20.42	67.77	47.35	ARG	VF	Highly carbonaceous graphitic black shales. Material competency ranges from high to low with ~30 % of the interval being highly fractured and variably clayey. Silicification occurs within the lower portion of the interval associated with minor realgar mineralization. Shales are typically weakly calcareous. The lower portion of the interval is non calcareous and highly porous indicating some degree of decarbonization has taken place. Minor euhedral barite crystals are noted in the upper portion of the interval. Calcite veins and veinlets (~5-10 /m) are consistently present. No sedimentary foliations are observed.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
67.77	71.60	3.83	LST	FG	Completely silicified limestone with minor amounts of silicified shale. Shale within the interval appears decarbonized. Silicified material appears to be brecciated in a brittle fashion. Breccias are clast dominant with a very thin matrix of hydrothermal silica. Silicification occurs as replacement as well as open space filling. Realgar is moderately abundant throughout the interval occurring within open spaces and on fracture planes. Early phase calcite veins appears to be completely replaced by silica. No calcareous material occurs within the interval. A silica sinter is common on fracture faces and euhedral quartz veins are noted in vugs.							
						MD	GY	BX MA	DCA SIL	5I 5I	Re	0.1
71.60	127.35	55.75	ARG	VF	Generally competent dark shale. Sporadic calcite veinlets are present throughout. The upper 5 m of the interval appears variable decarbed.							
						DK	BK	MA	DCA	1I	--	0
127.35	137.89	10.54	LST	VF	Medium grey, typically fossiliferous (faint fragments and crinoids) packstone and wackestone (minority component). The upper contact with the shale unit appears to be stratigraphic (sharp). Material is generally competent with rubbly sections occurring throughout. Calcite veinlets are noted to crosscut faint stylolites. Stylolites occur sub parallel TCA while calcite veinlets occur between 50 and 70 degrees TCA. Minor strain expressions including a fault surface with slickenlines are present.

137.89	218.54	80.65	ARG	VF	Highly carbonaceous, variably calcareous black shales. Bedding definition increases with depth. Bedding is defined by lighter colored milimetric scale interbeds as well as pyritic banding. Bedding angles occur on average at 45 degrees TCA. The upper portion of the interval is rubbly and highly fractured. The remainder of the interval is competent with localized pockets of clayey gouge. Highly pyritic grey clayey material is also noted at a few location throughout the interval in association with shales. Very fine grained pyrite occurs disseminated throughout. Euhedral quartz crystals are noted on a fracture face at 148.44 m.

10.00	132.38	122.38	ARG	VF	Highly carbonaceous shales. Graphitic slip planes are common. Calcite veins and veinlets occur throughout. The majority of material is competent with rubbly sections occurring intermitently. The end of the interval, directly preceding a fault zone displays strain textures and limonitic banding.

COMMENTS
Scissor of An-12-001 and An-12-002

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	1.10	1.10	OVB	--	No Recovery.	--	--	--	--	--	--	0
1.10	9.39	8.29	ARG	VF	Rubby, highly fractured carbonaceous shales. Material competency increases towards the end of the interval. Competent pieces display interstitial bands of orange-brown limonitic material. Appears to be the same material running high arsenic in the shales before the fault zone in An-12-02. Material is non calcareous.							
						DK	BK	FR	---	--	--	0
9.39	18.90	9.51	LST	FG	Massive, heavily calcite veined, medium grey limestone. Veining is dominantly stockwork in fashion with larger, centimetric veins occurring at 45 degrees TCA. Material from 14.80-15.67 m is a clayey, low competency orange-brown oxide.							
						MD	BR					
						MD	GY	MA	OXI	3I	--	0
18.90	22.75	3.85	ARG	VF	Fractured, fissile, sometimes clayey, low competency carbonaceous shales. Minor calcite veining is noted. Minor orange-brown oxide occurs on fracture faces.							
						DK	BK	FR	---	--	--	0
22.75	28.60	5.85	LST	FG	Medium grey, highly calcite veined lime micrite. Medium grained carbonaceous fragments occur variably throughout supported by a micrite matrix. Calcite veining is stockwork in fashion, locally resulting in hydrostatic breccias. A localized band of cataclasite occurs within a slip plane oriented at 45 degrees TCA.							
						MD	GY	MA	---	--	--	0
28.60	153.79	125.19	ARG	VF	Variably calcareous black shales. Sections of silicified material in association with arsenic sulphides are present within the interval. Material displays an increased strain expression towards the end of the interval and coincident AsO on fractures.

