1 Introduction

The 2011 exploration program on the Betty property was conducted to test the potential for gold mineralization on the Betty property. The Betty property was identified and staked as an area of exploration interest by prospector Shawn Ryan following the discovery of gold near Coffee Creek by Kaminak Gold Corp. ("Kaminak"). Mr. Ryan proposed that the east-west trending gold-bearing Coffee fault being explored by Kaminak continued through the middle of the Betty Property. He also suggested this structure was transected by the north-east trending Dip Creek fault and that the confluence of these features would be a prime location for near surface gold mineralization. On November 30th, 2010 Ethos Gold Corp. ("Ethos") announced the acquisition of an option to purchase the Betty Property ("Betty").

1.1 Scope of Work

This report describes the exploration history, geology and mineral potential of the Betty property, including work performed by Ethos Gold Corp during the period June 15, 2011 to September 30, 2011. A review of historical industry work and other information within the immediate and surrounding region is included. Regional geology, associated data and current exploration information have been reviewed to determine the geological setting and potential for mineralization.

The author worked on the property during the period June 15nd to September 30th 2011. This report presents information based on a review of pertinent literature, results from geochemical surveys and historical findings, as well as conclusions and recommendations for future explorative work.

1.2 Work Program

The objective of 2011 exploration on the Betty property, including all contiguous Ethos claims south of the Yukon River, was to detect a gold target with a significant gold-in-soil and geophysics response to warrant further work. The 2011 exploration on the Betty property included soil sampling, trenching, prospecting and rock sampling, airborne magnetic and radiometric surveying, and orthophotography. A total of 470 man-days work was completed during the 2011 field season plus work by contractors up to September 30, 2011. Ethos established a 'base camp' in Dawson at the Bonanza Gold Motel for the summer where between 5 and 10 personnel were rotated. Ethos contracted Heli-Dynamics of Whitehorse YT which provided a Bell 206 Long Ranger or a Bell 407 (or both) based at the "Druid" helipad in Dawson YT during 2011. Property access was provided via daily helicopter flight from Dawson to the targeted areas within each property. The airborne magnetics and radiometric survey was based in Kaminak Gold Corporation "Coffee" camp and used a Northern Air Support Long Ranger helicopter. The soil survey was based in a series of locally mobile field camps on the Betty property and supported by TransNorth A-Star helicopter from the Thistle airstrip. The airphoto survey was based in Dawson and used a Piper Cherokee fixed-wing airplane to complete the photography.

1.3 Terms, Definitions & Units

The following terms and abbreviations are used within this report:

- Distances are reported in meters (m), kilometres (km) and feet (ft).
- Costs are reported in Canadian dollars (CAN$).
- Locational information is reported in both Latitude-Longitude and UTM grid (Easting, Northing) NAD83, Zone 7N.
- Geochemical data is reported in parts per million (ppm) the equivalent to grams per tonne (g/t) and ounces per tonne (oz/t), as well as parts per billion (ppb).
- QAQC refers to quality assurance and quality control.
- Geological ages include: Ka (thousand) and Ma (million) years ago.
- Elemental abbreviations include: antimony (Sb), arsenic (As), bismuth (Bi), copper (Cu), gold (Au), iron (Fe), lead (Pb), silver (Ag) and zinc (Zn).
- Mineralogical abbreviations include: pyrite (Pyr) and pyrrhotite (Po) [iron sulphides], limonite (Lim) [hydrated iron oxide], magnetite (Mag) [iron oxide], chalcopyrite (Cpy) [copper sulphide] and molybdenite (Mo) [molybdenum sulphide].
- MINFILE showing refers to documented mineral occurrences compiled by the Yukon Geological Survey.
- Directional units include: north (N), east (E), south (S), west (W) and may be used in combination (*i.e.*, NNE for north-northeast).

1.4 Source Documents

The following sources of information were used in writing this technical report and include private company data and information available on the public domain:

- Review of published and scientific papers on geology on the region and on mineral deposit types
- Review of geological maps and reports completed by the Yukon Geological Survey and the Geological Survey of Canada
- Research on the Yukon Geological Survey's MINFILE database (http://servlet.gov.yk.ca/ygsmin/index.do) and Map Viewer (http://maps.gov.yk.ca/imf.jsp?site=YGS)
- Review of previously written assessment and YMIP reports at the Energy, Mines & Resources Library (http://www.emr.gov.yk.ca/library/)
- Review of publically available data, including news releases, on Ethos Gold Corp. (www.ethosgold.com/s/home.asp)
- Work directed and performed by the author on the Betty property during June through September, 2011.

1.5 Geotechnical Information

Ethos uses NAD83 Zone 7 coordinates for geographic positioning system ("GPS"). Coordinates are expressed in NAD83 Zone 7 unless specified otherwise. Ethos employees and consultants are provided with Garmin "GPSMap 62s" model GPS devices, which can automatically record continuous route tracks as well as set waypoint information. The Garmin GPS devices are assumed accurate to within 5 meters horizontally and within 10 meters on elevation. Cameras were synchronized with clocks on individuals GPS units so that photographs could be geo-tagged using Garmin Basemap software. Tracks were continuously recorded daily for mapping and prospecting surveys, waypoints entered with notes where features of interest were encountered, and photographs tagged to individual waypoint and sample locations.

1.6 Limitations, Restrictions and Assumptions

The author has assumed that the previous and documented work on the property is valid and has not encountered any information to discredit such work.

1.7 Reliance on Other Experts

The author has relied in part upon work and reports completed by others in previous years and in the preparation of this technical report. The authors' opinion contained herein is based on information obtained to date, which in turn reflect various technical and economic conditions; given the nature of the mining industry, these conditions can change rapidly over relatively short periods of time. Furthermore, thorough checks to confirm results of such reports and work has not been completed and unless otherwise stated the author has not independently confirmed the accuracy of the data. To the authors knowledge there are no known litigations potentially affecting the Betty project. Title documents and option agreements were reviewed for this study, this report does not constitute, nor is it intended to represent a legal opinion a s to the validity of the title. The project is an early stage exploration property and therefore, limited surface disturbances have been created by the company.

1.8 Qualified Person and Participating Personnel

Mr. Peter Tallman, P.Geo Chief Operating Officer (COO) of Ethos Gold Corporation (Vancouver, British Columbia) examined the property, geology and mineral potential to make recommendations for the next phase of exploration work in order to test the economic potential. Mr. Tallman directed exploration and worked on the property during the period from June 15 to September 30, 2011.

This report describes the property and the work performed in 2011 and is based on historical information and a review of recent exploration in the region.

2 Property Location & Description

2.1 Location & Land Tenure

The Betty property is located in west-central Yukon in the White Gold district within the Whitehorse Mining District, Canada, (Figure 1) and is at an early exploration phase. For the purposes of this report, the Betty property is comprised of contiguous claims subdivided into Betty East (750 claims), Betty West (676 claims), and Hayes (750 claims). The contiguous Betty property claims (NTS map sheets 115J/09, 10, 15 & 16) are centered at a latitude of 62°47'N and a longitude of 138°34'W (Figure 2) and lie 130 km southeast of Dawson City, located 540 km north of Whitehorse via a paved highway (*Table 1*). The boundaries of the property have not been legally surveyed. Refer to *Appendix I. Mineral Tenure of the Betty* for a detailed statement of claims.

Figure 1: Property location map (Ethos, 2012)

Table 1. Betty Property Claim Summary

Claim Group Name	Claim No. (from)	Claim No. (to)	Grant No. (from)	Grant No. (to)	NTS	Expiry Date*	Total No.
Betty	1	564	YD96501	YD97064	115J/09,10, 15 & 16	01/08/16	564
Betty	565	730	YD133355	YD133520	115J/10 & 15	04/08/18	166
Betty	731	860	YD97071	YD97190	115J/09,10, 15 & 16	09/29/16	130
Hayes	1	100	YE24001	YE24100	115J/09 & 16	06/29/17	100
Hayes	101	1316	YE22701	YE23916	115J/09, 16, 115I/12 & 13	06/29/17	1216
*Based upon acceptance of this report						Total Claims-	2176
						Approximate Total Area (ha)-	44,090 ha

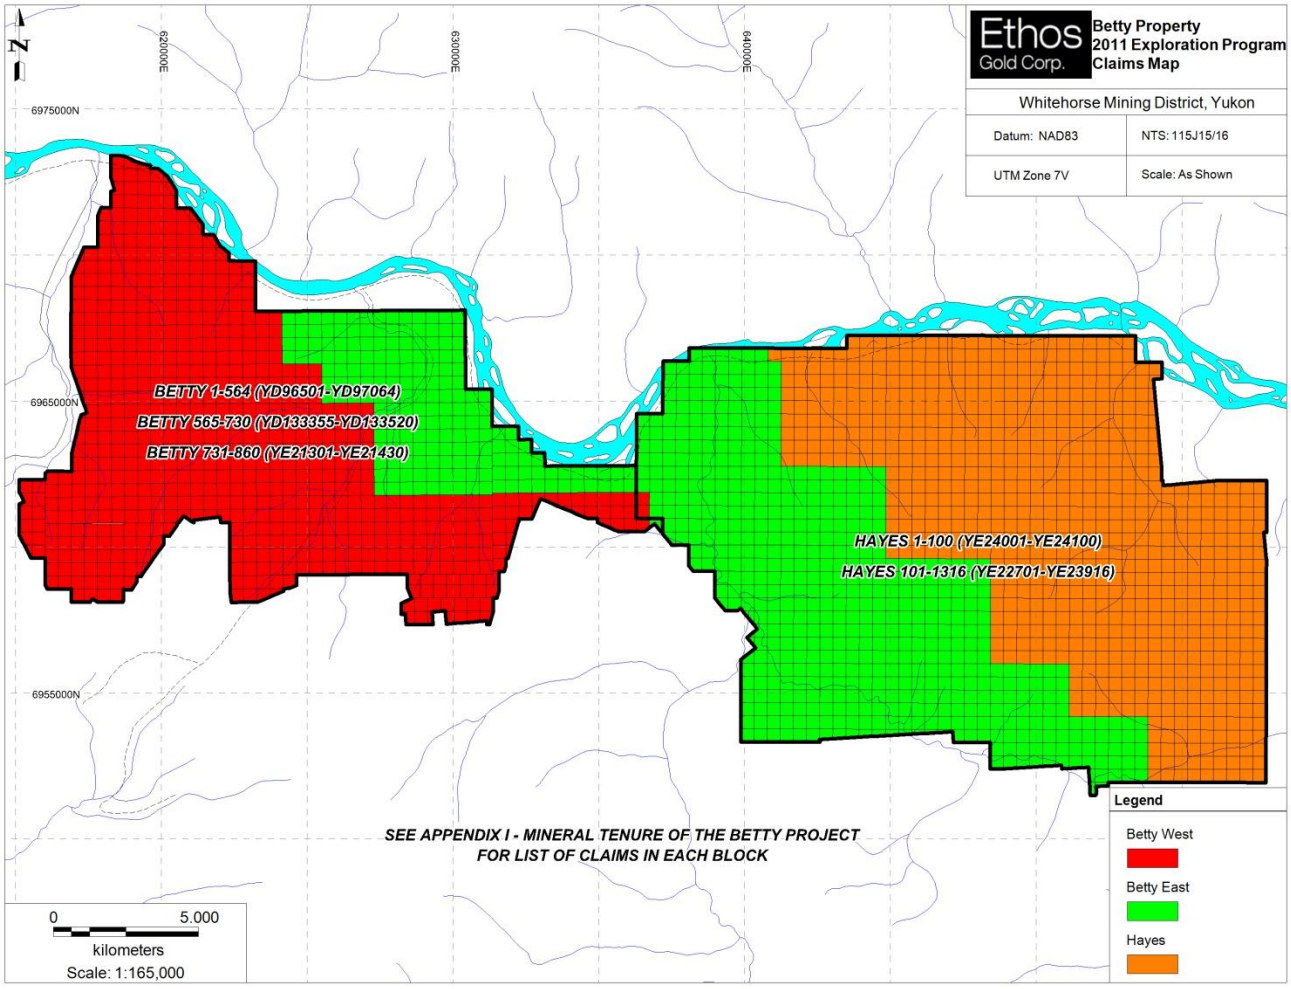

Figure 2: Claims Location Map (Ethos, 2012)

2.2 Underlying Agreements

The Betty Property, consisting of the Betty East claims, the Betty West claims, and the Hayes claims, were optioned from Shawn Ryan (70%) and Wildwood Explorations Inc. (30%) (the "vendors") by agreement dated November 30, 2010. At the time of the agreement, Shawn Ryan was 70% owner and Wildwood Explorations Inc. was 30% for the Betty 1-564 claims. Shawn Ryan was 100% owner of the Betty 565-860 claims.

Under the terms of the Betty agreement, Ethos can earn a 100% interest through a series of staged payments and issuance of shares over four years, as well as staged exploration expenditures by October 15th 2015. Additional common shares are payable upon Ethos having incurred $4,000,000 in cumulative expenditures and also having incurred a cumulative total of $7,500,000 in expenditures. The vendor retains a 2% underlying net smelter return royalty (NSR).

The claims are located within the Traditional Territory of the Selkirk First Nation with minor overlap with the Tr'ondëk Hwëch'in (TH) First Nation. Both First Nations have settled their land claims in the area. The closest Selkirk First Nation surveyed land (SFN R-12A) lies approximately 5 km south of the property. The claims are situated on Crown Land and therefore the mineral claims fall under the jurisdiction of the Yukon Government. Surface rights would have to be obtained from the government should the property go into development.

As required by the Yukon Quartz Mining Act, a mineral claim holder must perform $100 assessment work per claim, per year and document this work to maintain the title, or otherwise pay $100 in lieu per claim per year to maintain title to the claims.

Early exploration activities do not require permitting, however significant drilling, trenching, blasting, line cutting and excavating may require a Mining Lands Use Permit (MLUP) that must be approved under the Yukon Environmental Socioeconomic Assessment Act (YESAA). To the author's knowledge, the property does not cover any environmental liabilities.

3 Accessibility, Local Resources, Infrastructure, Physiography & Climate

3.1 Access, Local Resources & Infrastructure

The project is centered at a latitude of 62°47'N and a longitude of 138°34'W (E623575, N6964825 NAD 83, Zone 7N). There is no road access to the Betty property during the summer months however during the winter the Casino Trail winter road is serviced by "snowcats" which pass along the southern claim boundary of the Betty property. The claims are accessible via helicopter from Dawson City (150 km), 536 km north of Whitehorse via a paved highway, or from the communities of Carmacks (170 km southeast) or Minto (100 km east). The property is also accessible by fixed wing to the Thistle Airstrip (E6995390, N586256 NAD 83, Zone 7N) from airstrips at Dawson, Carmacks, Minto or Whitehorse, followed by a 45 km helicopter flight to the claims. Several charter aircraft companies provide services with a variety of aircraft types. Other airstrips close to the Betty property include the Casino airstrip located 10 km to the southwest built and maintained by Western Copper to service the Casino Au-Cu mine development project, and a smaller 300 meter long airstrip on Hayes Creek located 25 kilometers to the east was built and is maintained by Carmacks-based placer miner George Wilson. Other local airstrips of significance include those at Rude Creek, Black Hills, Kirkman, Barker, Scroggie, Ballarat, and Coffee Creek associated with placer mining operations.

Commercial charter barges are available during summer for bulk transport of materials from Minto or Dawson City (the largest town with amenities) along the Yukon River. Barge landing areas have been constructed at Britannia Creek on the Yukon River (maintained by Western Copper for the Casino project) in the northeast corner of the Betty property, and at Isaac Creek on the Yukon River (used c.1900 to 1930's). Nearby barge landings along the Yukon River have also been built at the mouths of Ballarat and Thistle Creeks which support placer gold mining operations. A cat-trail from the mouth of Isaac Creek extends along the creek into the surrounding highlands and connects to a cross-country trail constructed in the 1970's from Burwash Landing to Casino. Water is available from the northerly flowing tributaries of the Yukon River including tributaries of Issac and Britannia Creeks (Pautler, 2011) (Figure 3).

Dawson City, home of the historic 1896-1899 Klondike Gold Rush has approximately 1300 residents and draws nearly 60,000 visitors each year (Statistics Canada, 2006). Main industries in Dawson City are tourism and placer mining. Heavy equipment repair and rental, a lumber mill, freighting and trucking companies and a mining oriented labour force is available for contract exploration and mining work. An airport with air service to Whitehorse and Fairbanks, Alaska and two permanent and several seasonal helicopter company bases are present providing transportation. Facilities include a health center, grocery stores, a police station, service stations (tire repair and propane sales), welding and machine shops, accommodation and restaurants.

The nearest hydroelectric power source to the Betty claims is the Minto Mine owned by Capstone Mining Corporation which lies approximately 75 km to the south-southeast (Figure 3). The Minto Mine is a 3,600 tonne per day open pit copper

mining operation with conventional crushing, grinding, and flotation to produce copper concentrates with significant gold and silver credits. Concentrates are exported via truck through the Port of Skagway, Alaska. The Minto Mine was commissioned in 2007 and has an expected mine life (as of January 2012) sufficient to 2020 (Giroux, G.H., 2010; Hester, M., 2011).

The Casino Deposit owned by Western Copper and Gold Corporation is located on claims adjoining Ethos' Betty Property along the Betty southern claim boundary. The Casino Deposit contains reserves totaling 976M tonnes milling and 82M tonnes heap leachable containing 8M oz gold, 4.5B lbs copper, and 0.5B lbs molybdenum (G. Giroux, 2010; M. Hester, 2011) is undergoing final feasibility study. A greater than 50 man camp, fuel tanks, equipment ship, plus a large airstrip, a local road network, and other infrastructure is located on the property.

A private approximately 75 km road from Carmacks, YT is proposed to connect to the Casino Deposit to the Yukon Highway. Engineering, permitting, and some construction of this haulage road is underway (December 2011). The completion of this road to Casino has the near-future potential to favourably affect project thresholds and economic costs at the Betty Property.

