## INTRODUCTION

The Rackla Gold Property comprises a 1700 km<sup>2</sup> area of highly prospective platform to basin facies sedimentary rocks located along the northern edge of the Tintina Gold Belt at the transition from the Selwyn Basin to the Mackenzie Platform, in east central Yukon Territory. Various commodities have been explored for and discovered within the claim block. Historically, this exploration focused on base metal mineralization, while recently the emphasis has been directed towards gold potential. The property is owned 100% by ATAC Resources Ltd. (ATAC).

This report describes the work completed, methods and results of the 2012 exploration program conducted throughout the property from April 5<sup>th</sup> to October 3<sup>rd</sup>, 2012. Detailed breakdown of the work is shown in Table 1.

**Table I: Rackla Gold Property 2012 Work Summary**

Airstrip maintenance and construction	April 5 to October 3
Auger sampling	April 16 to May 22
Geophysical survey	May 7 to May 16th
Mapping Silt, soil and rock sampling Prospecting Trenching	May 24 to September 20
Diamond drilling	May 18 to September 30

Management and labour for the project was provided by Archer, Cathro & Associates (1981) Limited on behalf of ATAC. The authors participated in and/or supervised the geochemical sampling, prospecting, mapping, auger sampling, diamond drilling and airstrip construction. The authors' Statements of Qualifications are listed in Appendix I. Appendix II is a Statement of Expenditures related to the program.

Trans Territorial Consulting provided mapping services, and consultants from Geomantia Consulting and Hardrock Mineral Exploration provided guidance and expertise on data synthesis, regional setting and mineralization style.

The geochemical sampling program resulted in the collection of 19,332 soil samples, 659 silt samples and 1,507 rock samples. A total of 460.33 metres were drilled in 56 auger drill holes, while an additional 36,920 metres were completed in 116 diamond drill holes. For simplicity, this report will only provide detailed information on work required to keep the claims in good standing.

The Stewart airstrip was extended to 800 m by Bob's Contracting using a Kubota R320S loader provided by Atlin Small Engine and a John Deere 450 bulldozer provided by 15317 Yukon Ltd. This work was done to maximize the loads carried off the airstrip by our main support aircraft, a Cessna Caravan.

Aurora Geosciences completed 26.5 line kilometres of Total Field Magnetics and VLF-EM ground geophysical surveys.

### **PROPERTY LOCATION, CLAIM DATA, ACCESS AND INFRASTRUCTURE**

The Rackla Gold Property consists of 8618 contiguous mineral claims located from 64°04'N to 64°11'N latitude and stretching from 135°27'W to 131°54'W longitude on NTS map sheets 105M/14, 15, 106C/01, 02, 03, 04, 05, 06, 106D/01, 02, 03, 06, 07, 08 & 106B/04 (Figure 1). The claims are all registered with the Mayo Mining Recorder in the name of Archer Cathro, which holds them in trust for ATAC. Specifics concerning claim registration are tabulated below in Table I while the locations of individual claims are shown on Figures 2-10.

** Expiry dates include 2012 work which has been filed for assessment credit but not yet accepted.		

The property lies 100 km northeast of Mayo, the nearest supply centre. The closest road access is to the community of Keno City, situated about 49 km by road northeast of Mayo and 55 km by air southwest of the property. Mayo and Keno City can be reached in all seasons by two wheel drive vehicles using the Yukon highway system. The Wind River trail is also accessible via the Yukon highway system from McQuesten Lake near Keno City and crosses the western portion of the property. This winter trail has been used intermittently by various exploration companies since it was built in the late 1960s.

Access to the project in 2012 was routed via Mayo to the Rau, Rackla or Stewart airstrips. Alcan Air provided the project's daily service flights with a Cessna 208B Grand Caravan. Black Sheep Aviation assisted mainly in the spring by providing a DHC-3 Otter on skis. Great River Air provided occasional service flights utilizing a BN-Islander. Large or bulky supplies were brought to the property on Nomad Air's Skyvan or Alcan Air's DH6 Twin Otter. The locations of airstrips and camps are shown on Figure 11.

Daily access to work areas on the project and between the airstrips and camps was provided by one of four helicopters. Fireweed Helicopters Ltd. supplied a combination of two Hughes 500D and one MD 520 N models and Horizon Helicopters provided a Eurocopter AS350 SD2 (A-Star) and a Hughes MD900. The MD 520N provided daily employee transportation to and from work sites for samplers and geologists conducting mapping and silt, soil and rock sampling across the property; the two Hughes 500D and the Eurocopter AS350 SD2 provided support for drilling,

mapping and sampling from the Nadaleen camp. Fireweed also supplied a Bell 204 helicopter for moving the John Deere 450 bulldozer around the property. Trans North Helicopters provided occasional support.

### **HISTORY AND PREVIOUS WORK**

Locations of showings referred to in this report can be found on Figure 12.

#### **RAU TREND**

The earliest reported exploration within the area of the Rackla Gold Property occurred in 1922 following the discovery of silver mineralization at Keno Hill; prospectors first identified and staked mineralized float occurrences at Carpenter Ridge in the far northwest corner of the current property. In 1924, reconnaissance work conducted by the Geological Survey of Canada discovered galena-calcite-siderite in float on the southwest end of Carpenter Ridge. A sample of this float returned 8.75 oz. silver and 56.0% lead (Cockfield, 1925); however, the source of this mineralization was not found. Hand pits were dug in 1927 and 1928 but little record remains of the work completed during this period. All claims were ultimately dropped.

Nearby at Grey Copper Hill, 9 km to the southeast, silver-rich tetrahedrite float was discovered in 1923 by an independent prospector. This showing and other nearby prospects were staked later that year. Several investigatory adits were dug into the hillside during follow up exploration but eventually all claim holdings lapsed.

Between 1930 and 1974 Grey Copper Hill was staked several times by independent prospectors and exploration companies, including Cypress Resources Limited and United Keno Hill Mines Limited. Little work was reported (Hilker, 1969) and all claims ultimately expired.

Hesca Resources Corporation Ltd re-staked Grey Copper Hill in 1974 and conducted prospecting, soil sampling, hand trenching and adit maintenance. In addition, two shallow, small diameter diamond drill holes totalling 56.3 m were drilled; however, the results from this drilling are not documented. No further work was done by Hesca and the claims were dropped (Deklerk and Traynor, 2004).

In spring 1978 Prism Resources Limited re-staked the area and conducted prospecting and geochemical sampling later that year. Soil sampling identified several lead and silver anomalies; however, follow up prospecting failed to explain them (Sivertz, 1979). A sample collected from an outcrop of dolomite yielded 0.60% lead and 51.43 g/t silver, while a tetrahedrite sample collected near an old adit assayed 7000 g/t silver (Sivertz, 1980). Prism allowed the claims to lapse.

Grey Copper Hill was again restaked in 1983 by a prospector who conducted grid soil sampling later that year. This program delineated silver anomalies coincident with surface lineations. No further work was completed and the claims expired.

In 1988 Bonventures Limited staked the area and conducted limited blast trenching, prospecting, mapping plus soil and rock sampling. A gossan zone with pyrite and strong fracture filling

malachite and azurite was identified between two collapsed adits (Carlyle, 1989). These claims eventually lapsed.

The area remained open until August of 2005 when an independent prospector staked four claims over the Grey Copper Hill showing. No work on these claims has been reported and they are now surrounded by the Rackla Gold Property.

Approximately 45 km to the southeast, Cominco Limited staked the Beaver claims in 1968 based on results of regional geochemical sampling done the year before. Later that year, L. Elliott staked the nearby Now claims and optioned them to Cominco, which completed mapping and soil sampling in 1968 and 1969 (Johnson and Richardson, 1969a and 1969b).

In 1977, Prism Joint Venture (Asamera Oil Corp, Chieftain Development Company Limited, Prism Resources Ltd, Siebens Oil & Gas Limited and E & B Exploration Limited) restaked Cominco's claims as part of a larger block that extended for about 20 km along the north side of the Beaver River. In 1979, Dome Petroleum Ltd replaced Siebens in the joint venture.

Prism conducted most of its activities around the original Beaver claims. Soil sampling and mapping were performed in 1977 (Montgomery and Dewonck, 1978) and additional soil sampling and trenching were done in 1978 (Prism Joint Venture, 1979a). In 1979 Prism completed six diamond drill holes totalling 610 m (Dewonck, 1980). This work focused primarily on sedimentary exhalite and Mississippi Valley type lead-zinc mineralization, but resulted in the discovery of a narrow gold-rich vein (the Now Showing).

NDU Resources Ltd. staked claims over the Now Showing in 1987 to cover the lead, zinc and silver soil geochemical anomalies identified by Cominco and Prism. The following year, NDU conducted a geochemical sampling program which focused on the gold vein mineralization at the Now Showing (Cathro, 1989).

In 1977, 6.25 km further to the northwest, Prism conducted mapping, soil sampling and electromagnetic surveys. Numerous samples from that program returned high zinc-in-soil values ranging from 2100 ppm to 12.2%. One sample collected from a large transported gossan (Ocelot Showing) yielded 3.8 g/t silver, 800 ppm lead and 12.2% zinc (Montgomery and Cavey, 1978), suggesting the metals were leached and remobilized in acidic groundwater before being reprecipitated when the fluids were neutralized. These promising results were not followed up. In 1977, Prism also performed minor soil sampling near a strong gossan developed 19 km to the east (Kathy Showing) (Prism Joint Venture, 1979b).

In 1979 and 1980, Prism explored in two areas approximately 16 km southeast of the current Ocelot Showing and conducted prospecting, soil geochemical sampling and one diamond drill hole. This work led to the discovery of scheelite mineralization at the Blue Lite and Flat Top Showings. Well mineralized tremolite skarn specimens from the Flat Top Showing assayed up to 8.4%  $WO_3$ , but most material graded below 0.04% (Churchill, 1980). No further work was done at either showing.

ATAC's interest in the area was prompted by an isolated, high gold value (150 ppb) reported by a regional-scale stream sediment geochemical survey, conducted by the Geological Survey of Canada (Hornbrook, et al 1990). This value is in the 99<sup>th</sup> percentile of gold results from the survey and is supported by a 99<sup>th</sup> percentile tungsten value (25 ppm). The sample was collected near the Rackla Pluton, east of the Tiger Zone.

In summer 2006, ATAC staked 64 claims to cover the anomalous drainage. During the staking, a number of rock and soil samples were collected, many of which returned anomalous values for tungsten and a few were notably enriched in gold, lead, zinc, silver and copper. cursory prospecting relocated scheelite-bearing tremolite skarn (Flat Top Showing) and discovered tungsten in diopside-actinolite skarn and highly fractionated intrusive rocks, about 1500 m to the south.

In 2007 ATAC completed geological mapping, prospecting, grid soil sampling and helicopter-borne variable time-domain electromagnetic (VTEM) surveys (Eaton and Pantou, 2008). This work partially delineated a large hydrothermal system centered on the largely buried Rackla Pluton. Following that program, ATAC staked an additional 32 claims, mostly to improve coverage around a very strong gold-in-soil anomaly outlined on the western edge of the grid.