COMMENTS
Hole targets gold bearing pits.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
0.00	1.63	1.63	OVB	--	No Recovery.							
						-	-	--	--	-	-	0
1.63	20.42	18.79	ARG	VF	Rubby, highly fractured, strongly oxidized shales. Sections of clayey, completely oxidized, orange-brown material are present. Competent pieces of shale display a high density of oxide filled fracture seams. Fracture seams result in a chaotic breccia pattern. Limonitic seams run ~1000 ppm on the XRF.

						DK	BK	FR	OXI	4I	--	0
20.42	24.90	4.48	FLR	--	Medium orange-brown, highly oxidized clayey fault breccia. Breccia varies from clast to matrix dominant. Matrix material is highly oxidized and clayey. Clasts are dark colored, subrounded to subangular shale fragments. Material becomes calcareous towards the end of the interval.							
						MD	BR	BX	OXI	5I	--	0
24.90	67.67	42.77	LST	--	Footwall limestone unit. Pervasive crackle breccia texture. Typically competent with calcite veining and minor stylolites that post date crackle textures.

0.20	26.65	26.45	ARG	VF	Highly fractured and rubbly shales. Material is variably oxidized. The highest degree of oxidation is associated with medium brown, low competency clayey material. More competent pieces display oxidation restricted to fracture faces and fracture seams. Shales are non calcareous and generally massive. Bedding fabrics are not well defined. Competent pieces display chaotic fracture patterns. 15 cm of white-black, well sorted, medium grained sandstone occurs at 19.80 m.

26.65	38.85	12.20	FLR	--	Clayey, low competency, sometimes rubbly fault breccia. The majority of matrix material is pervasively oxidized, medium brown in color and non calcareous. The dominant protolith for the interval appears to be shales. Relative proportions of matrix and clasts components are highly variable. Matrix is clayey, oxide material while clastic component is predominantly subangular shale fragments. The last 41 cm of the interval is much lighter color (orange-brown) highly calcareous and has relict limestone fragments. No recovery between 35.66 and 37.19 m.

From (m)	To (m)	Interval (m)	Rock Type	Grain Size	Description	Shade	Colour	Texture	Alteration	Intensity	Mineral	Conc.
38.85	75.29	36.44	LST	-	Highly calcareous, typically competent limestone containing a pervasive crackle breccia texture defined by a chaotic network of thin, black fracture seams. Limestone in between the black seams is generally very light grey in color. The upper 15 m of the interval is significantly more fractured and rubbly than the lower portion. The upper portion of the interval also contains localized, decimetric scale pockerts of clayey, variably oxidized gouge like material. After 15 m limestone is highly competent. Oxidation is restricted to fracture faces. Calcite veins occur at a density of ~5/m at 45 degrees TCA. Calcite veins crosscut breccia textures. No primary fabrics are observed.			MA

Quartz and calcite veining is present variably throughout. Minor sphalerite occurs in association with quartz veining. Material is typically moderately fractured.

3.00	3.66	0.66	LST	FG	50% of the interval consist of competent, apparantly unaltered, black, highly calcareous calcite veined micrite. The remaining 50% consists of clayey brown, low competency material that may represent altered limestone.	MD	BR	RB	DCA	2I

3.66	146.91	143.25	DST	FG	Light grey, blocky, variably fractured dolostone. Primary lithology is bedded dolo micrite. A minority component of green, terrigenous intraformational mudstone is present. White dolomite veining is abundant resulting in various breccia textures and zebra banding throughout the interval. The upper portion of the interval is clayey and decarbonitized with arsenic oxide. COMMENTS
Hole ended because the maroon mudstone was intersectedd. Massive sulphide body from 51.50 to 51.87 m could be from MVT mineralization.

288.99	505.53	216.54	SLT	FG	Thinly bedded to laminated, dark grey silts and light grey silicious sands. Bedding is typically undulate with minor sections (<10%) of core where BD is sheared/convolute. SIL alteration is preferential to zones of deformed core with white, irregular Qz stringers and blebs. Rare patches of gouge up to 25 cm wide are intermittently seen, hosting blebby orpiment. Trace realgar and orpiment are present as fracture fills scattered throughout. Pyrite is present as fine disseminations visible with hand lens in dark grey silty interbeds. Bedding angles are poor, near parallel to core axis for much of unit.

