INTRODUCTION

The Wand property lies within a district of precious metal enriched, replacement style, volcanogenic massive sulphide and vein occurrences, such as ATAC Resources Ltd.'s Tiger and Conrad deposits, Xstrata's Craig deposit, Redtail Metals Corp.'s Marg deposit, Victoria Gold Corp.'s Dublin Gulch deposit and Alexco Resource Corp.'s Keno Hill deposits. The Wand property covers strong multi-element soil geochemical anomalies and is one of several claim blocks comprising Strategic Metals Ltd.'s wholly owned Midas Touch Project.

This report describes prospecting and geochemical sampling conducted between August 24 and August 29, 2013 by Archer, Cathro & Associates (1981) Limited on behalf of Strategic Metals. The author supervised the program and interpreted all results from this work, his Statement of Qualifications is in Appendix I. A Statement of Expenditures is located in Appendix II.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Wand property comprises 126 contiguous mineral claims, which are located in east-central Yukon at latitude 64°01' north and longitude 133°52' west on NTS map sheet 106C/04 (Figure 1). The property covers an area of approximately 2500 ha (25 km²). The claims are registered in the name of Archer Cathro, which holds them in trust for Strategic Metals. Details concerning the claims are listed below, and the locations of individual claims are shown on Figure 2.

<u>Claim Name</u>	<u>Grant Numbers</u>	<u>Expiry Date*</u>
Wand 1-126	YD109171-YD109296	March 27, 2018

*Expiry date does not include 2013 work which has not been filed for assessment credit.

The Wand property lies 110 km northeast of the town of Mayo, the nearest supply centre. The closest road access is at the community of Keno City, which is situated about 49 km by road northeast of Mayo and 70 km by air west of the property.

Access to and from the property in 2013 was provided by an AStar B3 helicopter operated by Horizon Helicopters from a temporary base at ATAC Resources' Nadaleen camp, which lies approximately 70 km east of the property.

HISTORY AND PREVIOUS WORK

In 1964, the Geological Survey of Canada (GSC) conducted a low-density stream sediment survey in the areas of Rackla River and Mayo Lake (McIntyre, 1966). The following spring, a number of operators staked claims in order to cover anomalous drainages, including Canadian Superior Exploration Ltd., Arivaca Explorations Ltd. and United Keno Hill Mines Ltd.

In 1974, Union Oil Company of Canada Ltd. collected 14 contour soil samples across the area of the current Wand property at 500 m spacings, as part of its Pelly Project, a reconnaissance exploration program targeting specific areas in Yukon (Cathro, 1975). One sample collected from the property area yielded 323 ppm copper, 50 ppm lead and 950 ppm zinc.

551000 mE

553000 mE

555000 mE

In 1976 and 1977, the Geological Survey of Canada (GSC) conducted a low-density stream sediment and water sampling survey from areas of eastern and central Yukon on NTS map sheet 106D and portions of 106C, 106E and 106F (Hornbrook et al., 1990). One sample taken from a creek draining the central part of the current Wand property returned 62 ppm for copper, 400 ppm for zinc, 27 ppm for cobalt and background values for gold, silver and lead.

In 2010, Strategic Metals staked the Wand property as part of its Midas Touch Project in order to cover the anomalous soil geochemistry reported by Union Oil in 1975. In 2011, Strategic Metals conducted a two-day exploration program involving soil and stream sediment geochemical sampling on the property. Results from the 2011 and 2013 programs are jointly described in the appropriate sections of this report.

GEOMORPHOLOGY

The Wand property is located on the southwestern flank of the Nadaleen Range and is drained by creeks that flow into to the Beaver and Nadaleen rivers, which are both part of the Yukon River watershed.

The property covers a series spurs and drainages along the north side of an east trending ridge. Elevations on the property range from 1090 to 1700 m above sea level (asl), and treeline is approximately 1500 m asl. Grass, moss, talus slopes and cliffs characterize alpine terrain, while sub-alpine areas are typically devoid of outcrop and vegetated with stunted black spruce, willow and alder. Valley bottoms are densely treed with mature spruce. There are a number of avalanche chutes with downed trees on the property. Creeks on the property have sufficient water for camp and drilling purposes throughout the summer and early fall.

The climate in the vicinity of the Wand property is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. Although summers are relatively mild, snowfall can occur in any month. The property is mostly snow free from early June to late September.