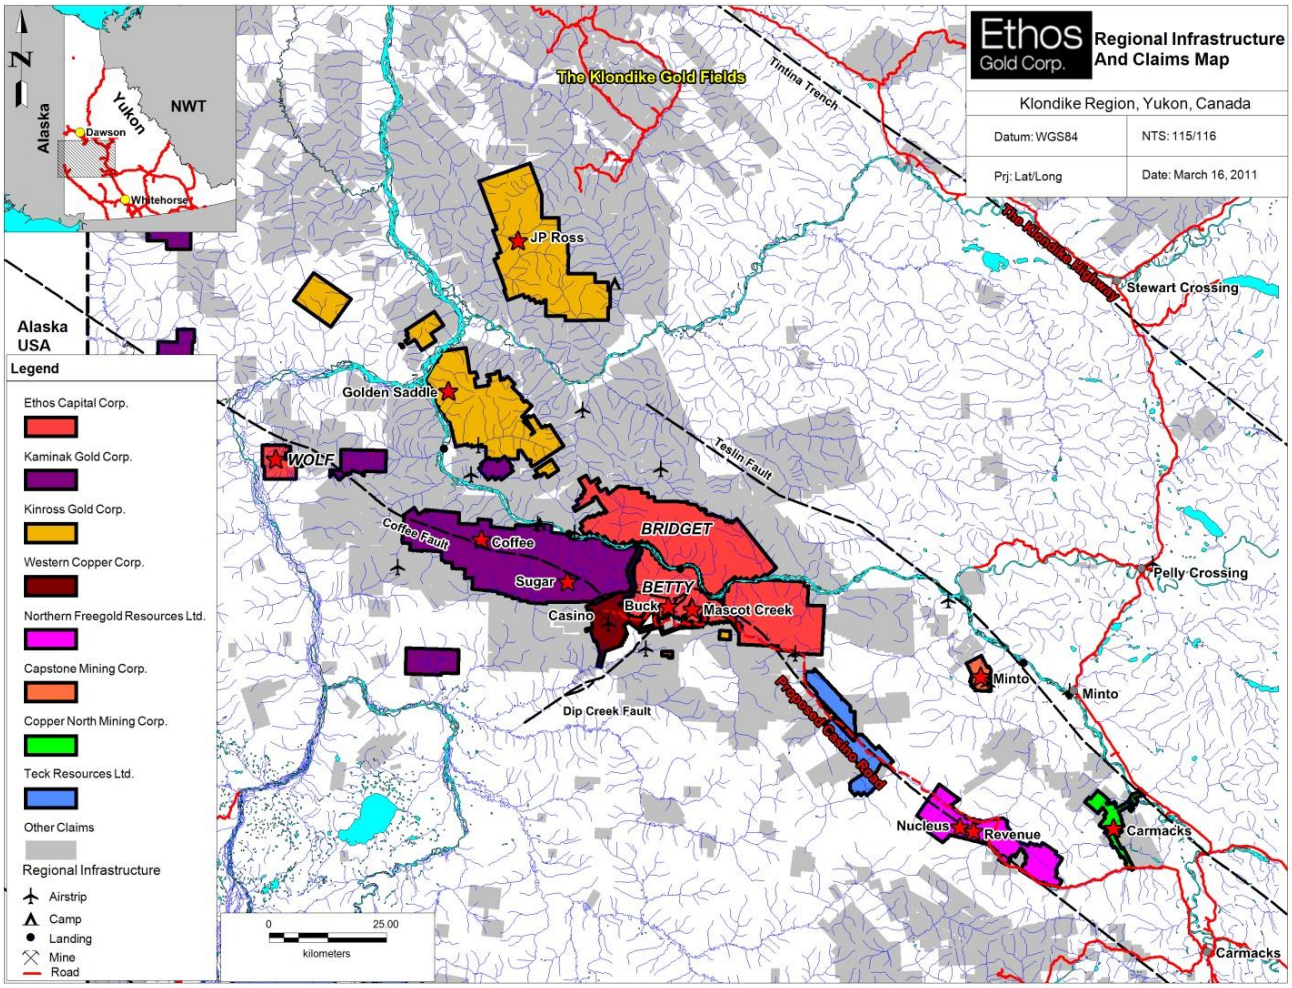

Figure 3: Property infrastructure (Ethos, 2012)

3.2 Physiography & Climate

The area of interest covers low rolling hills within the Dawson Range on the unglaciated Yukon Plateau. The topography is characterized by rolling terrain with rounded hill tops and local flat plateau areas. Elevations range from just under 1300' (396 m) along the Yukon River to 4400' (1341 m) in the southwestern corner with central ridges reaching 3700' (1128 m). Vegetation is typical boreal forest with sparse vegetation above elevations of 3500' (1067 m). Exploration in the region

typically begins in late May and ends in October as the climate is characterized by continental subarctic conditions with average temperatures ranging from 15.6°C (60°F) in July to -26.7°C (-16°F) in January (Environment Canada, 2012).

The property is drained by the northerly-flowing tributaries of the Yukon River. Vegetation is typical boreal forest (white spruce, birch, poplar and black spruce) with sparse vegetation above elevations of 3500' (1067 m) dominated by buckbrush and sparse tree cover.

4 Property History

The Dawson Range has been placer mined and explored for copper porphyry mineralization since the 1960s. The property covers the Empire, Marguerite, Brewster and Mascot MINFILE occurences (115J 069, 070, 071 & and 074, respectively). Empire (115J 069) and Mascot are unknown mineral occurrences, Marguerite is a polymetallic Ag-Pb-Zn± Au, Cu and mineralization at Brewster is reported to be plutonic-related gold. Modern gold exploration in the area began in the late 1990's and the area has become a regional focus since the discovery of the Golden Saddle gold deposit 60 km to the northwest in 2007 by Underworld Resources (now owned and operated by Kinross Gold Corporation) and the Coffee gold mineralization 40 km to the west in 2009 by Kaminak Gold Corporation. The area of the Betty property has been staked intermittently although little exploration results are recorded. In 2008 Shawn Ryan collected 33 reconnaissance soils.

The Betty property was staked by Shawn Ryan in August 2010 following the discovery of gold on the adjacent property at Coffee. Exploration by Ethos began in June 2011 with soil surveys, airbourne geophysics, orthophotography and surficial mapping, prospecting, and trenching.

The property history is summarized in *Table 2* and is based upon information from the YGS's MINFILE capsules 115J 069, 070, 071 & and 074 (Empire, Marguerite, Brewster and Mascot; Deklerk (*compiler*), 2011), 'Mineral Industry Reports', and various 'Yukon Exploration and Geology' publications.

Table 2. Betty Property – Work History

April 1924	Mascot occurrence (115J 074) originally staked as Premier (*15032*; Deklerk, 2011).
1966	Marguerite occurrence stakes as the Sun claims (*Y5404*) by Kluane Exploration Ltd. Later that season explored by soil geochemical surveys concentrating on silver-lead veins (Deklerk, 2011).
1969	Marguerite occurrence restaked Arm, Carlo, Folly, Fred etc. claims (*Y43296*) by Marguerite Lake Mines Ltd.
1969-1970	Brewster occurrence staked as Folly (*Y43021*, *Y43043, Y43065 & Y43089*) in 1969 and Rain (*Y53507*) in 1970 by Brewster Lake Mines Ltd. Later that season explored via geochemical grid soil sampling (593 samples) and prospecting (on Folly and Rain claims to east). Sampling delineated a 240 m X 460 m copper soil anomaly (Brewster anomaly) with copper-in-soil values ≤105 ppm (Radvak, 1971).
1970	Empire occurrence staked as Hop (*Y48919*) in January 1970 by Empire Mercury Corporation Ltd. Later that season, 423 grid soil samples were collected in conjunction with mapping (probably staked as a copper-porphyry target). Reportedly returned no significant anomalies (Scott, 1970). Exploration of the Marguerite via geochemical grid soil sampling, geological mapping and bulldozer trenching by Nippon Mining of Canada Ltd., under option from Marguerite Lake Mines Ltd., resulting in delineating four copper soil anomalies, one up to 550 m-long where trenching exposed a small section of rusty skarn with weakly mineralized chalcopyrite (Marguerite showing) hosted by the metamorphic rocks (Craig & Laporte, 1972).
1999	Brewster occurrence staked as Hiho (*YC09898 & YC13901)* 2 km to the east and subsequently optioned the claims to Prospector International Resources Inc. which carried out geochemical soil sampling later that year. The survey identified an area of weakly anomalous arsenic (≤143.4 ppm), antimony (≤10.36 ppm) and molybdenum (≤4.42 ppm), approximately 1.1 km northeast of the Brewster occurrence in a location underlain by schist and gneiss (Jaworski and Meyer, 2000a).

2007-2008 Brewster staked as Flush claims (*YC60340*) 1.5 km to the northeast and later in 2008, Ryan collected 33 soil samples along a line to follow-up the 1999 arsenic anomaly. Samples returned a broadly arsenic anomalous zone (≤78.5 ppm) and antimony (≤10.1 ppm) at the ends of the line (Ryan, 2008).

5 Geological Setting

5.1 Regional Geology

The Betty property is located on the 1:250,000-scale 115J (Stevenson Ridge) map-sheet, which was completed in 1974 by Templeman-Kluit (Geology, Snag, Yukon (NTS 115J/K), GSC Preliminary Map 16-1973). In 2005, Gordey and Ryan re-compiled map sheets 115N, 115O and part of 115J (GSC Open File 4970).

The property is located in the Yukon-Tanana terrane (*herein* YTT), which underlies much of central and western Yukon. Its history and tectonic evolution, particularly prior to mid-Mesozoic time, has been largely obscured by younger magmatism and tectonism. The YTT is primarily a product of episodic continental arc magmatism forming a sequence of accreted pericratonic terranes that form a large portion of the Omineca Belt. The terrane underlies part of the Tintina gold belt and hosts gold deposits related to Mesozoic intrusions, including the Sonora Gulch gold deposit and the Casino copper-gold-molybdenum porphyry located southeast of the Coffee project (Bennett *et al*., 2010). The widespread YTT is defined by metamorphosed and deformed sedimentary and volcanic rocks (schists and gneisses) that were accreted along foliation-parallel thrust faults and later deformed in the late Paleozoic, creating multiple penetrative rock fabrics. The TTY was intruded by a number of Mesozoic suites including the Late Cretaceous Dawson Range intrusions (felsic stocks and related rhyolite dykes). The rocks were later tectonically staked along foliation-parallel trust faults during the Early Jurassic (Mortensen, 1996) and subsequent regional extension occurred between the middle Cretaceous and Eocene, accompanied by fault-controlled mafic and felsic magmatism (Gabrielse and Yorath, 1991).

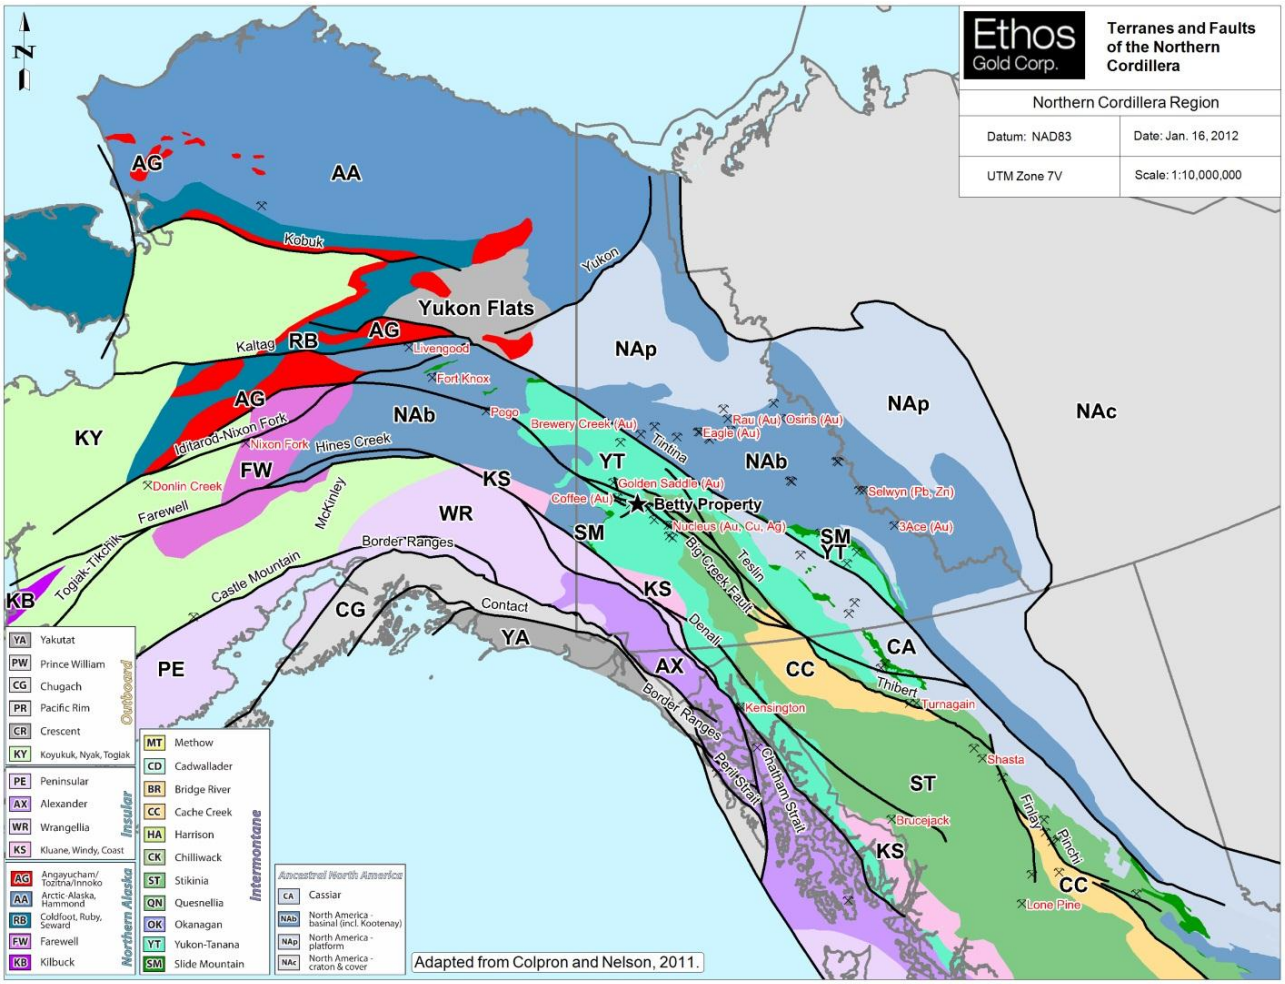

Figure 4: Regional geology (Ethos, 2011)

5.2 Property Geology

The property occurs in the unglaciated Dawson Range, wedged between the northwest-striking Tintina fault to the northeast and the Denali fault to the southwest. The Dawson Range is characterized by metamorphosed basement rocks of the YTT and is intruded by voluminous Jurassic to Cretaceous intrusions, largely the mid-Cretaceous Dawson Range Batholith. The YTT basement rocks in the northern claim area are represented by Devonian to Mississippian-aged Snowcap Assemblage (420 Ma) orthogneiss. The YTT basement rocks in the center of the property are represented by the Permian-aged Sulphur Creek suite (262 Ma). Both YTT basement rocks were intruded upon during the Mid-Cretaceous by smaller felsic stocks and related rhyolite dykes of the Whitehorse Suite (112-105 Ma) (located to the south on the property). The Whitehorse Suite includes the Coffee Creek phase and the Dawson Range Batholith. The Dawson Range Batholith primarily consists of Casino granodiorite phase. However, in the southeastern and southwestern corners, a dioritic phase is exposed (*Table 3) (Ryan et al., 2012)*.

Table 3. Regional Geological Units (Ryan *et al.*, 2012).

Unit	*Age*	*Rock Type*
Dawson Range	Lower Cretaceous 112-102 Ma	Medium to coarse-grained, unfoliated to weakly foliated, hornblende +/- biotite granodiorite with lesser quartz diorite, tonalite, granite and diorite (may contain orthoclase megacrysts and fine-grained diorite enclaves). Leucocratic and aplitic margins.

Sulphur Creek suite	Permian 262 Ma	Quartz and K-fledspar porphyritic to augen monzogranite; strain varies from moderately foliated to gneissic; biotite bearing; is locally the protolith of felsic Klondike Schist.
Simpson Range Suite	Mississippian 345 Ma	Compositionally layered, weakly to intensely foliated, granodiorite to diorite to monzogranite.
Finlayson Assemblage	Devionian-Mississippian 416-318 Ma	Carbonaceous metasilicclastic: interlayered with carbonaceous quartzite and mica-quartz schist; black to white quartzite, garnet schist and rare black phyllite. Also amphibolite schist to garnet-amphibolite; metabasite; usually hornblende+/-garnet, with local chlorite-biotite. These rocks were probably derived from mafic to intermidate volcanic to volcaniclastic units of the Finlayson arc assemblage (some mafic sills).
Snowcap Assemblage	Pre-Devonian 420 Ma	Metasilicilastic rocks – include layered quartzite, psammite and lesser semipelite. The latter commonly contain garnet with local kyanite or andallusite porphyroblasts.

The property covers a major structural intersection with the northeasterly-trending Dip Creek fault intersecting the northwesterly-trending Coffee Creek structure (probable extension of the Big Creek fault; Pautler, 2011). Kaminak Gold Corporations' Coffee project situated 40 km to the southeast, reported significant gold mineralization along the Coffee Creek structure.
The creeks in the claim region have seen some placer mining, Britannia Creek has been a significant gold producer and Isaac Creek has also seen some placer activity.