ATAC and Yankee Hat Minerals Limited signed an option agreement in spring 2008 concerning 40 claims that covered the Rackla Pluton and the tungsten-bearing skarns. During the summer of 2008 Yankee Hat conducted prospecting and a total of 437.38 m of diamond drilling in three holes (Dumala, 2008). Several narrow skarn bands with weak to moderate tungsten mineralization were identified within the carbonate host rocks. The option agreement was terminated in late 2008 following poor results and the claims were returned to ATAC.

Also in the summer of 2008, ATAC conducted geological mapping, prospecting, soil and stream sediment geochemical sampling, 3,423.21 m of diamond drilling in 18 holes and property-wide helicopter-borne magnetic variable time-domain electromagnetic (VTEM) surveys on the claims not covered by the Yankee Hat option agreement. Drilling identified three stacked, gold-bearing horizons in what is now known as the Tiger Deposit (Dumala, 2009). The central horizon (Discovery Horizon) contains gold in iron carbonate replacement and hosts the most abundant mineralization. In 2008 grid soil sampling and stream sediment sampling was extended to the northwest. In response to positive results, ATAC added 1,340 claims to cover the favourable stratigraphy along the anomalous trend.

In 2009, ATAC continued to delineate the Tiger Deposit with an additional 58 diamond drill holes totalling 9,578.30 m (Dumala and Lane, 2010). Drilling identified a significant oxide component to the northwest, within the Tiger Deposit. Prospecting in 2009 also identified several new showings containing mineralization similar to that found at the Tiger Deposit. These include the Cub, Lion, Jaguar, Panther, Cougar, Puma, Cheetah and Lynx Showings.

In 2010, ATAC continued definition drilling at the Tiger Deposit resulting in the completion of a NI 43-101 compliant resource estimate of the sulphide and oxide horizons (Stroschein, et al 2011). Results of the resource estimate using a 0.3 g/t gold cut off yield an indicated resource estimate of 508,000 ounces of gold (7,150,000 tonnes at an average grade of 2.21 g/t) and an

inferred resource estimate of 290,200 ounces of gold (8,280,000 tonnes at an average grade of 1.09 g/t) for the oxide and sulphide horizons combined.

Prospecting at the geochemically anomalous Ocelot Showing in 2010 resulted in the discovery of high grade Ag-Pb-Zn massive sulphide mineralization. Grab samples from this area included 2100 g/t Ag, 55.33% Pb and 62 g/t In (Dumala, 2011).

In 2011 ATAC drilled 19 holes totaling 3784.75 m at the Ocelot target beneath a known but previously undrilled surface gossan. The best grade intervals yielded 145.43 g/t silver, 3.36% lead and 11.65% zinc across 41.72 m and 188.07 g/t silver, 8.69% lead and 6.06% zinc over 37.91 m in semi-massive to massive sulphide mineralization. Drilling by the end of the 2011 season identified mineralization over a 230 m strike length and to a depth of 150 m. (Dumala, 2012a). During the field season, the 900 m long Rau gravel airstrip was constructed at the confluence of the Beaver and Rackla rivers.

Also in 2011, ATAC drilled 10 holes totaling 2,113.2 m of diamond drilling at the Now Showing (3 holes) Puma Showing (2 holes) Cheetah Showing (3 holes) and Kathy Showing (2 holes). Weakly anomalous gold, silver, lead and zinc values were intersected in one Now drill hole. Puma and Cheeta drilling intersected weak gold mineralization; Kathy drilling intersected no significant results (Dumala, 2012b).

### **NADALEEN TREND**

The earliest recorded exploration on the eastern side of the Rackla Gold Property occurred when McIntyre Mines staked the Birkeland claims, then called Tom and Mom in 1974 approximately 200 km east of Mayo. Mapping, geochemical soil sampling, trenching and 10 BQ and 22 Winkie holes were carried out in 1975. The best results were 4.4% zinc, 0.5% lead and 2.7 g/t silver over 1.8 m in DDH75-31 (Shearer, 1975). In 1978 McIntyre Mines entered a joint venture with Canadian Superior Exploration, Ltd. No further work was reported and the Birkeland claims expired.

In 1976 the Sian claims were staked approximately 37 km southwest of the Birkeland claims by McIntyre Mines following prospecting of geological targets. Mapping, geochemical soil sampling and EM, mag and SP geophysical surveys were carried out in 1977. Gold was tested for in 4 grab samples; however, results did not exceed the detection limit for gold (Birkeland, 1978). After entering a joint venture with Canadian Superior Exploration, detailed mapping, trenching and sampling was completed in 1979. Results of this work found low grade lead and zinc throughout a folded dolomite unit. One diamond drill hole was completed in 1980 but did not intersect any mineralization. No further work was recommended and in 1982 the Sian property passed to Serem Ltd, after which the claims were voided and no further exploration was reported.

The Star claims, located approximately 12 km to the west of the Sian claims, were staked by private prospectors and optioned to Prism Resources Ltd in 1976. Mapping and soil geochemical testing completed by Prism in 1977 had disappointing results and all claims were dropped. The Lee and Nod claims were staked to the south of the Leah claims in December of

1976 and were optioned to Tay River Mines. No work is on record for these claims and they were allowed to lapse.

McIntyre Mines staked the Jam property in 1977, 4.2 km north of its Sian property. Soil and silt sampling in conjunction with mapping later that year found a favorable dolomite breccia host rock with associated zinc and lead sulphide mineralization. No further work was reported and the Jam claims lapsed.

In 1976, the Black, Ida, Red and Eira claims, located approximately 8 km east of the Sian claims, were staked by the Ortell Syndicate (Precambrian Shield Resources Ltd, Giant Yellowknife Mines Ltd, Nemco Resources Ltd and Highwood Resources Ltd). In 1977, the Black and Ida claims were optioned by a joint venture between DeJour Mines Limited and Nova-Co Exploration Limited (Thompson, 1977). Mapping and geochemical sampling on the Ida claims later that year returned moderately anomalous zinc values, with erratic lead and silver support.

Also in 1977, prospecting and stream sediment sampling carried out on the Eira property by the Ortell Syndicate returned anomalous silver and zinc results, up to 2.4 ppm and 680 ppm respectively (Curry, 1977). This led to more detailed grid soil sampling and geological mapping. This work returned a number of moderate, non-coincident silver, zinc and lead anomalies.

In 2001, the Geological Survey of Canada completed a regional stream sediment sampling program (Heon, 2003), which included coverage of the current Sten claims, located 19 km west of the Birkeland claims, in an area now referred to as the Nadaleen Trend. Creeks draining this area returned weak gold and strong arsenic anomalies.

ATAC's initial interest in the area was to follow up a strong arsenic silt anomaly collected by the Geological Survey of Canada in 2001. Over a three day period in 2009, 89 stream sediment, 1 rock and 9 soil samples were collected on the Sten claims. These samples returned a string of moderately to very strongly anomalous results ranging from 12 to 1775 ppb gold and 123 to 155,000 ppm arsenic (Eaton, 2010). As a result, additional claims were staked by ATAC.

Follow-up prospecting of the anomalous creek in the summer of 2010 led to the discovery of in situ gold mineralization occurring within a folded, deformed carbonate horizon now referred to as the Osiris Zone. A follow up soil grid consisting of 50 m line spacing and 50 m sample spacing was conducted over this carbonate horizon. Results from the soil grid yielded four distinct gold anomalies known as Osiris, Conrad, Isis and Isis East.

Drilling in the fall of 2010 defined three gold bearing zones (Lane, 2011). The Osiris Zone returned the most significant gold grades yielding 65.20 m of 4.65 g/t Au in OS-10-01. Five more holes were drilled within the Osiris Zone with all but one (OS-10-05) intersecting significant gold mineralization. The Conrad Zone, one kilometer to the east was drilled to target a gold bearing trench. Assay results from this hole included 8.03 g/t Au over 21.13 m in OS-10-08. A second hole drilled in the Conrad Zone intersected arsenic sulphide mineralization in a siliciclastic package (OS-10-09) with an average gold grade of 1.61 g/t over 39.76 m. Drilling in the Isis Zone one kilometer west of the Osiris Zone (OS-10-07) returned comparatively lower, albeit anomalous, gold grades averaging 0.92 g/t over 17.00 m (Lane, 2011).

In 2011 ATAC carried out an extensive drill program at the Osiris, Isis East and Conrad Zones as well as testing pathfinder geochemical anomalies at the Isis East, Amon, Dale, Ptah and Pyramid Zones, for a total of 26,675 m of diamond drilling in 89 holes. Collectively these are known as the Nadaleen trend. (Lane and Carne, 2012).

Of the 37 holes that tested the limestone horizon at the Osiris Zone, 23 intersected significant gold mineralization with the best intersections in OS-11-088 (11.15 g/t gold over 6.27 m) and OS-11-084 (4.41 g/t gold over 44.20 m). Mineralization with accompanying decalcification appears to roughly follow the contact between silty limestone and an overlying dolostone unit, in close proximity to steeply dipping structures.

Six holes tested carbonates of the Isis Limestone Horizon, likely a structural repeat of the Osiris carbonate horizon. One hole at the Isis Zone returned low gold values, but holes drilled following up on a 450 m long gold in soil geochemical anomaly south of Osiris defined a new zone of mineralization, named the Isis East Zone. OS-11-073 returned both the longest (3.13 g/t Au over 51.82 m) and highest grading (12.51 g/t Au over 10.76 m) intervals.

Twenty nine holes drilled at the Conrad Zone in 2011 suggested a reasonably continuous, 450 m long, structurally controlled zone of mineralization possibly related to the east-west trending, north dipping Nadaleen Fault which juxtaposes an extensive mudstone package against limestone and siliciclastic rocks that host the Conrad mineralization. OS-11-010 had the longest (3.15 g/t Au over 114.9 m) while OS-11-014 had the highest grade (20.55 g/t Au over 6.09 m) intervals.

Eight holes were drilled in the Amon Zone, an area drained by very arsenic rich springs. Though realgar and orpiment were abundant, the highest gold grade encountered was 0.83 g/t Au over 1.52 m in OS-11-034. One hole drilled in the Ptah Zone north of Conrad to test the potential of finding mineralization under the Nadaleen Fault did not reach favorable stratigraphy.

A soil geochemical pathfinder anomaly at the Dale Zone was tested by two holes which intersected trace realgar, but no significant gold.

Five holes tested the Pyramid Zone, another soil geochemical pathfinder anomaly with massive orpiment boulders and realgar cobbles. Poor drilling conditions meant none of the holes reached their target depth. PY-11-004 intersected significant realgar and orpiment mineralization.

Mapping during the 2011 season in the Nadaleen trend continued to refine stratigraphic and structural interpretations and correlations.

### **PROPERTY WIDE**

In 2011 ATAC Resources carried out an extensive geochemical sampling program across the Rackla Gold Property with the goal of locating new low temperature gold occurrences, similar to those found at the Nadaleen Trend. It resulted in 1,172 silt samples and 13,144 contour, ridge and spur and grid soil samples as well as 180 rock samples (McDivitt, 2012). Grid sampling focused on the Pyramid and Dale targets in the Nadaleen Trend and at the Ocelot, Blue Lite and

Cheshire targets in the Rau Trend. Results defined multiple areas of interest on both the west and east ends of the property.

