## Summary

In 2012, Anthill Resources Yukon Ltd (Anthill), a private mineral exploration company based in Vancouver, British Columbia, Canada, conducted a property-wide exploration program on its Hess Property, centered about 160 km east of Mayo, Yukon Territory, Canada. The property was staked to cover potential mineralization centered on a felsic intrusion in the northwestern area.

The property is located within a large package of Neoproterozoic to Lower Cambrian Hyland Group rocks, forming the basal portion of the Selwyn Basin, consisting of shelf and off-shelf sediments originating from the Ancient North American Platform. Limited rock sampling suggests most of the property is underlain by fine grained Narchilla Formation sediments, representing the youngest Hyland Group rocks. The Hess Property area is also located within the Tombstone-Tungsten Intrusive Suite, consisting of plutons and stocks of felsic to intermediate composition known to be associated with sizable hydrothermal gold, base metal-silver deposits and tungsten skarn deposits.

The 2012 program consisted of intensive reconnaissance-style soil geochemical sampling, with limited silt and rock sampling. Results revealed that the target setting is "Intrusion Related Mineralization", specifically lode-style lead-zinc-silver +/- gold mineralization. Six targets were identified, of which the two most important are: Target 1, the intrusive stock and proximal country rock; and Target 2, a linear coincident lead – silver – arsenic +/- gold anomaly extending southeast from the stock. A third target area, Target 3, is located in the southwestern area; the other three lie northeast of the main trend.

The property has moderate potential to host significant mineralized zones, warranting a further program of detailed surface exploration. Grid soil sampling is recommended across Targets 1 through 3, and detailed prospecting and rock sampling is recommended for Targets 4 through 6. The program is recommended to consist of a six person crew of two geological staff and four soil samplers, camping on site with helicopter support provided from the nearby Einarson Project. The program may be completed in about 20 days, commencing in late June. The objective is to determine drill targets, if any, for programs in 2014; no drilling is recommended for 2013.

Projected expenditures, including pre-program preparation, post-season data compilation, digitization and report writing, stand at **CDN\$194,090**: with 10% contingency the proposed expenditures stand at **CDN\$208,999**.

## **2. Introduction**

In 2011 Anthill Resources Yukon Ltd. (Anthill), a private mineral exploration company based in Vancouver, British Columbia, Canada, acquired the 206-claim, 4,305-hectare HESS property, located in east-central Yukon Territory, Canada. Limited surface exploration, consisting mostly of rock geochemical sampling, was conducted in 2011.

In 2012 All-Terrane Mineral Exploration Services (All-Terrane) was contracted by Anthill to conduct a more comprehensive surface geochemical program consisting of fairly intensive reconnaissance-style soil geochemical sampling and additional silt geochemical sampling across the property. The objective was to identify target areas for subsequent surface exploration programs.

The author has been requested to write this report using these terms of reference:

1. To satisfy assessment filing requirements with the Yukon Mining Recorder, Ministry of Energy, Mines and Resources, Government of Yukon.
2. To fulfill requests by Anthill Resources Yukon Ltd. for a comprehensive analysis of the 2012 geochemical program.

Mr. Carl Schulze, PGeo, designed and supervised the program on a remote basis, based from Anthill Resources' Einarson project. Mr. Schulze did not visit the property in 2012: however, a visit by a Qualified Person was not imperative, as Anthill Resources Yukon Ltd. is a private company, currently not listed on any exchanges.

## **3. Reliance on other Experts**

Very limited data is available on the HESS property area. Limited data is provided by a report entitled "Structure and Stratigraphy of the MacMillan Fold Belt, Evidence of Devonian Faulting" by J.G. Abbott of the Northern Affairs Program of the Geological Survey of Canada. Some geological information was also provided by the Yukon Minfile, Energy Mines and Resources, Government of Yukon.

