1.0 Introduction and Summary

1.1 Introduction:

This document is an assessment report outlining work done in 2011 on the GLEE and TESS claims owned by Ryan Gold Corp. The two properties, GLEE and TESS, were staked in April of 2011 by Ryan Gold Corp. The properties were staked based on the occurrence of silt samples anomalous in gold from the Yukon Geochemical Database (2003).

1.2 Summary

The GLEE and TESS projects are located south-central Yukon within the Whitehorse Mining District on NTS mapsheet 105D-01 and 105C-06 respectively. The GLEE property is located approximately 80km southeast of Whitehorse and the TESS property is located 100km southeast of Whitehorse.

The Yukon Geological Survey provides us with an excellent database of silt samples for the drainages within the properties and surrounding area. The YGS also provides historical Minfile occurrences as well as historical Assessment Reports in the area around both properties but none lie directly within the boundaries of the current GLEE and TESS claims.

The GLEE and TESS Projects are located within the Teslin Plateau on Intermontane Superterrane in the geologic province of the Northern Canadian Cordillera. Specifically both properties are within Cash Creek Terrane. The Cash Creek Terrane is composed mainly of volcanic rocks that formed on the ocean floor, as well as overlying successions of chert, limestone and shale.

From September 21stth to September 25thth 2011, Ryan Gold Corp. contracted Ground Truth Exploration to complete a ridge and spur soil sampling program on the GLEE and TESS projects. The program totaled of 363 soil samples on GLEE and 396 soil samples on TESS. The goal of the work was to identify gold potential in structures outlined by favorable geology and magnetometer surveys. This phase one soil program on the GLEE and TESS was successful in identifying target areas for follow-up. Soil results from the phase one sampling included maximum values of 479ppb and 380ppb Au on the GLEE property and values of 183ppb and 145ppb Au on the TESS property.

The results from work on both properties warrants further investigation, and follow-up work programs to further outline Au potential.

2.0 Terms of Reference and Source Material

2.1 Terms, Definitions and Units

All geographic coordinates for sample locations and property scale references are reported in the NAD83 datum and projected to Universal Transverse Mercator (UTM) Zone 8. Distances are reported in metric units, including meters (m) and kilometers (km). Any monetary references in this report are reported in Canadian dollars (CAD).

Directional references are reported relative to True North. Standard elemental abbreviations are utilized when referring to analytical results, including Gold (Au). Unit abbreviations for analytical results are indicated where appropriate, including: parts per million (ppm), parts per billion (ppb), grams per tonne (g/t) and percent (%).

2.2 Source Documents

This report incorporates data from multiple sources including regional geochemical, geological and geophysical studied conducted by the Geological Survey of Canada and Yukon Geological Survey, available in public Open Files. Private Company data that is available in the public domain has also been utilized to create this report. Sources are listed in Appendix IV.

3.0 Property Location and Description

3.1 Property Location

The GLEE and TESS projects are located in southern Yukon within the Whitehorse Mining District on NTS mapsheet 105D-01(GLEE) and 105C-06(TESS). By air, GLEE is approximately 80km and TESS is approximately 100km southeast of Whitehorse, Yukon. The properties are geographically centered in UTM Zone 8 548000E, 6670000N (GLEE) and 592000E, 6692000N (TESS). (See Figure 1)

3.2 Access

Access to the GLEE and TESS properties is currently restricted to helicopter, based in Whitehorse, respectively 80km and 100km southeast by air. From Whitehorse the Alaska Highway is open year round along which staging areas exist at various locations that can reduce the ferry to the properties significantly. These staging areas can cut the flight distance to 15km to the GLEE and 10km to the TESS. (See figure 1)

3.3 Climate and Physiography

The GLEE and TESS Project areas have a subarctic continental climate with a summer mean of 10 degrees Celsius and winter mean temperature of -23 degrees Celsius. Summer temperatures can reach up to +32˚C and winter temperatures can drop to -62˚C. Precipitation is low (30mm to 70mm in June and July) because the region lies in the rain shadow of the St. Elias Mountains. Winds in the area are moderate but often strong and Gale force winds have caused structural damage. Frost can occur at any time of the year.

GLEE and TESS lie within the physiographic region of the Teslin Plateau (part of the Yukon Plateau) which is characterized by rounded summits and broad valleys occupied by lakes and rivers. Property elevations range from 1000m to 1600m on GLEE and 1100m to 1500m on the TESS.

3.4 Land Tenure

The GLEE and TESS Projects are comprised of 168 and 160 contiguous quartz claims covering an aggregate area of approximately 3,400 and 3,200 hectares respectively. Ryan Gold Corp owns the claims constituting both projects.

Total TESS Claims: 160

(See figure 4: TESS Claim Map)

4.0 Exploration History

There are no Minfile occurrences documented by the Yukon Geological Survey specifically within the boundaries of the GLEE and TESS properties but Minfile occurrences do exist in the outlying areas within the mapsheets. Just to the North of the GLEE property is the historical PENNYCOOK occurrence (occurrence #105D 157) which has been prospected, trenched, and drilled. Also just north of the TESS property is Minfile occurance #105C 013 called HAYES PEAK which was a showing of ultramafic hosted asbestos. There are also extensive silt samples from the Yukon Regional Geochemical Database (2003) that show anomalous Au values for the area on both the GLEE and TESS properties. The 2011 soil sampling program on the GLEE and TESS projects were the first intensive examination for mineral potential on this ground.