Remote sensing data was collected over the course of the season to provide property wide, orthorectified satellite imagery and high resolution contours with low level aerial photos over target areas.

A combined airborne magnetic and radiometric geophysical survey flown over the Pyramid target defined broad, curvilinear lineaments trending east-southeast reflecting the general trend of lithologies and structures in the area.

### **GEOMORPHOLOGY AND CLIMATE**

The Rackla Gold Property stretches 185 km from east to west in the Selwyn and Werneke Mountains and is drained by creeks that flow into the Nadaleen, Rackla, Stewart and Beaver Rivers, all part of the Yukon River watershed. Local topography varies from low forested valleys to alpine areas and features east-west to northwest trending major valleys and ridges, north-south trending rocky spurs and valleys that flank a main east-west trending ridge system. Elevations range from about 600 to 2000 m above sea level. Outcrop is most abundant near ridge crests and in actively eroding creek beds. Most hillsides are talus covered at slope breaks and are blanketed by glacial till at lower elevations. The region was glaciated in the Late Pleistocene, 22,000 years ago (Duk-Rodkin, 1999) with ice flow from east to west.

Treeline in the vicinity of the project is at about 1500 m. Slopes above that elevation, especially steep north facing slopes are unvegetated. Moderately steep, south facing slopes are well drained and are often lightly forested with poplar. The density and size of vegetation gradually increases on lower slopes, and the valley floors are well treed with mature black spruce. Understory vegetation typically consists of low shrubs and moss.

The climate in the Rackla Gold Project area is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. Although summers are relatively mild, arctic cold fronts often cover the area and snowfall can occur in any month. The property is mostly snow free from early June through late September.

### **REGIONAL GEOLOGY**

The Geological Survey of Canada performed geological mapping in the vicinity of the Rackla Gold Property at 1:250,000 scale in the early 1970s (Blusson, 1974). In 1999, the Geological Survey of Canada (Gordey and Makepeace, 1999) completed a compilation of Yukon-wide geology and updated the lithological units named in the Rackla area. The Yukon Geological Survey completed mapping of 106C/03 and 106C/04 1:50,000 map sheets during 2010 and 2011 (Colpron, 2012; Chakungal and Bennett, 2010) and completed the Rackla belt compilation, map sheets 106D1, 106C1-4 in 2012 (Colpron et. al., 2013).

The Rackla Gold Property straddles the boundary between deep water dominantly clastic rocks of the Selwyn Basin to the south and shallower water shelf strata of the Mackenzie platform to

the north. The Dawson Fault, which juxtaposes rocks of Selwyn Basin against rocks of Mackenzie Platform, is a crustal break that may date back to late Neoproterozoic rifting and was reactivated as a north directed thrust in the Cretaceous (Macdonald et. al, 2010). The tectonic setting of the Rackla Gold Property is shown in Figure 13, while regional relationships and the importance of the Dawson Fault system are presented in Figure 14.

Yukon Geological Survey mapping during the 2012 field season refined the Proterozoic to Paleozoic sedimentary stratigraphy underlying the Rackla Gold Property (Figure 15). A description of this new mapping is described below.

Proterozoic to Lower Cambrian rocks are divided as follows:

- Proterozoic units north of the Kathleen Lakes Fault are correlative with Rapitan Group.
- Neoproterozoic to Cambrian units in the hanging wall (south) of the Dawson Thrust include Hyland Group (Yusezyu , Algae and Narchilla Formations) and the Gull Lake Formation.
- Neoproterozoic to Cambrian units between the Kathleen Lakes and Dawson Thrust faults have been given local names: the Nadaleen and Stenbraten Assemblages, which may be correlative with Windermere Supergroup rocks. Additionally, Ediacaran aged Hyland Group rocks including the Algae Formation, Narcilla Formation and unnamed Cambrian siltstones and limestones are also mapped on the north side of the Dawson Thrust.

Paleozoic Rocks are divided as follows:

- Off-shelf Rocks - Ordovician to Lower Permian rocks including Road River Group black shale, Ordovician to Silurian limestone, Middle Devonian limestone, Middle Devonian to Lower Mississippian dominantly shale of the Earn Group, and Mississippian to Lower Permian dominantly clastic rocks.
- Platform Rocks – Upper Cambrian to Devonian (?) limestone and dolostone.

To date, mineralization along the Rackla Gold Property has dominantly been discovered between the Kathleen Lakes and Dawson Thrust Faults.

### **PROPERTY GEOLOGY – NADALEEN TREND**

Property scale geologic mapping continued in the Nadaleen area during the 2012 field season with attention focused on areas of interest identified during 2011 geochemical surveys and prospecting. The distribution of lithologies and regional scale structures determined during this mapping program are shown on Figure 16.

Lithologies have been divided into three groupings: Paleozoic Rocks, Neoproterozoic - Cambrian rocks and Neoproterozoic Rocks. Descriptions of each of these are provided below.

Paleozoic Rocks – Thought to be equivalent to Earn Group, they are exposed from the Pyramid Zone to just south and west of Nadaleen Camp. This group has been subdivided into four lithologically distinct map units:

- **Pz4:** Thinly bedded, dull grey-brown weathering siltstone interbedded with shale and minor fossiliferous limestone.
- **Pz3:** Fossiliferous (locally described as 'fossil hash'), medium- to coarse-grained, calcareous and moderately calcareous wackestone interbedded with shale, calcareous siltstone and minor chert. Fossil fragments include shelly bits, crinoids and bryozoa.
- **Pz2:** Well bedded, carbonaceous and argillaceous chert interbedded with carbonaceous shale, siltstone, and lesser amounts of chert pebble conglomerate and minor sandstone that may locally be calcareous. Grades into fossiliferous, micritic limestone.
- **Pz1:** Pale grey weathering, micritic limestone interbedded with thick debrite packages and carbonaceous chert. Includes fossils of favocites, halycites(?) rugose coral, crinoids, brachiopods, bryozoa and possibly sponges. In the Dale target area this unit is silicified and brecciated. Limestone outcroppings at Pyramid, Dale South and Sten peaks are fossiliferous, medium- to coarse-grained wackestone with fossil fragments including shelly bits crinoids and bryozoa.

Neoproterozoic - Cambrian Rocks may in part be equivalent to the Hyland Group and Windermere Supergroup. This stratigraphy is exposed across the entire length of the map area. It is divided into ten lithologic map units as follows:

- **phy:** Maroon and turquoise-green phyllites and siltstones interbedded with rosy pink limestone (at the Sian Target), and/or invariably calcareous, green weathering sandstones.
- **dol:** Zebra textured dolostone locally with chert lenses overlies very dark grey/black, crystalline limestone. This may be the same dolostone exposed at the Isis Zone.
- **xlst:** Very dark grey/black, coarsely crystalline limestone. Often associated with beds of polymict floatstone containing clasts of orange weathering dolostone, limestone, rounded quartz pebbles and minor shale, particularly near the base of the unit. 'Beef' textured calcite layers are common, particularly in outcrops near the Nadaleen camp. This unit is logged as O-LST2 in drill core at the Osiris Isis and Isis East Zones. Graded calcite cemented pebble conglomerate to sand layers are very distinctive in the Osiris area. Larger quartz clasts can be quite angular.
- **slt:** Green-grey siltstone and shale interbedded with fine- to medium-grained sandstone, lesser calcareous sandstone, minor limestone and limestone debrites.

- **cgl, sst:** Well sorted, coarse grained, quartz granular sandstone to pebble conglomerate.
- **Odm:** Limestone pebble to boulder conglomerate, predominantly matrix supported debrites. Clasts vary from centimetre to metre scale and comprise limestones that are markedly similar to the limestone described below. Matrix composition is variable comprising non to weakly calcareous green siltstone and shale (south of Osiris and Nadaleen camp where overlain by non-calcareous shale siltstone and sandstone) and/or crystalline limestone (east and west of Osiris where overlain by crystalline limestone).
- **Olst: Osiris Limestone:** Well bedded, tan and grey limestone preserving sedimentary structures (ie. climbing ripples, cross bedding). Monolithic, intraclast rudstone layers, averaging 0.5-2 metres thick, are common throughout the unit, particularly in basal sections. They consist of randomly oriented to imbricated, tabular to equant clasts in a carbonate mudstone matrix. Clast composition is almost exclusively the same as the enclosing carbonate mudstones. Where in contact with underlying maroon siltstones, the limestone is characteristically orangey-tan weathering vs. light grey weathering where underlying siltstones are green. Higher up in the section, the limestone includes interbedded calcareous and non-calcareous lithic and arkosic sandstones. (Turner, 2012 suggests that this unit and the underlying maroon siltstone may be correlative with Mesoproterozoic, <1.3 Ga; >1.0 Ga, Pinguicula Units B and A respectively.) In the Osiris area this unit is further subdivided into a lower limestone unit as described above and an upper tan weathering, massive to crackle brecciated dolostone. Total thickness of this limestone/dolostone package at Osiris/Isis East averages 150 m.
- **Osst:** Maroon and green siltstone, finely laminated. This unit is generally identified by its proximity to the overlying Osiris limestone. It is referred to as the Osiris maroon siltstone in Osiris/Conrad area.
- **Clst2: Conrad calciclastics:** Dark, crystalline lime mudstone, calc-arenite, and lensoidal pebble to boulder conglomerates, interpreted as debris flows with lesser interbedded siltstone and grey to black shale. Clast composition of the conglomerate is dominated by limestone and lesser dolostone.
- **Cslc: Conrad siliciclastics:** grey-green pyritic siltstone and mudstone, poorly sorted matrix-supported quartz pebble conglomerate with lesser grey, well sorted, weakly calcareous sandstone. The conglomerate, informally referred to as ‘starry night’, consists of rounded quartz pebbles floating in a mix of sand and silt with occasional larger clasts that appear to be rip up clasts of matrix material.
- **Clst1:** Conrad limestone: Light grey weathering, silty laminated clastic limestone with cone in cone and beef calcite, and wispy fine quartz sand layers.

Neoproterozoic rocks, possibly equivalent to Windermere Supergroup as suggested by the Yukon Geological Survey. These rocks are exposed to the north and east of Nadaleen Camp and may also be exposed in the hills immediately east of the Dale target area. In the Osiris area they are locally called Nonad (North of Nadaleen fault). This package is divided into five lithologic map units as follows:

- **N5:** Finely laminated, grey-green limestone interbedded with ‘beef’ textured calcite and minor siltstone, particularly proximal to the contact with limestone.
- **N4:** Grey weathering shale and minor siltstone.
- **N3:** Grey weathering, fine grained sandstone interbedded with siltstone. This may be part of the coarse-grained sandstone/conglomerate unit described next.
- **N2:** Orange-brown weathering, well bedded, fine-to coarse-grained sandstone interbedded with grey/blue quartz granular sandstone and /or quartz pebble conglomerate. Quartz clasts are most commonly rounded.
- **N1:** Chlorite green siltstone and shale interbedded with orange weathering, coarse-granular quartz and chert pebble sandstone and conglomerate. This unit is polydeformed and has a well-developed cleavage.

Locally, stratigraphic relationships between the mapped units in the central Nadaleen drill area have been determined. This stratigraphic column is shown in Figure 17, while a revised geologic map of this area is represented in Figure 18.