## **4. Property Description and Location**

The HESS Property consists of 206 Yukon quartz mining claims covering 4,305 hectares, centered at 603500E, 7030500N, (UTM NAD 83, Zone 8) along the north side of the Hess River roughly 160 km east of Mayo, Yukon. There are currently no permits in place on the HESS property; all exploration to date falls under the category of Class 1 activities. No environmental

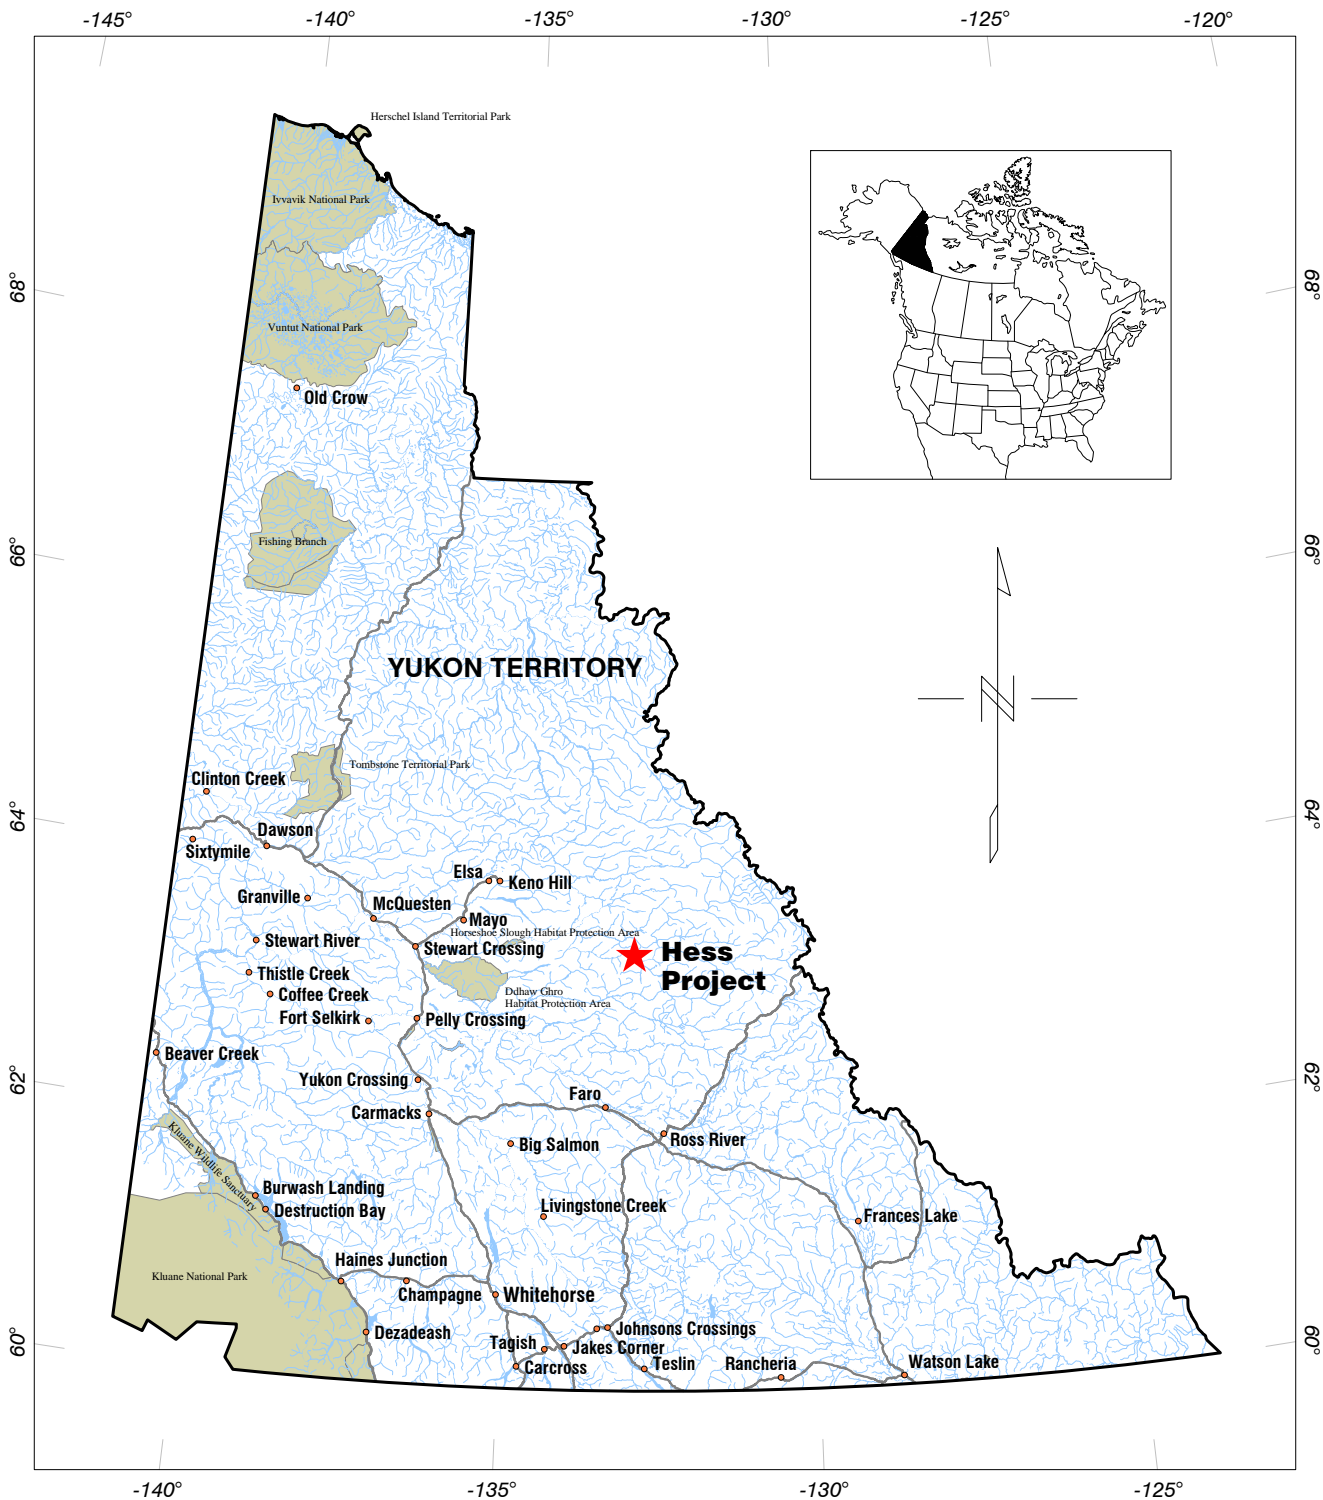

liabilities are known on the property, and no significant past disturbances are known. There are no official restrictions on activities on the property, although the Hess River is occasionally utilized as a recreational canoe, kayak and rafting route.

The property is located within the traditional territory of the Nacho Nyak Dun (NND) First Nation, based at Mayo, Yukon. As of November 2012 a good relationship has been established between the NND and Anthill Resources, based on notification of proposed activities and involvement of NND-based contacts for services on Anthill's Einarson Project to the northeast.

The claim status is located below in Table 1:

## 5. Accessibility, Climate, Local Resources, Infrastructure and Physiography

The HESS property, located about 150 km east of Mayo, central Yukon, is very remote from existing infrastructure. Access is by helicopter to a small campsite in the southwest property area. The nearest infrastructure is the Plata property, with a functional airstrip, located roughly 50 km northeast of the Hess property. Although the property is located on the north shore of the Hess River, the waterway is considered unnavigable due to a waterfall downstream. However the waterway may be usable by fixed wing aircraft, although this author is not aware of the local river conditions and possible rocks or shoals that would render its usage prohibitive.