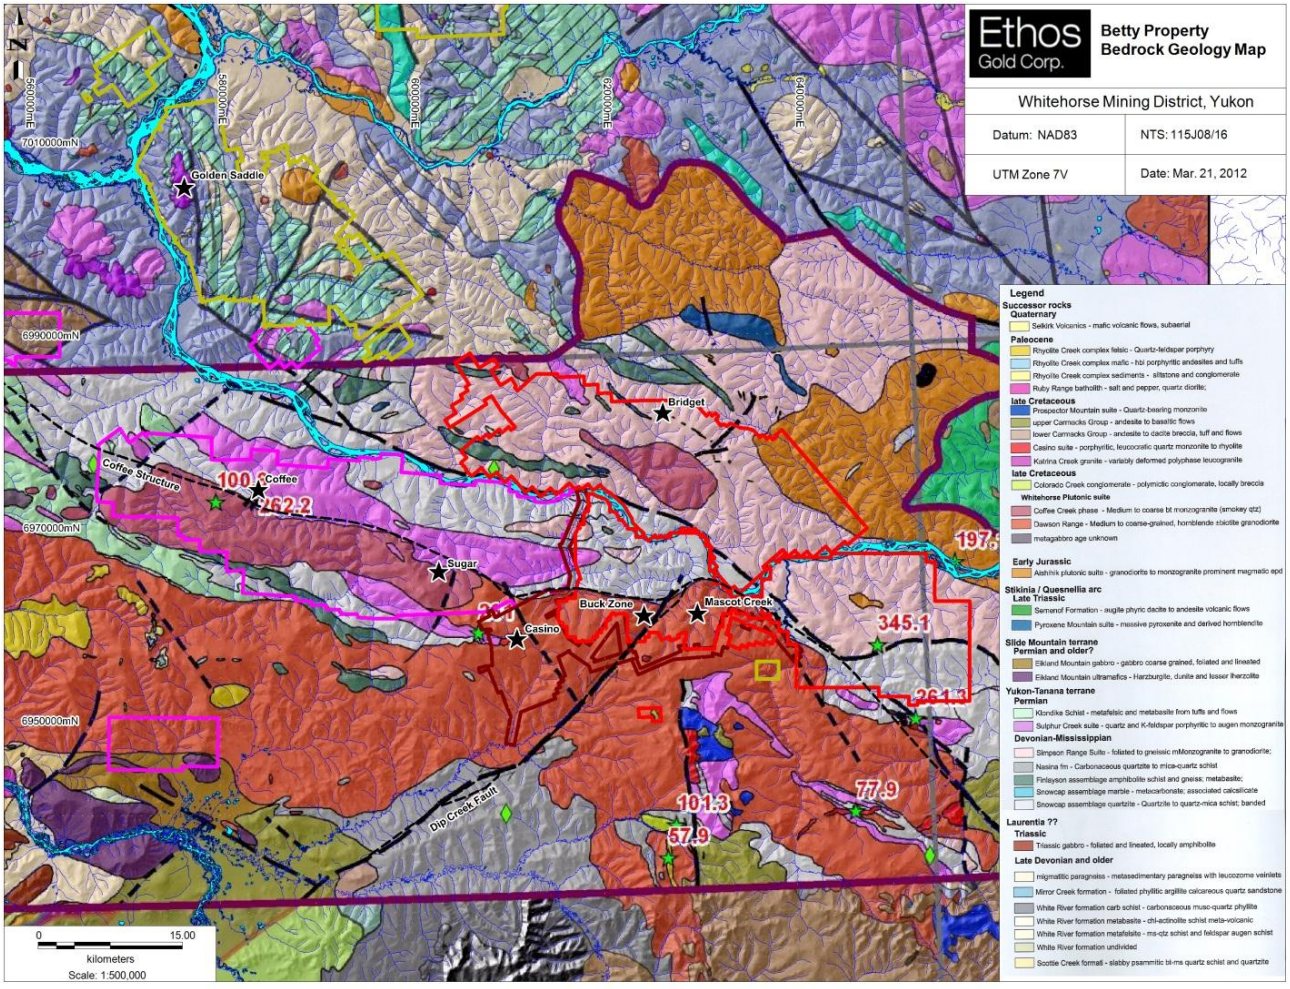

Figure 5: Betty property geology (after Ryan, 2012)

6 Deposit Types & Mineralization

6.1 Deposit Type

The Betty claims cover a portion of the Tintina Gold Belt, a 200 km-wide by 1,200 km-long arcuate, metallogenic province that extends from British Columbia, through Yukon to Alaska. The province is underlain by rocks of the YTT and is characterized numerous gold deposits including: Pogo and Fort Knox, True North, Donlin Creek, Shotgun (Alaska), and the White Gold (Yukon). The Pogo property has proven and probable reserves of 3.6 million ounces gold and measured and indicated resources of 1.7 million ounces gold. Donlin Creek has proven and probable reserves of 29.3 million ounces of gold and measured and indicated resources of 6 million ounces gold. Kinross Gold Corporations' White Gold deposit (AKA-Golden Saddle) is located thirty-five kilometers to the northeast. The White Gold deposit contains an indicated resource of 9,797.000 tonnes grading 3.2 g/t gold (1,005,000 ounces), primarily mineable by open pit methods using a cutoff of 0.5 g/t Au for the open pit and 2.0 g/t Au for underground (Weiershauser *et al.*, 2010). The deposit has additional inferred resources of 9,391,000 tonnes grading 1.91 g/t gold (578,000 ounces) (Weiershauser *et al.*, 2010).

Mineralization on the White Gold property, at the 'Golden Saddle' showing is preferentially hosted within the Devono-Mississippian aged YTT rocks including metamorphosed intrusive rocks (felsic orthogneiss), as well as felsic and mafic metavolcanic rocks. Gold mineralization is associated with quartz veins, stockwork and breccia zones, as well as pyrite veinlets and disseminations, and includes cubic pyrite and visible gold (Paulter, 2011). Mineralization at Golden Saddle is largely structurally-controlled and models for mineralization include epithermal and intrusion related gold. Epithermal textures are evident within the veins and porphyry style alteration is suggestive of a younger intrusion at depth (Paulter, 2011). Penetrative carbonate-sericite-potassic feldspar-silica alteration surrounds mineralized zones. The property has multiple mineralized zones, some of which are associated with Permian intrusive rocks, others are hosted by Nasina Assemblage (DMN_3) and part of the Golden Saddle is hosted by an ultramafic horizon.

At Kaminak's Coffee project, mineralization is similar to White Gold in that gold is hosted in quartz veins, stockworks and breccia zones. A strong association with gold and pyrite has been established and mineralization is largely structurally controlled and proximal to the Coffee Creek structure. Gold structures [on the Coffee project] are generally steeply-dipping and cross-cut all rock units; moreover, there is a lack of direct evidence of gold mineralization associated with specific vein or breccia events (Couture, 2011). Host rocks include felsic orthogneiss, an ultramafic horizon and the Cretaceous Coffee Creek granite (Paulter, 2011). Selected intersections from Kaminak's news releases at Coffee include gold grades of 17.1 g/t over 15.5m (Supremo Zone), 1.08 g/t over 83.93m (Latte Zone), 6.3 g/t over 35m (Double Double Zone), 2.21 g/t over 56.75m and 1.92 g/t over 23m (Kona Zone), 2.36 g/t over 18m (Americano Zone) and 5.5g/t over 11m (Connector Zone). Soil sampling, detailed ground magnetic data, aerial photograph interpretation, trenching and drilling data suggest that the gold mineralization is hydrothermal, structurally controlled and that the auriferous structures crosscut all lithologies on the property (Couture, 2011).

The Betty property is considered prospective for near-surface, bulk tonnage intrusion-related to epithermal, structurally-controlled gold mineralization similar to that recently discovered at Coffee and the White Gold deposit and within the Tintina Gold Belt (Table 4). Furthermore, the Coffee fault structure which localizes gold mineralization is interpreted to strike across the Betty property.

Table 4: Gold deposits in the Tintina Gold Belt (Kinross 2012, Kaminak 2012, Donlin Gold 2012, Sumitomo Metal Mining 2012)

Deposit	Owner	Proven & Probable reserves	Measured & indicated	Host & Deposit Type
Pogo	Sumitomo Metal Mining Pogo LLC	3.6 M oz Au	1.7 M oz Au	Quartz-vein hosted in mid-Paleozoic gneiss
Donlin Creek	Donlin Gold	29.3 M oz Au	6 M oz Au	Quartz-vein and breccias hosted in felsic sill and dikes

Fort Knox	Kinross Gold Corp	4.3 M oz Au	1.4 M oz Au	Quartz, quartz-sercite, quartz pegmatite veins, stockwork, and shear zones hosted in intrusive granitic complexes.
White Gold (Golden Saddle)	Kinross Gold Corp.		1.6 M oz Au	Quartz-vein, stockwork and breccias hosted in Devonian-Mississippian felsic orthogneiss and felsic and mafic metavolcanics. Structurally controlled, epithermal and intrusion related
Coffee Project	Kaminak Gold Corp.		Drilling on going*	Quartz-vein, stockwork and breccias hosted in felsic orthogneiss, ultramafics and granites

*gold grades of 17.1 g/t over 15.5m, 1.08 g/t over 83.93 m, 6.3 g/t over 35 m, 2.21 g/t over 56.75 m and 1.92 g/t over 23 m, 2.36 g/t over 18 m, and 5.5 g/t over 11 m.

6.2 Mineralization

The Betty property has less than 3% outcrop making it difficult to characterize the mineralization. However, samples from outcrop, trenches and pit trenches, mineralization in surrounding projects, and previous mineral occurrences were used to describe and constrain the mineralization as much as possible.

6.2.1 Mineralization of the Mascot and Buck Zones

Based on outcrop and trench results mineralization is associated with quartz veining hosted in altered granodiorite or diorite. The quartz veining contains arsenopyrite, pyrite and galena, with lesser chalcopyrite, stibnite, and molybdenum. Limonitic (+hematitic), carbonate, and silica alteration were associated with mineralization. Soil samples from the two zones indicated the strongest correlation to gold was with arsenic, followed by bismuth and silver (respectively).

6.2.2 Mineralization in surrounding properties

Mineralization at Kinross' White Gold (Golden Saddle) project is largely structurally-controlled and models for mineralization include epithermal and intrusion related gold. Epithermal textures are evident within the veins and porphyry style alteration is suggestive of a younger intrusion at depth (Pautler, 2011). Penetrative carbonate-sericite-k-feldspar-silica alteration surrounds mineralized zones. The project area has multiple mineralized zones, some of which are associated with Permian intrusive rocks, others are hosted by Nasina Assemblage and part of the Golden Saddle is hosted by an ultramafic horizon.

At Kaminak Gold Corporations' Coffee project, mineralization is similar to White Gold in that gold is hosted in quartz veins, stockworks and breccia zones. A strong association with gold and pyrite has been established and mineralization is largely structurally controlled and proximal to the Coffee Creek structure. Gold structures in the project area are generally steeply-dipping and cross-cut all rock units; moreover, there is a lack of direct evidence of gold mineralization associated with specific vein or breccia events (Couture, 2011). Host rocks include felsic orthogneiss, an ultramafic horizon and the Cretaceous Coffee Creek granite (Pautler, 2011).

The Betty property has a prominent intersection of the northeasterly-trending Dip Creek fault and the northwesterly-trending Coffee Creek structure (probable extension of the Big Creek fault) which exhibits the claims potential to host similar mineralization to the above mentioned projects. Therefore, the Betty property is considered prospective for near-surface, bulk tonnage intrusion-related to epithermal, structurally-controlled gold mineralization similar to that recently discovered at Coffee and the White Gold deposit.

6.2.3 Mineralization of previous mineral occurrences

The Betty property covers the Marguerite and Brewster MINFILE occurrences (115J 070, & 071 respectively).

The Marguerite showing is reported to cover a small section of rusty skarn that includes the contact between the YTT and metasedimentary rocks with the Dawson Range Batholith. The rusty skarnified marble exhibits weak chalcopyrite (copper) mineralization (Pautler, 2011). Abundant quartz-feldspar porphyry and felsite dykes or sills with minor disseminated pyrite have been reported across the property with pyrite associated with late felsic dykes. Pyrite is commonly associated with mineralization on the Coffee project.

The mineralization at the original copper-in-soil Brewster anomaly is reportedly plutonic-related gold (Deklerk, 2010). An area of anomalous arsenic, antimony, and molybdenum is located approximately 1.1 km to the northeast of the property (Jaworski and Meyer, 2000a). In 2008, Ryan conducted a line of soil sampling that verified a broad arsenic anomaly with anomalous antimony at the ends of the soil line.

7 2011 Ethos Exploration Work

Ethos carried out its first exploration program on the claims over the course of the 2011 first field season. The objective of 2011 exploration on the Betty property was to screen the property, primarily using soils, to detect anomalous soils that would suggest a substantial zone of gold mineralization. Exploration in 2011 consisted of soil sampling, prospecting and rock sampling, pit trenching, airborne magnetic and radiometric surveying and air-photo/orthophoto imagery. A total of 558 man-days of explorative work was completed on the claim block during the program.

7.1 Soil Sampling

Prior to 2011, Shawn Ryan (2008) completed a small soil geochemical sampling program, collecting a total of 33 samples along a test line. During 2011, Ethos' contracted Ground Truth Exploration Inc., of Dawson City, to complete the soil-sampling component of the exploration program.

Photo-plate 1.
Ground Truth provided several crews of 5 people each. The crews camped at convenient location on the Betty Property including a camp on the Mascot grid during grid soil collection.

Ethos engaged Trans-North Helicopters who provided A-Stars from their Dawson, Yukon base to provide helicopter support to Ground Truth and Ethos. Ethos also utilized Great River Air for fixed-wing aircraft logistical support to the Thistle and Ballarat airstrips.

Ground Truth planned each job and sample sites using ESRI ArcMap to sample over areas of exploration interest. Grid sampling (typically 100 x 50 m) and reconnaissance ridge and spur (also known as elevation contour) sampling was planned in advance with ESRI. The guide points were transferred to each soil sampler's GPS for use in the field and supplied with an accompanying small-scale topographic map.

During the 2011 field season 14,677 soil samples were collected and submitted for assaying. A total of 14,670 soil geochemical sample results were returned including 827 duplicates, 521 blanks, and 657 standards (7 rejects due to insufficient soil after removal of organics). A total of 7,016 soil samples were collected on the Mascot Grid which were

designed to follow up on gold-soil anomalies obtained from the reconnaissance 7,661-sample ridge-and-spur soil campaign on the Betty Property (assay certificates are in Appendix IV).

A highly anomalous area was identified and occurs near the intersection of the Coffee Fault and the Dip Creek Fault defining a 3 km^2 area of anomalous gold (597 ppb) and arsenic (920 ppm). Gold has a strong positive correlation with arsenic (statistically >70%) in the soil results, acting as an excellent pathfinder for gold mineralization. This area was called the Buck zone. A second anomalous area (Mascot Creek Anomaly) was identified later in the exploration season. This anomaly was expanded with grid soil work to cover a 17.5 square km area with gold in soil values up to 7.3g/t Au (Figure 6). Anomalies were also identified in the highly prospective Coffee fault with gold in soil values up to 441 ppb. Soil sampling within the contiguous claims to the east (the Hayes property) identified sporadic single-site gold-in-soil anomalies (Figure 7).

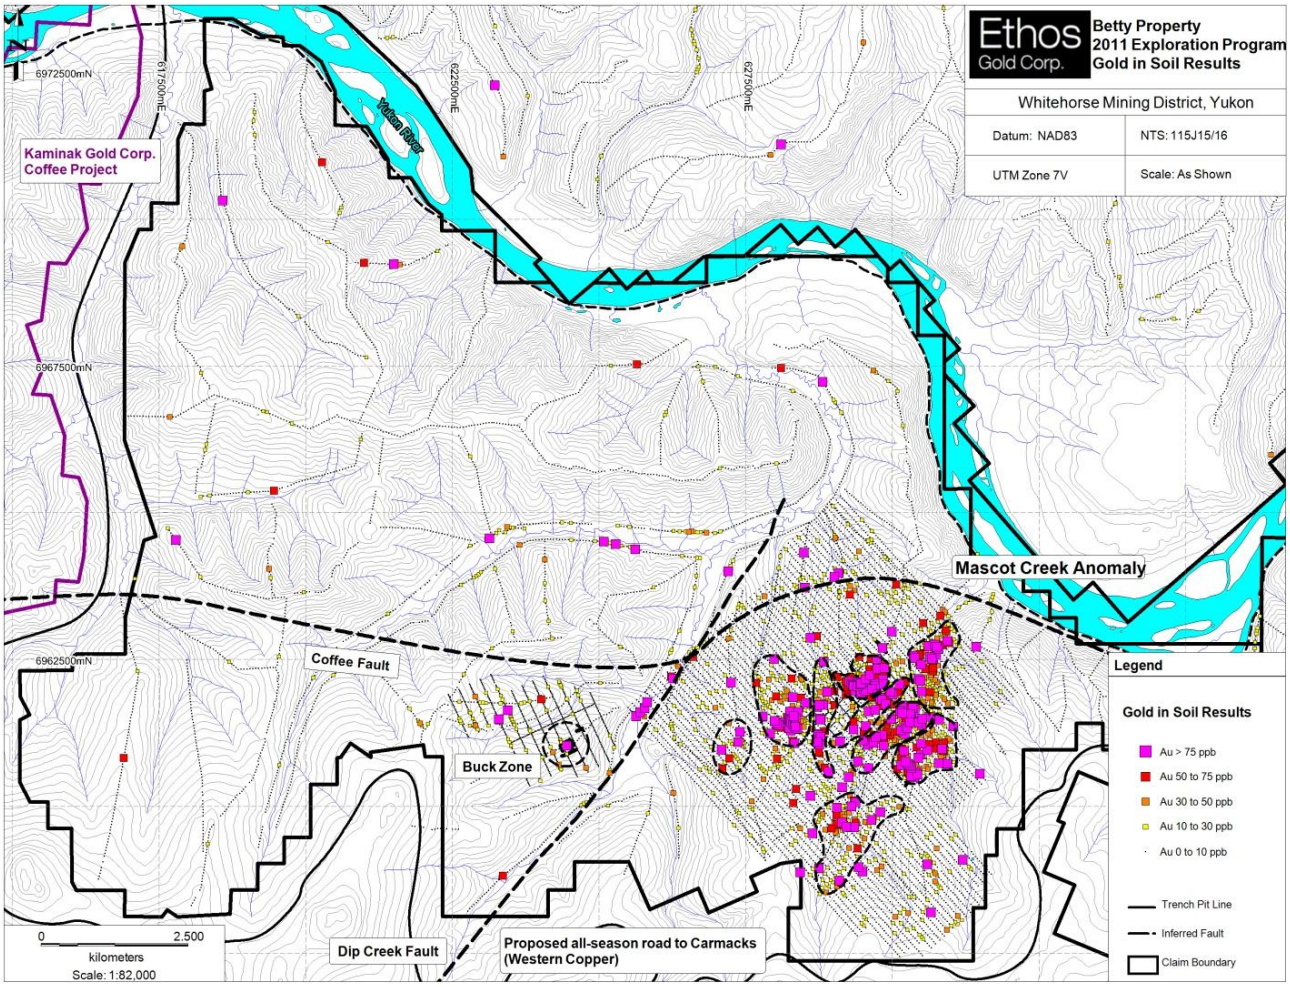

Figure 6: Soil Results for the Betty Property (Ethos, 2012)