It is believed that the Rackla Gold Property area underwent extensive deformation as part of a Mesozoic to early Cretaceous fold and thrust event, followed by a transition into a probable strike slip regime. Two major regional structures transect the property: the Dawson Thrust and the Kathleen Lakes Fault. The Dawson Thrust, historically described as defining the northern edge of Selwyn basin, places Precambrian Hyland Group rocks over Paleozoic shelf carbonates as part of Jurassic to Cretaceous compressional tectonics. This is likely a much older structure, possibly dating back to Precambrian rifting that was reactivated during compression.

The Kathleen Lakes Fault marks the contact between Paleozoic platform rocks to the north and Paleozoic shelf to basin rocks to the south in the western part of the property. Both the Dawson Thrust Fault and Kathleen Lakes Faults are more difficult to trace to the east as they move into broad valleys covered by a thick layer of glacial till. The Nadaleen Fault near the eastern end of the property appears to be a splay off the Kathleen Lakes Fault.

The prevalence of debrite and turbidite facies within almost all units, along with the highly variable stratigraphic thicknesses of units provides strong evidence for long lived synsedimentary tectonism.

## SOIL, SILT AND ROCK GEOCHEMISTRY

### GENERAL

The goal of the 2012 geochemical sampling program on the Rackla Gold Property was to locate new precious metal occurrences and define scout drill targets. Samplers collected 1,507 rock, 659 silt and 19,332 contour, ridge and spur and grid soil samples. Infill silt sampling completed coverage of drainages that had not previously been sampled. Soil sampling was mainly focused along Nadaleen Trend between the Pyramid and Osiris targets and at the Pharaoh target in addition to an area south of the Tiger Deposit in the Rau Trend. Prospecting and pit sampling followed up on some of the soil geochemical anomalies generated.

The locations of soil silt and rock samples, along with the sample identifier are located in Figures 19-63. Sampling and analytical procedures are explained in Appendix III; rock sample descriptions are provided in Appendix IV; and certificates of analysis occur in Appendix V.

Background and anomalous values for gold and arsenic were calculated for all soil and silt samples collected across the Rackla Gold Belt. Background, average, weak, moderate, moderately strong and strongly anomalous thresholds approximately correspond to the 50<sup>th</sup>, 90<sup>th</sup>, 95<sup>th</sup>, 98<sup>th</sup> and 99<sup>th</sup> percentiles from these samples. The geochemical characteristics of the soil and silt samples are summarized in the following tables.

**Table III – Thresholds Values for Soil Samples**

Thresholds	Au (g/t)	As (ppm)	Sb (ppm)	Tl (ppm)	Hg (ppm)

## **RESULTS**

The 2012 sampling program generated new areas of gold potential in the Rau Trend as well as a widespread spatial distribution of anomalous pathfinder elements in the Nadaleen Trend in an area between Pyramid and Osiris. Figures 64-67 present thematic maps illustrating the gold and arsenic soil values in the Rau and Nadaleen Trends.

Geochemical definition of the Anubis and Pharaoh Zones, as well as the delineation of ten high priority “N series” targets in the area between Pyramid and Osiris are the result of wide spaced geochemical transect sampling that occurred late in the 2012 field season. The location of these newly defined zones are shown in Figure 66 and tabulated below in Table V.

A summary of advanced stage and high priority exploration targets is summarized in Table VI. These targets and zones are representative of the culmination of exploration done in the Rackla Gold belt from 2008 to 2012. Rau Trend showings are displayed on Figure 64.

**Table VI – Summary of Targets and Zones Defined to Date along the Rackla Gold Belt**

<b>Trend</b>	<b>Target(s)/ Zones</b>	<b>Comments</b>
<b>Nadaleen</b>	Osiris Zone	2010 Carlin-type discovery hole returned 65.20 m of 4.65 g/t gold in hole OS-10-001. Zone remains open down dip and to the north.
	Conrad Zone	Most advanced Carlin-type gold zone with 800 m strike length, open in all directions, 99 diamond drill holes. Highlight 2012 hole intersected 42.93 m of 18.44 g/t gold in hole OS-12-114.
	Isis East Zone	Very encouraging near surface gold zone directly south of Osiris with limited drilling. Highlight 2012 drill hole intersected 27.43 m of 6.28 g/t gold in OS-12-120. Major focus for 2013.
	Sunrise Zone	2012 discovery directly east of Osiris. Hole OS-12-173 intersected 14.86 m of 10.54 g/t gold. Sunrise Zone remains open in all directions and will be a major focus for 2013.
	Anubis Zone	2012 discovery located 10 km west of Osiris. Hole AN-12-001 intersected 8.51 m of 19.85 g/t gold. Anubis Zone remains open in all directions and will be a major focus for 2013.
	Pharaoh	2012 surface discoveries of Carlin-type and high-grade quartz vein material with visible gold.
	N(1-10)	Ten Tier 1 pathfinder±gold anomalies surrounding the Anubis and Pharaoh areas. Primary focus for 2013 follow-up.
	Isis	Intense gold in soil anomaly 600 m west of Osiris. Additional mapping and drilling to be completed.
	Pyramid	4 by 0.6 km arsenic anomaly and orpiment/realgar boulder train.
	Amon	500 by 250 m area of arsenic mineralization 1.8 km northwest of Osiris.
	GT	Decarbonated and clay altered showing with abundant realgar and barite located 6.9 km west of Osiris.
<b>Rau</b>	Tiger Deposit	NI 43-101 resource of oxide and sulphide at a cut-off grade of 0.30 g/t gold estimated at: Indicated: 508,000 oz gold (7,150,000 tonnes at 2.21 g/t Au) Inferred: 290,000 oz gold (8,280,000 tonnes at 1.09 g/t Au)
	Ocelot Zone	Silver-lead-zinc discovery made in 2010. Hole OC-11-010 intersected 63.44 m of 73.81 g/t silver, 2.44 % lead and 8.18 % zinc. 19 holes have defined a zone with a strike length of 230 m. Area has received very limited exploration.
	Bengal	Gold showing discovered in 2012 located 3.2 km south of the Tiger Deposit and within a newly defined 5.6 km intermittent gold-in-soil contour anomaly. Additional prospecting and geochemistry planned for 2013.
	Cheetah, Cougar, Jaguar, Puma and Panther	All five targets are dispersed 5 to 8 km to the northwest from the Tiger Deposit along a regional structure. They exhibit many of the same surface characteristics as the Tiger Deposit but have received limited drilling and exploration.

	Kathy	Gold skarn target 4.5 km south east of the Tiger Deposit. Veinlet hosted mineralization grades up to 13.7 g/t gold.
	Flat Top	Gold skarn target 2.5 km northeast of the Tiger Deposit defined by a 700 by 250 m gold-bismuth soil anomaly.
	Blue Lite	Gold skarn target occurring 5.7 km northeast of the Tiger Deposit defined by a tight cluster of anomalous gold and bismuth in soil.
	Now	Gold and antimony anomaly located 10 km west of the Tiger Deposit. The anomaly is a 5 by 1 km northwesterly linear trend that occurs in a geologic environment similar to the Bengal Showing.
	Now West	2012 gold in silt anomaly located 17.5 km west of the Tiger Deposit.

## 2012 Nadaleen Trend Discoveries

### *Anubis*

The Anubis Zone was discovered in August of 2012 as a result of detailed 50 m x 50 m grid soil sampling. Follow up prospecting found in-situ jasperoid with four grab samples collected along the exposure returning 139 g/t, 125 g/t, 122 g/t and 84.2 g/t Au. The Anubis discovery is hosted in a carbonaceous argillite package bounded to the northeast and the southwest by northwest trending regional scale structures. Hand pits dug 600 m to the southwest of the high grade jasperoid material along the southern-most bounding structure resulted in fault rock yielding values ranging from 1.01 g/t to 5.59 g/t Au. While kinematics on the structures are not fully constrained, their latest motion may have been contractional and oblique slip.

### *GT*

The GT target is an arsenic in soil anomaly as well as outcrop with alteration characteristics and gangue mineralization associated with a Carlin type system. Mineralization and alteration are associated with a banded dolomite unit. Alteration includes strong decarbonitization as well as argillic alteration. Gangue minerals include realgar and barite. To date no gold has been found in association with altered material or in soil.

### *Pharaoh*

Exploration in the Pharaoh Zone followed up silt samples containing anomalous mercury and antimony values. Prospecting up the main drainage resulted in the discovery of disseminated realgar in sandstone in the creek and realgar-cinnabar and stibnite bearing fault zones at the head of the main drainage. Assays values for gold in samples containing indicator minerals for Carlin type mineralization are typically below detection. Detailed contour sampling in the Pharaoh area delineated multiple ridge top to ridge proximal gold in soil anomalies. Follow up prospecting of these gold in soil anomalies resulted in the discovery of visible gold in quartz veins. The veins, typically east west trending, are proximal to north trending, east dipping structures that contain indicator minerals for Carlin type gold mineralization. Assays values for gold bearing quartz vein material are highly variable with a range maximum of 79.40 ppm (weighted +/- fractions).

## 2012 Rau Trend Discoveries

The locations of showings discovered or improved upon in 2012 within the Rau Trend are displayed on Figure 64. Much of this work was conducted in late May through early June while snow melted in the higher elevation target areas. A description of each zone follows.

### *Ocelot*

Four days of prospecting on the Ocelot Zone resulted in the discovery of a new showing of high grade Ag-Pb-Zn mineralization occurring along a north westerly trend 866 m northwest of the main Ocelot drill area. This trend may correspond to the extension of the north westerly trending regional strain corridor associated with mineralization at the Tiger Deposit.

The majority of sulphide mineralization at the new Ocelot showing consists of galena (presumably argentiferous) with large coarse grained barite crystals. Maximum metal values from grabs at the showing are 2960 g/t Ag, 60.3 % Pb, 45.8 % Zn and 1.0 % Sn.

### *Kathy*

Exploration work in the vicinity of the Rackla Pluton resulted in the discovery of skarn related gold mineralization at the Kathy showing, a historically known skarn target (Deklerk and Traynor, 2004) associated with a previously believed to be base of slope gossan. The gossanous material is likely hydromorphic in origin and not the surface expression of a massive sulphide body. Soil geochemistry defines a circular zone of enriched gold, arsenic and bismuth in a knoll south of the base of slope gossan. Prospecting in this area resulted in the discovery of narrow, irregular, oxidized veinlets containing gold values up to 13.7 g/t along with values of 5,530 ppm bismuth and 2,790 ppm antimony. A sample of white coloured tremolite skarn containing unidentified disseminated sulphides was also collected yielding assay values of 1.65 ppm Au with elevated arsenic, bismuth and antimony values of 529 ppm, 100 ppm and 3,940 ppm respectively. At the Kathy target exposure is poor. The presence of a base of slope gossan that appears to be sourcing from a north-easterly trending structure with veinlets and disseminated sulphides in marble that contain potentially economic gold grades make it a high priority target.

