## 1.0 INTRODUCTION

The DOW property consists of 106 contiguous mineral claims covering an area of approximately 18.91km<sup>2</sup>, located in the Klondike Plateau, north-western Yukon. In 2011, Golden Predator Canada Corp. (Golden Predator) signed an option agreement with Bernard Kreft to acquire a 100% interest in the property and is targeting structurally hosted gold deposits.

This report describes a 3 day, 473 sample, soil program covering a 1.7 x1.6 km grid located in the southern portions of the claim group.

## 2.0 PROPERTY LOCATION AND DESCRIPTION

The property is located in the Klondike Plateau, north-western Yukon. It is located approximately 65 km west-northwest of Dawson City, YT (Figure 2-1). It is accessed by 10 minute helicopter trip from Dawson City. The property is also accessible by unmaintained 4x4 roads from Dawson City. The property is located in the Dawson Mining District, and consists of 106 contiguous mineral claims covering an aggregate area of 18.91 km<sup>2</sup> (Table 2-1, Figure 2-2).

### **3.0 INFRASTRUCTURE, CLIMATE AND PHYSIOGRAPHY**

The property lies within the un-glaciated Klondike Plateau, which is characterized by low rolling hills dissected by deeply incised stream valleys.

Natural bedrock exposures are rare, and generally restricted to steep slopes, with the effects of surface weathering extending to depths of as much as 80 metres or more. Overburden and regolith material appears to average approximately 1.0 metre in thickness, but is certainly deeper in some spots. South facing slopes are generally snow free from early May, with frost leaving the ground by the middle to end of May. North facing slopes are generally free of snow by mid to end of May, with permafrost often remaining year-round. The property is below tree line, with vegetative cover consisting of variable amounts of spruce, poplar, alder and brush, with brush and stunted spruce trees predominating on north facing slopes, higher elevations and in areas of permafrost or poor drainage, while south facing slopes are generally covered by more mature stands of spruce. Several recent forest fires have swept through the area, leaving large areas devoid of moss and vegetative cover resulting in more rock exposure and better soil sampling conditions due to at least partial destruction of permafrost in these areas, but also resulting in increased difficulties for ground traversing due to wind-fall.

The centre of the property is located at 508840 E, 7113453 N (NAD83, zone 8) on NTS Mapsheet 116C02. The nearest settlement is Dawson City, which is located approximately 65 east-southeast along Top Of The World Highway.

### **4.0 EXPLORATION HISTORY**

The DOW property is located in the historical Klondike region Northeast of Dawson City, and aside from the significant placer mining activity in the area very little historical hard rock exploration work has been completed in the area. Previous exploration work has been limited to either to the northeast or to the southwest of this Property. Twelve mineral occurrences are clustered in two areas, either a few to ten more kilometers away to the northeast or a few to ten more kilometers away to the southwest of the Property.

To the northeast side of the Property there are a sedimentary exhalative (sedex) Zn-Pb-Ag drilled prospect, Mickey (two occurrences, north and south); a Kuroko massive sulphide Cu-Pb-Zn showing, Mort; a sedex Zn-Pb-Ag drilled prospect, Clip; and a Kuroko massive sulphide Cu-Pb-Zn prospect, Top of the World (two occurrences, west and east). To the southwest side of the Property blocks there are a Kuroko massive sulphide Cu-Pb-Zn mineral showing, Pub (it lies within the boundary of the DOW Property); a polymetallic veins Ag-Pb-Zn+/-Au showing, Cholach; a coal drilled prospect, Hungry (two occurrences); an Au-quartz veins showing, Glasmacher; a Besshi massive sulphide Cu-Zn showing, Baldy; a polymetallic veins Ag-Pb-Zn+/-Au showing, Miller; an Au-quartz veins showing, Bedrock; and a polymetallic veins Ag-Pb-Zn+/-Au drilled prospect, Per.