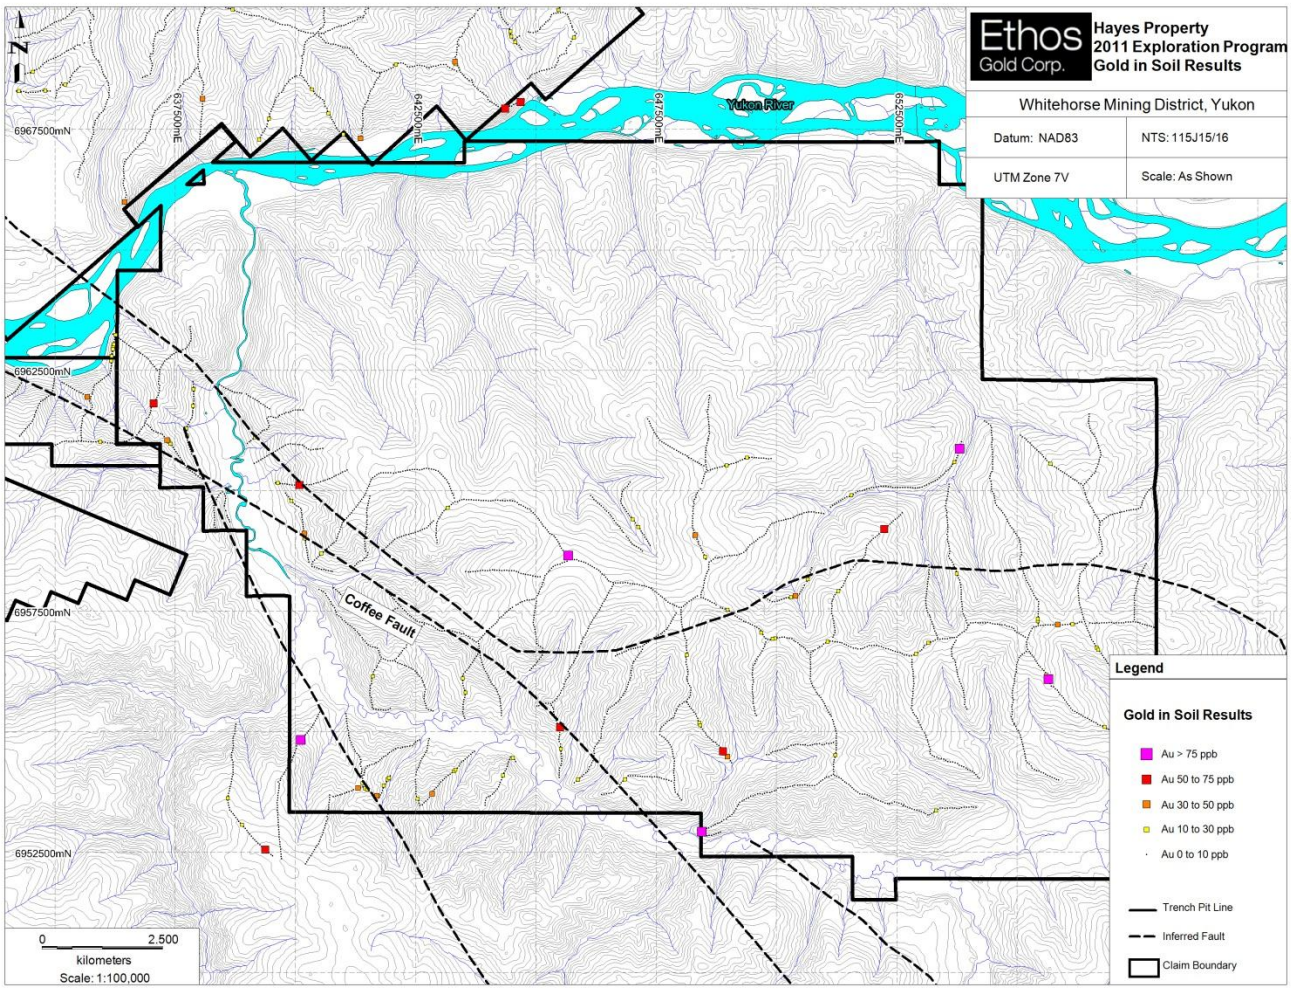

Figure 7: Soil Results for the Hayes Property (Ethos, 2012)

7.1.1 Mascot Zone

The Mascot zone encompasses a 17.5 km^2 area and contains a large, multiline gold-soil anomaly that is similar in size and intensity to anomalies defined at recent gold discoveries in the Klondike White-Gold District, including the White Gold (Kinross) and Coffee (Kaminak) properties. When directly compared to these areas, the Mascot anomalies rank among the top three gold soil anomalies in the region: six soil values above 1,000 ppb Au to a maximum of 7,288 ppb Au, 105 sites with values above 100 ppb Au, and 462 sites with values above 25 ppb Au. The Mascot zone has been subdivided somewhat arbitrarily into nine zones; Bond, Mercedes, Thornton, Spitz, Miller, Perrault, Marshall, Koona and Teek. The zones were divided based on interpreted magnetic lineaments combined with anomalous soil chemistry, encouraging assays from prospecting rock grab samples, and visual results from recently completed prospecting pits.

The Mercedes anomaly is 1,300 meters in length and up to 700 meters wide defined by samples greater than 75 ppb gold in soils. The maximum gold soil value is 1,149 ppb gold.

The Spitz anomaly is 1,700 meters long with a maximum soil value of 7,288 ppb gold (7.3 g/t Au) with 78 g/t silver. The 7.3 g/t gold in soil anomaly is the second highest soil result known to the Company in the Klondike-White Gold district and is comparable to the highest gold soil values at the White Gold and Coffee projects.

The Thornton anomaly is open-ended and 1,600 meters length. It has nine soil sites greater than 100 ppb gold and up to 306 ppb gold. It is defined primarily by gold anomalous ridge-and-spur reconnaissance soil samples.

The Miller anomaly is 1,500 meters in length with values in soils up to 560 ppb gold and is up to 550 meters wide with values above 50 ppb Au. One rock sample grab from a prospecting pit in the middle of the anomaly assayed 1.3 g/t gold with 6 g/t silver.

The Perrault anomaly is 900 meters in length with soil values up to 792 ppb gold. It has 29 soil samples over 75 ppb. So far this is the only soil anomaly that appears to be fully constrained.

The Bond anomaly is 2,000 meters in length and open-ended with soil values up to 1,136 ppb gold. The soil anomaly corresponds to a north-south oriented magnetic 'break' feature. Two rock grab samples from the Bond trench assayed 0.7 g/t to 0.9 g/t gold with 8 g/t to 10 g/t silver.

The Marshall anomaly is 1,600 meters in length with 25 samples over 75 ppb and values up to 935 ppb gold.

The Teek anomaly is 2,200 meters in length with 10 samples over 75 ppb gold and samples up to 2,488 ppb gold. Arsenic in this area shows the strongest correlation to gold.

The Koona anomaly is a cluster of anomalous gold soils up to 687 ppb (3 soils over 75 ppb). The cluster area is approximately 600 meters in length.

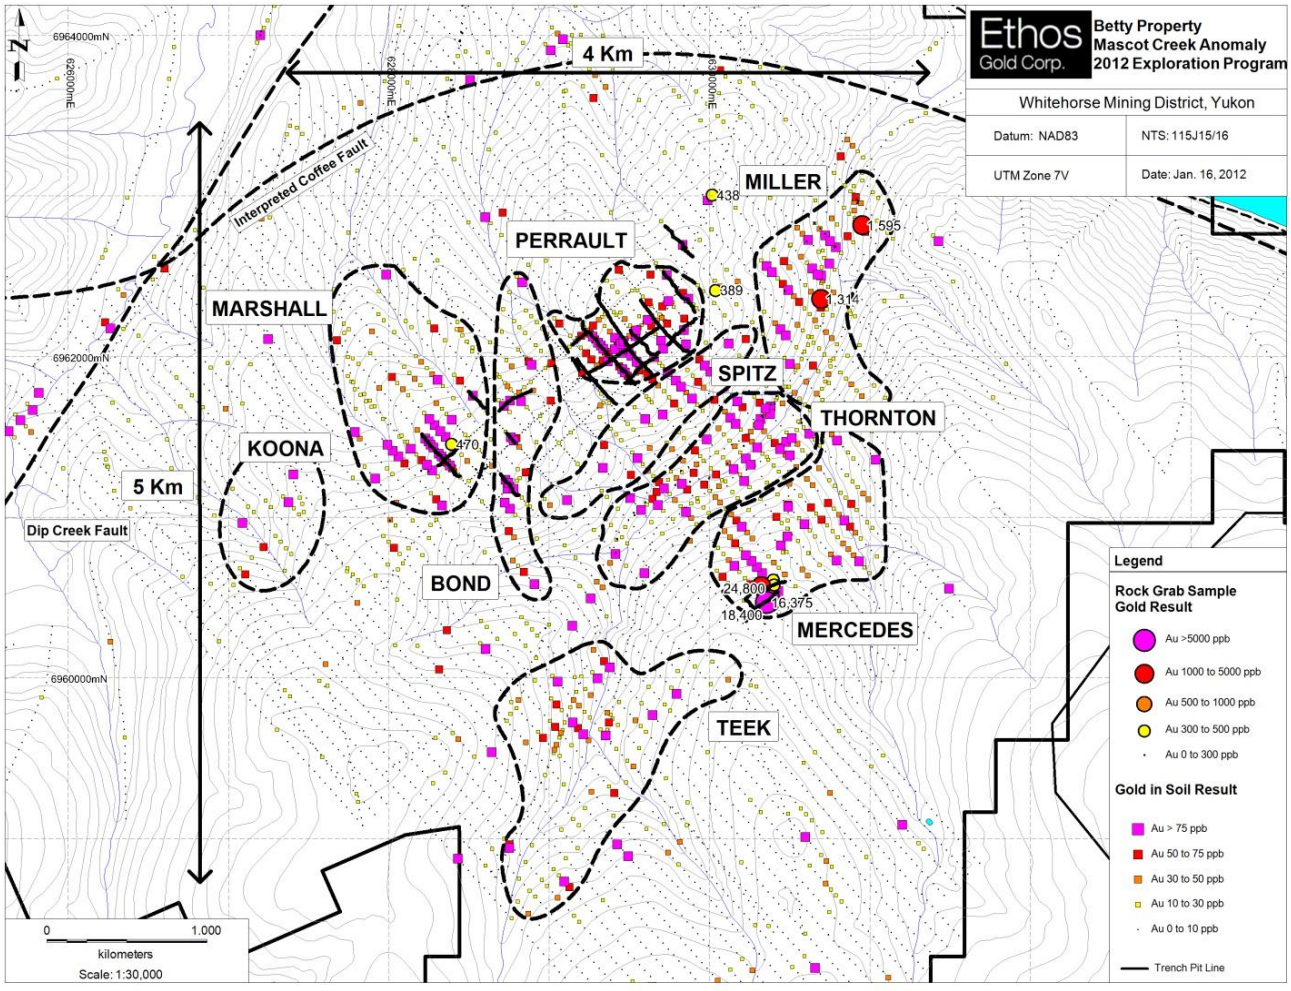

Figure 8: Mascot zone gold-in-soil results (Ethos, 2012)

7.1.2 Buck Zone

The Buck Zone, identified by Ethos's ridge and spur soil sampling, includes a 597 ppb gold soil anomaly. The soil sample site contains abundant quartz clasts, which may be indicative of eroding quartz veins hosted in the bedrock below. A grab sample of sub-crop consisting of a silicified, pyrite-arsenopyrite-bearing felsic intrusion cut by quartz veins was 10 m north of the soil site and returned 2.1 g/t gold and 1,113 ppm arsenic.

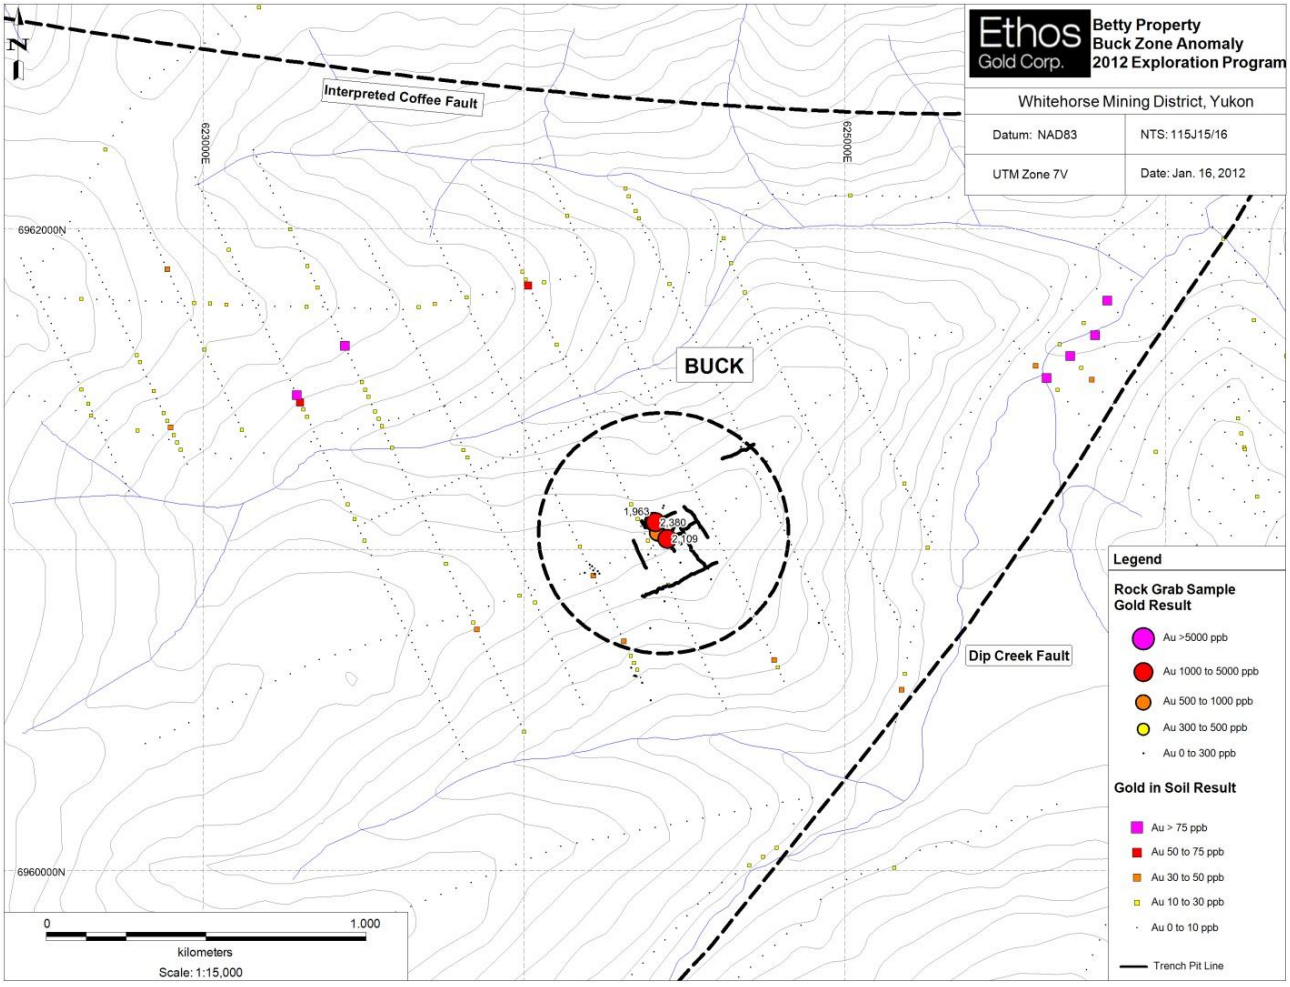

Figure 9: Buck zone gold-in-soil results (Ethos, 2012)

7.2 Prospecting

A total of 1723 rock samples were collected on the Betty property during the 2011 exploration program. Each rock samples' location and description were recorded before being sent for assaying (assaying certificates are in Appendix IV). Prospecting traverses focused along and adjacent to the Coffee Fault, as well as targeted specific gold-in-soil anomalies, any visually similar rocks to the Buck or Mascot zones, and sites where Ground Truth personnel identified quartz/silicification in their sample.

Two rock grab samples at the Mercedes zone assayed 18.4 g/t gold with 45 g/t silver as well as 19.8 g/t gold with 21 g/t silver from arsenopyrite veining. One rock grab sample of similar mineralization from an area 20 meters away to the northeast assayed 24.8 g/t gold with 19 g/t silver.

At the Buck Zone, rock samples of sub-crop were collected systematically from hand excavated pits spaced 10 meters apart within a 20 m X 10 m grid adjacent to the original 597 ppb gold soil anomaly. The rock samples were composed of oxidized, altered felsic intrusions with variable quantities of quartz veins. All of the samples returned anomalous arsenic from 324

ppm to 1,113 ppm, antimony from 4 to 46 ppm, mercury from 0.2 to 0.5 ppm and barium from 212 to 674 ppm. Gold results varied from detection limit (0.5 ppb) to 2,108 ppb.