86.12	91.15	5.03	DST	FG	Changed to Dolostone, visual and chemistry. Original log: Grey to green, variably deformed, well bedded to laminated sandy SLT. Bedding is variably deformed, most often expressed by silty interbeds. Sandy bands up to 65 cm wide preferentially hose white, irregular Qz veinlets and black crackling. Sandy beds are weakly reactive with HCl when scratched. Pyrite is present as scattered blebs at times strung along bands (disaggregation?).	MD	GN

6.71	126.28	119.57	SHL	FG	Highly fractured bedded dark grey shale. Thin millimetric bands of light grey siltstone. Material varies from competent to extremely clayey and rubbly. Intermittent strain features are present. Bedding angles vary slightly averaging 50 degrees TCA. Material ranges from sandy to clayey. Competent sections have a soapy feel.

126.28	140.35	14.07	LST	--	Variably brecciated, variably dolomitized limestone package. Stylolites post dating calcite veinlets are noted. Realgar mineralization is present at the upper contact with shales. Material is typically rubbly and highly fractured with competent pieces displaying cataclastic breccia textures. Protolith may have been lime micrite and fossiliferous wackestone. Crinoids appear to be present. The hardness of material suggests silicification has occurred. Both upper and lower contacts appear to be faulted contacts.

140.35	148.44	8.09	SHL	--	Dark extremely carbonaceous shale. Only obvious fabric is a faint, planar, deformation related fabric at 70 degrees TCA.

148.44	150.14	1.70	LST	--	Brecciated limestone package with calcite veining. Calcite veins post date breccia textures. Breccia texture may be sedimentary in origin. Texturally, the limestone may be a wackestone as abundant fossil fragments are evident. The upper and lower contacts into this interval are likely fault contacts.

150.14	230.73	80.59	SHL	--	Highly carbonaceous, strained, dark colored shale unit. Primary fabric is a deformation related planarity occurring at ~40 degrees TCA. This fabric is defined by deformed bedding and vein fragments as well as banded pyrite. Lighter colored deformed siltstone beds are present. Not necessarily the same as the shale unit intersected at the top of the hole. Material is extremely carbonaceous and friable.

**SAMPLING AND ANALYTICAL PROCEDURES – DRILL CORE**

## **2012 Core Geochemical Samples**

Core was transported by helicopter from the drill sites to a logging area on the property where recovery was measured and geological and geotechnical logging was performed. Geologically and mineralogically favorable intervals from each hole were split in half using a diamond bladed core saw with one half sent for analysis and the other returned to the core box. All core is stored on the property.

Core samples were double bagged in plastic sample bags, grouped into batches of 36 and placed into rice bags for transport. Batches were flown out by helicopter to the Stewart airstrip then flown by fixed wing aircraft to Mayo. From Mayo the samples were transported by truck to Whitehorse escorted by a representative from Archer Cathro. The samples were submitted to ALS in Whitehorse or occasionally flown to the Vancouver lab for preparation.

Core samples were dried and crushed to 70% minus 2 mm before a 250 g split was taken and pulverized to better than 85% minus 75 microns. To reduce contamination, equipment was twice washed with silica sand between samples. Splits of the pulverized fractions were routinely dissolved in four-acid “near-total” digestion and analyzed for 49 elements using the ME-MS61m method which includes combined inductively coupled plasma (ICP) with mass spectroscopy (MS) and atomic adsorption spectroscopy (AAS). Mercury was analyzed for using HG-CV41 methods by aqua regia digestion and atomic adsorption spectroscopy. Samples were analyzed for gold by fire assay finished with AAS (Au-AA26). Certificates of Analysis are found in Appendix X.

**APPENDIX X**  
**QA/QC RESULTS**

## **2012 QA/QC Results**

During the field season, core samples were divided into batches, each containing 31 core samples, two blanks, two standards, one quarter core field duplicate and one coarse reject lab duplicate. A total of 769 blanks, 769 standards, 397 field duplicates and 378 lab duplicates were inserted into the sample sequences. Blank samples each comprise 5 kg (NQ samples) and 7 kg (HQ samples) of landscaping marble obtained from a garden centre in Whitehorse. Samples of this material were randomly selected and analyzed prior to the field season to define the baseline geochemical signature.

Six standards were chosen from CDN Resource Laboratories Ltd. prepared from matrix compatible material. Certificates for each of the standard samples occur in the following pages, while Table X summarizes the consensus and two standard deviation values for each of the standard samples used during the program.