## 5.0 GEOLOGY

### 5.1 Regional Geology

The Dow Property is located on the Southwest side of the Tintina Trench within the Tintina Gold Belt which is host to several significant gold deposits such as Donlin Creek, Pogo, Fort Knox in Alaska and Brewery Creek, Dublin Gulch and the newly discovered Whitegold deposit in the Yukon. The property covers greenschist to lower amphibolite facies metamorphic the northwestern portion of the Yukon-Tanana Terrain which can be divided in to two main assemblages: metasedimentary rocks with a penetrative ductile deformation to the northeast, and metavolcanic rocks with a brittle shearing and deformation to the southeast.

### 5.2 Property Geology

Regional scale government mapping indicates that the southeastern portion of the property is underlain by Devonian-Mississippian meta-quartzites and quartz-muscovite chlorite schist and the northwestern portion of the property is underlain by mafic and ultramafic meta-volcanic rocks including chlorite-biotite schist, amphibolite, and hornblende gneiss. No detailed property mapping has been completed on the Dow property however Kreft 2011 has made some geological observations on the property and they are outlined below.

The following geological description is taken from Kreft 2011: Outcrops at higher elevations on the ridge east of Browns Creek consist of carbonate and clastic rocks cut by rare volcanic dykes. Outcrops of Nasina Series quartzite, graphitic schist and quartz muscovite schist are found below this unit. At the contact between these two units are occurrences of mafic to ultramafic rocks, variably serpentinized, with occasional areas of extensive limonite development and listwaenite alteration. It appears that the carbonate-clastic unit forms the hangingwall to the thrust, the surface trace of which is marked by the variably altered mafic to ultramafic unit. Occurring within the Nasina Series metasediments are several porphyritic granodiorite to quartz diorite dykes, sills or elongate plugs presumed to be Jurassic in age. Known areas of intrusive are associated with increased arsenic in soil content, but appear to be somewhat distal to areas of gold in soil enrichment. Actual extent of the intrusives is unknown so it may be that the gold in soil values are located at, or within, the yet to be determined margins of the intrusive bodies.

## 6.0 EXPLORATION

### 6.1 Exploration Program

A 10 man field crew access the property for a total of 3 days on August 26, 27, and 28, 2011. A total of 473 soil samples were collected at 597 stations. Stations were established at 50 spacing on 100m lines to cover the target area. No sample was collected at 134 stations due to permafrost or lack of suitable material (i.e. bedrock or boulders).

### 6.2 Sampling Methodology and Protocols

Most samples were collected at > 0.4 m depth using hand-held Dutch augers except where soils were very shallow or sparse, such as in boulder fields. Maddocks were employed in areas with thin overburden cover. At each sample station, sample descriptions, UTM co-ordinates and photographs were recorded. Location and observational data were recorded when no sample was collected due to ground conditions (i.e., permafrost or boulder field with insufficient fines).

Soil sample descriptions were recorded on waterproof paper with the following information: geographic location, relief, vegetation, depth of sample, soil horizon, sample color, soil texture and moisture.

Samples were freighted to Acme's ISO 9001 certified preparation facility in Whitehorse, YT and the pulps were analyzed at Acme's ISO 9001 certified laboratory in Vancouver. Samples were dissolved in an aqua regia acid solution and then analyzed by ICP-MS methods (package 1DX2-15g). Acme completes quality assurance/ quality control data verification of their assays through internally inserted duplicates, standards and blanks. Assay certificates are compiled in Appendix 3 and the detailed methodology and detection limits are in Appendix 4.

Soil samples were ranked by percentile to determine statistical anomalies for the property. Black circles plot samples ranking in the lower 50<sup>th</sup> percentile (0.0 - 0.0044 ppm), blue circles are samples ranking in the 50<sup>th</sup> - 75<sup>th</sup> percentile (0.0044 - 0.0075 ppm), green circles represent samples in the 75<sup>th</sup> - 90<sup>th</sup> percentile (0.0075 - 0.0153 ppm), yellow circles indicate 90 - 95<sup>th</sup> percentile (0.0153 - 0.0256 ppm), orange 95-98<sup>th</sup> (0.0256 - 0.0880 ppm) and red circles are the upper 2 percentile (0.0880 - 0.2880 ppm).