### *Bengal*

The Bengal showing is a gold occurrence found within an area mapped as the Earn Group shales (Blusson, 1974). Low elevation contour soil sampling returned a highly anomalous soil sample containing 2.36 g/t Au with highly elevated bismuth and arsenic values of 237 ppm and 3690 ppm respectively. Hand trenching proximal to the soil sample exposed rocks with geochemistry and alteration similar to the Tiger Deposit. Gold mineralization up to 3.19 g/t associated with pyrite and elevated arsenic and bismuth values occurs within highly friable, carbonaceous material. Mineralization occurs within moderately dipping stratigraphy consisting of basinal argillites interbedded with fossiliferous carbonate debrite layers containing two hole crinoids. The carbonate layers are preferentially oxidized and altered to coarse grained hydrothermal dolomite. Samples of this oxidized material ran between 0.3 and 0.8 g/t Au. The carbonaceous material assayed consistently around 3 g/t Au and was associated with abundant disseminated

pyrite and sulfate. The Bengal discovery occurs in what was thought to be unfavourable stratigraphy and has therefore opened up exploration potential in the area.

### **AUGER SAMPLING PROGRAM**

Prospecting and trenching at the Pyramid Zone in 2011 returned cobbles of orpiment and realgar in till. Diamond drilling later that year failed to determine the source of this material. Over the following winter a new approach was designed to test the potential for mineralization.

An auger drill was mounted onto a modified hydraulic system on the back of a John Deere 450 bulldozer. Eight inch (20 cm) diameter auger flutes were mounted on 5 foot (1.5 m) extension steels. Augering services were provided by 15317 Yukon Ltd., and started on April 16, 2012 to take advantage of frozen ground conditions and snow cover which prevented excessive disruption to the ground cover. Drill site preparation was minimal as the bulldozer had a hydraulic leveling system, although some leveling was required on more uneven terrain.

The auger sampling program was designed to test a 500 x 250 m As-Hg-Tl-Sb soil anomaly at the Pyramid Zone. Thick till overlies much of the area so traditional soil geochemical sampling methods had returned irregular results. Geomorphic features defined from air photo interpretation suggested that the prevailing ice direction had transported material from east to west. Drill holes were placed approximately every 300 metres along east-west oriented section lines. The exact location of auger drill collars was somewhat defined by the terrain. Collar locations are presented on Figure 68 and in Table VII.

Holes were drilled on average to a depth of 6-10 m. Hole depth was determined by location of bedrock or more commonly the limit of the hydraulic system on the bulldozer. Samples were collected in 2.5 foot intervals and placed into cloth sample bags to dry. A representative sample was kept in camp for future analysis if required. When the samples were dry they were packaged up and sent to ALS for analysis. Analytical and sampling procedures are documented in Appendix III; certificates of analysis can be found in Appendix VII and geologic auger logs with results are listed in Appendix VI.

Results indicated that the source of the anomaly was not from the east, but rather downslope hydromorphic transport from a known alteration zone that had been drilled in 2011. Samples from the area graded up to 13,150 ppm As and 0.16 g/t. Au. The highest gold value of 0.16 g/t was obtained from PyAG-12-01. Although the auger sampling program did not define a new gold anomaly, the equipment and program design exceeded expectations in terms of depth and rate of augering at the drill sites.

## **DIAMOND DRILLING**

### **GENERAL**

Diamond drilling was carried out on the Conrad, Osiris, Isis, Isis East, Sunrise, Pyramid, Anubis and GT Zones between May 18 and September 30 by Superior Diamond Drilling Ltd. of Peachland, BC. The work was completed using HQ and NQ equipment on six heli-portable Discovery II drills. A total of 36,920 m of diamond drilling was completed in 116 holes. This report presents the results of 5,613 m in 20 holes filed for assessment.

Each drill was set up on an approximately 16 foot square platform built of 8" x 8" timbers covered with 2" x 8" planks or on an earth filled log structure of approximately the same size. Each of these pad types were prepared by hand. Drill collars were marked a piece of drill rod cemented into the hole and labeled with the drill hole data. All drill holes were assayed for gold and multi element data for the entirety of their length.

Drill collar locations are plotted on Figures 68-71, and key data for the holes is listed in Table VIII. Geologic cross sections are presented in Figures 72-87. Geological and sample logs are given in Appendix VIII, sampling and analytical procedures are provided in Appendix IX, QA/QC results are summarized in Appendix X, and certificates of analysis are shown in Appendix XI.

### **Conrad Zone**

Drilling refined the geological interpretation of the Conrad Zone defined in previous years of drilling. The Conrad Zone consists of a package of carbonates (Conrad Limestone) and overlying siltstones to conglomerates (Conrad Siliciclastic) that are folded into a broad east west trending doubly plunging anticline. This fold appears to be folded again in the centre with the eastern and western limbs curving towards the north. The doubly folded Conrad Limestone and siliciclastic package is in fault contact with the Nonad mudstone unit along the steeply north dipping Nadaleen Fault Zone. This fault zone ranges up to 50 m wide and is a brittle to ductile cataclasite consisting of fragments of all three rock units occurring in irregular blocks against one another.

Gold mineralization is hosted in both the Conrad limestone and Conrad siliciclastic rocks, usually within 50 m of the very steeply dipping and often sheared contact. Gold mineralization is accompanied by decalcification and deposition of sooty pyrite, giving mineralized core a darker appearance than unmineralized intersections, although this is very subtle to non-recognizable in siliciclastic rocks. Permeability is the key factor controlling the distribution of alteration and mineralization. Features that control permeability include primary fluid conduits such as fault and shear zones as well as stylolites, veinlets and fold hinges (Tucker et. al., 2013). Realgar is commonly associated with gold bearing zones, but not all occurrences of realgar have associated gold.

In total, the gold mineralized zone at Conrad was extended 150 m to the west and 200 m to the east for a total mineralized extent of 800 m.

### **Isis East Zone**

Drilling at the Isis East Zone extended gold mineralization in three directions: 50 m to the northwest along the steeply dipping west limb of the south-plunging anticline, 50 m to the northeast along the more shallowly dipping east limb of the fold and to a depth along the plunge of the anticline of nearly 300 m.

Gold mineralization is hosted in silty limestone and dolostone of the Osiris carbonate package. Mineralization is strongly stratigraphically controlled along the limestone-dolostone contact, as well as focused along the hinge of the anticline. Decalcification and deposition of realgar accompanies gold mineralization.

### **Isis Zone**

Hole OS -12-189 hole was drilled to test the Isis gold-in-soil anomaly. While weakly anomalous in gold and strongly anomalous in arsenic, this hole did not explain the strength of the soil anomaly found on surface at the Isis Zone. The weak gold mineralization in the hole occurred in rocks to the north of the fault separating the Osiris carbonate package from more clastic rocks to the north. This was unusual as we would have expected the prospective Osiris limestone-dolostone to host the mineralization. Further work needs to assess the mineralizing potential of this structure and the clastic dominated rocks to the north of it.

### **Anubis Zone**

Drilling at the Anubis Zone focused on testing underneath high grade gold mineralization in outcrop and nearby pit samples along a northwest trending fault zone. Significant gold mineralization occurs within a carbonaceous, ferruginous Paleozoic argillite unit. This unit is thought to be Devonian in age as it occurs stratigraphically above a micritic limestone unit containing two hole crinoids.

Drill hole AN-12-001 intersected 19.85 g/t Au over 8.51 m in the subsurface equivalent of the gold bearing jasperoid material found at surface. AN-12-002 undercut AN-12-001 targeting the same jasperoid horizon but, while too steep to intersect the structure, it encountered a fault zone at an interval between 132.38-152.30 m containing weakly elevated gold values up to 0.32 g/t. This fault zone appears to be equivalent to the one targeted to the northwest by holes AN-12-004 and AN-12-005. Directly before intersecting the fault zone, AN-12-002 encountered a zone of 0.88 g/t Au over 7.69 m. This zone may correlate with the jasperoid zone encountered in AN-12-001 although alteration characteristics and quantitative gold values show significant differences.

AN-12-003 scissored AN -12-001 and returned 9.08 g/t Au over 16.76 m in the jasperoid zone. This hole also bottomed unexpectedly in mineralization in an apparent fault zone separating carbonaceous argillites from light grey lime-micrite.

Holes AN -12-004 and AN -12-005 continued testing the structure 600 m to the northwest under a pit sample grading 5.59 g/t. Both holes intersected intensely decalcified and clay-altered limestone with anomalous gold at or near the fault contact between the limestone and black shale.

A third soil anomaly with accompanying 0.88 g/t Au in a pit sample, along a parallel lineament 400 m north was tested by hole AN -12-006. Encouraging alteration was encountered from the top of the hole to a depth of 124 m. This zone of alteration is comprised of decalcification and minor silicification of limestone, accompanied by highly anomalous Carlin-type deposit pathfinder elements (As, Hg, Tl, Sb) and intermittent gold mineralization up to 1.2 g/t.

### **GT Zone**

Drilling at the GT Zone tested an apparently structurally controlled alteration zone with realgar and barite that was discovered during mapping and exposed through hand trenching. GT-12-01 intersected altered grey, clay-like material with green arsenic oxide staining. Samples collected within the alteration zone yielded elevated values for arsenic, mercury, antimony and thallium (up to 10,550 ppm, 9.84 ppm, 9.78 ppm, and 10.15 ppm respectively). Gold values were at or below detection.

### **Pyramid Zone**

Drilling at the Pyramid Zone targeted a previously defined east-west trending, south dipping, arsenic sulphide bearing structure. The structure was defined through a lithologic transition from carbonaceous argillite to dolomitized and brecciated limestone. PY-12-006 failed to reach the hanging wall argillite package due to poor ground conditions. PY-12-007 reached the target depth, intersecting realgar mineralization in the structure at 126.28 m. Gold assays throughout the hole were very low with the highest assay value returning 0.02 g/t between 111.86-114.91 m.

## **GEOPHYSICAL SURVEY**

### **GENERAL**

In late May 2012, detailed ground based gravity, magnetic and VLF electromagnetic surveys were conducted by Aurora Geosciences. The surveys were designed to show the mineral potential at the Kathy target (gold skarn) and Ocelot Zone (Ag-Pb-Zn) in the Rau Trend. Data from these geophysical surveys is presented in Appendix XII.

The Kathy and Ocelot Targets are both high temperature mineral assemblages. Mineralization at the Kathy Zone and the Ocelot Zone is dominated by high temperature assemblages related to the magmatic-hydrothermal system associated with the Rackla Pluton. The nature of alteration and high density of the sulphide phases that have formed in response to the magmatic-hydrothermal system and its interaction with country rocks make both of these zones prime candidates for geophysical prospecting.

## **RESULTS**

### **Ocelot Zone**

Of the three methods used, gravity appears to be the most insightful into the potential for further massive sulphide mineralization at the Ocelot Zone. The main sulphide body at the Ocelot Zone stands out as a first order gravity anomaly. Furthermore, the gravity data displays four other first order anomalies in the area. Some of these unexplored anomalies also have coincident geochemical and vegetative anomalies and should be considered high priority for future exploration.