**Table X: Standard Sample Parameters**

Standard Name	Standard Gold Grade	2Sigma
CDN-GS-P3A	0.338	0.022
CDN-GS-P3B	0.409	0.042
CDN-GS-P3C	0.263	0.02
CDN-GS-3G	2.59	0.18
CDN-GS-4C	4.26	0.22
CDN-GS-15B	15.98	0.71

Gold values from all blank samples were within acceptable range. Of the 389 batches analyzed in 2012, 19 returned results where the standards were out of acceptable range. All of these batches were reanalyzed by the laboratory to ensure results were accurate. Results from the reanalyses gave acceptable values for the standards and typically showed little variation in results for the non-standard samples. One batch required a third analysis to give acceptable results for the standard.

For the duplicate samples, both field quarter cores and lab coarse rejects, in general there was little variation between the initial samples and the field and lab duplicate samples.

**Gold concentration: 15.98 ± 0.71 g/t (30g Fire Assay / Gravimetric finish)**

**PREPARED BY:** CDN Resource Laboratories Ltd.  
**CERTIFIED BY:** Duncan Sanderson, B.Sc., Licensed Assayer of British Columbia  
**INDEPENDENT GEOCHEMIST:** Dr. Barry Smee., Ph.D., P. Geo.  
**DATE OF CERTIFICATION:** May 1, 2010

### **ORIGIN OF REFERENCE MATERIAL:**

Standard CDN-GS-15B was prepared using ore supplied by Barrick Gold Inc. from their Goldstrike Mine in Nevada, USA. It is Carlin Style Mineralization in the prolific Northern Carlin Trend in Northern Nevada, USA. The source material is from Devonian carbonates of the Popovich Formation. Gold is strongly associated with pyrite and other sulfides including the arsenic minerals orpiment and realgar. 800kg of the -270 Barrick ore was blended with 46 kg of a high grade gold ore (also screened to -270).

### **METHOD OF PREPARATION:**

Reject ore material was dried, crushed, pulverized and then passed through a 270 mesh screen. The +270 material was discarded. The -270 material was mixed for 5 days in a double-cone blender. Splits were taken and sent to 15 commercial laboratories for round robin assaying. Round robin results are displayed below:

**Statistical Procedures:**

The final limits were calculated after first determining if all data was compatible within a spread normally expected for similar analytical methods done by reputable laboratories. Data from any one laboratory was removed from further calculations when the mean of all analyses from that laboratory failed a t test of the global means of the other laboratories. The mean and standard deviation were calculated using all remaining data. Any analysis that fell outside of the mean  $\pm 2$  standard deviations was removed from the ensuing data base. The mean and standard deviations were again calculated using the remaining data. This method is different from that used by Government agencies in that the actual "between-laboratory" standard deviation is used in the calculations. This produces upper and lower limits that reflect actual individual analyses rather than a grouped set of analyses. The limits can therefore be used to monitor accuracy from individual analyses, unlike the Confidence Limits published on other standards.

**Gold concentration:  $2.59 \pm 0.18$  g/t (30g Fire Assay / ICP)**

**PREPARED BY:** CDN Resource Laboratories Ltd.  
**CERTIFIED BY:** Duncan Sanderson, B.Sc., Licensed Assayer of British Columbia  
**INDEPENDENT GEOCHEMIST:** Dr. Barry Smee., Ph.D., P. Geo.  
**DATE OF CERTIFICATION:** March 10, 2010

### **ORIGIN OF REFERENCE MATERIAL:**

Standard CDN-GS-3G was prepared using ore supplied by Barrick Gold Inc. from their Goldstrike Mine in Nevada, USA. It is Carlin Style Mineralization in the prolific Northern Carlin Trend in Northern Nevada, USA. The source material is from Devonian carbonates of the Popovich Formation. Gold is strongly associated with pyrite and other sulfides including the arsenic minerals orpiment and realgar.

## REFERENCE MATERIAL: CDN-GS-P3A

Recommended value and the "Between Laboratory" two standard deviations

**Gold concentration:  $0.338 \pm 0.022$  g/t (30g Fire Assay / ICP)**

**PREPARED BY:** CDN Resource Laboratories Ltd.  
**CERTIFIED BY:** Duncan Sanderson, B.Sc., Licensed Assayer of British Columbia  
**INDEPENDENT GEOCHEMIST:** Dr. Barry Smee., Ph.D., P. Geo.  
**DATE OF CERTIFICATION:** July 16, 2010

### **ORIGIN OF REFERENCE MATERIAL:**

Standard CDN-GS-P3A was prepared using ore supplied by Barrick Gold Inc. from their Bald Mountain Mine in Nevada, USA. It is Carlin Style Mineralization in the prolific Battle Mountain-Eureka Trend in Northern Nevada, USA. The material is from breccias near the contact between the Mississippian Pilot Shale and the underlying Devonian Guilmette formation. Near the center of the system, micron-sized native Au occurs with base metal sulfides and sulfosalts. In peripheral deposits and in later stages of mineralization, Au is typically submicron in size and resides in pyrite or arsenopyrite.