The area has a subarctic climate, combined with some northern alpine effects. Average July daily high temperatures range from 15° to 20° C, although cooler temperatures are common. Although no records are available for the Hess property area, average January high temperatures are likely in the -20°C range, with temperatures below -40° not uncommon. Precipitation is moderate, with fairly frequent afternoon showers and some electrical storms. Annual average precipitation stands at 500 – 625 mm (20 – 25 inches). The field season at lower elevations ranges from about June 1<sup>st</sup> to Sept 20<sup>th</sup>, although it will be shorter at higher elevations.

The topography is mountainous, with abundant rugged terrain interspaced with deep stream valleys. Elevations range from about 1,780m (5,850 feet) to about 640m (2,100 feet) along the Hess River. Areas below 1,450m are covered by sub-arctic fir mixed with spruce and minor poplar stands along south-facing slopes. White and black spruce dominate in the Hess River valley and the lower extents of several streams within the property.

The Hess Property is large enough contain any amount of mining, milling, tailings facilities and other infrastructure related to mining, although rugged terrain would likely confine development to the Hess River valley and some of the larger stream valleys. There is fairly abundant water throughout the property, particularly from the Hess River, although smaller streams will freeze completely during the winter. There is no available power in or close to the property.

Mayo (pop. 480, including surrounding area) is a village with basic services, consisting of groceries, propane, and accommodations, as well as local expediting services, and a limited available work force. The community is roughly 420 road-kilometres from Whitehorse, Yukon, a full-service community of about 27,000, with excellent available accommodations, groceries, hardware, camp supplies bulk fuel and expediting services, and an available skilled workforce. The communities are connected by all-weather paved roads.

