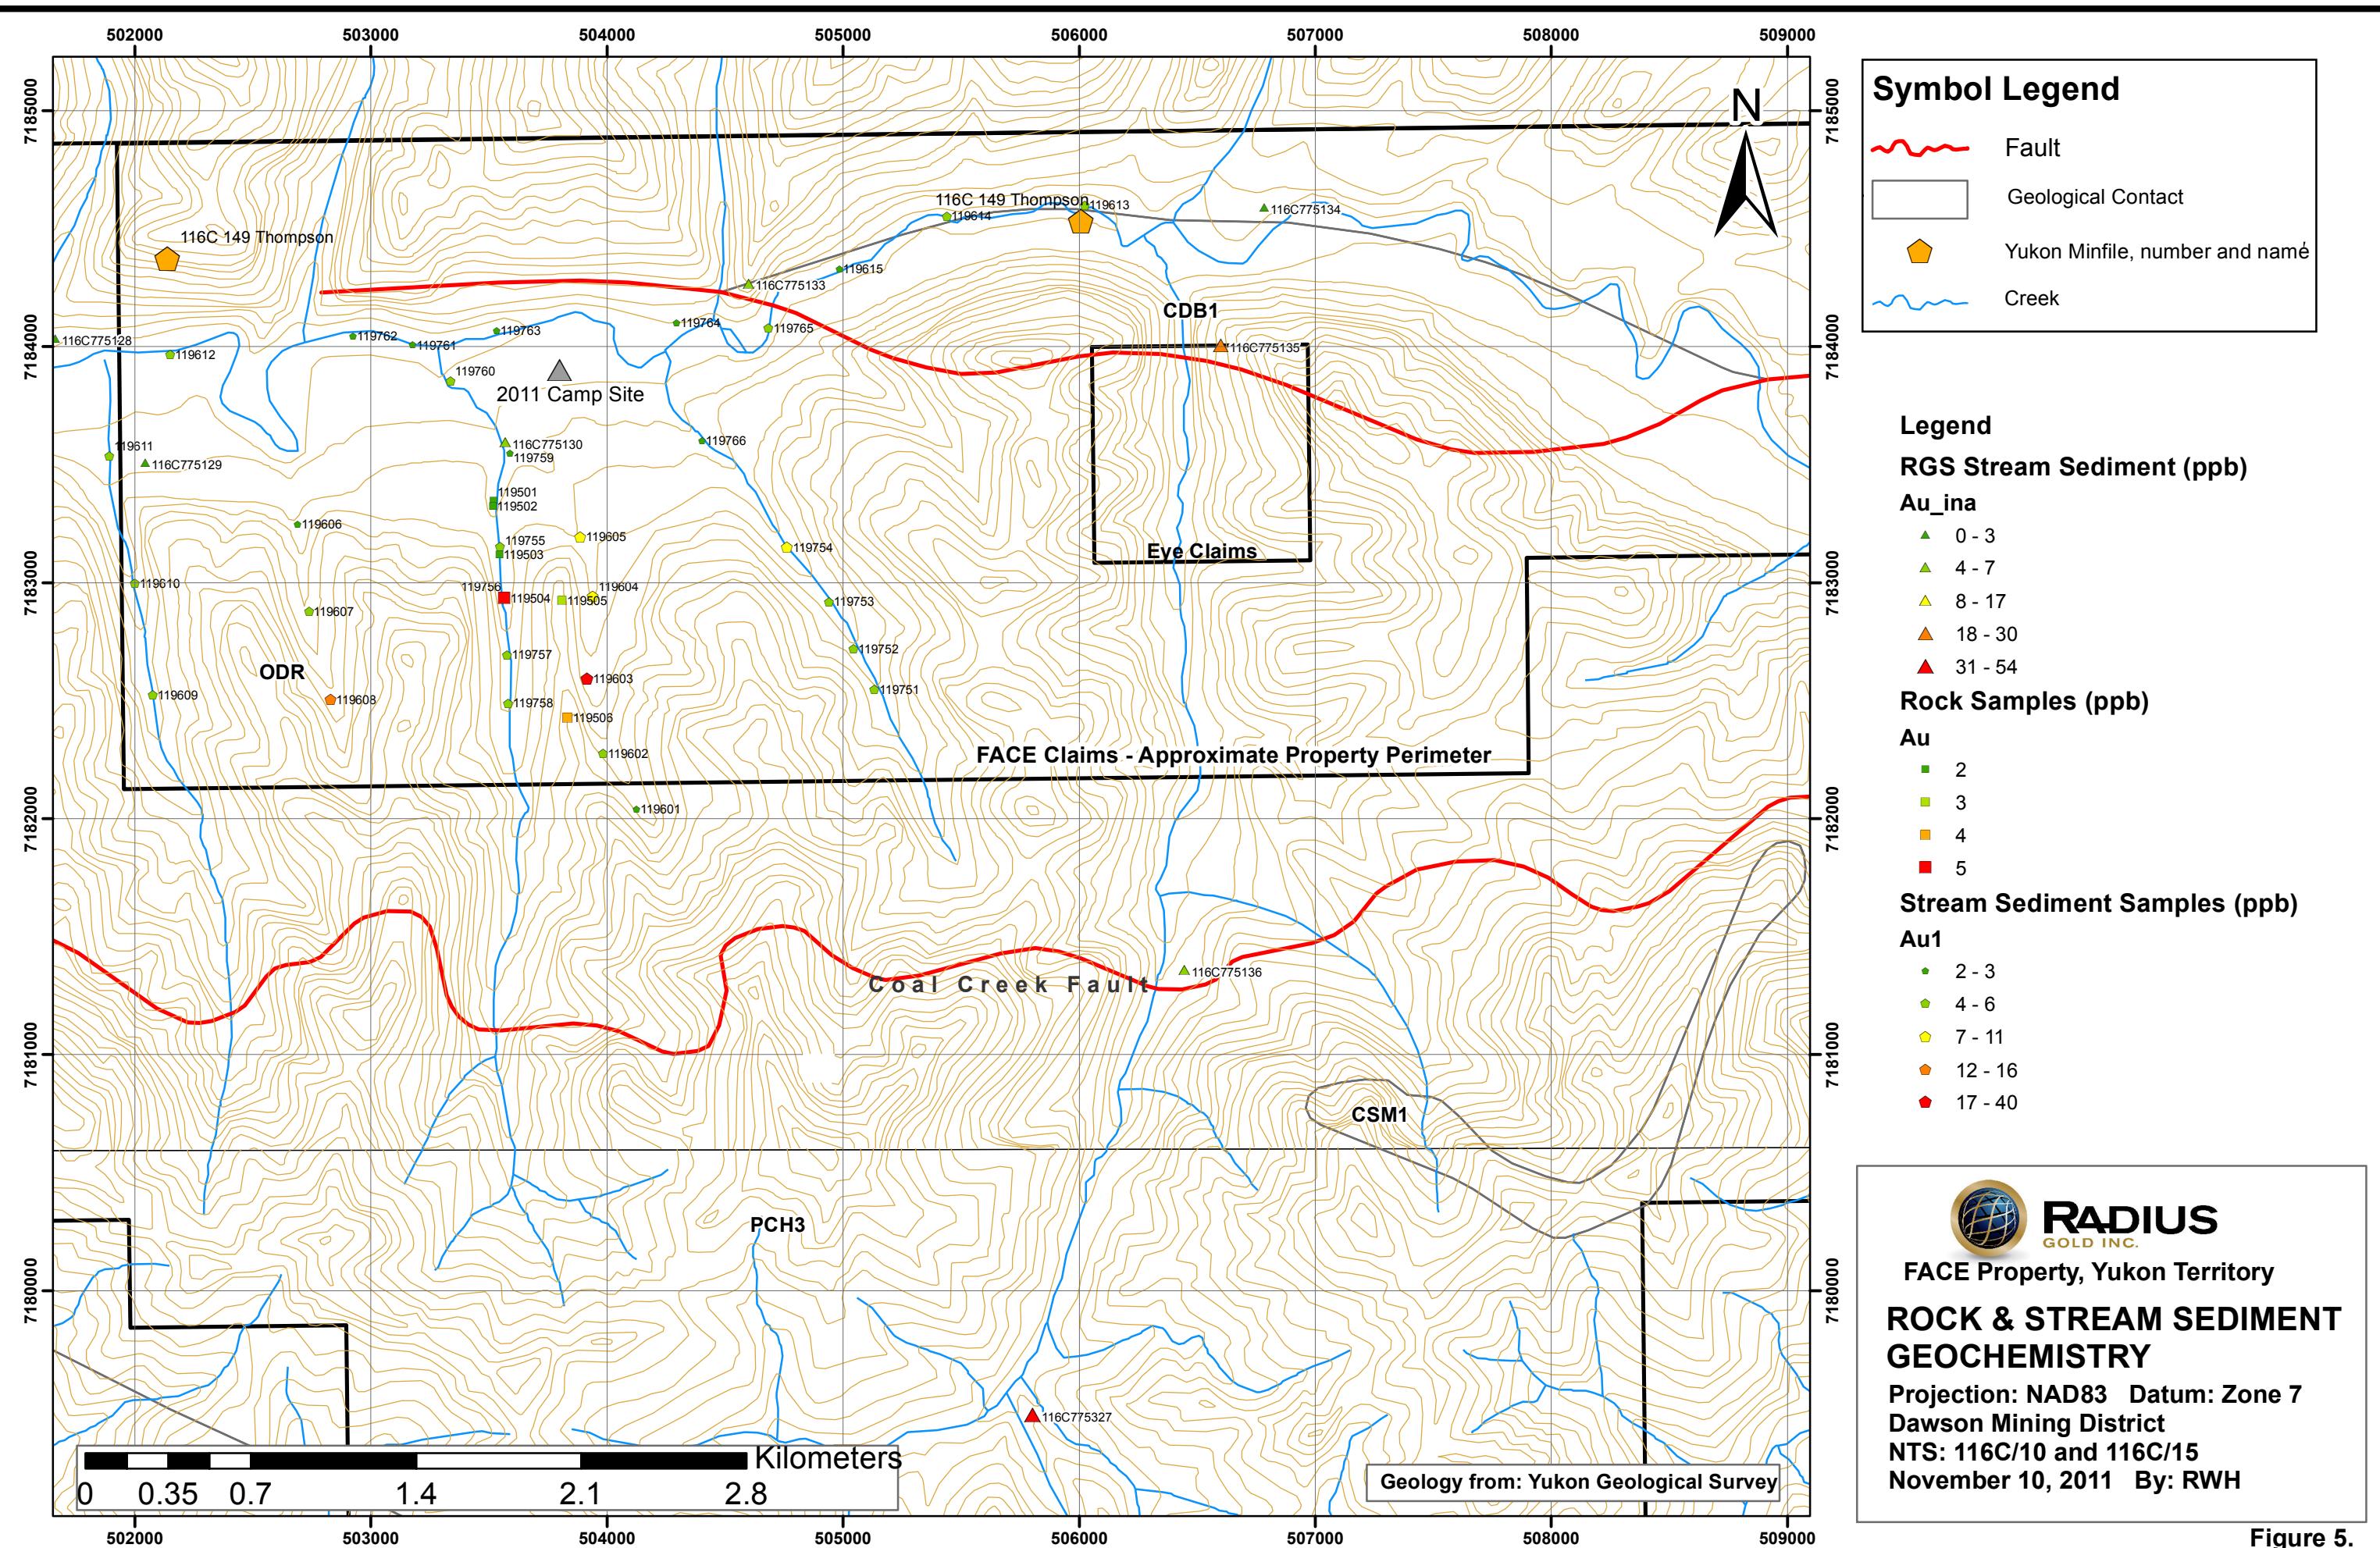

do hereby certify that:

1. I am a mineral exploration geologist with over 25 years of experience working in the Yukon.
2. I am a graduate of Saint Mary's University, Halifax, with a degree in geology (B.Sc., 1981) and have been involved in geology and mineral exploration continuously since 1978.
3. I am a fellow of the Geological Association of Canada (F3572).
4. I am registered as a professional geoscientist (No. 19127) with the Association of Professional Engineers and Geoscientists of the Province of British Columbia.
5. I am the author of this report on the Face 1-94 claims in the Dawson Mining District, Yukon.
6. The work was described in the report was carried out under my supervision from July 7 to July 14, 2011.
7. I have not been on the ground covered by the Face 1- 94 claims.
8. The report is based on results and descriptions provided by coworkers and on referenced sources.

Roger Hulstein, B.Sc., FGAC, P.Geo.

CERTIFICATE OF ANALYSIS

WHI11000789.1

CLIENT JOB INFORMATION

Project: FACE
Shipment ID: 2011-002
P.O. Number NA-10337
Number of Samples: 155

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Method	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SS80	153	Dry at 60C sieve 100g to -80 mesh			WHI
Dry at 60C	153	Dry at 60C			WHI
1F05	153	1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis	15	Completed	VAN
RJSV	153	Saving all or part of Soil Reject			WHI

SAMPLE DISPOSAL

PICKUP-PLP Client to Pickup Pulps
PICKUP-RJT Client to Pickup Rejects

ADDITIONAL COMMENTS

Acme does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Radius Gold Inc.
830 - 355 Burrard St.
Vancouver BC V6C 2G8
Canada

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Acme assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted. ** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