Magnetic and electromagnetic data appear to have a less obvious signature in association with the known massive sulphide body at Ocelot. Both in-phase and out-of-phase electromagnetic data indicate the presence of northeast trending structures at Ocelot which parallel structures thought to control mineralization in the previously drill tested area. Magnetic data shows an arcuate area of moderate magnetic intensity surrounding the southeast flank of the mineralized zone. The hypothesized projection of the north westerly trending strain corridor that hosts the Tiger Deposit 20 km to the east appears to be defined by moderate to high magnetic intensity. A strong first order magnetic anomaly, corresponding to an area of higher elevation, occurs in the northern portion of the survey grid. The cause of this magnetic anomaly is unknown, but based on other geochemical and geophysical data it does not appear to be related to the presence of sulphides.

### **Kathy Target**

Gravity data that has been processed to remove regional scale gravity trends (maps with regional trend removed) illustrates a first order gravity anomaly where gold in marble has been encountered during prospecting. A curvilinear trend defined by a transition from high to low gravity response ranges from northwest oriented in the south portion of the grid to north trending in the northern portion of the grid. The eastern limit of this first order gravity trend corresponds to a northerly oriented lithologic change from marble to carbonaceous argillite. Since bedding in the area is discordant with this contact orientation, the gravity gradient may indicate a fault.

Electromagnetic data over the Kathy area shows a northeasterly grain with a prominent conductivity trend at approximately the contact between the carbonaceous argillites and marble. This could represent the contact between the two units, but is at a different orientation than suggested by the gravity data. Therefore, further work is needed to determine whether the gravity or electromagnetic trends approximate a prospective contact between the two units.

A large, first order magnetic high occurs in the northwest portion of the grid across a well-defined northeasterly trending structure from which the Kathy gossan is sourcing. This magnetic anomaly may indicate an abrupt lithologic transition as the result of fault displacement. Massive pyrrhotite was dug out of a pit in the area to the northwest of the structure underneath a soil sample that contained elevated gold, bismuth and arsenic. The presence of magnetic pyrrhotite could be responsible for the anomalous magnetic characteristic of this area.

## **DISCUSSION AND CONCLUSIONS**

The Rackla Gold Property lies at the boundary between Mackenzie Platform and Selwyn Basin, within geomorphological and geological settings similar to those at the Carlin gold district in northeast Nevada. At the eastern end of the 185 km long Rackla Gold Property, the Nadaleen trend is the first discovery of Carlin type gold mineralization in this belt of rocks. In contrast, precious and base metal mineralization at the Rau Trend at the western end of the property, specifically the Tiger Deposit, appears to be geochemically related to the nearby early Tertiary Rackla Pluton (Thiessen, et al 2012; Gleeson, 2012). Encouraging new Carlin type discoveries along the Nadaleen Trend and new magmatic related discoveries in the Rau Trend during the 2012 exploration season promote continued exploration on the property and across the district.

Silt and soil sampling, prospecting and geophysical surveys in 2012 defined 12 new first order Carlin pathfinder element target areas requiring follow up work in the Nadaleen Trend and one new anomalous zone in the Rau Trend. Along the Nadaleen Trend, analysis of satellite imagery suggested the southern bounding structure at the Anubis Zone appears to continue northwesterly for at least 4 km. Focused exploration along this structure may result in further discoveries of Carlin type gold mineralization. Detailed mapping should be continued around all geochemical anomalies with particular attention to recognizing folds, faults and favourable carbonate strata, since they are the principal controls over the location of mineralization in gold-rich, carbonate-hosted replacement deposits.

Diamond drilling during 2012 focused on the Nadaleen Trend at the eastern end of the property. The drilling extended the area of known mineralization at the Conrad Zone by 350 m and better defined structural and stratigraphic controls on the gold mineralization. The gold mineralization is found within approximately 50 metres of the contact between the silty limestone and overlying pyritic siliciclastic rocks with the best intersections in the hinge of the Conrad anticline near this lithologic contact. Mineralization remains open to west, east and at depth. Further work testing deeper in the Conrad Zone is needed to define the extent and orientation of mineralization peripheral to the main zone.

Drilling at the Isis East Zone confirmed that mineralization is strongly stratigraphically controlled near the hinge of a south plunging anticlinal structure. Further drilling both at depth and along stratigraphic horizons is required. Drilling at the Isis Zone returned anomalous but not significant gold values. The source of high gold-in-soil values at the Isis Zone remains elusive, and therefore more work is required to define the source of this mineralization.

The newly discovered Anubis Zone is proving to have significant Carlin type gold mineralization at depth as well as at surface. Mineralization appears to be controlled by west-northwest trending, steeply dipping structures. The dramatic soil anomaly defined by soil sampling along this structural trend supports the need for significant additional pitting, trenching and follow up drilling.

Additional drilling at the Pyramid Zone intersected the east-west trending arsenic sulphide bearing structure found during 2011 drilling, but returned no significant gold values. Deeper drilling of the structure may be required to define gold bearing zones that may occur at depth.

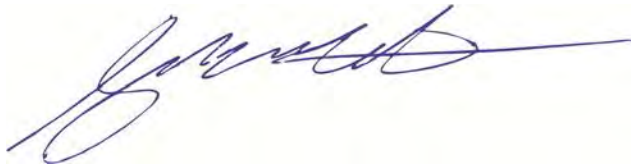

It is likely that currently undiscovered gold occurrences within the Racka Gold Property occur at depth and may have relatively subdued surface signatures. The Osiris and Isis East Zones within the Nadaleen Trend and the Tiger Deposit within the Rau Trend are at surface gold occurrences with strong geochemical signatures. Further exploration techniques should focus on the coincident presence of favourable indicator elements in soils occurring in association with favourable stratigraphy and structural features which facilitate auriferous fluid transport and gold deposition.

## LEGEND

**QUATERNARY**  
**Q** QUATERNARY: unconsolidated glacial, glaciofluvial and glaciolacustrine deposits; fluviatile silt, sand, and gravel, and local volcanic ash, in part with cover of soil and organic deposits

### IGNEOUS ROCKS

**LATE CRETACEOUS(?)**  
**LKp** McQUESTEN SUITE?: medium-grained, pegmatitic, microlitic, leucocratic fluorite-rich, muscovite, biotite granite; granodiorite (67-63 Ma) [only in 106D1 and 106C4]

**MIDDLE TRIASSIC**  
**Ta** GALENA SUITE: massive, dark grey weathering, medium-grained hornblende gabbro sills and dikes intruding Earn Group (c. 234-228 Ma)

**PALEOZOIC(?)**  
**Pg** dark green to black, fine to medium-grained gabbro, pyroxenite

**Pum** bright green to black serpentinite; orange to brown weathering listwaenite, commonly contains fuchsite

### MESOZOIC ROCKS

**MIDDLE TO UPPER TRIASSIC**  
**TJl** JONES LAKE FORMATION: recessive, buff to grey weathering, black sooty limestone; calcareous and non-calcareous, micaceous black shale; dark grey non-calcareous silt shale at base of sequence

**TJs** JONES LAKE FORMATION: recessive, non-calcareous grey slate and shale; recessive, buff to grey weathering calcareous black shale, micaceous, calcareous siltstone and sandstone (may include Lower Jurassic strata locally)

### PALEOZOIC PLATFORM ROCKS

**ORDOVICIAN TO DEVONIAN?**  
**ODa** BOUVETTE FORMATION: resistant, generally well-bedded to massive, grey weathering variably dolomitized carbonate; locally fossiliferous; locally contains black diagenetic chert

**SILURIAN TO MIDDLE DEVONIAN**  
**SDc** thick-bedded to massive light grey dolostone and limestone. Dark grey feld limestone containing "two hole" and "star" crinoids near top of unit

**SILURIAN (LLANDOVERY-WENLOCK)**  
**Sv** dark green to brown weathering vesicular basalt; carbonate-cemented hyaloclastic breccia; volcanic sandstone, grit and pebble to cobble conglomerate in platform carbonate hosting Rau (Tiger) deposit in 106D1

**ORDOVICIAN TO SILURIAN?**  
**OSs** rusty brown weathering, medium-grained, planar laminated sandstone, siltstone

**ORDOVICIAN TO SILURIAN**  
**OSc** thin to medium-bedded, grey and buff weathering, silty limestone; massive, white limestone; well bedded, pale yellow and grey limestone in upper part of unit

**UPPER CAMBRIAN TO LOWER ORDOVICIAN**  
**COc** massive, pale grey dolostone; oncoidic dolostone; minor quartzite and sandy dolostone

**UPPER CAMBRIAN**  
**uCT** TAIGA FORMATION?: finely laminated to thinly bedded grey and black dolostone; massive to well bedded, medium grey, pinkish grey dolostone

**NEOPROTEROZOIC (EDIACARAN) TO LOWER CAMBRIAN**  
**PCc** massive, pale grey limestone

### PALEOZOIC OFFSHORE ROCKS

**UPPER MISSISSIPPIAN TO LOWER PERMIAN**  
**CPps** dark grey shale interbedded with laminated quartz sandstone and thick-bedded, massive, fine-grained quartzite; buff and green phyllite; minor grey chert

**CPI** thick-bedded, buff and grey weathering, dark grey limestone; locally interbedded with shale; basal third of unit contains abundant ooids and fragments of other megafossils, and grit and chert-pebble conglomerate

**CPrg** chert pebble conglomerate, silica cemented in some places and carbonate cemented in others

**CARBONIFEROUS TO PERMIAN**  
**CPMc** MOUNT CHRISTIE FORMATION?: greenish-grey, pink and dark grey shale; light grey-green to black chert; minor sandstone, limestone

**MISSISSIPPIAN**  
**MT** MOUNT CHRISTIE FORMATION?: thin to medium bedded, greenish-grey to black chert; greenish-grey and grey shale

**MISSISSIPPIAN**  
**Mc** TSICHU GROUP (KENO HILL QUARTZITE): light to dark grey, thick bedded to massive, vitreous quartzite, black shale

**UPPER DEVONIAN TO LOWER MISSISSIPPIAN**  
**DME** EARN GROUP (undivided): brown-weathering, dark grey to black shale, chert, minor sandstone, siltstone; minor limestone; chert-pebble conglomerate and sandstone; locally bedded beds

**DMc** EARN GROUP?: bioclastic limestone, conglomerate, common chert pebble, crinoids and coral fragments (debris flow deposit in Earn Group shale)

**DMep** EARN GROUP, PREVOST FORMATION?: dark grey to black shale, white siltstone and sandstone

**DMvn** EARN GROUP?: light to dark green weathering, vesicular basalt, locally pillowed; mafic lapilli buff, volcanic breccia and volcanic sandstone; greenstone; minor light green quartz-kegular porphyry

**DMvl** EARN GROUP?: dark grey to buff weathering, dark grey foliated aphanitic felsic volcanic rocks, foliated quartz porphyry, interbedded buff weathering limestone near top of unit near Marg deposit (Milestone 106D009)

**MIDDLE TO UPPER DEVONIAN**  
**Dppl** EARN GROUP, PORTAIT LAKE FORMATION?: grey limestone

**Dppl** EARN GROUP, PORTAIT LAKE FORMATION: brown-weathering, dark grey to black shale; grey, black and grey-green, medium-bedded chert

**MIDDLE DEVONIAN (EIFELIAN)**  
**mDc** light grey conoidal limestone, contains "two-hole" and "star" crinoids

**ORDOVICIAN TO SILURIAN?**  
**OScs** buff weathering, medium-grained calcareous sandstone and sandy limestone/dolostone; locally gritty and very fossiliferous