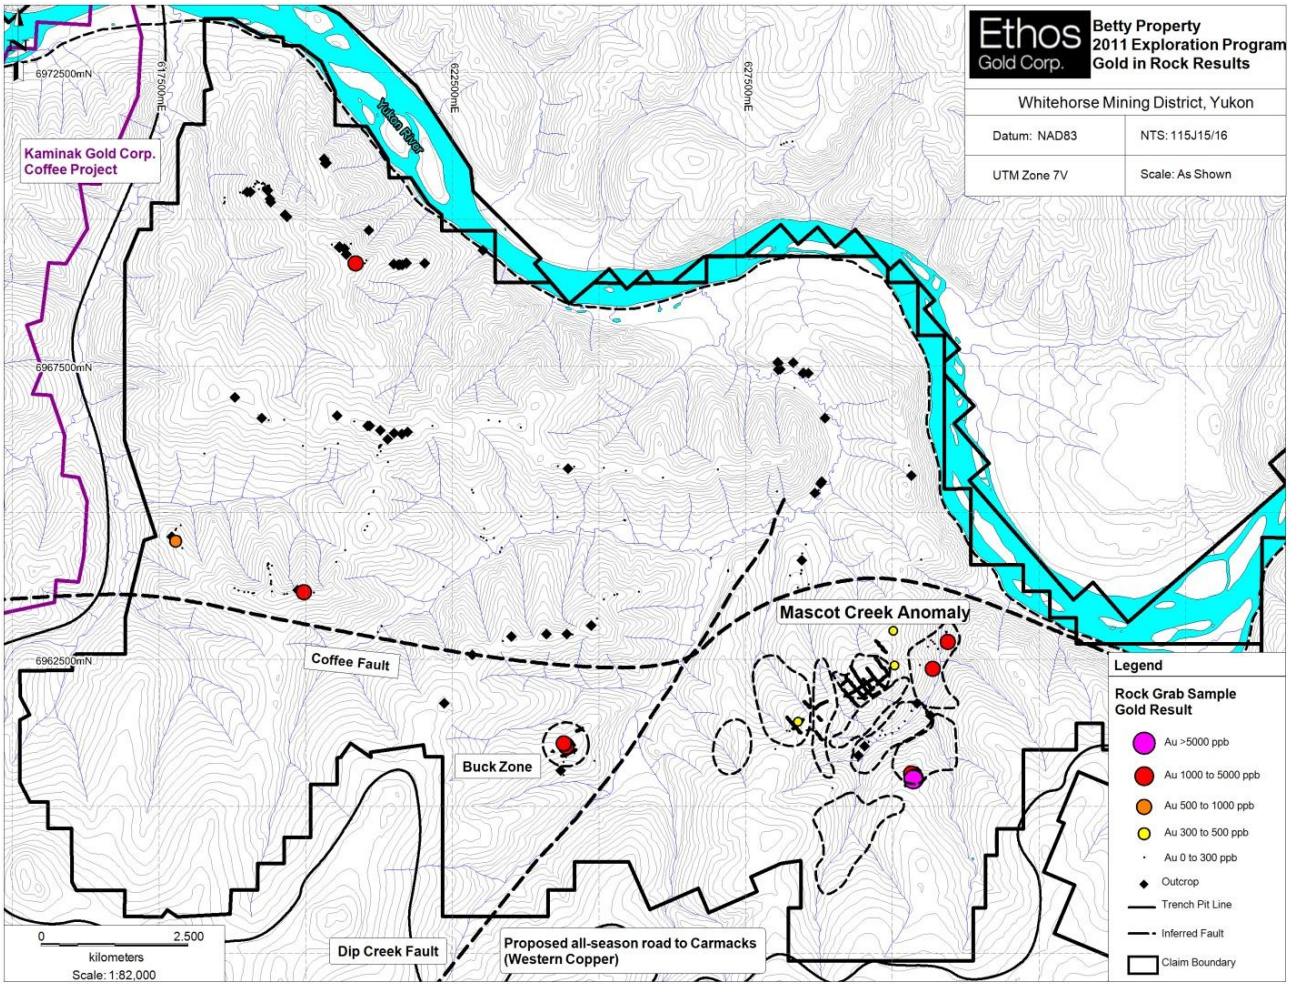

Figure 10: Betty rock sample location and assay results (Ethos, 2012)

No significant prospecting assays were returned from samples collected from the claims contiguous to the east at the Hayes property (Figure 11).

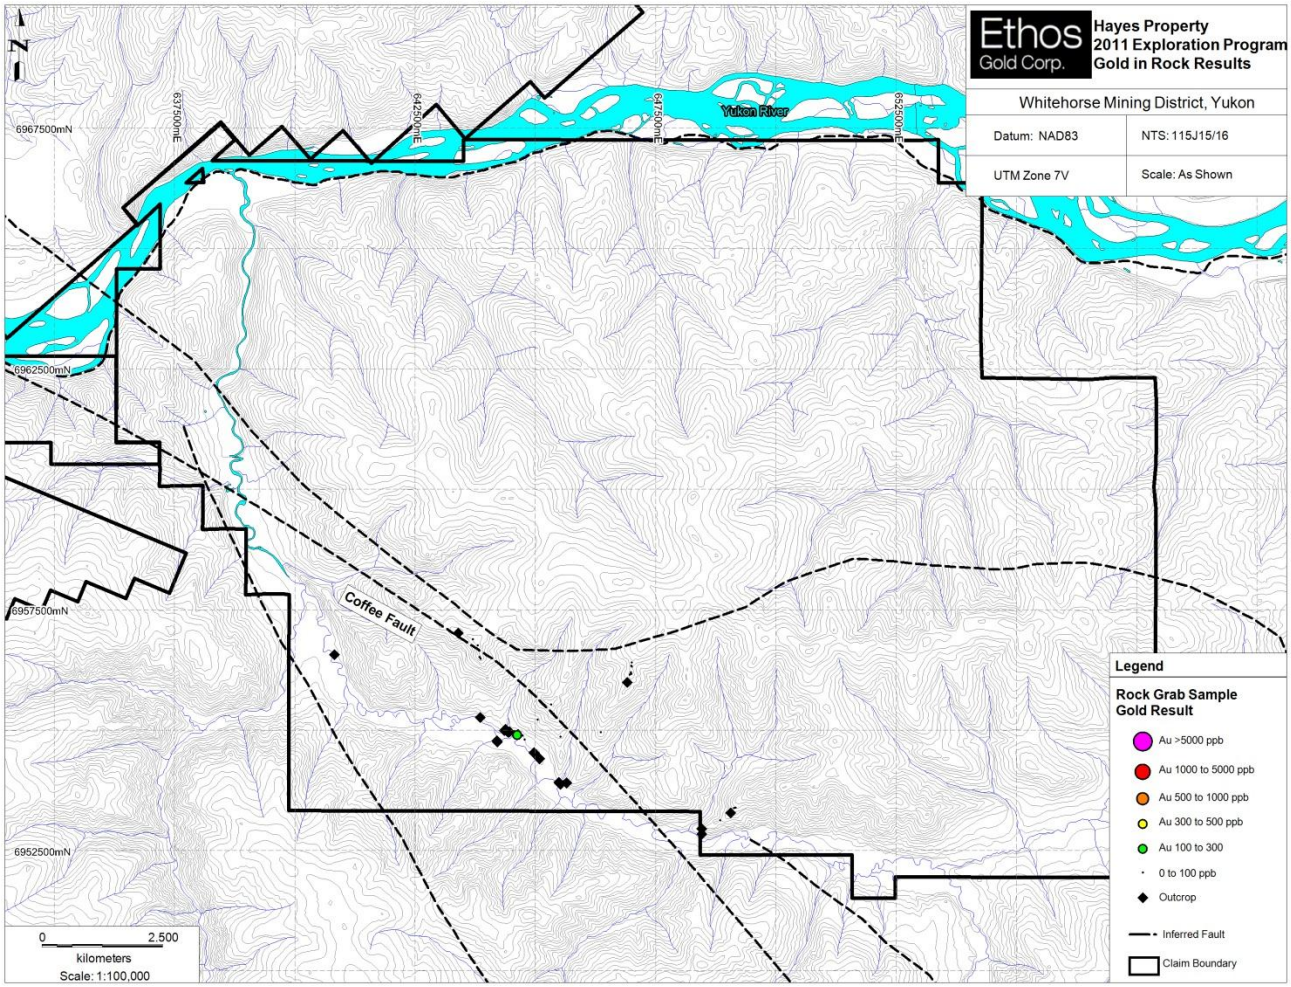

Figure 11: Hayes rock sample location and assay results (Ethos, 2012)

7.3 Trenching

Prior to the 2011 field season, Ethos' submitted a Mining Land Use Plan (MLUP) for a Level III Permit in order to complete a trenching program over areas highlighted by anomalous soil geochemistry (refer to section 7.7). Ethos engaged Talus Exploration Inc. (*herein* Talus) of Dawson City to complete the trenching component of the 2011 exploration program. A total of 7 km of trenching, systematically sampled (section 9.1.3), was completed on the claims. Permafrost was encountered in all areas of trenching.

Talus provided a modified 'Can-dig' heli-portable backhoe plus an operator, plus one or two cutters whose primary job was to clear brush ahead of the progress of the backhoe. Talus personnel established a small (2 to 3 man) tent camp adjacent to work area(s). Ethos used a Heli-Dynamics Bell 407 helicopter to mobilize/demobilize the backhoe and Talus camp gear between areas once on site. The mobilization point originated from the Thistle airstrip in June, the demobilization point was to the Black Hills airstrip in October.

7.3.1 Buck Zone Trenching

A total of 10 continuous trenches and pit trenches were excavated totaling approximately 1,500 m in length at the Buck Zone (see photo-plate 2 and Figure 10). The area contained strong alteration, quartz veining, and iron-oxide within felsic intrusive rock. The trench locations were selected based on gold in soil anomalies and as follow up to the 2, 108 ppb gold hand sample. Only Buck lines 6, 7, and 8 returned anomalous gold results with 686 ppb, 2380 ppb, and 450 ppb res pectively from grab samples in the trenches.

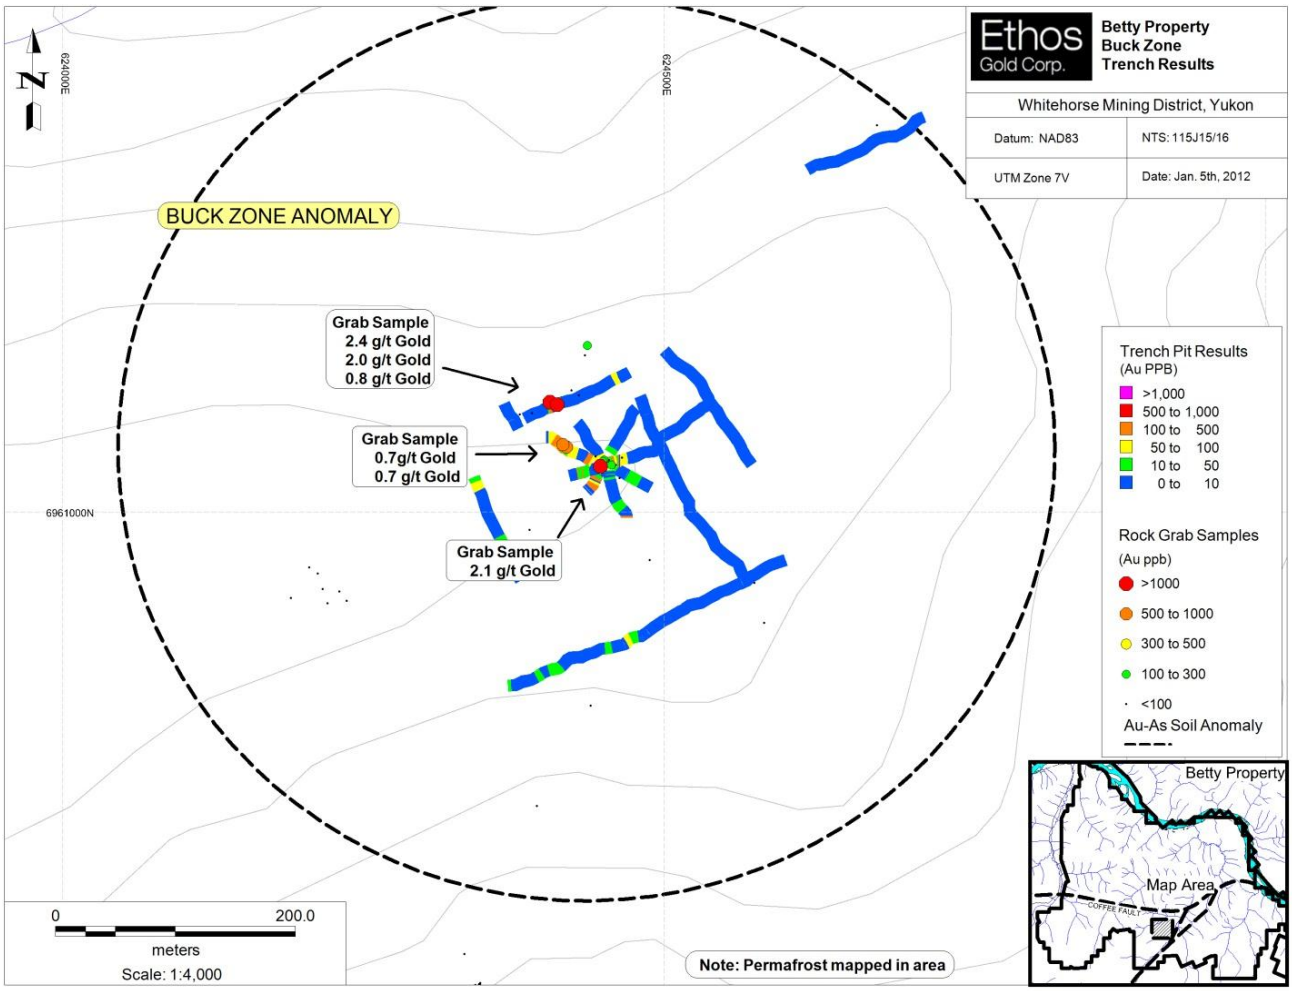

Figure 12: Buck zone trench location and results map (Ethos, 2012)

Photo-plate 2. Trenching at Buck with Talus' modified 'Can-dig' heli-portable backhoe.

7.3.2 Mascot Zone Trenching

A total of approximately 5, 500 meters of pit trenching was completed at the Mascot Creek soil anomaly on the Mercedes and Bond targets. These targets were selected as follow up to areas of high grade gold-in-soil anomalies as well as cluster areas in an attempt to identify the bedrock source of the soil anomaly. Representative samples from each pit trenched consisted of angular to subangular weathered bedrock and weighed an average of 1.6 kg. The Talus camp at the Mascot grid was located at UTM 626659mE, 6962129mN.

Photo-plate 3: Mascot grid tent camp

Mercedes Target

A series of trench pits dug along two trench lines (Line 1 and Line 2) were excavated to test the intensity and continuity of subsurface gold mineralization within the Mercedes gold-in-soil anomaly.

Mercedes Line 1: A total of 52 trench pits were excavated along a 270 m-length. Nine samples from a 50 m mineralized interval within Line 1 average 7.3 g/t gold over the 50 m-length. The gold-bearing interval in Line 1 was 83 m south of the gold-bearing interval in Line 2.

Mercedes Line 2: A total of 64 trench pits were excavated along a 370 m-length. Six samples from a 45 m sub-section of Line 2 average 2.9 g/t gold over the 45 m-length.

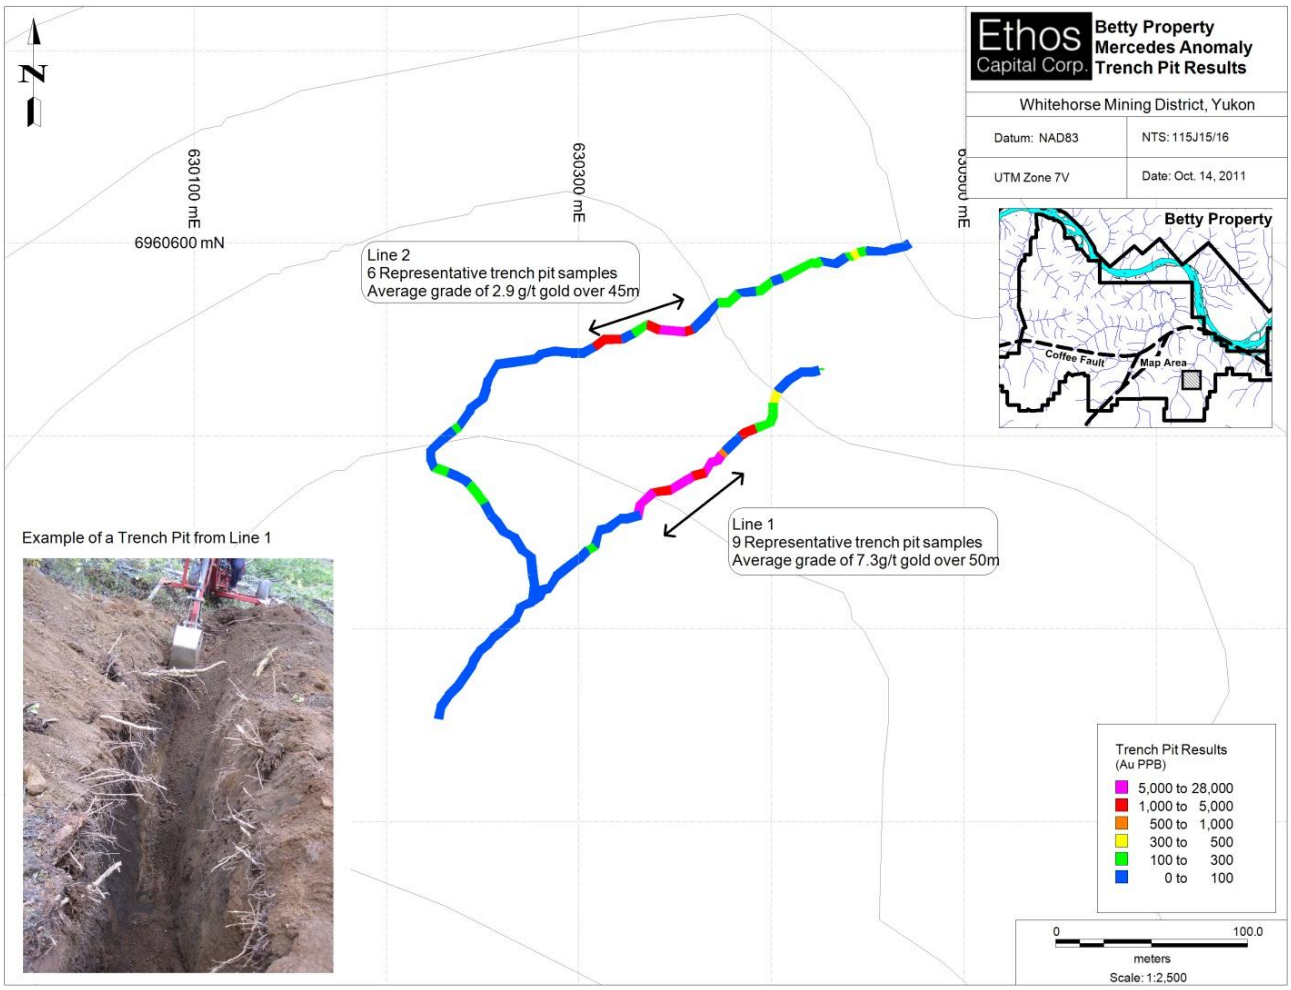

Figure 13: Mercedes Zone trench location and results (Ethos, 2012)

Bond Target

The Bond target is located 1.75 km to the west of Mercedes. The Bond gold-soil anomaly is associated with a fault interpreted from a north-south oriented magnetic 'break' feature. Trenching tested a 575 m-length along the Bond target with a series of three trench pits lines (Line 3, Line 4 and Line 5). Line 3 is the southernmost line and is 325 meters south of Line 4. Line 4 is the middle line and is located 250 meters south of Line 5.