### 6.3 Results

Results from the 2011 soil sampling program highlight 3 zones of anomalous (>98 percentile) gold on both the north and south sides of Browns Creek in the southern portion of the property.

Zone 1 is located on the north side Browns Creek near the junction of a smaller northeast trending stream that feeds into Browns Creek from the south and is a 450 x 200m wide zone with 5 samples above 0.088 ppm gold and up to 0.288 ppm gold. Zone 1 also has elevated Ag, As, and Sb.

Zone 2 is located on the south side of Browns Creek on the north side of a smaller creek that feeds into Browns Creek from the south and consists of two samples with 0.152, and 0.0949 ppm Au respectively.

Zone 3 is located on the south side of Browns Creek near a second smaller creek that feeds into Brown Creek from the south and consists of three samples with 0.092, 0.093, and 0.089 ppm gold respectively.

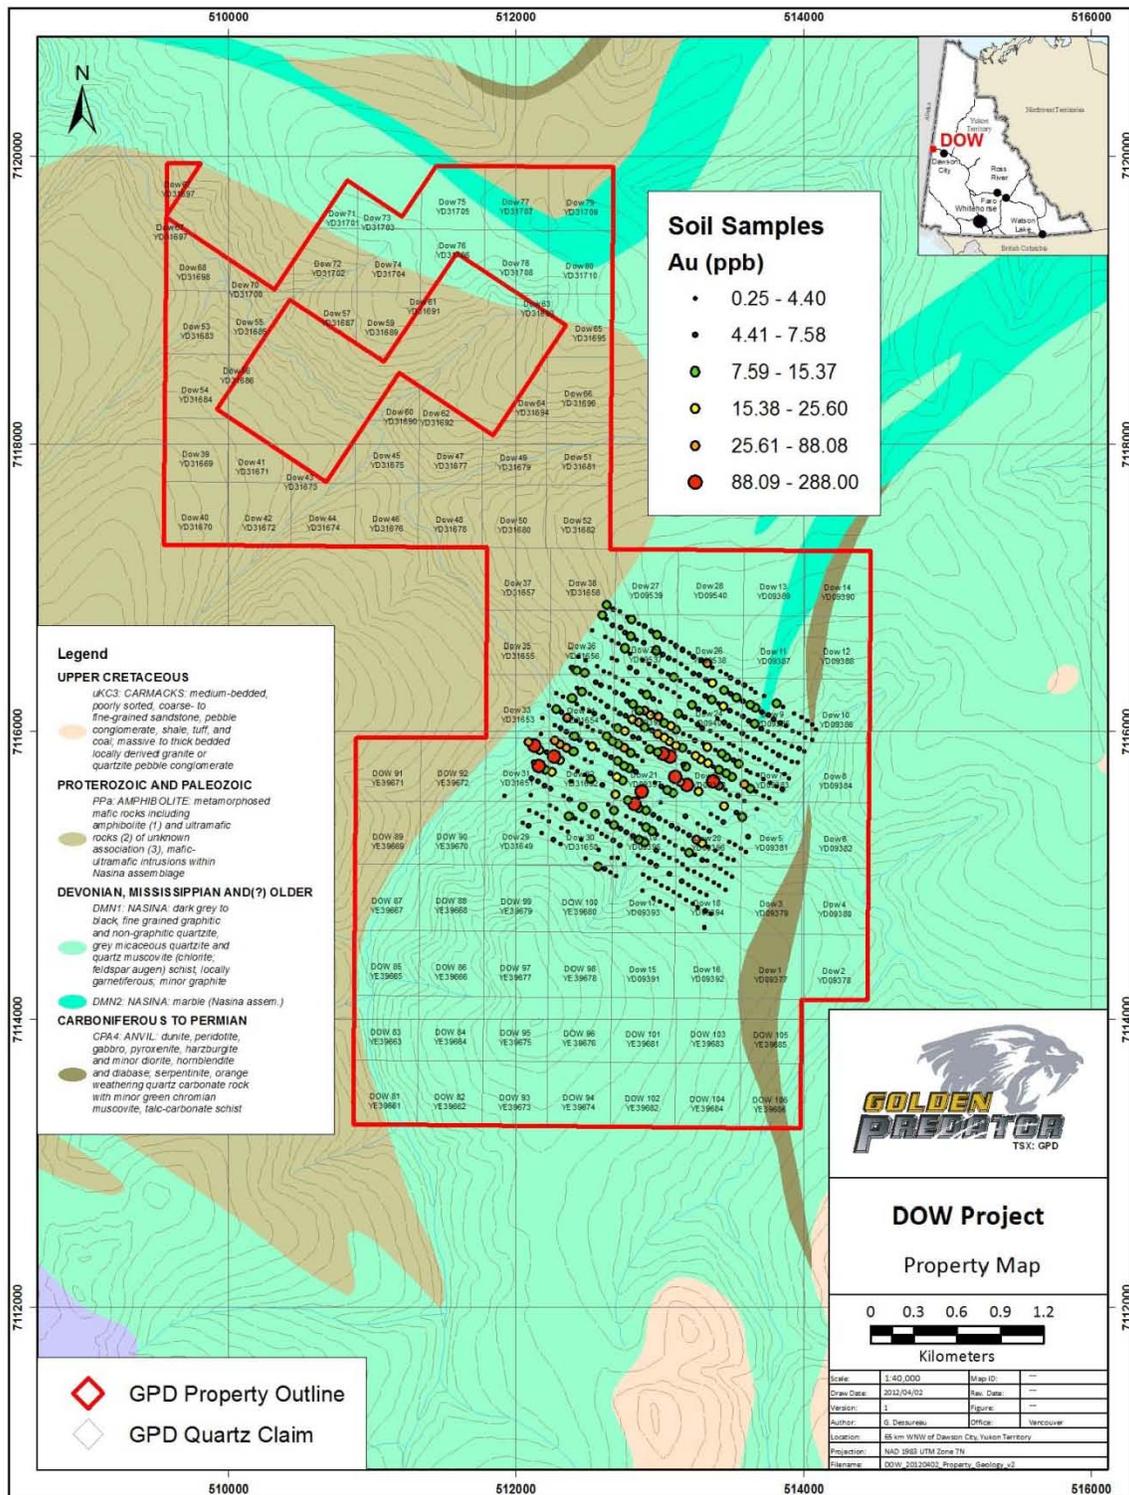

Figure 6-1. Regional Geology DOW area showing Au in soils results.

## **7.0 CONCLUSIONS AND RECOMMENDATIONS**

The DOW property consists of 106 contiguous mineral claims covering an area of approximately 18.91km<sup>2</sup>, located in the Klondike Plateau, north-western Yukon. Golden Predator is exploring the property for structure-hosted, intrusion related gold deposits.