**ORDOVICIAN TO LOWER DEVONIAN**  
**ODRn** ROAD RIVER GROUP: black shale, locally graptolitic; black limestone

**CAMBRIAN TO ORDOVICIAN**  
**COv** MARMOT GROUP?: dark green to black volcanoclastic sandstone and cobble to boulder conglomerate; dark brownish-grey weathering basalt, locally pillowed; black, hyaloclastic breccia

### NEOPROTEROZOIC-CAMBRIAN ROCKS IN HANGING WALL OF DAWSON THRUST

**LOWER TO MIDDLE CAMBRIAN**  
**COlv** GULL LAKE FORMATION?: brown-weathering, green volcanic sandstone, siltstone; locally gritty; conglomerate with mud chips; local orange weathering dolostone bands

**NEOPROTEROZOIC (EDIACARAN) TO LOWER CAMBRIAN**  
**PCIn** HYLAND GROUP, NARCHILLA FORMATION: maroon and green shale and siltstone, locally dolomitized; locally grey, brown shale, locally black grey sandstone; locally green and white sandstone; yellowish-buff weathering dolomitic limestone. Note: maroon shale typical of the Narchilla Formation also occur locally below or within dolomitic limestone of the Algas Formation

**NEOPROTEROZOIC (EDIACARAN)**  
**PHa** HYLAND GROUP, ALGAE FORMATION: light grey to yellowish-buff weathering dolomitic limestone and dolostone, variably dolomitized and variably silty/sandy; locally fine-grained, dolomitic sandstone; commonly graded and cross-bedded; local occurrence of Ediacaran fossils; minor grey and/or maroon shale; local debris flow units; generally limestone pebbles to cobble breccia and conglomerate; some polymeric breccia, locally boulder-size

**HYLAND GROUP, YUSEZYU FORMATION:** brownish-grey sandstone and grit (pebbly sandstone), calcareous near top of unit, brown, grey, olive green and locally maroon shale and siltstone; locally quartz pebble conglomerate

**NEOPROTEROZOIC-CAMBRIAN ROCKS IN FOOTWALL OF DAWSON THRUST**  
**CSH** recessive, dark grey, black to brown weathering, thin bedded silty limestone

**CSs** moderately resistant, thin bedded, blue-grey siltstone and sandstone; brown weathering, dark grey-green bedded, weakly laminated siltstone and shale; local limestone near base of unit

**NEOPROTEROZOIC (EDIACARAN) TO LOWER CAMBRIAN**  
**PCIn** HYLAND GROUP, NARCHILLA FORMATION?: buff weathering, locally calcareous quartzite

**PCIn** HYLAND GROUP, NARCHILLA FORMATION: maroon and green shale and siltstone, locally dolomitized; locally grey, brown shale; locally green and white sandstone; yellowish-buff weathering dolomitic limestone

**NEOPROTEROZOIC (EDIACARAN)**  
**PHa** HYLAND GROUP, ALGAE FORMATION: light grey to yellowish-buff weathering dolomitic limestone and dolostone, variably dolomitized and variably silty/sandy; locally fine-grained, dolomitic sandstone; commonly graded and cross-bedded; minor grey and/or maroon shale; local debris flow units; generally limestone pebbles to cobble breccia and conglomerate; some polymeric breccia, locally boulder-size

**PSs** "STENBRATEN ASSEMBLAGE", UPPER: "upper mixed chertic sequence" - brown-weathering, grey shale and siltstone; minor sandstone and grit; rhythmically bedded, brown-weathering, grey limestone and shale; calcareous shale, thin-bedded, grey limestone (possibly correlative with Bluewater formation of Windermere Supergroup?)

**PSi** "STENBRATEN ASSEMBLAGE": brown-weathering, silty siliceous limestone

**PSq** "STENBRATEN ASSEMBLAGE": grey, medium-bedded quartzite

**PSc** "STENBRATEN ASSEMBLAGE", LOWER: carbonate minter - grey, buff, tan and orange weathering dolostone, dolomitic sandstone and limestone, commonly planar and/or cross laminated; calcareous shale and siltstone; maroon shale; carbonate-chert diamictite and conglomerate; pink weathering siltstone at base of unit (possibly correlative with General formation of Windermere Supergroup?)

**PHu** "NADALEEN ASSEMBLAGE", UPPER: orange-weathering, greenish-brown rhythmically bedded fine-grained sandstone, siltstone, mudstone; polymeric diamictite, conglomerate (carbonate and quartz pebbles to cobbles); maroon and green fine-grained sandstone-siltstone-mudstone

**PHl** "NADALEEN ASSEMBLAGE", LOWER: brownish-grey siltstone, mudstone, limestone; rhythmically thin to medium bedded mudstone and limestone; local pink-grey quartz sandstone and quartzite; calcareous grit and sandstone (possibly equivalent to Sheppard formation of Windermere Supergroup?)

**PHb** "NADALEEN ASSEMBLAGE", LOWER: black crystalline limestone

**PHq** "NADALEEN ASSEMBLAGE", LOWER: pink-grey, quartz arenite and grit; quartzite

**PHc** "NADALEEN ASSEMBLAGE", LOWER: grey limestone

**PHd** "NADALEEN ASSEMBLAGE", LOWER: diamictite, conglomerate (debris flow deposit); casts of carbonate and quartzite, pebbles to boulder; locally megafossils up to 100 m long; matrix locally sandy, grey limestone

**PHw** "NADALEEN ASSEMBLAGE", BASAL: black, grey and greenish quartz wacke, quartz-pebble conglomerate, siltstone, mudstone

### OTHER PROTEROZOIC UNITS NORTH OF KATHLEEN LAKES FAULT

**NEOPROTEROZOIC (CRYOGENIAN)**  
**PCg** RAPITAN GROUP: green and orange weathering, polymeric cobble conglomerate; clasts include: dolostone, limestone, shale and chert; fine to coarse-grained sandstone, siltstone

**PCc** RAPITAN GROUP: dark grey weathering limestone with discontinuous diagenetic black chert

**PCs** RAPITAN GROUP: red-brown to purple weathering, medium to thick bedded, medium-grained wacke, siltstone, carbonate, grit

**NEOPROTEROZOIC (TONIAN)**  
**PCp** PINGUICULA GROUP: chocolate to orange-brown weathering, crystalline laminated, medium to thick bedded dolostone; rusty-brown weathering, olive-green siltstone and shale; lesser maroon, buff and black shale

**PALEOPROTEROZOIC**  
**mPGL** GILLESPIE LAKE GROUP?: thinly laminated to thinly bedded, orange weathering, greenish-grey silty limestone, dolostone and calcareous silty shale

### LEGEND

#### Igneous rocks of unknown age

**int** Gabbroic intrusions

#### Paleozoic Rocks - Equivalent to Earn Group and younger packages?

- Pz4** Thinly bedded, dull grey-brown weathering siltstone interbedded with shale and minor fossiliferous limestone.
- Pz3** Fossiliferous, medium- to coarse-grained, calcareous and moderately calcareous wackestone interbedded with shale, calcareous siltstone and minor chert.
- Pz2** Well bedded, carbonaceous and argillaceous chert interbedded with carbonaceous shale, siltstone, lesser amounts of chert pebble conglomerate and minor sandstone that may locally be calcareous.
- Pz1** Pale grey weathering, micritic limestone interbedded with thick debris packages and carbonaceous chert. Includes fossils of favosites, halictes (?) rugose coral, crinoids, brachiopods, bryozoans and possibly sponges.

- Contact - inferred
- Limit of mapping
- Fault - inferred
- Thrust fault - inferred
- Anticline

Geology compiled from mapping by Trans Territorial Consulting and Archer, Cathro & Associates (1981) Limited

#### Neoproterozoic - Cambrian of rocks. May be equivalent to Hyland Group, basal Selywn Basin, rocks.

- phy** Maroon and turquoise/green phyllites, shale and siltstones interbedded with rosy pink limestone (at the Sian Target), and/or invariably calcareous, green weathering sandstones.
- dol** Zebra textured dolostone locally with chert lenses overlies very dark grey/black, crystalline limestone.
- xlst** Very dark grey/black, coarsely crystalline limestone. Often associated with beds of polymict floatstone containing clasts of orange weathering dolostone, limestone, rounded quartz pebbles and minor shale, particularly near the base of the unit.
- silt** Green-grey siltstone and shale interbedded with fine- to medium-grained sandstone, lesser calcareous sandstone, minor limestone and limestone debris.
- cgl,sst** Well sorted, coarse grained, quartz granular sandstone to pebble conglomerate.
- Odm1** Limestone pebble to boulder conglomerate/debrite, predominantly matrix supported.
- Oist** Oisris limestone: Well bedded, tan and grey limestones and dolostone. Distinctive monolithic, intraclast rudstones are common, particularly in basal sections. Dolostone at top of unit at Oisris.
- Oslt** Oisris Maroon and green siltstone, finely laminated.
- Cist2** Conrad Calcilastics: Dark, crystalline lime mudstone, calc-arenites and lenses of limestone debris, with lesser siltstone and shale.
- Cslic** Conrad silicilastics: grey-green pyritic siltstone, mudstone with lesser grey sandstone. Poorly sorted, matrix supported quartz pebble conglomerate.
- Cist1** Conrad Limestone

#### Neo-proterozoic package of rocks that may be equivalent to Windermere Supergroup. NE Nadaleen area.

- N5** Finely laminated, grey-green limestone with 'beef' calcite and minor siltstone.
- N4** Grey weathering shale and minor siltstone.
- N3** Grey weathering, fine grained sandstone interbedded with siltstone.
- N2** Orange-brown weathering, well bedded, fine- to coarse-grained sandstone and quartz pebble conglomerate
- N1** Chlorite green siltstone and shale interbedded with orange weathering, coarse-granular quartz and chert pebble sandstone and conglomerate.

Lithology	Gold	Informal Name	YGS Correlation	Description	
		Osiris siltstone	<b>PNi</b>	Maroon to grey micaceous siltstone and mudstone. Minor quartz arenite.	
		Isis dolostone	<b>PHa</b>	Buff-weathering, tan, massive to fine silty laminated dolostone. Sugary texture. In core the unit exhibits blocky broken texture and brecciation.	
		Osiris siltstone	<b>PSs</b>	Brown to grey siltstone.	
		Osiris gritty limestone		Tan to brown weathering, quartz gritty limestone to calcareous sandstone interbedded with siltstone.	
		Osiris debris-flow	<b>PSc</b>	Distinctive unsorted polymict conglomerate debrite dominated by carbonate clasts from pebble to >1 metre boulders. Fine-grained silty to lime mud matrix. Grey to tan weathering, massive to brecciated dolostone. Lower contact is gradational to interfingering. Thinly laminated lime mudstone and dolomudstone with quartz silty layers, weakly calcareous siltstone and distinctive lensoid intraclast rudstones ~1-2m.	
		Osiris dolostone			
		Osiris limestone			
			Osiris maroon siltstone	<b>PNu</b>	Maroon and green weathering siltstone.
			Grey shale		Grey to brown weathering shale and siltstone. May grade upwards into maroon siltstone.
			(Gabbro dikes) Conrad calciclastics (Debris-flow limestone lenses)	<b>PNi</b>	Med to very dark grey weathering, crystalline lime mudstones, calc-arenites and lesser siltstone and shale with lenses of light grey weathering debrites with clasts up to > 1m. Debrite clasts are dominantly limestone. Unit is intruded by gabbro dikes.
			(Black shale with ls lenses) Conrad dolostone		
			Conrad Siliciclastics (Gabbro dikes)		
			(Gabbro dikes) Conrad Limestone	<b>PNc</b>	Light grey weathering, massive to silty laminated limestone, lime mudstone, packstone, wackestone with cone-in-cone and beef calcite lenses and wispy fine-quartz sandstone layers.
			Nadaleen Fault Zone		Nadaleen Fault Zone: zone of shearing up to 40 m wide, dips steeply North.
		Nonad mudstone	<b>PNu</b>	Distinctive rusty weathering sequence of light teal-green to maroon and brown mudstone with minor interbedded quartz pebble conglomerate and quartz sandstone with carbonate cement.