Bond Line 3: A total of 23 trench pits were excavated along a 172 m-length. Six representative samples from 4 pits along a 27 meter mineralized interval within Line 3 average 0.9 g/t gold over the 27 meter length, within a longer interval of 0.5 g/t gold over an 80 meter length. Of note, these correspond to soil samples results spaced 25 meters apart of 125, 85, 193, and 1137 ppb gold over this same interval.

Bond Line 4: A total of 13 trench pits were excavated along a 78 m-length. Three samples from an 11 meter mineralized interval within Line 4 average 0.5 g/t gold over the 11 m-length. The corresponding Line 4 soil results spaced 25 meters apart individually were 300 and 137 ppb gold over this same interval.

Bond Line 5: A total of 17 trench pits were excavated along a 235 m-length. One sample from a 5 meter mineralized interval within Line 5 assayed 7.0 g/t gold over the 5 m-length. The corresponding Line 5 soil result contained 377 ppb gold at this same interval.

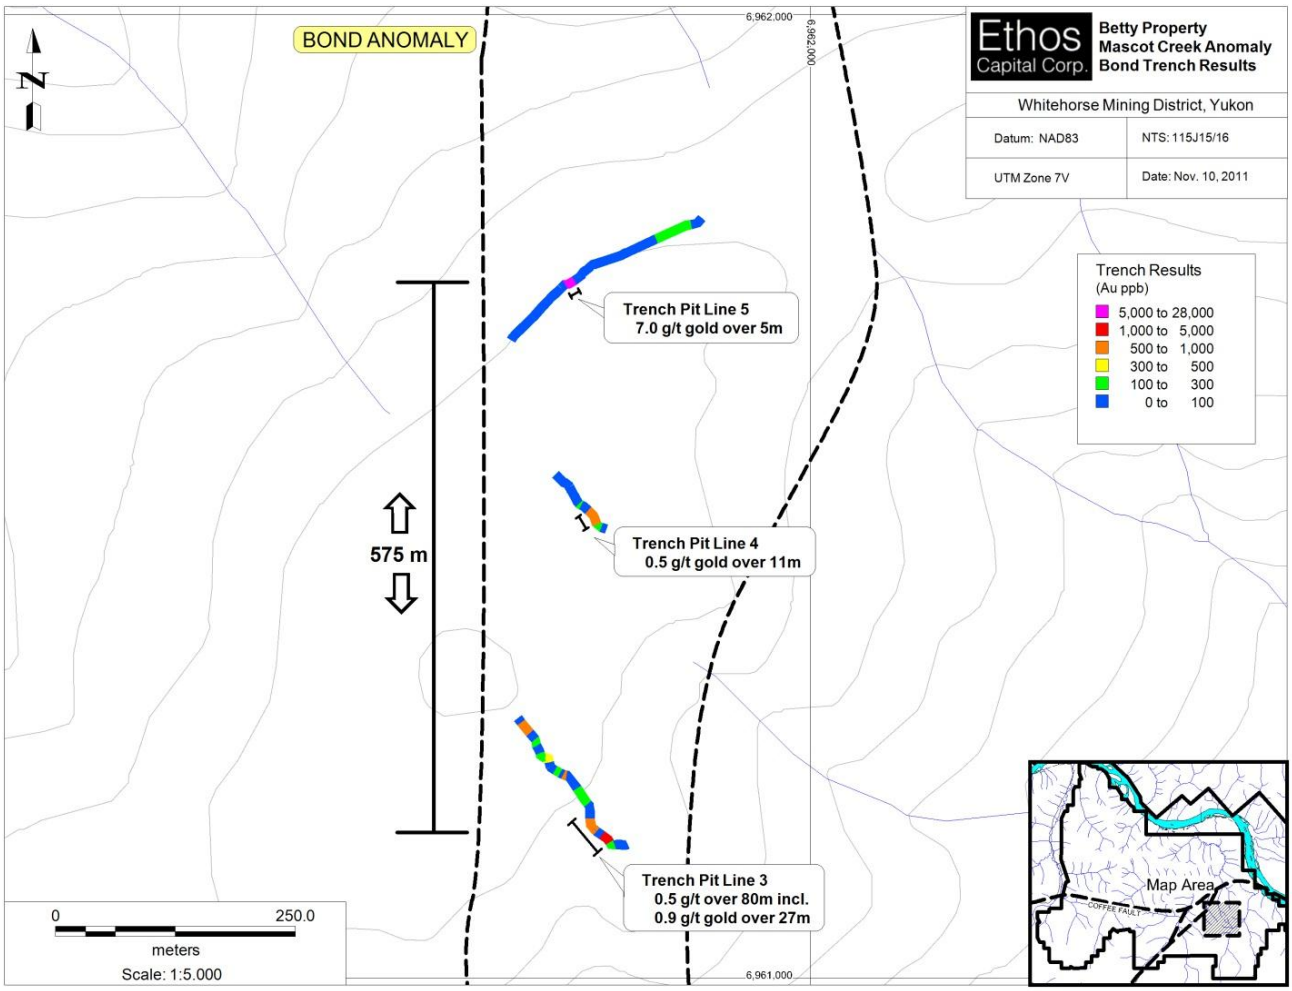

Figure 14: Bond Zone trench location and results (Ethos, 2012)

Perrault Target

The Perrault target is located immediately east of the Bond target. A total of 11 trench pit lines tested the Perrault gold-in-soil anomaly. Of the 11 trench pit lines, four returned anomalous results.

Perrault Line 6: A total of 74 trench pits were excavated along a 500 m-length on the western portion of the target and returned 0.3 g/t gold over 107 meters.

Perrault Line 7: A total of 96 trench pits were excavated along a 625 m-length and returned 12.7 g/t gold over 2 meters. Line 7 is located 140 meters to the east from Line 6.

Perrault Line 8: A total of 41 trench pits were excavated along a 250 m-length and returned 11.7 g/t gold over 2 meters, 66 meters to the east of Line 7. Total distance of anomalous gold in adjacent trench pits is 206 meters.

Perrault Line 9: A total of 43 trench pits were excavated along a 275 m-length testing a target generated by prospecting northeast of the Perrault area. The line assayed 1.3 g/t gold over 15 meters.

Lines 10 through 16 did not return anomalous gold results

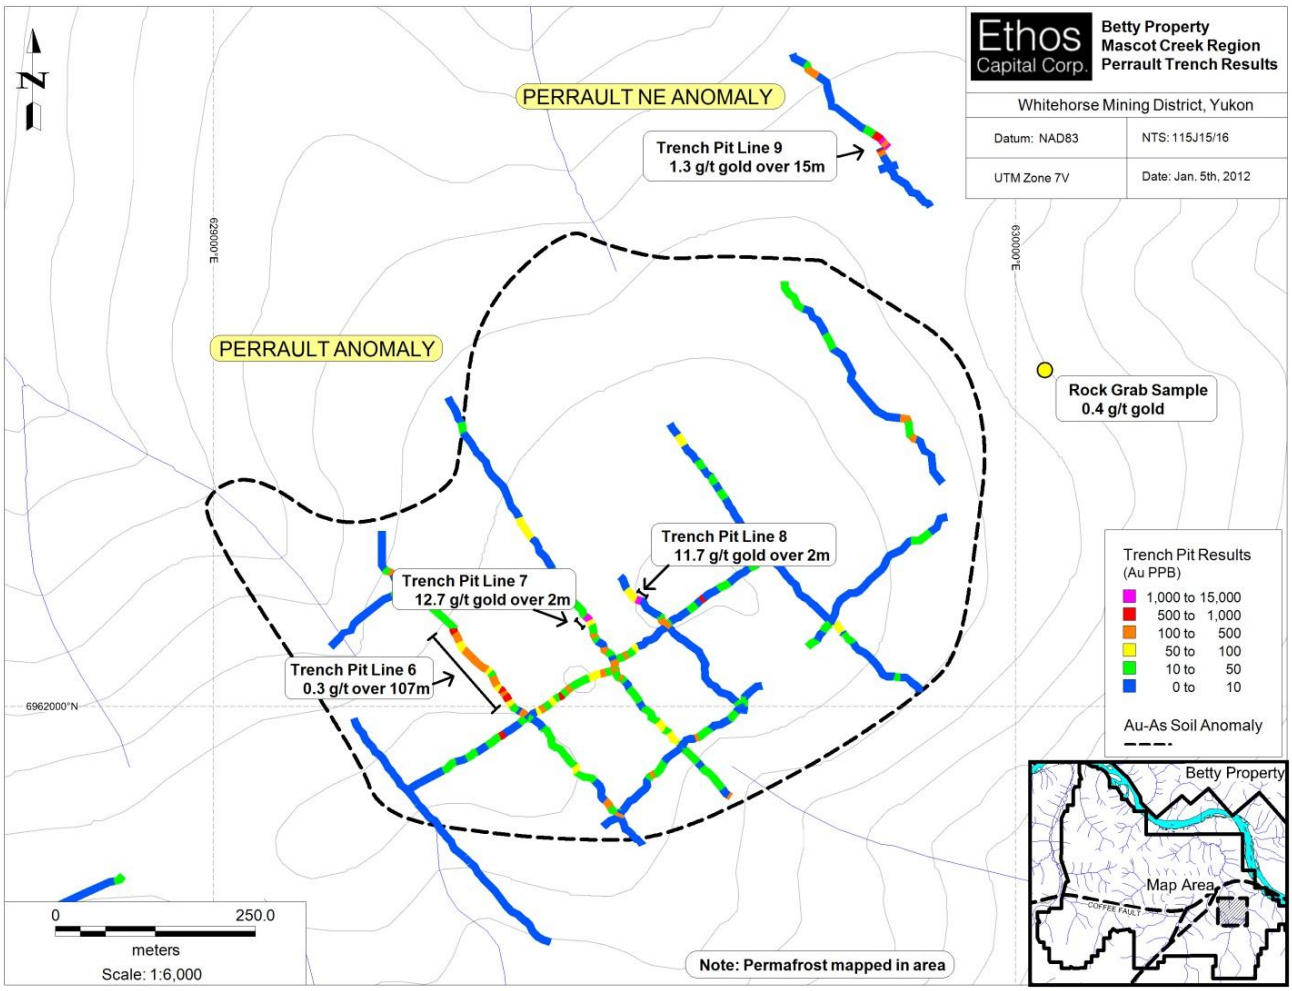

Figure 15: Perrault Zone trench location and results (Ethos, 2012)

Marshall Target

The Marshall target is located immediately west of the Bond target. A total of 3 trench pit lines tested a small portion of the Marshall anomaly.

Marshall Line 17: A total of 60 trench pits were excavated along a 350 m-length and returned an anomalous result of 0.5 g/t gold over 21 meters.

Marshall Line 18: A total of 22 trench pits were excavated along a 150 m-length and returned a result of 0.5 g/t gold over 15 meters.

Marshall Line 19: A total of 36 trench pits were excavated along a 250 m-length and returned a result of 0.4 g/t gold over 9 meters.

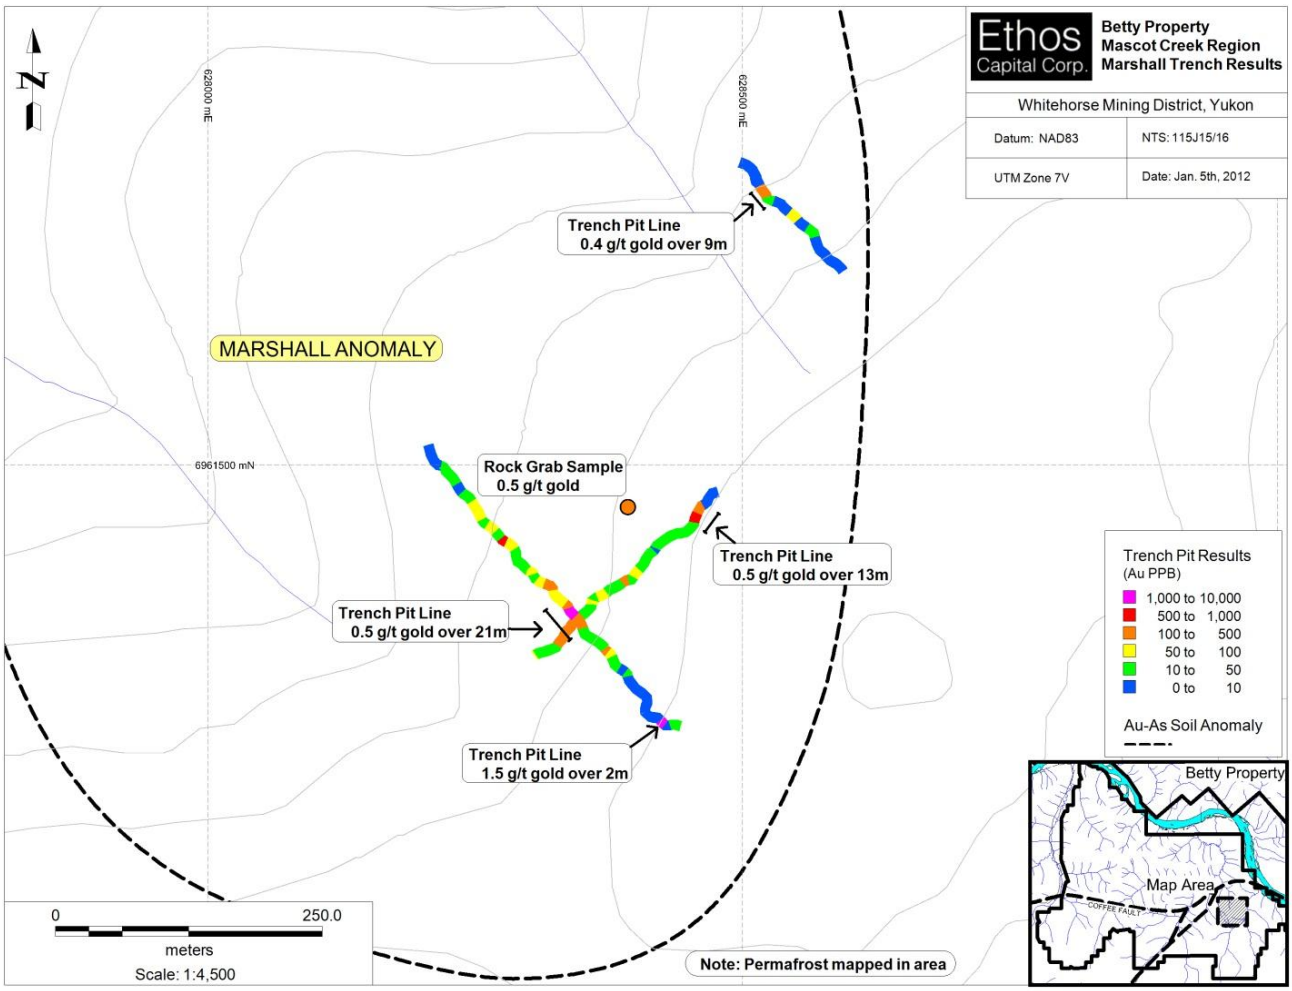

Figure 16: Marshall Zone trench location and results (Ethos, 2012)

7.4 Airborne Geophysics

During 2011, Ethos' employed New-Sense Geophysics Limited ("New-Sense") of Toronto, Ontario to complete 2,406 line-kilometers of helicopter magnetic and gamma-ray spectrometric (radiometric) surveying over the Betty property as part of a larger survey covering Ethos' Betty, Hayes, Bridget, Wolf and Hen properties. Pre-survey calibration flight testing was conducted on the property on June 24 and June 25, 2011. Surveying commenced on July 8 and was completed August 12, 2011 as part of a total survey of 12,499 line kilometers.

The geophysical equipment was comprised of one high-sensitivity Cesium-3 magnetometer mounted in a fixed stinger assembly and a 1024-channel RS-500 spectrometer with four downward looking crystals (total 16 liters) and one upward looking crystal (total 4 liters) mounted in the storage compartment of the aircraft. Airborne ancillary equipment included digital recorders, fluxgate magnetometer, radar altimeter, and global positioning (GPS) receiver. The GPS receiver provided accurate real-time navigation and subsequent flight path recovery. The equipment was mounted on a Bell 206 B3 helicopter chartered from Northern Air Support based in Kelowna, British Columbia. Surface equipment included a magnetic base station with GPS time synchronization, and a PC-based field workstation which was used to check the data quality and the completeness on a daily basis. Ethos also employed Williams Geophysics Limited (Brian Williams) of Hereford, United Kingdom to monitor the daily flight production, assess the data quality, and provide quality control during the term of the survey. The helicopter and pilot and survey engineer were based at the Coffee Camp operated by, and with permission of, Kaminak Gold Corporation. Ethos contracted JDS Energy and Mining Inc ("JDS") to install a fuel liner and containment berm sufficient for 120 drums of fuel. Ethos obtained 120 drums of Jet A fuel from Whitehorse, YT and delivered it by transport truck to the barge landing operated by JDS at Minto. Ethos contracted the JDS barge to transport

the 120 drums of Jet A fuel to Kaminak's Coffee Camp and store them in the lined berm in early August prior to commencement of the survey. At the end of the contract, the fuel liner was sold to Kaminak.

Photo-Plate 5: Northern Air Support Bell 206 B3 helicopter with magnetometer mounted in a fixed stinger assembly used in survey.

The technical objective of the survey was to provide high-resolution total field magnetic and radiometric maps suitable for anomaly delineation, detailed structural evaluation, and identification of lithological trends. The survey was flown at a nominal traverse line spacing of 100 meters with control line ("tie-line") spacing of 1,000 meters. The traverse lines were flown at 0 degrees or 180 degrees true north. Fully corrected magnetic and radiometric maps were prepared by New-Sense in their Toronto office after the completion of survey activities.

A full description of the survey parameters is included in Appendix V entitled "Logistics Report for the High Resolution Helicopter Magnetic and Gamma-ray Spectrometric Airborne Geophysical Survey Flown Over Betty/Bridget/Hayes (BBH), Hen, and Wolf Blocks".

Total field magnetics (Figure 17) and total count radiometrics (Figure 18) data results from the survey are reproduced. Note that the block flow includes Betty, Hayes, and also Bridget claims (contiguous with Betty but situated north of the Yukon River). The total field magnetics map indicates a prominent northeast trending fault-structure magnetic low in Mascot Creek corresponding to the mapped position of the Dip Creek fault. This magnetic low intersects a broad east-west magnetic low corresponding to the interpreted position of the east-west trending Coffee fault. In detail, it is interpreted that the Dip Creek fault disrupts the Coffee fault implying Dip Creek is a younger feature.