## 6. History

Very little past exploration has been done in the HESS property area. Only one Minfile occurrence, the Pebble occurrence identified in 1967 by Atlas EL for the “Hess Project” (consisting of: Atlas EL, Quebec Cartier Mg C and Philip Bros (Can) Ltd), exists within property boundaries (Yukon Minfile, 2013). This consists of galena-bearing quartz vein float discovered in a small stream. The source was not located although it likely occurs in the northwestern property area; the occurrence was never staked.

A second occurrence, the Cartier showing, located somewhat south of the Hess River, was also identified by Atlas EL in 1967. This consists of pyrrhotite with minor chalcopyrite in narrow quartz-frilled shear zones within Proterozoic quartzite (Yukon Minfile, 2013). In 1968, nine grab samples were obtained, returning copper values from 0.01 to 0.11% with traces of lead, zinc and silver (Yukon Minfile, 2013).

In 1997 and 1998 Viceroy International Exploration Ltd. conducted regional soil and silt sampling and reconnaissance-style mapping across much of the eastern Selwyn Basin in the Plata area; however, the present HESS property was not selected as a target for detailed exploration.

## 7. Geological Setting and Mineralization

### 7.1 Regional Geology

The HESS property is located within a large package of Hyland Group rocks, forming the basal group of the Selwyn Basin, which consists of a thick sequence of shelf and off-shelf sediments with lesser mafic volcanic units deposited along the southern margin of the Ancient North American Platform. The Selwyn Basin forms the bulk of the stratigraphy between the North American Platform and the north-west trending Tintina Fault Zone. The Hyland Group, deposited during Neoproterozoic to Lower Cambrian time, consists of three major formations: the Yusezyu Formation, comprised of coarse clastic with lesser fine clastic sediments; the Algae Lake formation, consisting of carbonate assemblages including dolostone; and the Narchilla Formation, consisting largely of fine clastic sediments, including green and maroon shales.

Although the HESS property is likely underlain entirely by Hyland Group sediments, a district-scale package of Devono-Mississippian Earn Group chert pebble conglomerate, shale, argillite, mudstone and lesser felsic to intermediate volcanic flows occurs to the northeast. The contact is at least partially marked by the northwest-southeast trending, northeast-dipping Robert Service Thrust.

The majority of the Selwyn Basin stratigraphy, including the Hess property area, has undergone emplacement of numerous intrusive bodies belonging to the 91 MA Tombstone-Tungsten

Intrusive Suite, part of the 70 – 110 MA Tintina Gold Belt. This consists of plutons, stocks, and associated dykes, sills and apophyses with a dominantly syenitic to monzonitic composition, although dioritic and granitic phases are common. Adjacent sediments typically exhibit well-developed hornfelsing, commonly visible on regional magnetic geophysical maps as magnetic “high” halos.

## **7.2 Property Geology**

The property did not undergo geological mapping in 2012, and no detailed mapping is known to have occurred previously. However, regional government mapping indicates the majority of the property is underlain by Hyland Group sediments. A Tombstone Suite stock has intruded this in the northwestern property area. Limited rock sampling, mainly within or near the intrusion, suggests that Hyland Group sediments in this area consist of phyllite and “green schist”. This suggests that sediments belong to the Narchilla Formation, and that the green schists may belong to the Arrowhead Member, typified by fine grained green chloritic shales and maroon shales. Sampling also suggests that the intrusion is of granitic composition, although detailed mapping is required to confirm this.

## **8 Deposit Types**

The deposit setting targeted at the Hess property is that of “Intrusion-Related Mineralization”, focusing in this case on gold and silver. Intrusion related systems consist of any deposit setting centered on an intrusion of felsic to intermediate composition. Individual bodies typically belong to a suite of intrusions of similar composition and ages, and coeval with equivalent extrusive units. In the Hess area, intrusions belong to the 91MA Tombstone Intrusive Suite extending from the Dawson area east-southeast to the Cantung mine area along the Yukon-Northwest Territories border. This is part of the 70 – 110 MA Tintina Gold Belt, extending in an arcuate manner from southwest Alaska through Fairbanks, the Dawson Range of central Yukon and terminating roughly along the Yukon – British Columbia border.