REGIONAL GEOLOGY

The Wand property is located at the southwestern corner of the Rackla Belt, which is an 18 by 120 km belt that is host to a range of mineralization types, including various styles of base metal and gold occurrences (Colpron et al, 2013).

The Rackla Belt spans the southern portion of the Nadaleen map sheet (106C) and southeastern corner of the Nash Creek (106D) map sheet. The GSC published 1:250,000 scale geological maps of the Nash Creek and Nadaleen map sheets in 1972 (Green) and 1974 (Blusson), respectively. In 1990, Indian and Northern Affairs Canada (predecessor to the Yukon Geological Survey) released a 1:50,000 scale geological map of NTS map sheet 106D/01 (Abbott, 1990).

In 2010, the Yukon Geological Survey (YGS) initiated a project to better understand the geology of the Rackla Belt as a result of the recent discoveries in the area. Work to date has included

1:50,000 scale mapping of the: 1) Mount Mervyn map area (106C/04) in 2010 (Chakungal and Bennett, 2011); 2) Mount Ferrell map area (106C/03) in 2011 (Colpron, 2012); and 3) Ortell Lake and Mount Stenbraten map areas (106C/02 and 01) in 2012 (Colpron et al, 2013). It also included integrating structures and stratigraphic units across map sheets 106C/01 to 106C/04 and 106D/01 (Colpron et al, 2013).

Geology of the Rackla Belt presented in the following paragraphs is primarily summarized from the YGS's recent work (Colpron et al, 2013).

The Rackla Belt straddles the boundary between deep water, dominantly clastic rocks of the Selwyn Basin to the south and shallower water shelf strata of the Mackenzie Platform to the north.

The Rackla Belt is divided into three main structural panels – Richardson fault array, Mackenzie fold belt and Selwyn fold belt (Figure 3). Both the north-trending Richardson fault array and the northern edge of the northwest-trending Selwyn fold belt have prolonged histories of Proterozoic and Paleozoic faulting (mainly extensional and strike-slip) that were reactivated during Mesozoic compression.