The total count radiometric data suggests a (radiometric high) wedge shaped intrusion on the Betty property, north of the Coffee fault, thickening westward and corresponding to an area mapped by YGS of the Coffee granite with smokey quartz.

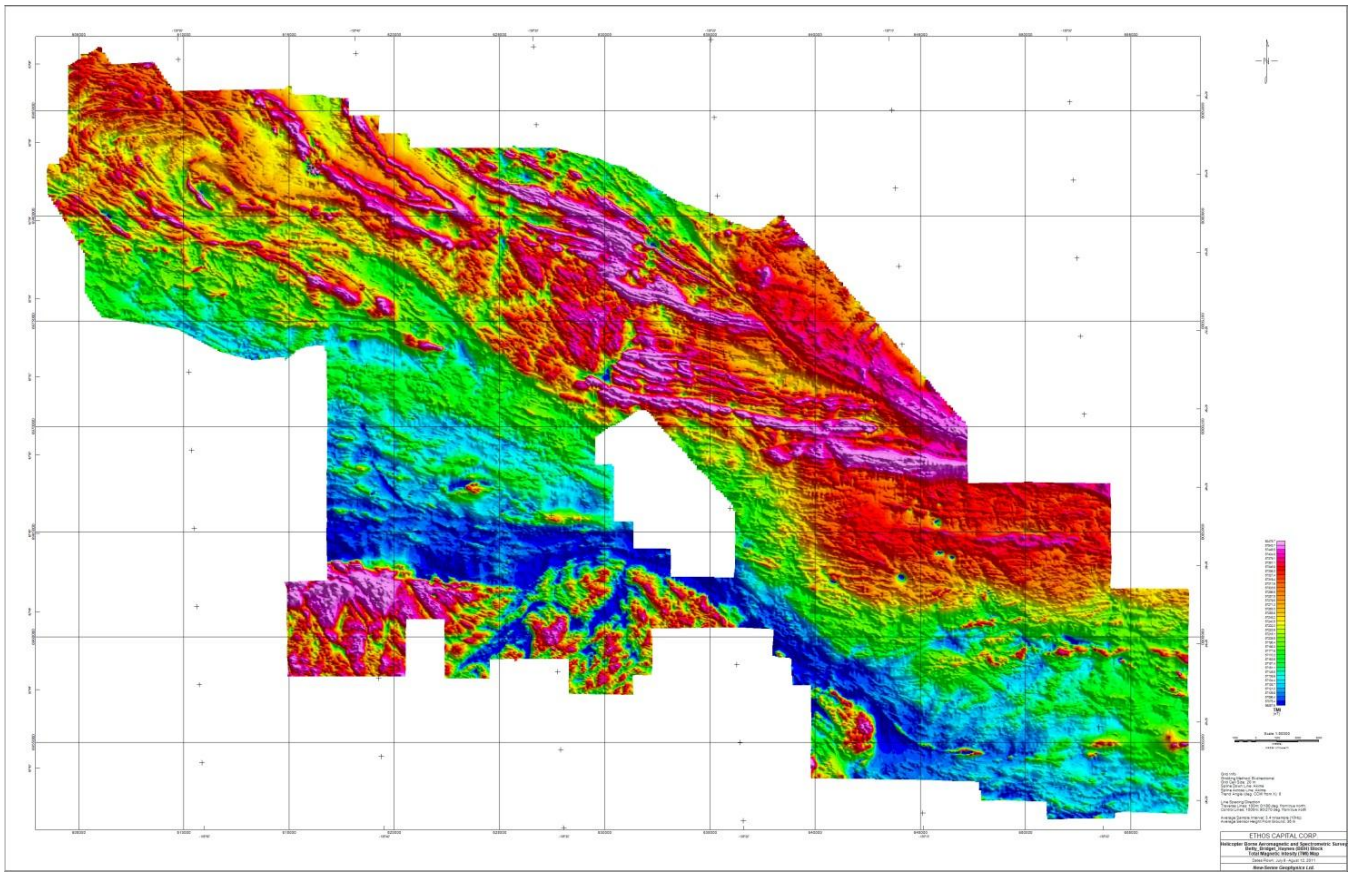

Figure 17: Airborne geophysics – Total field magnetic (New-Sense, 2012)

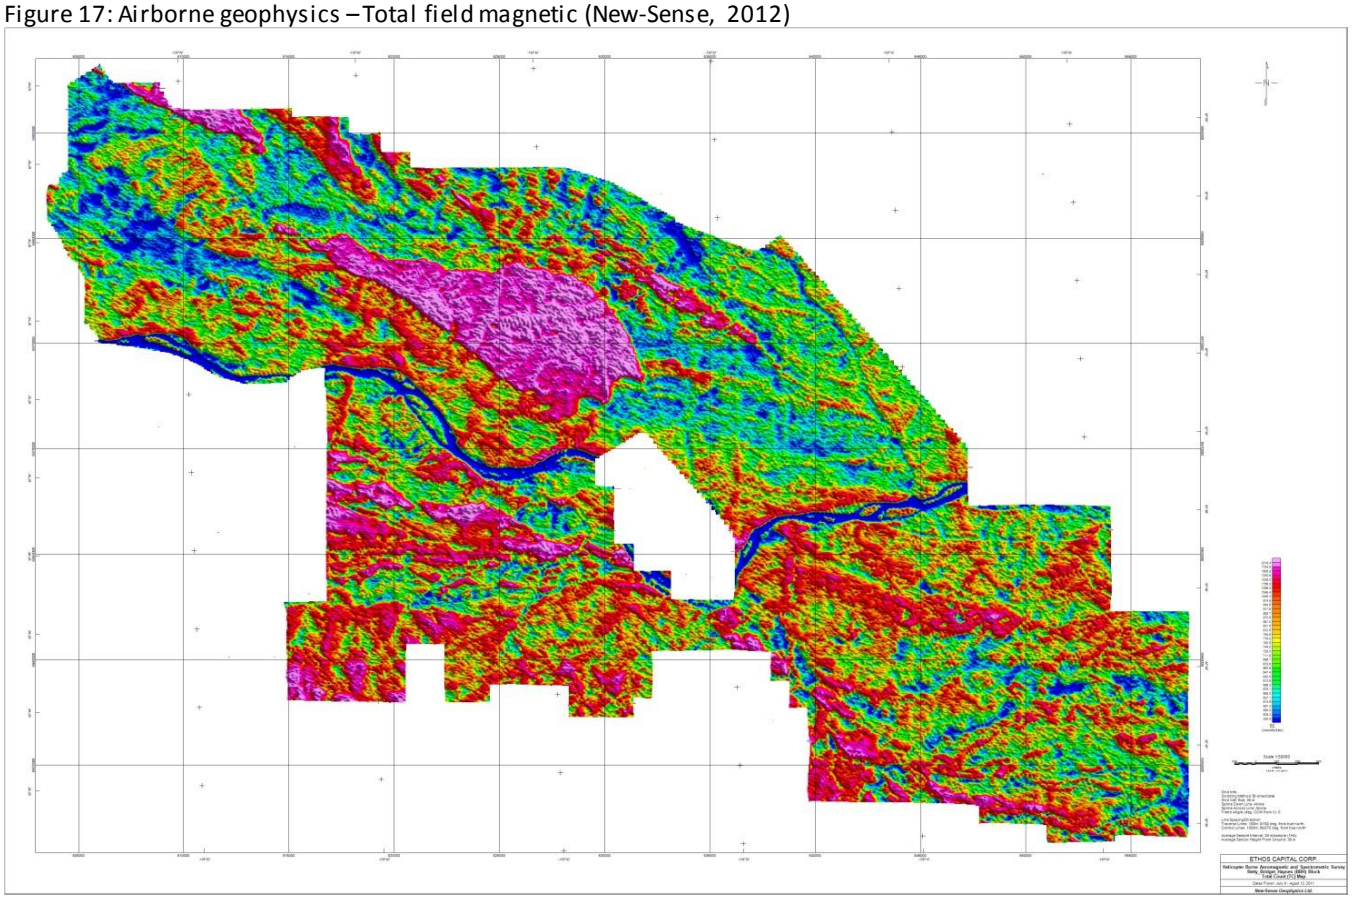

Figure 18: Airborne geophysics – Total radiometric count (New-Sense, 2012)

7.5 Orthophotography

During 2011, Ethos' employed AECOM of Markham, Ontario to complete 107 line-kilometers of air-photo imagery over the Betty property as part of a larger 366 line-kilometer air-photo imagery program covering Ethos' Betty, Hayes, Bridget, Wolf and Hen properties. Geographic Air Survey Ltd. (GAS) of Edmonton, Alberta performed the flight acquiring the aerial photography on behalf of AECOM on August 25th, 27th, and 30th, 2011 (Figure 19).

GAS used a RC30 Aerial Camera with Airborne Kinematic GPS positioning and Forward Motion Compensator as well as a Trimble 1000 SSI airborne GPS system all mounted in an Aero Commander 690 A aircraft (the acquisition of the colour aerial photography adhered to the Interdepartmental Committee on Air Surveys (ICAS) Specification for Aerial Survey Photography 2000). Photographs were flown with variable sun angles of >30°, at the 1:20,000 scale (±1.0m vertical and horizontal), with 60% forward overlap and 30% side-lap suitable for stereoscopic viewing. Photograph indices were provided in a NTS 1:250,000-scale map sheet format. Flight lines were centered along the north and south perimeter boundaries of the property. A total of 18 flights lines and approximately 250 images were used to cover all property area of which five flight lines and approximately 50 images covered the Betty property. The onboard Airborne GPS was utilized as the basis for ground control for the images as well as known survey monuments.

Ariel photograph image capture and processing was completed by AECOM. The air-photo film was scanned using a Vexcel 4000HT photogrammetric scanner and processed with a variety of programs including SOCET SET, ARC GIS, OrthoVista, PCI, AutoCAD, and Adobe PhotoShop. AECOM produced a DEM (digital elevation model) and Orthophotographes with 2m interval topographic contours. The true optic resolution was 10 microns or 0.20m ground resolution.

The high resolution orthophotography was used to provide a geomorphological (terrain) map and landscape model development as a strategy for developing a soil sampling suitability map. This map aimed at identifying the areas where soils would most likely be representative of bedrock. The geomorphological map was generated based on distinct surficial materials, texture, surface expression, geomorphological process, and drainage class. The soil sampling suitability map took into consideration soil processes such as veneering, colluvial soil creep, and cryoturbation. This mapping was complemented by a field program designed to examine the various indentified terrain units (surficial materials, texture, and surface expression) and dig representative soil pits and collect soil samples from geomorphologically-based depths.

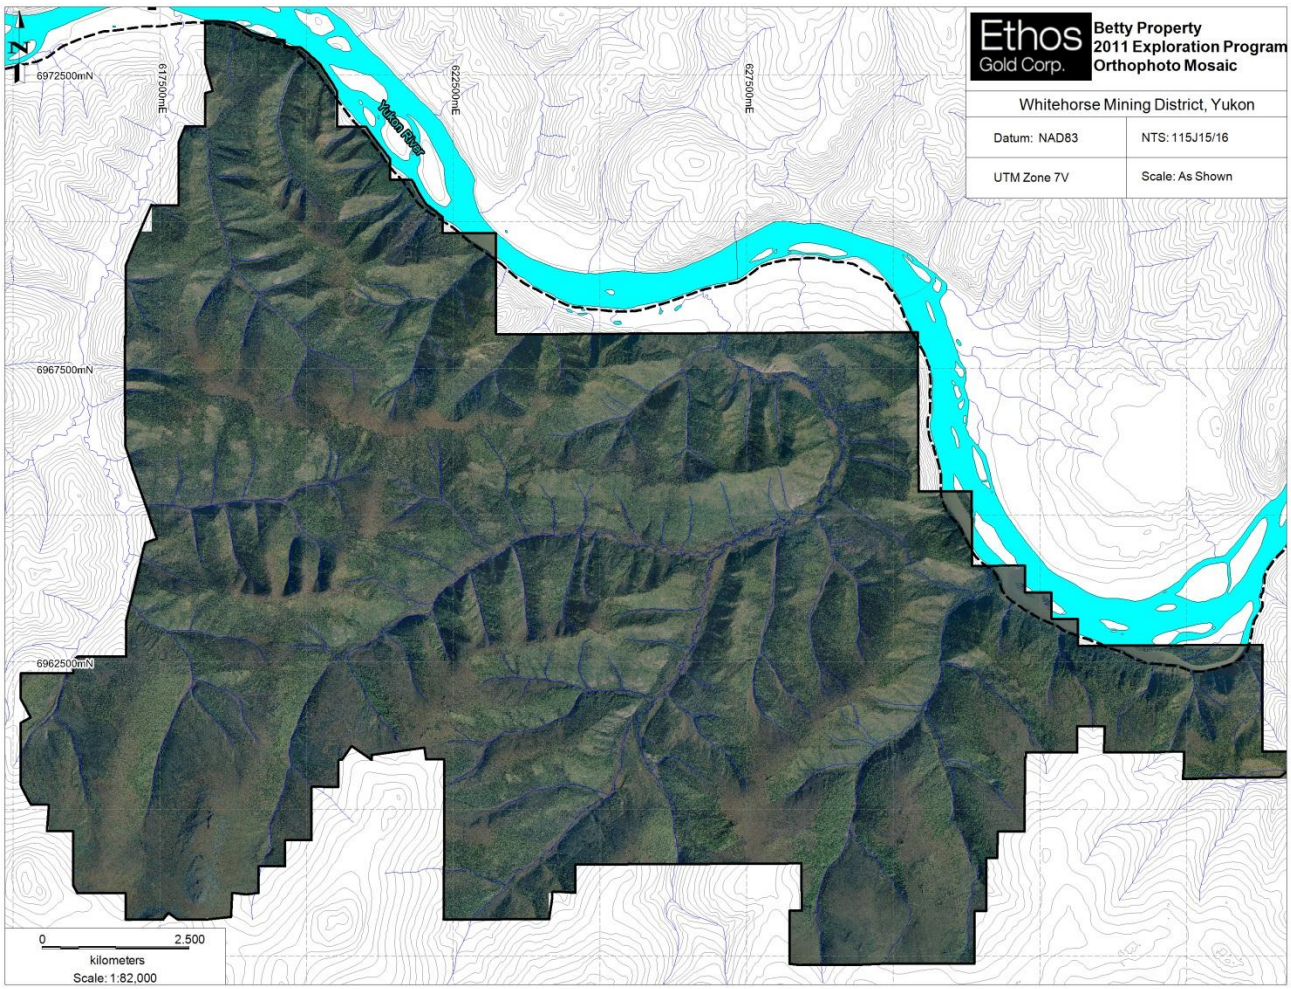

Figure 19: Betty Property orthophoto mosaic (Ethos, 2012)

7.6 GIS Mapping

GIS mapping was undertaken in-house at Ethos using ArcGIS 9.3, Mapinfo 11, and Geosoft Oasis Montaj 7.2 software. Map generation began with the creation of a master database incorporating all available data from the Yukon Geological Survey as well as publicly available data from other companies in the region. The data compiled included regional topography of the White Gold district, claim areas, mineral occurrence, regional geophysics and geology, assay results and locations, and drillhole locations and results. Ethos data was incorporated as it was generated.

GIS maps generated from complied data include glacial limit map and a permafrost cryosol map. GIS maps generated from the summer soil sampling program include maps highlighting areas of interest requiring follow-up. Those areas were based on discovered outcrop and quartz veins during soil sampling as well as on the results of the 36 element geochemical analysis results. Maps generated from geochemical analysis include soil sample grade maps and element domain maps. A mineral prospectivity map was generated based on gold correlation coefficiants of arsenic, silver, lead, bismuth, cadmium and zinc (Figure 20). Other maps created include depth of permafrost on north and south facing slopes as well as inverse distance weight grids of all 36 the elements to aid in the interpolation of linear features and linear breaks to help identify possible faults and other geological features.

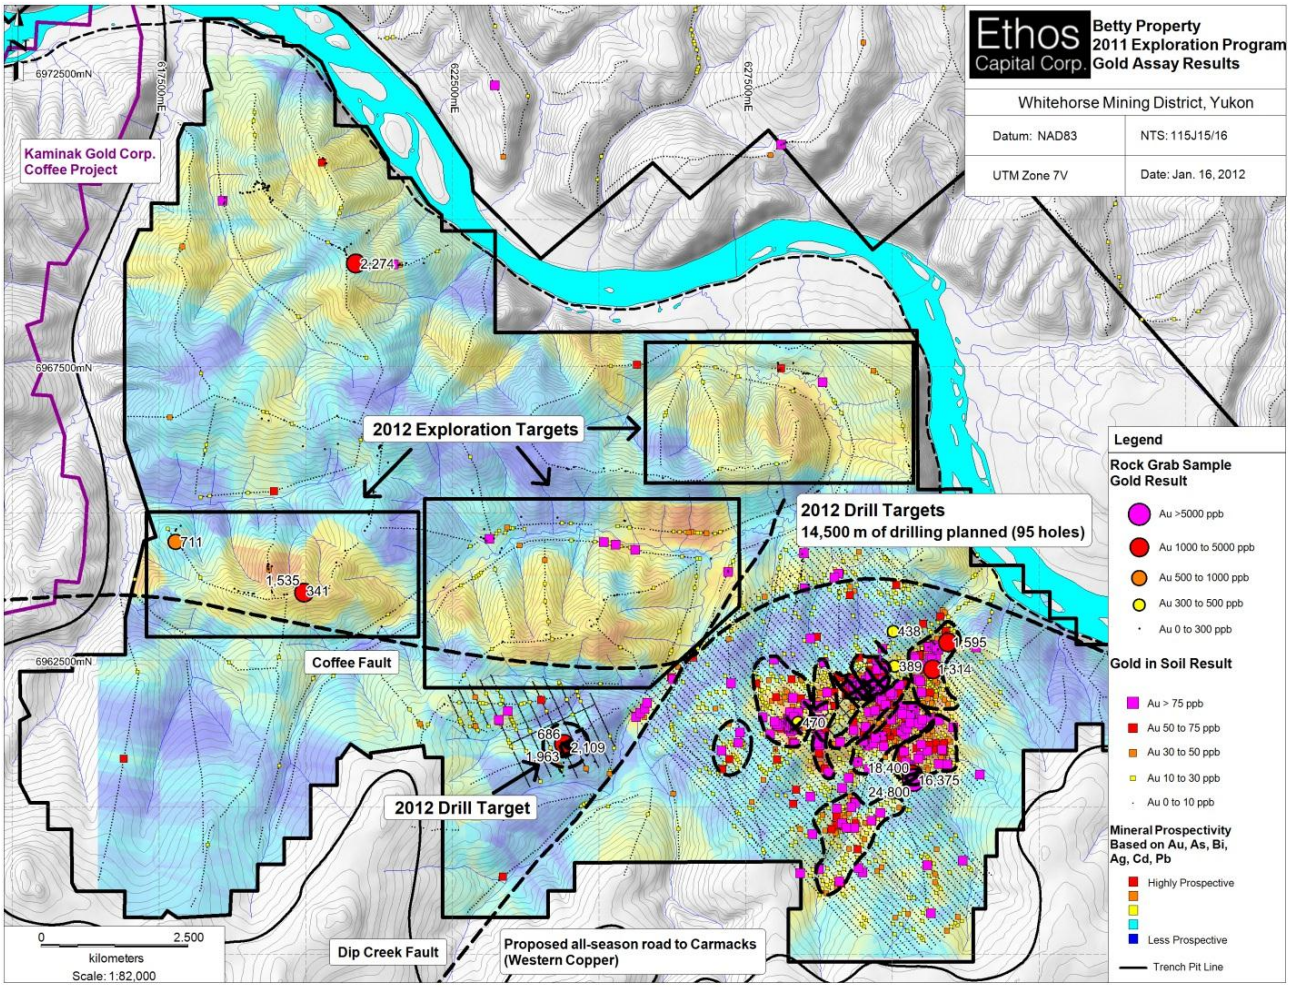

Figure 20: Mineral prospectivity map for the Betty property (Ethos, 2012)

7.7 Permitting

Ethos contracted All-Terrane Exploration Mineral Exploration Services of Whitehorse, Yukon to apply for Class III Exploration permits on the Betty property. The permit was received from Yukon Environmental and Socio-economic Assessment Board (YESAB) in June 2011.