### **METHOD OF PREPARATION:**

Reject ore material was dried, crushed, pulverized and then passed through a 270 mesh screen. The +270 material was discarded. The -270 material was mixed for 5 days in a double-cone blender. Splits were taken and sent to 14 commercial laboratories for round robin assaying. Round robin results are displayed below:

**Statistical Procedures:**

The final limits were calculated after first determining if all data was compatible within a spread normally expected for similar analytical methods done by reputable laboratories. Data from any one laboratory was removed from further calculations when the mean of all analyses from that laboratory failed a t test of the global means of the other laboratories. The mean and standard deviation were calculated using all remaining data. Any analysis that fell outside of the mean  $\pm 2$  standard deviations was removed from the ensuing data base. The mean and standard deviations were again calculated using the remaining data. This method is different from that used by Government agencies in that the actual "between-laboratory" standard deviation is used in the calculations. This produces upper and lower limits that reflect actual individual analyses rather than a grouped set of analyses. The limits can therefore be used to monitor accuracy from individual analyses, unlike the Confidence Limits published on other standards.

## MEMORANDUM

**To:** Rob Carne

**Date:** May 18<sup>th</sup>, 2012

**From:** Mac Clohan

**Re:** Field Report - Ocelot and Kathy Mag VLF surveys

---

This memorandum report describes Total Field Magnetism (TFM) and VLF ground geophysical surveys conducted for ATAC on the Ocelot and Kathy grids. During the period of May 7<sup>th</sup> to May 16<sup>th</sup>, 2012, a total of 26.5 line kilometres (10.5 on the Ocelot grid and 16.0 on the Kathy grid) of TFM and VLF surveying were completed.

**a. Personnel:** The ground geophysical surveys were conducted by the following personnel:

Mac Clohan	Crew Chief	May 7 - May 16, 2012
------------	------------	----------------------

---

**b. Instruments and Equipment:** The crew was equipped with the following instruments and equipment.

Mag Survey	1 - GEM Systems GSM-19 VLF magnetometers
	2 - GEM Systems GSM-19 Base magnetometers
	1 - Handheld non differential GPS

**c. Survey Location:** While surveying the crew stayed at ATAC's Rau Camp. A 520 Fireweed helicopter used a gravel pit 10km past Elsa on the Silvertrail highway to mobilize gear and crew into camp. The Ocelot grid is located roughly 10km NW of the Rau Camp and occupies NTS map sheet 106 D/07. The Kathy grid is 6km S of camp and occupies NTS map sheet 106 D/01. Access to both grids was by helicopter.

Both properties had cut lines with an overlaid virtual grid. Most of the surveying was done on cut lines, but on the Kathy grid, roughly half the survey was conducted via the virtual grid on uncut lines. UTM coordinates and NAD83 zone 8N were used during data

acquisition.

**d. Survey Specifications:** The Mag VLF survey was completed according to the following specifications

Station Separation	12.5 m
Line Spacing	100 m
Positioning Data	Collected with the handheld NDGPS receiver sampling at one reading per 3 seconds
Corrections	Temporal geomagnetic variations were removed by linear interpolation of drift determined by the base station magnetometer. Reference field set to 57,700nT
Base Station Magnetometer	The unit was cycled at a 3 second interval throughout the survey. Both base and roving magnetometers' clocks were synchronized daily to local time.
VLF Frequency	21.4 Khz (NPM) Lualualei, Hawaii

**e. Data :** The Mag VLF data were downloaded at the end of each survey day and the raw, unedited data archived. A copy of the data was then corrected for diurnal variations using GEM Systems software GEMlink5. Geosoft's cross database channel lookup was used to append the positioning data collected during the survey. The data were leveled each day to a common datum and poor quality readings removed. Profiles of the corrected magnetic and VLF data were reviewed on a line by line basis to check for data integrity. Plan images of the total magnetic field were produced using Geosoft's Bigrid gridding algorithm. VLF Profiles were low pass filtered using a wavelength of 10 and fraser filtered. Plan contour maps of the fraser filtered data were generated using Geosoft's Bigrid gridding algorithm.