Individual plutons and stocks of the Tombstone Intrusive Suite are typically monzonitic to quartz-monzonitic in composition, and have a high original hydrothermal and pneumatic component, as well as high amounts of arsenic, antimony, base and precious metals. The core of the system is typically a monzonitic stock formed from a melt having a high concentration of metal-rich fluids and vapours. Upon final stages of solidification, the hydrothermal fluids and gas-rich “volatiles” became concentrated along intrusive margins and also began movement along fault zones, along permeable, reactive rock units, and along dykes and sills originating from the core pluton. A variety of settings may result: these include intrusion-hosted “Fort Knox”-style sheeted vein –hosted gold deposits; skarns and replacement zones along areas of reactive, calcareous stratigraphy replaced by base metal and/or precious metal bearing mineralization; and zones of stockwork-style mineralization hosted by strongly fractured to brecciated host rock. Perhaps the most well-known deposit setting is that of vein-style mineralization, including “Bonanza-style” gold veins, caused by precipitation of metals from

silica-rich hydrothermal fluids passing through open fissures, commonly linear. Epithermal-style gold-bearing mineralization may also occur along the outer margins of these systems.

A zonation of deposit settings typically occurs as a series of concentric zones centered on the intrusion. Fort Knox-style and endoskarn mineralization typically occur within outer portions of the actual stock; exoskarn and replacement-style mineralization occurs in proximal areas outside the stock; Bonanza-style veins occur somewhat beyond these, and epithermal mineralization occurs in peripheral areas of the system. Base-metal hydrothermal mineralization is known to occur both inbound and outbound of the Bonanza Vein horizon. Deposit types are influenced by decreasing temperatures and pressures of hydrothermal fluids emanating from the stock.

## 9. Mineralization

The soil sampling program was designed to identify anomalous gold and/or pathfinder element zones across the property, focusing on gold (Au), silver (Ag), lead (Pb), arsenic (As) and antimony (Sb). Results revealed scattered anomalous gold values with a slight enrichment along a trend extending southeast from the stock underlying northwestern property areas (Map 2). Plotting of silver values reveal a coincident and more pronounced anomalous northwest – southeast trend coincident with the gold trend (Map 3). Plotting of lead values show a strong correlation with silver values, as well as scattered high values peripheral to the stock (Map 5). Antimony plots show only a weak correlation with the lead-silver trend, with high values typically associated with high gold values. However, consistently anomalous antimony values were returned from sampling along both flanks of a stream in the south-central property area (Map 4). Plotting of arsenic-in-soil results revealed anomalous values both along the southwestern margin of the stock and northeast of it, and a moderate correlation with the northwest – southeast trending lead - silver anomaly (Map 6).

Sampling of a galena-bearing quartz-calcite vein within hornfelsed phyllite along the northern margin of the stock returned a value of 0.380 g/t Au with 432 g/t Ag, 1.29% Pb and 3.77 g/t Zn and 42 ppm Sb. Rock sampling elsewhere also returned a high lead value of 2.04% Pb with 18.5 g/t Ag and 10 ppm Sb in the east-central property area, coinciding with anomalous Pb and Sb values in soil. Although strongly anomalous, the aerial extent is very limited. One rock sample in the central area returned a value of 607 ppm arsenic (As), along the northwest – southeast trending coincident Pb-Ag soil anomaly.

A third area of interest occurs in the south-western area along the north flank of the central stream, where two rock samples of galena-bearing quartz veining in muscovite schist returned silver values of 18.1 g/t Ag with 1170 ppm Pb and 0.020 g/t Au, and 18.5 g/t Au with 189 ppm Pb respectively. This occurs along the lower extent of the stream hosting anomalous Sb values along both flanks.

Silt sampling returned a high gold value of 0.193 g/t Au downstream of the stock, and a value of 0.117 g/t Au further upstream along the main drainage, but still downslope of the stock (Map 2). A third sample between these returned a value of 29.6 ppm Pb with 3 ppm Sb.

## **10. Work Program**

The 2012 work program consisted of intensive reconnaissance-style “ridge-and-spur” soil sampling at 100-metre station intervals, as well as systematic silt sampling at 250-metre intervals and tributaries along one major stream in the northwestern property area. Limited rock grab sampling also occurred in the northwestern and central property areas.

A four-person crew conducted the program from July 13 – 27, 2012, under supervision from Carl Schulze of All-Terrane Mineral Exploration Services based at the Einarson Project. A total of 904 soil, 10 silt and 17 rock samples were taken.