5.0 Regional Geology

Geologically, the GLEE and TESS properties lie within the Northern Canadian Cordillera's Intermontane Superterrane and Cash Creek Terrane. *(Gordey and Ryan, 2005).* For more information see tables below and Figures 2, 7 and 8

6.0 2011 Exploration Field Program

6.1 Field Program Summary

This report summarizes the results of the phase one geochemical soil sampling program conducted on the GLEE and TESS properties during September of 2011. Soil sampling was contracted to Ground Truth Exploration Inc. of Dawson, YT and was approved and funded by Ryan Gold Corp. of Vancouver, BC. Phase one Soil Sampling began on September 2nd, 2011 and was completed on September, 2011. 363 samples were taken on GLEE and 396 samples were taken on TESS. Both soil sampling programs were designed as a comprehensive property wide survey to identify initial exploration targets, specifically anomalous values of gold in soil. All major ridges, spurs and some contours were traversed and sampled at 50m intervals. Isaac Fage, of Ground Truth Exploration Inc, supervised all project operations.

6.2 Sampling Protocol and Data Handling Procedures

All sampling traverses are pre-planned, with pre specified sampling intervals, typically 50m. Field technicians navigate to sample site using handheld GPS units. The soil sampler arrives at each sample site, identifies the most appropriate location to collect the sample and lays out a sheet of plastic (12”x20” ore bag). The soil sample is taken using an Eijklcamp brand hand auger at a depth of between 20cm and 110cm. Samplers strive to consistently collect C-Horizon sample material. Where necessary (rocky or frozen ground) a prospector's pick ('mattock') is used to obtain the sample. The soil is laid out on the sheet of plastic in the order it was recovered from the sample hole. Standardized photos are taken of the sample site- across slope, 5m from sample hole with auger inserted. With the necessary amount of soil (400-500 grams) has been

collected, the deepest soil is taken and placed in a bag labeled with the 3-letter project and tagged with a unique barcode ID tag containing a unique 7 digit sample identification number. Another barcoded tag inscribed with the sample identification number is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape.

A field duplicate sample is taken once for every 25 samples. Both samples are given unique Sample identification number. The data for both samples is recorded and a note is made indicating the duplicate and its corresponding sample identification number.

The GPS location of the sample site is recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD 83 format, and the waypoint is labeled with the project name and the sample identification number.

A weather proof handheld device equipped with a barcode scanner is used in the field to record the descriptive attributes of the sample collected. this includes: sample identification number (scanned into device at sample site), soil colour, soil horizon, slope, sample depth, ground and tree vegetation and sample quality and any other relevant information. As well, the GPS coordinates are entered into the handheld device as a secondary backup in case of GPS failure.

Each night in the field, the GPS and Palm PDA devices are downloaded to a laptop computer. The data is verified and mapped on a sampler-by-sampler basis in proprietary database auditing and mapping software. At the end of each day, the crew boss inspects all samples for size and consistency as a quality check. Each sampler then repackages all samples for shipping- barcode scanning them as they are placed into a rice bag that is sealed with a barcoded security zip tie. Samples are shipped from the field to the lab on a daily basis, tracked by the unique ID on each security seal.

A backup of the sample data is made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion. Where possible, a backup is also sent via e-mail.

6.3 Sample Preparation and Analysis

Samples were processed by Acme Labs in Vancouver with Aqua Regia digestion and analyzed with ICP-MS for 36 elements (Acme Labs 1DX-15 gram). Samples are dried at 60°C, sieved at -80 mesh.

6.4 Interpretation

The GLEE and TESS projects phase one ridge and spur soil sampling programs were successful in delineating target areas with anomalous gold values in soil. Soil results from the phase one sampling included maximum values of 479ppb and 380ppb Au on the GLEE property and values of 183ppb and 145ppb Au on the TESS property. Au values do not seem to be associated with any other indicator elements such as arsenic.

The high gold values on both properties seem to be loosely tied to the Mag high/low borders. Bedrock geology, described by the Yukon Geological Survey, does not seem to correlate with higher gold values on both properties nor does the bedrock geology correlate with the mag high lows.

6.5 Recommendations

Since anomalous gold values were found on both properties it is recommended that the areas be prospected and mapped by a prospector or geologist. Also, the areas with the highest concentration of gold in soil should be overlain with a soil sampling grid spaced at 100m apart and 50m sampling intervals. The work described would require approximately ten man days of work on each property. After results from this short work program is compiled then further potential can be assessed.

Appendix III: Statement of Qualifications

I, Isaac Fage, having my place of residence at 982 7th Avenue in Dawson City, Yukon Territory do hereby certify that:

1. I obtained an Advanced Diploma in Remote Sensing at the Graduate Level from the Centre for Geographic Sciences, in 2008 and prior to that graduated with a Bachelor of Arts from Dalhousie University in 2002.

2. I am President of Ground Truth Exploration Inc.; the contractor that conducted the exploration field program referred to in this report. I have been employed continuously in the Yukon mineral exploration industry since March 2004.

3. I have directly supervised the fieldwork referred to in this technical report.

4. I have authored this technical report titled: Geochemical Report on the GLEE and TESS Properties

5. This report has not been prepared for the purposes, nor in full compliance with, National Instrument 43-101.

Respectfully Submitted on this 6th day of November 2012