## MEMORANDUM

**To:** Rob Carne  
ATAC Resources Ltd. **Date:** June 12, 2012

**From:** Genevieve Hetu  
[Genevieve.Hetu@auroraesciences.com](mailto:Genevieve.Hetu@auroraesciences.com)

**Re:** Field report – Ocelot & Kathy Gravity Survey - 2012

---

This memorandum is a short form geophysical report describing a gravity survey conducted for ATAC Resources Ltd. over the Ocelot and Kathy grids within the Mayo Mining District, Yukon. The Ocelot grid comprised 417 gravity points which extended a 2011 gravity survey. The Kathy grid included 594 gravity points.

The work was performed during the period of May 7<sup>th</sup> to June 6<sup>th</sup>, 2012. All work was conducted out of the RAU camp and the work areas were accessed daily by helicopter.

A complete log of the work performed is appended to this report.

### **Survey Location.**

The Ocelot and Kathy grids are located on mining claims owned by ATAC Resources Ltd. in Yukon Territory, approximately 400 kilometres north of Whitehorse. The work described in this memo is centred at 64° 11' N / 134° 26' W. The project area covers NTS 1:50,000 map sheets 106D/02 and 106D/08.

The grid was all on cut lines except for lines 0, 100, 200, 1100 and 1200 on the Kathy grid.

**Crew and Equipment.** The surveys were conducted by the following personnel:

Andre Lebel	Crew Chief – (Grav operator)	May 7 – May 16 May 29 – June 5
Genevieve Hetu	Crew Chief – (Grav operator)	May 16 – May 29
Mike Murdock	Field Assistant	May 7 – May 16
Jeremy Beales	Field Assistant	May 16 – June 5

The crew was equipped with the following instruments:

- Gravity                      1 - Scintrex CG-5 Gravimeter S/N:961049349
- GPS                            1 set - Leica GS-15 RTK Differential GPS Receivers and Transmitters S/N: 1508673 and 1502747
- Other                         1 - Laptop with Geosoft, Gravred2, Scintrex Software  
                                   1 - Repair tools  
                                   2 - Icom two way radios  
                                   2 - Garmin handheld GPS

**Gravity Survey.** Each Gravity station's coordinates were determined from position measurements taken with Post Processed / RTK Differential GPS system and recorded in NAD83 and then transformed into UTM Zone 8N coordinates using the NAD83 datum. The station spacing was 25 m and the line separation was 100 m.