The following personnel conducted the program on site:

N. Goeppel:	Senior technician and crew boss
C. Knowler:	Technician
M. Sidler:	Tehnician
S. Shoniker:	Technician

Helicopter support services were provided by Chris Perry and Patrick Stephens of Horizon Helicopters, based at the Anthill Camp of the Einarson Project.

## **11.0 Sample Preparation, Analysis and Security**

### **11.1 Surface Sampling Preparation**

All geochemical sampling was subject to rigorous parameters, including detailed descriptions of each sample. Rock samples were obtained using an Estwing rock hammer, and located in the field using a non-differential Global Positioning System (GPS) instrument. Samples were placed in plastic bags designed specifically for rock sampling. A tag with the unique sample number, supplied by Agat Laboratories, was placed in the bag; the sample number was written on both sides of the bag using “Magic Markers”.

Soil samples were taken by a 1.5-metre long hand auger to assist with depth penetration. Soil samples were recorded as to location (UTM – NAD 83), horizon, depth, slope angle, colour, moisture content, presence of permafrost, vegetation type, surficial geology, texture, sample quality, weather conditions, date, sampler and comments. Samples were preferably taken of C-horizon material, although sampling of A or B horizon soil was done where C-horizon material

was unavailable. This was preferable to omitting the sample. The minimum original sample weight was 0.25 kg. Sample numbers supplied by Agat Laboratories were marked at each station location. Samples were placed in kraft bags, with a tag supplied by Agat showing the unique sample number placed in the bag, and the sample number written in “Magic Marker” on both sides of the bag. The bags were then dried as much as possible before shipping. Variability in results of soil sampling may be caused by depth of overburden, slope angle, vegetative cover, if any, and outcrop exposure, with lower values expected in flat areas with thick overburden.

Silt samples were taken from several locations at a particular site to improve representability, focusing on fine material. Sample locations in UTM NAD-83 format were recorded in the field using a non-differential GPS and described as to percentages of silt, sand and gravel, colour, drainage quality (perennial or intermittent), stream grade, flow rate, depth and width, boulder lithology, ground vegetative cover, presence of organics, trap description, date, sampler and comments. Samples were placed in kraft bags with a sample tag showing unique sample number, labeled and marked in the field in the same manner as soil samples.

Field data was entered into Microsoft Excel spreadsheet format, and later matched with analytical results. This process was continually re-checked to ensure correct results are associated with descriptions.

The routine and repetitive methodology of soil and silt sampling should eliminate any chance of bias; metal values should accurately represent actual amounts per site. Soil anomalies may be transported, depending on slope and groundwater conditions; detailed records of slope, vegetation, soil conditions are used to determine probability of transportation. Despite rigorous sampling parameters, it is still possible for a nugget to enter the sample and provide an isolated high value; this is called the “Coarse Gold Effect”.

## **11.2 Surface Sample Analysis and Security**

All rock samples were placed in thick plastic industry standard sample bags, sealed with thick plastic serrated “Zap Straps” and sent in a similarly sealed rice bag to a preparatory laboratory of Agat Laboratories at Whitehorse, Yukon, an analytical laboratory with ISO 9001:2000 certification and ISO/IEC 17025 certification. Sealed rice bags were personally handed to the courier, Small’s Expediting Services, by the qualified person or by agents of that person, and then delivered by the courier directly to AGAT Labs. All rock samples were crushed to ensure that 75% of the material passed through a 2mm (10-mesh) screen using a Jones riffler splitter or rotary split. The resulting material was then pulverized so that 85% of the material could pass through a 75-micron size (200-mesh) screen; then a 50-gram sample of this underwent fire assay analysis with atomic absorption finish. This technique provides gold analysis ranging from 0.001 to 10.0 g/t gold.

Soil and silt samples were dried at 60° C, and then underwent crushing in order that 75% of the material passed through a 2mm (10-mesh) screen using a Jones riffler splitter or rotary split. The resulting material was then pulverized so that 85% of the material could pass through a 75-micron size (200-mesh) screen; the fine fraction then underwent gold analysis by 30-gram fire assay with ICP – AES finish, providing a detection limit of 0.001 g/t Au. A Rocklabs Boyd Crusher with RSD combo and TM-2 Pulverizers are routinely utilized during preparation of all samples, including core samples (AGAT website, 2012).