The 2011 soil program consisted of 597 soil samples collected on a 50 x 100 m grid centered on Browns Creek in the southern portion of the claim group. The program identified an anomalous zone on the north-west side of Browns Creek and 2 smaller zones on the south side of the creek. These zones may represent intersections of northeast striking structures and a northwest striking structure represented by Browns Creek.

Follow-up work consisting of prospecting and mapping is recommended to investigate the sources of the geochemical anomalies.

#### Method Description:

Prepared sample is digested with a modified Aqua Regia solution of equal parts concentrated HCl, HNO<sub>3</sub> and DI H<sub>2</sub>O for one hour in a heating block of hot water bath. Sample is made up to volume with dilute HCl. Sample splits of 0.5g, 15g or 30g can be analyzed.

For 1F07, Lead isotopes (Pb<sub>204</sub>, Pb<sub>206</sub>, Pb<sub>207</sub>, Pb<sub>208</sub>) are suitable for geochemical exploration of U and other commodities where gross differences in natural to radiogenic Pb ratios, is a benefit. Isotope values can be reported in both concentrations and intensities. Sample splits of 0.25g, 0.5g, 15g or 30g can be analyzed.

\* Solubility of some elements will be limited by mineral species present.

^Detection limit = 1 ppm for 15g / 30g analysis.

**Limitations:**

Au solubility can be limited by refractory and graphitic samples.