8 Drilling

No drilling has been completed on the Betty claims to date.

9 Sampling Method & Analyses

Collection of rock and soil samples on the property during the 2011 field season was completed under the supervision of qualified geologists by experienced geological technicians. Ethos adhered to industry best practices for sample collection and handling of rock and soil samples on location. ACME Analytical Laboratories Ltd. was employed for geochemical sample analysis. ACME is an ISO 9001:2008 credited facility (certificate number FM 63007) and ISO/IEC 17025:2005 credited by the Standards Council of Canada.

9.1 Sampling Method & Approach

9.1.1 Soil Samples

At each soil sample site, the Soil Technician identified the most appropriate location to collect the sample and laid out a 1 2" x 20" thick plastic (poly) rock sample bag. The soil sample was taken using an Eijklcamp© hand-auger at a depth of between 20 and 110 cm. Samplers strived to consistently collect C-horizon sample material. Where necessary (rocky or frozen ground) a prospector's pick ('mattock') was used to obtain the sample. The soil was laid out on the sheet of plastic in the order it was recovered removed from the sample hole. Once the necessary amount of soil (400 - 500 g) was obtained the deepest soil was taken and placed in a kraft soil sample bag labeled with the 3-letter project code and a unique 5-6 digit sample identification number. A representative rock chip sample was then taken from the recovered soil and placed in a small (1" x 1.5") bag labeled with the same project code and sample identification number. An aluminum metal tag inscribed with the sample identification number was attached to a rock or branch at the sample site along with a length of pink flagging tape. A duplicate sample was taken once for every 25 samples: at the sample site twice as much of the desired soil was acquired and then placed on the plastic sheet and homogenized before being placed into two sample bags. Both samples were given their own sample identification number. The data for both samples was recorded and a note was made indicating the duplicate and its corresponding sample identification number.

The soil samples were packaged daily into fiber bags, sealed, and delivered via helicopter or fixed wing to Dawson where Ground Truth personnel deliver them to the ACME sample preparation laboratory. ACME issued a receipt upon each delivery. Once received ACME would place all the samples on drying racks and then shipped them to ACME's laboratory in Vancouver.

The GPS location of the sample site was recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD 83 format, and the waypoint were labeled with the project name and the sample identification number. A Palm PDA device was used in the field to record the characteristics and description of the sample taken which included: sample identification number, soil colour, soil horizon, slope, sample depth, ground and tree vegetation, sample quality, and any other relevant information. Furthermore, the GPS coordinates were entered into the Palm device as a secondary backup in case of GPS failure.

Every night in the field, the GPS and Palm PDA devices were downloaded to a laptop computer and the data verified on a sampler-by-sampler basis in proprietary database auditing software ("Dirtbagger 3000") to ensure accurate data was recorded. The data was also mapped out daily using ESRI ArcMap to assure proper sample spacing and location. A backup of the sample data was made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion. When possible, a backup was also sent via e-mail.

9.1.2 Rock Samples

Outcrop and float rock samples were collected during the summer by prospectors and geologists. At each sample location detailed sample descriptions were collected and locations were marked with flagging tape and recorded with a GPS. Samples were placed in thick plastic (poly) rock sample bags along with an assay sample tag. The assay tag number was recorded on the flagging tape marking the sample location. The descriptions for each sample were then entered into the 'rock sample report form' at the end of each day. The rock samples bags were placed into a rice bag and sealed for shipment to ACME's sample preparation facility in Dawson City whereby Ethos personnel were issued a submittal receipt. Acme employees placed the fiber sacks on pallets, which were trucked daily by subcontractor Kluane Freight Lines to Acme's Whitehorse rock and soil preparation laboratory. Rocks were either crushed and split in Whitehorse or shipped via Air North air-freight to Acme's Vancouver laboratory to be crushed and split. The originating preparation lab is indicated on the final signed assay certificate.

9.1.3 Pit Trenching Methodology

Two different trenching sampling methods were used at the Buck Zone: continuous trenching and pit trenching. Only pit trenching was used at the Mascot zone. All trenches lines were delineated using flagging tape by the project geologist. Any vegetation, consisting largely of sparse brush, along the flagged lines was then cut by chainsaw and removed. The backhoe excavated to at least 30 cm depth and to a maximum of 2.5 meters depth exposing large competent rock fragments as well as C-horizon soil.

9.1.3.1 Continuous Trenching Methodology – Buck zone

Continuous trenches were excavated to the effective depth capable of the backhoe of between 1.5 to 2.0 meters. Continuous trenches were chip sampled with a rock hammer over 1-m intervals from the side of the trench wall. Each meter interval was GPS'd (in UTM NAD83 datum) with a hand-held Garmin instrument with an assumed accuracy of ±5 meters horizontally and a unique waypoint assigned. The meter interval is photographed and the photo geo-tagged to the pit UTM coordinate. The continuous 1-m chip sample of rock fragments plus C-horizon soil component collected and bagged, an assay tag with unique sample ID inserted into the bag, and the bag sealed. Individual bags are aggregated in larger 'rice bags' with sample numbers per bag recorded, the rice bags sealed, and delivered to ACME Lab facility in Dawson. An ACME Lab representative signs for receipt of bag(s).

9.1.3.2 Pit Trenching Methodology- Buck and Mascot zones

Pits were excavated along the flagged line to the effective depth capable of the backhoe of between 1.5 to 2.0 meters over a length at bottom of 1 to 2 m. Pits are spaced between 5 and 10 m-apart along the line. Each pit is GPS'd (in UTM NAD83 datum) with a hand-held Garmin instrument with an assumed accuracy of ±5 meters horizontally. The pit is photographed and the photo geo-tagged to the pit UTM coordinate. One continuous rock-soil sample across the bottom/side of the pit is collected weighing 1.3 to 2.5 kg and geo-tagged to the pit UTM coordinate. The rock and mineral fragments are examined and described; a sample assay tag is inserted into the bag and sealed. As with the continuous trenching metho dology, the individual bags are aggregated in larger 'rice bags' with sample numbers per bag recorded, the rice bags sealed, and delivered to ACME Lab facility in Dawson. An ACME Lab representative signs for receipt of bag(s).

Using the pit trench methodology, grade/length estimations are indicators of exploration potential only and should not be relied upon as they may overestimate the area of the potential bedrock source. The Mascot soil anomaly area is unglaciated and has been weathered in place over time; solid bedrock is beyond the depth reach of the backhoe in this area. Consequently, material collected by pit trench sampling is considered a C-horizon soil comprised of mechanically and chemically disaggregated fragments derived directly from the bedrock below. Because it is a soil, there are process such as downslope dispersion that act to 'fan' the area of locally-derived anomalous material which, using the pit trench methodology, will overestimate the area of the potential bedrock source.

9.2 Sample Preparation, Analyses and Security

Soil samples were analyzed by ACME Analytical Laboratories Ltd. in Vancouver, British Columbia using a 36-element ICP-MS nitric-aqua regia digestion with a mass spectrometer finish, code "1DX2" (Table 5). A 15 g sub-sample material was analyzed for Al, Sb, As, Ba, Bi, B, Cd, Ca, Cr, Co, Cu, Ga, Au, Fe, La, Pb, Mg, Mn, Hg, MO, Na, Ni, P, Ag, K, Sc, Sr, S, Tl, Th, Ti, Sn, W, U, V and Zn. A 0.5 g sub-sample undergoes aqua regia digestion with ICP-MS analysis for Au. Quality control procedures were implemented at the laboratory, involving regular insertion of blanks, standards (approximately every 25th sample) and repeat analyses (approximately every 15th sample). Furthermore, soil sample field duplicates were routinely collected and inserted into the analytical stream (every 25th sample). There is no evidence of sample tampering during collection or shipping. ACME Labs prepared the samples in Dawson City and then shipped prepared samples to Vancouver for analysis. Soils are dried at 60^{o}C and sieved to collect up to 500 grams passing the -80 mesh fraction. Soil samples for 2011 were primarily processed in ACME's Dawson City preparation laboratory; however, some samples were processed in the Whitehorse and Vancouver labs.

Rock samples are analyzed using specific ACME rock and drill core packages coded "Geo2" which consists of the code 1DX1 and 3B01procedures as follows (Table 5). Rock samples are analyzed for gold coded "3B01" using a 30 gram sub-sample by fire assay with an atomic absorption finish for concentrations under 10 g/t Au and a gravimetric finish if greater than 10 g/t Au. All rocks are also analyzed coded "1DX1" using a 0.5 g sub-sample which undergoes aqua regia digestion with ICP-MS analysis for 36 reporting elements using the same methodology as per soils.

Ethos uses protocols standard to the industry and professional QA/QC procedures for assaying including the use of duplicates and certified laboratory standards. Furthermore, Ethos ensures the maintenance of chain-of-custody and that ACME Labs retains the pulps.

Table 5: Summary of description and code for Acme Analytical soil and rock analytical packages used by Ethos during the 2011 exploration program

1. Sample Preparation

Package	Description	Code	Unit Cost CDN$
Soils	Dry at 60°C, sieve (up to) 100g to -80mesh, up to ½ kg		
	Soils processed in Dawson City	SS80-DAW	2.85
	Soils processed in Whitehorse	SS80-WHI	1.85
	Sieve large samples: 80 mesh per ½ kg		0.80
Rock and Drill Cores	Crush 1kg to 80% passing 10mesh, split 250g and pulverize to 85% -200mesh	R200-250	6.20
	Extra crushing and saving rejects over 1kg, per kg		0.60

2. Sample Analysis

Package	Description	Code	Unit Cost CDN$
Soils	15g sample, aqua regia digestion, ICPMS finish for low detection limits	1DX2	15.20
Rocks and Drill Cores	A. Consists of:		
	1. 1DX1 – 0.5g sample, aqua regia digestion, ICPMS analysis	Geo2	23.40
	2. 3B01 – 30g sample, fire assay, AA or ICP finish (2 – 10,000 ppb)	(package)	
	B. (Over limit Au > 10,000 ppb)	G601+G612	15.85
	30g sample, fire assay, gravimetric finish		

10 Data Verification

The author visited the property to inspect the explorative work of logistical aspects and to ascertain the property geology. The geochemical data was verified by sourcing original analytical certificates and data, which indicated QA/QC was met by the favourable reproducibility of the standards, blanks and duplicate samples.

11 Adjacent Properties

Adjoining the Betty claim block immediately to the west are the Brit claims related to the Casino porphyry copper-gold-molybdenum deposit of Western Copper and Gold Corporation. The Casino deposit has 4.4 billion pounds copper, 7.5 million ounces gold, 494 million ounces molybdenum, and 54.3 million ounces silver in proven + probably mill ore contained metal plus an additional 0.1 billion pounds of copper, 0.8 million ounces of gold, and 6.3 million ounces of silver in proven + probable heap leach contained metal (Hester, 2011). The Casino deposit is currently in the pre-feasibility and permitting phase.

40 km to the west of the Betty claims is Kaminak's Coffee project. The Coffee project claims are to the west and adjoin the narrow strip of Brit claims. Kaminak's 2011 exploration drilling season on the project has defined gold mineralization along the Coffee Creek structure reporting 17.1 g/t Au over 15.5m with wider intervals running 1.08 g/t Au over 83.93 m from drillcore (Couture, 2011). The Sugar Trend, an 8 km X 4 km gold-in-soil anomaly on the Coffee property, lies 15 km west of the project area; a zone of intermediate to mafic dykes intruding the Whitehorse Suite granitic rocks underlies the Sugar Trend.

The Kinross' White Gold deposit (or Golden Saddle) is located 55 kilometers to the northeast, reporting 9,797, 000 tonnes measured and indicated of 3.19 g/t gold (1,005,000 ounces), with an additional 9,391,000 tonnes inferred of 1.91 g/t gold (578,000 ounces) (Kinross, 2012).

12 Mineral Processing & Metallurgical Testing

The project is at an early exploration phase and therefore no metallurgical testing has been carried out to date.

13 Mineral Resource & Reserve Estimate

There has not been sufficient work on the property to undertake a resource calculation.

14 Other Relevant Data and Information

To the author's knowledge, there is no additional information relevant to this technical report.

15 2011 Statement of Exploration Expenditures

Betty Property
Ethos Gold Corp.
Work completed: June 15, 2011 to September 30, 2011

	Description	Collection Cost	Assay Cost	Total Cost
Soils	14,678 (470 man days)	$ 405,333.00	$ 299,661.00	$ 704,994.00
Rocks	491 (88 man days)	$ 111,638.00	$ 16,273.00	$ 127,911.00
Trenching	approximately 7km (1232 samples)	$ 134,218.00	$ 43,440.00	$ 177,658.00
Prospecting				$ 60,150.00
Aecom Orthophotography and Mapping				$ 67,625.00
Geophysics				$ 351,994.00
Fuel				$ 150,168.00
Transportation				$ 712,651.00
				$ 2,353,151.00

Expenditures certified correct,

Peter Tallman, P.Geo.
Chief Operating Officer, Ethos Gold Corp.

16 Interpretation and Conclusions

Soil surveying on the Betty property identified a 17.5 km^2 area of gold-in-soils coincident with anomalous multi-element soil chemistry at the Mascot Zone, as well as a much smaller anomaly at the Buck Zone. These areas represent a small portion of the larger Betty property.

Prospecting the soil anomalies led to the discovery of gold-bearing rock (grab) samples in colluvium in several areas with the Mascot zone and at Buck. Follow up pit trenching suggested the gold-bearing mineralization, sampled in colluvium interpreted to represent locally derived bedrock, had potentially economic grades and widths – particularly the trenches with the Mercedes portion of the Mascot zone soil anomaly.

Airborne geophysics and orthophotography provided high-resolution total field magnetic, radiometric maps, and photographic base maps from which future mapping can be accurately compiled. The magnetic and radiometric data are useful for mapping lithology and structure given the very limited amount of outcrop exposure present.

The Betty property is a property of merit that warrants further exploration. The property has a favourable geological setting as it similar to the geologic setting of Kaminak's Coffee Project and Kinross' White Gold deposit which lie 35 km and 55 km to the northwest respectively. They are all underlain by the Dawson Range Batholith with intruding Paleozoic metamorphic rocks of the Yukon-Tanana Terrane along the Big Creek Fault and Coffee structure; both of which are associated with significant gold mineralization along their extent. The Betty property has the potential to host mineralization to both the Coffee Project and the White Gold deposit.

17 Recommendations

The results of the 2011 Ethos exploration season are of sufficient merit to recommend additional exploration. A 2012 follow-up exploration program should include additional soil sampling focussing along the Coffee fault; pit trenching to test the many additional gold-soil anomalies untested during 2011; reverse circulation ("RC") drilling to test for widespread gold-bearing alteration (suggested by the size of the soil anomaly) with bulk-tonnage characteristics (necessary to reach thresholds for economic extraction); follow-up diamond drilling is suggested to determine geological characteristics and refine the geological and grade models once the RC program is complete. Approximately 60 reverse circulation holes (9000 meters) and 25 diamond drill holes (3750 meters) are recommended to test the lateral extent and depth of the gold-in-soil anomalies and positive trenching results.

Based on airborne geophysical results detailed ground geophysics follow-up is recommended. Detailed ground magnetic and perhaps HLEM surveys are suggested to help delineate alteration zones and structure.

Table 6: Recommended exploration program budget for the Betty Project

Description	Cost (C$)
Reverse Circulation Drilling (includes assaying)	$2,500,000
Diamond Drilling (includes assaying)	$1,100,000
Soil sampling	$500,000
Trenching	$350,000
Ground geophysics	$200,000
Mobilization / Demobilization	$200,000
Barging	$200,000
Helicopter Charter	$1,000,000
Fixed Wing Air Service	$500,000
Camp operation	$240,000
Equipment rental (camp, trucks)	$10,000
Rehabilitation (trenching, drill pads)	$150,000
Compilation	$50,000
Total	**$7,000,000**

19 Certification, Date and Signature

I, Peter Tallman, of Vancouver, British Columbia hereby certify that:

- I am a graduate of the University of Western Ontario with a Bachelor of Science (Geology) degree (1984).
- I am a practicing Professional Geoscientist (#02366) with the Professional Engineers and Geoscientists of Newfoundland and Labrador (PEGNL) since May 1991.
- I have practiced my profession as a geologist in Canada, throughout the America's as well as Australia and Africa continuously since graduation.
- I have held the position of executive officer and/or director of various publically listed Canadian corporations since 1995.
- I currently hold the position of Chief Operating Officer with Ethos Gold Corp., a company listed publically on the TSXV Exchange.
- I own shares and have been granted options to purchase shares in Ethos Gold Corp.
- I directed work on the Betty Property during the period June 15 to September 30, 2011 and am the designated Qualified Person as defined by National Instrument 43-101 policy.

Dated in Vancouver, British Columbia this 8th day of April, 2012.

Peter Tallman, P.Geo.