All samples were also analyzed by 45-element ICP to test for abundances of Ag, Al, As, B, Ba, Be, Bi, CA, Cd, Ce, Co, Cr, Cu, Fe, GA, Hg, In, K, La, Li, Mg, MN, Mo, Na, Ni, P, Pb, Rb, S, Sb, SC, Se, Son, Sir, Ta, Te, Th, Tl, Ti, U, V, W, Y. Zn and Zr. Values for Pb and Zn exceeding 10,000 ppm (1.0%) were analyzed by over limit analysis.

Agate Labs provides comprehensive in-house quality-control, using numerous blanks to test for any potential contamination, confirming that no detectable contamination has occurred. Agate also conducts repeated in-house standard sampling for all 45 elements involved in ICP analysis and gold to determine accuracy of analysis. The lab also incorporates more limited analysis of standard samples with known element concentrations provided by several outside firms.

## **12 Interpretations and Conclusions**

### **12.1 Interpretations**

Intensive reconnaissance-style soil sampling combined with limited rock and silt sampling indicate that the target setting is intrusive-related mineralization emanating from the felsic stock in the northwest property area. The high lead – zinc-silver values with anomalous gold from one sample of quartz-carbonate veining proximal to the stock indicate that fluids from the stock were base-metal enriched with strong associated silver and some gold enrichment. This association and base metal: precious metal ratios are typical of lead-zinc-silver mineralization within Yukon, particularly at the Keno Hill camp and the Plata prospect to the east. Target 1 (Map 7) covers the stock and proximal country rock. To date, only minor vein-hosted mineralization has been discovered, although scattered high precious +/- base metal and pathfinder element values in the stream draining the area suggest potential for more widespread mineralization.

A second major target area, Target 2, is the northwest – southeast trending corridor of anomalous lead-silver-arsenic values. This is roughly parallel to the regional-scale strike-slip fault lineation paralleling the Tintina Fault Zone. Although these tend to be compressional faults, they may still represent permeable zones, allowing for metal-bearing fluid movement and subsequent emplacement. At the Hess property, a fault marking this geochemical anomaly may have been the conduit for fluid movement extending southeast from the intrusion, possibly combined with fluids from other proximal intrusions.

Target 3 covers an area of anomalous Sb-Pb +/- Au-in-soil values in the southwestern property area, also marked by two rock samples returning anomalous Ag and Pb values. This also marks the southwestern end of a series of Sb-in-soil anomalies extending along both flanks of the stream. The samples are described as quartz-galena veining in muscovite schist, suggesting mid-grade metamorphism; however, sericite (a form of muscovite) is also common in alteration halos of mineralized zones as well as mineralized shear zones.

Target 4 covers a galena bearing quartz vein returning 2.04% Pb with 18.5 g/t Ag. Geochemical sampling suggests the showing is of limited extent: however it lies to the north of the Target 2 trend and may suggest a separate source or mineralized structure. The rocks are hosted by "green schist", suggesting possible chloritic alteration, commonly associated with hydrothermal mineralization. The green colour may also represent chloritic Narchilla Formation, Arrowhead member shales to mudstones.

Target 5 covers strong lead-in-soil values, locally associated with elevated gold and antimony values along the eastern property boundary. A rock sample of galena in quartz veining taken here returned a weakly elevated Pb value of 34.5 ppm. Again, the rock sample is hosted in green schist, here in rocks that appear to be sheared.

Target 6 covers a strong lead-in-soil anomaly with scattered anomalous antimony values in the northern property area, associated with a galena-bearing quartz vein in a small shear zone. High arsenic-in-soil values were returned from a ridgeline to the northwest (Map 6). Anomalous lead values suggest an east-west trending structure; however further detailed exploration is recommended to confirm this.

Geochemical results suggest that the most prospective mineralized setting is that of intrusion-related hydrothermal lead-zinc-silver mineralization, similar to that of the Plata property, and may represent a member of coeval occurrences.

## 12.2 Conclusions

- Intrusion related vein-style lead-zinc-silver mineralization constitutes the main target setting for the Hess property.
- Six exploration targets have been selected, of which the two most important are: Target 1, centered on the felsic stock; and Target 2, focusing on the northwest-southeast trending coincident lead-silver +/- gold anomalies revealed from soil sampling.
- The other four targets have similar geochemical signatures, suggesting similar mineralogical settings. To date, the sources are unknown.