### **SAMPLING AND ANALYTICAL PROCEDURES – ROCK, SOIL, SILT**

## 2012 Rock and Auger Geochemical Samples

Rock geochemical sample sites on the property were marked with orange flagging tape labelled with the sample number. The location of each sample was determined using a handheld GPS unit. Rock sample descriptions are presented in Appendix III.

Auger samples were collected in 2.5 foot intervals and placed into cloth sample bags to dry. When the samples were dry they were packaged up and sent for analysis. Auger sample sites were marked with a lath with a metal tag identifying the hole. The location of each hole was determined using a handheld GPS unit.

Rock and auger samples were submitted to ALS in Whitehorse, Yukon where they were dried and fine crushed to 70% passing 2 mm. A 250 g split of the crushed material was then pulverized to better than 85% passing 75 microns. Separate splits of the pulverized fraction were analyzed for gold by fire assay and atomic absorption spectroscopy (Au-AA26) and for 49 other elements using a four acid near total digestion technique (ME-MS61m) at ALS in North Vancouver, British Columbia. Mercury was analyzed for using HG-CV41 methods by aqua regia digestion and atomic adsorption spectroscopy.

Samples containing visible gold and samples suspected of containing coarse gold were assayed by ALS method Au-SCR21 in which 1 kg of sample pulp is passed through a 100 micron screen and all of the coarse material on the screen is assayed by Au fire assay. Two samples of homogenized pulp that passed through the screen are assayed by Au-AA25 and Au-AA25D which is fire assay with AAS finish on a 30 gram sample charge. The weighted average of coarse and fine fraction assays are calculated by the laboratory and reported as the total gold concentration of the rock sample.

## 2012 Soil Geochemical Samples

Soil sample types ranged from grid samples taken at lines along a constant bearing, to contour and ridge and spur samples targeting constant elevations and high elevations respectively. Soil samples were taken using an auger, targeting `C` horizon soils below organic cover; sample depths ranging from 10-90 cm dependent on local soil development, vegetation and frozen ground conditions. Samples were placed in kraft soil sample bags, and sample sites were flagged and marked with stakes etched with assay tag number, line or point number and grid name. The soil samples were sent to ALS where they were dried and screened to 180 microns. Soils samples were sent for 51 element, aqua regia digestion using ICP-MS and ICP-AES assay analysis (ME-MS41). Gold values in soil samples were determined using a 30 gram nominal sample weight. The analytical process for quantitative determination of gold values was a fire assay fusion with an ICP-AES finish (Au-ICP21).

## 2012 Silt Geochemical Samples

Silt samples were taken from in-stream silt-rich sediment or from silty accumulation within the roots of overhanging moss at the creek edge where stream conditions did not allow for sufficient

silt build-up. Flagging marked with the assay sample number was used to mark silt sample locations. The stream sediment samples were sent to ALS, where they were dried, screened to 180 microns, dissolved in aqua regia solution and then analyzed for 51 elements using an aqua regia digestion and a combination of ICP-MS and ICP-AES for analysis (ME-MS41). Gold values in silt samples were determined using a 30 gram nominal sample weight. The analytical process for quantitative determination of gold values was a fire assay fusion with an ICP-AES finish (Au-ICP21).

L842705	615216	7113899	Halfway	dark grey brecciated limestone with fine grained light grey matrix
L843667	615226	7114240	Halfway	moderately silicified limestone fault breccia with minor specs of peachy clay and trace realgar along fractures. Trace black carbonaceous patches and minor sphalerite. In situe.
L843786	615233	7114231	Halfway	grey limestone bearing rusty pyrite crystals(squares), and band of slick n slides
L842706	615234	7113894	Halfway	brecciated grey micritic limestone wth a calcite matrix. Minor peachy clay along fractures. Float.
L842721	615242	7114133	Halfway	moderately silicified grey micritic limestone fault breccia. No visible sulphides.
L842720	615242	7114133	Halfway	bulk pit sample of red kill zone soil.
K242247	615242	7113900	Halfway	light grey limestone breccia with calcite matrix. Cryptic realgar. From red soil kill zone float.
L842707	615249	7113895	Halfway	grey limestone with very small flake of realgar in calcite vien
L842725	615280	7114125	Halfway	blue-grey limestone with cryptic purple fluorite?-bearing calcite veinlets. Subcrop.
L843668	615291	7114324	Halfway	black carbonaceous-speckled, moderately porous fine grained calcite sandstone. From red soil kill zone.
L843787	615292	7114325	Halfway	Float.
L843669	615309	7114418	Halfway	brecciated grey limestone with black blebs and vienlets, pink clay patches, calcite viens and vugs in caltie bearing realgar
L842723	615312	7114132	Halfway	grey micritic limestone breccia with trace scorodite and peachy clay along fractures. Float.
L842722	615312	7114132	Halfway	grey brecciated limestone with calcite matrix and pink clay spots
L842724	615312	7114132	Halfway	grey micritic limestone with minor peachy clay and granular realgar in fractures. Float.
K242248	615313	7113824	Halfway	grey, locally carbonaceous limestone fault breccia with cryptic realgar. Kill zone float.
L842719	615320	7114145	Halfway	moderately porous, salt and pepper limestone breccia. Float.
L842708	615321	7113895	Halfway	grey fractured limestone, with black shiny material, carbonaceous.
L842718	615331	7114131	Halfway	light grey limestone breccia with calcite matrix. Minor sphalerite and galena. Float.
L842715	615384	7113957	Halfway	brown-black vesicular, weathered fossiliferous limestone float.
L842709	615425	7114082	Halfway	grey calcite veined limestone with carbonaceous pits and fractures. Kill zone float.
L842711	615445	7114076	Halfway	moderately fractured grey micritic limestone with trace specks of peachy clay. Subcrop.
L842717	615446	7114087	Halfway	sparry limestone fault breccia with black carbonaceous fractures. Float.
L842716	615449	7114074	Halfway	grey limestone breccia with 3% rusty oxidized pits.
L842717	615446	7114087	Halfway	grey limestone float. Trace peachy clay and carbonaceous dusting along fractures. Cryptic red sphalerite.
L842716	615449	7114074	Halfway	mottled, grey limestone with blocky calcite veining, carbonaceous porous patches and disseminated black carbonaceous speckles. Float.

L842713	615453	7114249	Halfway	grey, porous silty limestone with black specks. Float.
L842710	615455	7114065	Halfway	grey, locally decarbonated limestone with black sooty pits. From killzone boulder float.
L842712	615493	7114158	Halfway	calcite veined, partially clay altered, black speckled creamy limestone float from killzone.
L843788	615496	7114494	Halfway	dark grey micritic limestone breccia with heavy calcite veining. Float.
L843887	615497	7114500	Halfway	Brown soil and assorted small rock fragments taken from near the bottom of pit. Highly calcareous fine grained crystalline carbonate. Grey in color, vitreous lustre. Visible calcite veining and oxide pits from rocky horizon.

L843649	619305	7112809	Anubis	pit 6. brown-black shaley soil with rare orange-red oxidized soil patches. 1.3-1.4m.
L843646	619305	7112809	Anubis	pit 6. brown-black shaley soil. 1.7-2.2m.
L843645	619305	7112809	Anubis	pit 6. brown-black shaley soil. 2.2-2.8m.
L843648	619305	7112809	Anubis	pit 6. brown-black shaley soil with minor limestone cobbles. 1.4-1.6m.

L843647	619305	7112809	Anubis	pit 6. redish brown clay rich soil. 1.6-1.7m.
L843644	619305	7112809	Anubis	pit 6. brown-black shaley soil. 3.2m depth by auger.
L843650	619305	7112809	Anubis	pit 6. brown-black shaley soil with minor limestone cobbles. 0.9-1.3m.
L843701	619305	7112809	Anubis	pit 6. brown-black shaley soil with minor limestone cobbles. 0.3-0.9m.
L843702	619305	7112809	Anubis	pit 6. organic rich brown soil. 0-0.3m.
L843706	619305	7112809	Anubis	dark grey laminated limestone. Pit 6 float.
L843703	619305	7112809	Anubis	grey carbonaceous debrite, pit 6 float.
L843705	619305	7112809	Anubis	rusty weathering grey limestone breccia with calcite veins. Pit 6 float.
L843704	619305	7112809	Anubis	rusty weathering grey limestone breccia with calcite veins. Pit 6 float.
L842954	619305	7112777	Anubis	grey quartz sandstone with 3% clay altered coarse grains and 3% limonitic pits. From boulder float on spur.
L842727	619362	7113143	Anubis	Favosites coral altered to massive limonite with some textural preservation. Saddle float.
L842726	619370	7113148	Anubis	Massive limonite cobble in saddle float. Tectonic breccia (matrix supported) containing limestone clasts within a brown, oxidized, non calcareous matrix.
L842601	619375	7113170	Anubis	calcareous floatstone in carbonate member of Yusezyu. With pyrite?
I357935	619405	7115209	Dale North	Brown limonite altered angular clasts in fault breccia? Saddle float.
L842728	619415	7113108	Anubis	black fossiliferous limestone, porous, blue-grey weathering
L842695	619577	7113659	Anubis	bright orange weathering limestone breccia cemented with calcite.
I357934	619603	7115153	Dale North	altered, med grained quartz conglomerate , black crumbly material, calcite viens
L842694	619689	7113163	Anubis	alteration of siltstone - fine sandstone in Yusezyu Formation of Hyland?
I357932	619779	7113931	Anubis	Silicified carbonate material from within a fold hinge zone.
L842602	619823	7113117	Anubis	bedded grey limestone, bearing fine grained disseminated pyrite, calcite viens
L842693	619864	7112987	Anubis	bedded grey limestone bearing rusty limestone
L842692	619878	7112934	Anubis	Composite sample from fold hinge zone. Carbonate, fine terrigenous material and chert containing Qz-Ca veins and a late, unidentified brown mineral.
L842603	619895	7113046	Anubis	Rounded cobble of oxidized, silicified carbonate found in float.
L842608	619907	7115380	Dale North	grey limestone with black moderatly silicified layer
L842691	619914	7112895	Anubis	bedded limestone, grey, bearing fine grained disseminated pyrite