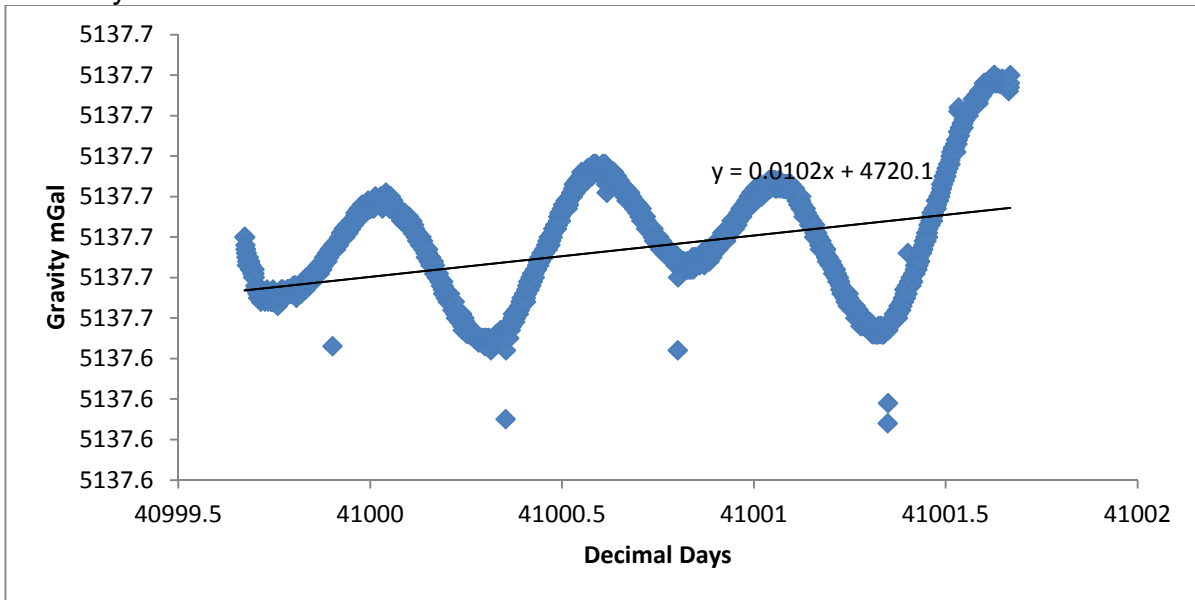

- Geographic datum & projection:      UTME, UTMN NAD83 datum, 8N.
- Elevation datum:            Mean sea level using Geoid EMG96.
- Station locations:            Stations were located with non-differential GPS receivers.
- Station marking:             Stations were marked with flagged nails driven flush to ground level where possible.
- Gravimeter preparation:    The gravimeter was levelled on a cement block and warmed up for a period of 48 hours to stabilize. After the spring stabilized, the instrument was cycled for 72 hours taking readings for 60 seconds every minute to determine the remnant instrument drift and to reset instrument drift constants. The instrument remained under power at all times throughout the survey operation.
- Gravity readings:            Readings were stacked for 60 s and maximum standard deviation in reading error was kept to less than 50 microGal if possible. When this was not possible, readings were repeated several times to ensure that the data is repeatable. Seismic filters were engaged to remove wind noise.

Gravity Base Station: Ocelot location at 517086E 7127309N NAD83 Z8N and Kathy location at 532896E 7117704N NAD83 Z8N, marked with butter tags and flagging.

Gravimeter drift for CG-5 S/N 961049349:

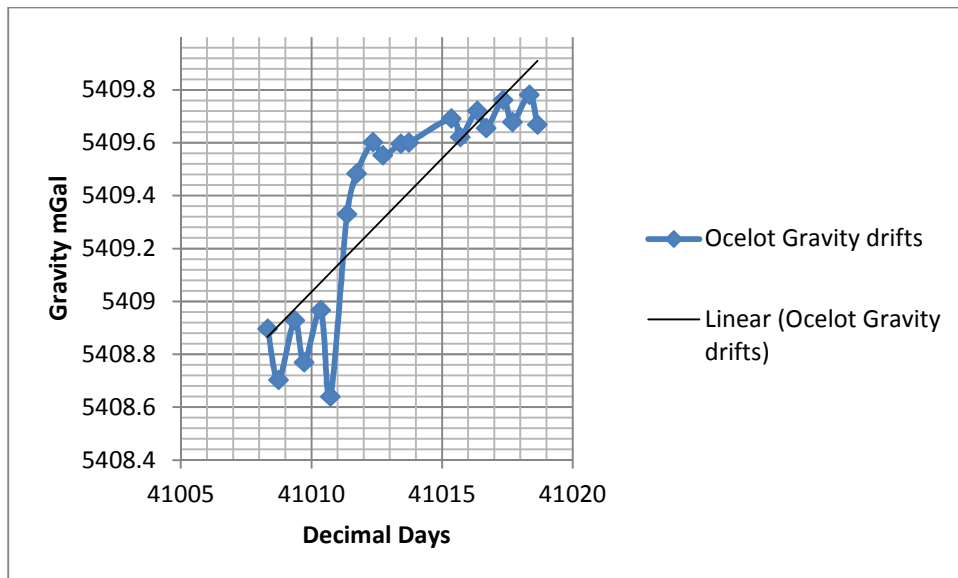

The gravimeter was checked daily for instrument drift prior to surveying by occupying a drift station on both work areas. During the survey, a minimum initial and final tie-in drift measurement were made prior to and after each day's survey.

Pre-survey:

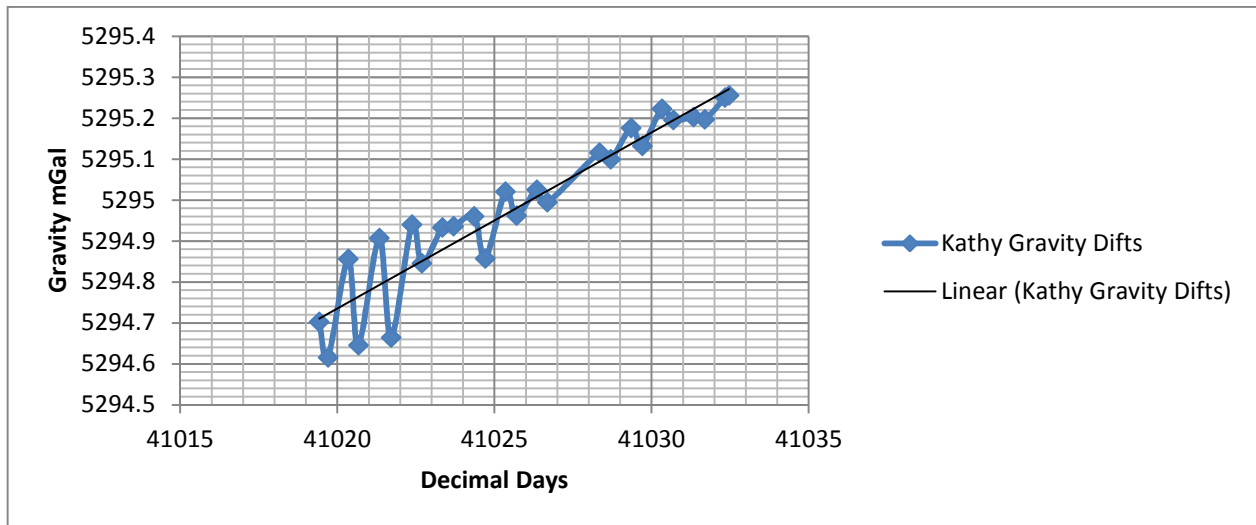

Graph 1. Shows the linear trend of the springdrift throughout the 72 hours from May 1-May 3, 2012, pre-survey. X-axis: time in decimal hours. Y-axis: mGal.

During Survey (Tie File):

Graph 2. Shows the spring drift from May 9 to May 20, 2012 while surveying on the Ocelot grid.

Graph 3. Shows the spring drift from may 21 to June 4, 2012 while surveying on the Kathy grid.

DGPS survey base station: The GPS base station was installed to transmit RTK position corrections and record positioning at 1 second epoch intervals.

The GPS base was installed at UTME, UTMN NAD 83 Z8N:  
 Ocelot - 517086.3E, 7127308.6N with base height of 1.17  
 Kathy - 532896.9E, 7117704.1N with base height of 1.22  
 Both bases were set over a floating position and marked with butter tags and flagging.

DGPS survey rover: Antenna was placed on the gravity survey station hub and elevations corrected for rover antenna height of 1.8m. RTK was achieved for about 96% of the surveyed data points. Because of occasional poor satellites configuration that impacts the RTK reliability, 4% of all elevations are accurate to the decimeter. These stations are flagged in the final database.

Bouguer Correction Free Air, Bullard B, Bouguer: density: 2.67, Datum: 0.0 (sea level)

Latitude Correction Ocelot grid: UTM Declination -0.7, Center Latitude 64.25, Center UTM 579500E, 7128000N NAD83 Z8N  
 Kathy grid: UTM Declination -0.7, Center Latitude 64.20, Center UTM 532770E, 7117670N NAD83 Z8N

Near station terrain measurement:	Terrain elevations within 20m of the gravity station were directly measured applied to the data as near-station terrain corrections. The offset for the operator height was accounted for 1.5 m.
Inner DTM	Terrain corrections from 20 m to approximately 10 km were calculated. A DEM equivalent to a 1:50 000 NTS topographic map was used modified to be consistent with the GPS data collected over the course of this survey.
Outer DTM	Terrain corrections from 10km to approximately 100 km were calculated. A DEM equivalent to a 1:250 000 NTS topographic map was used modified to be consistent with the GPS data collected over the course of this survey.
Tide Correction	Centre of Grid: 64.2 Lat, 134.3 Long was used for on-board Gravimeter tide corrections.

**Data Processing.** The gravity data was downloaded and processed daily in the field using propriety software package 'Gravred2'. All of the field maps and databases were created in Geosoft Oasis Montaj. Gravity data repeats were averaged. The Ocelot 2011 gravity data were leveled with the Ocelot 2012 gravity data. Long wavelength features were isolated by applying a trend removal to each grid.

**a. Data Formats.** The unedited ASCII instrument dump files are named for the date (survey type/day/month /operator's initials) on which they were produced. The RTK GPS dump files include the hyper, rover and base folders. The Near Terrain Corrections (NTC) are in an excel spreadsheet. The final processed data are in Geosoft data base (.gdb) format and in ASCII (.xyz) format.