## 13 Recommendations

### 13.1 Recommendations

The property has moderate potential to host significant mineralized zones, warranting one further program of detailed exploration. Grid soil sampling is recommended across Targets 1 through 3, with a 100-metre line spacing and 50-metre station spacing. Roughly 70 line-kilometers for 1,400 soils are recommended to cover the three grids. Grid soil sampling is not recommended for the other three targets; however these should undergo detailed prospecting, rock sampling and mapping to determine whether follow-up work is recommended later in 2013. Detailed geological mapping is recommended for the entire property, particularly across the six targets. Silt sampling at a 250-metre interval and tributaries is recommended for all streams within the property; roughly 120 silts will be required to cover this.

The project should consist of a geologist, geological assistant and four soil/silt samplers based at a camp along the stream separating Targets 1 and 2 (Map 7). This may require an advance team to clear a site capable of a camp consisting of three to four tents and a helipad. The program is recommended to commence in late June, when sufficient snow has melted from higher elevations. Fixed wing support is recommended to be provided to the Plata Strip; helicopter support, including set-outs and pickups for the geological crew during the latter stages of the program, will be provided from the Anthill Lake camp. The program as proposed may be done in 20 days, including mobilization and de-mobilization time, and two weather days. Total cost of the program, including pre-program preparation, post-season data compilation, digitization and report writing, is projected at **CDN\$194,090**; with 10% contingency the proposed expenditures stand at **CDN\$208,999**. Costs are exclusive of gear purchase but include camp rental.

An airborne combined magnetic and electromagnetic survey is recommended across the property, to determine the location of intrusions as well as major structural corridors. A series of quotes should be gathered to determine the best value of services provided; selection should be based on deliverables as well as price. Projected costs are currently excluded from this proposed budget.

The project is still at a very early stage and the recommended 2013 program is designed to determine drill targets, if any, for subsequent seasons. The project is unpermitted; however, proposed activities should continue to fall under the category of Class 1 activity. No drilling or trenching is proposed for 2013.

### 13.2 Recommended Budget

Project Geologist (including pre and post-season): 32 days @ \$680/day:	\$ 21,760
Geological Assistant: 20 days @ \$437,50/day:	\$ 8,750
Technician 1: 20 days @ \$480/day:	\$ 9,600
Technician 2: 20 days @ \$480/day:	\$ 9,600
Technician 3: 20 days @ \$480/day:	\$ 9,600
Technician 4: 20 days @ \$480/day:	\$ 9,600

## Appendix 1. Certificate of Author

I, Carl M. Schulze, PGeo, hereby certify that:

a) I am a self-employed Consulting Geologist and sole proprietor of:

All-Terrane Mineral Exploration Services  
35 Dawson Rd  
Whitehorse, Yukon Y1A 5T6

b) This certificate applies to the assessment report entitled: "Assessment Report on 2012 Soil, Silt and Rock Geochemical Sampling Program on the Hess Project, Anthill Resources Yukon Ltd." dated Jan 25, 2013 (the "Assessment Report").

c) I am a graduate of Lakehead University, Bachelor of Science Degree in Geology, 1984. I am a member in good standing of the Association of Professional Engineers and Geoscientists of British Columbia (APEGBC), Lic No. 25393. I have worked as a geologist for a total of 26 years since my graduation from Lakehead University.

d) I have not personally inspected the property although I designed and remotely supervised its activities.

e) I am responsible for all Sections of the Assessment Report.

f) I am independent of Anthill Resources Yukon Ltd as defined by Section 1.5 of the Instrument.

g) I have no prior involvement with the Property that is the subject of the Assessment Report.

h) I have read the Instrument and the Assessment Report. This is an Assessment Report, and is not meant to be filed with any Securities Commission. It is to be filed with the Yukon Mining Recorder, Ministry of Energy, Mines and Resources, Government of Yukon.

i) At the effective date of the technical report, to the best of my knowledge, information and belief, the Assessment Report contains all scientific and technical information that is required to be submitted to the Mining Recorder, and to make the assessment report not misleading.

Dated this 25th Day of January, 2013

---

Fire Assay - Trace Au, ICP-OES finish (202552) (50g charge)			
DATE SAMPLED: Jul 30, 2012	DATE RECEIVED: Jul 30, 2012	DATE REPORTED: Aug 24, 2012	SAMPLE TYPE: Soil
Analyte:	Sample Login Weight	Au	
Unit:	kg	ppm	
Sample Description	RDL:	0.01	0.001
07741		0.71	0.031
07742		0.61	0.008
07848		0.58	0.003
07849		0.73	0.007
07850		0.57	0.004
07851		0.68	0.007
07852		0.57	0.002
07853		0.60	0.043

Comments: RDL - Reported Detection Limit