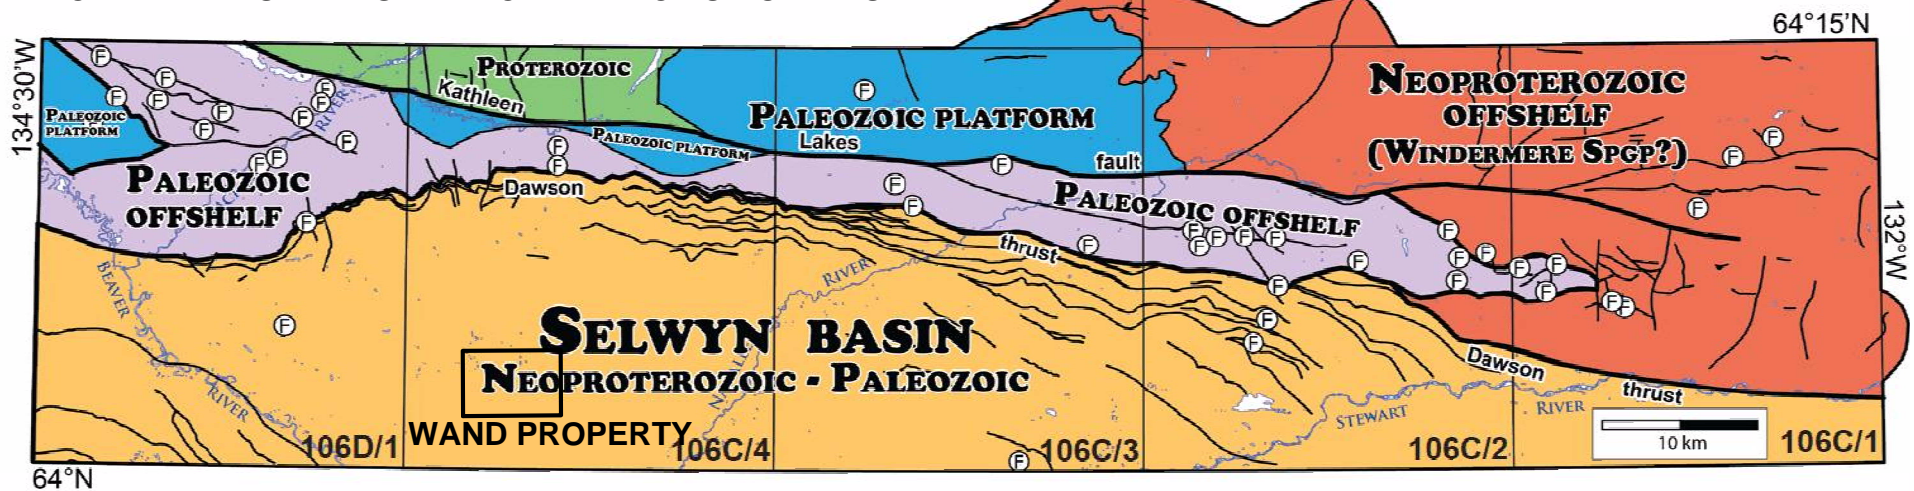

The three main structural panels are separated by the Dawson Thrust and Kathleen Lakes faults (Figure 3). The Dawson Thrust Fault is a crustal break that may date back to late Neoproterozoic rifting and was subsequently reactivated as a north-directed thrust fault during Paleozoic extension and Mesozoic compression. The direction of movement along Mesozoic thrust faults in the region is generally towards the north. The Kathleen Lakes Fault is an enigmatic structure with uncertain kinematics. It likely has a long history that may have begun as a normal fault in the Neoproterozoic and has since been reactivated, possibly accommodating strike-slip and normal movement.

Both extensional and apparent sinistral strike-slip faults cross-cut structures associated with compression represent some of the youngest deformation in the Rackla Belt. Some strike-slip reactivation may have occurred along both the Kathleen Lakes and Dawson Thrust faults; however, the amount of motion is probably very small and appears to die out to the east.

The Rackla Belt can be divided into five stratigraphic and facies domains that are generally bounded by the Dawson Thrust and Kathleen Lakes faults (Figure 3).

- 1) Neoproterozoic to Paleozoic Selwyn Basin: The southern part of the belt (hanging wall of the Dawson Thrust Fault) comprises Neoproterozoic to Upper Paleozoic predominantly off-shelf clastic sedimentary rocks of Selwyn Basin;
- 2) Paleozoic Off-shelf: To the north of the Selwyn Basin, Ordovician to Permian off-shelf carbonate and shale (including abundant debris flow and turbidite deposits) are bound by the Dawson Thrust and Kathleen Lakes faults;
- 3) Neoproterozoic Off-shelf (Windermere Supergroup?): In the northeastern part of the belt, rocks in the footwall of the Dawson Thrust Fault consist of fine-grained siliciclastic and carbonate rocks. Ediacaran fossils in this sequence suggest correlation with the upper part of the Neoproterozoic Windermere Supergroup;

RACKLA BELT REGIONAL GEOLOGY

WAND PROPERTY

- 4) Paleozoic Platform: Platformal carbonate rocks of Ordovician to Devonian age occur mainly north of the Kathleen Lakes Fault in the central part of the belt. A notable exception is a window of this package at the west end of the belt; and,
- 5) Proterozoic: Older Proterozoic rocks of the Wernecke Supergroup and Pinguicula Group occupy the region north of the Kathleen Lakes Fault in the northwestern part of the belt.

The transition between platformal and basinal facies varies around Selwyn Basin. Its eastern boundary exhibits a more typical facies transition that migrates through time. By contrast, the northern boundary of Selwyn Basin is strongly localized and was apparently controlled by the Dawson Thrust Fault. Figure 4 illustrates an idealized cross-section through Rackla Belt stratigraphy, along the northern boundary of Selwyn Basin. The lithological units that occur in the immediate vicinity of the Wand property are described in Table I.

Table I – Regional Lithological Units (after Colpron et al, 2013)

Map Suite	Age	Map Unit	Description
Galena Suite	Middle Triassic	TrG	Massive, dark grey weathering, medium grained hornblende gabbro sills and dykes (ca. 234-228 Ma).
Earn Group	Devonian to Mississippian	DME	Brown weathering, dark grey to black shale, chert and siltstone; minor limestone, chert-pebble conglomerate and sandstone; locally bedded barite and mafic volcanic rocks.

PROPERTY GEOLOGY

No detailed geological mapping has been done on the Wand property. The property geology described below is based on the mapping by Colpron et al (2013) and observations made by exploration geologists who have worked on the property at various times.

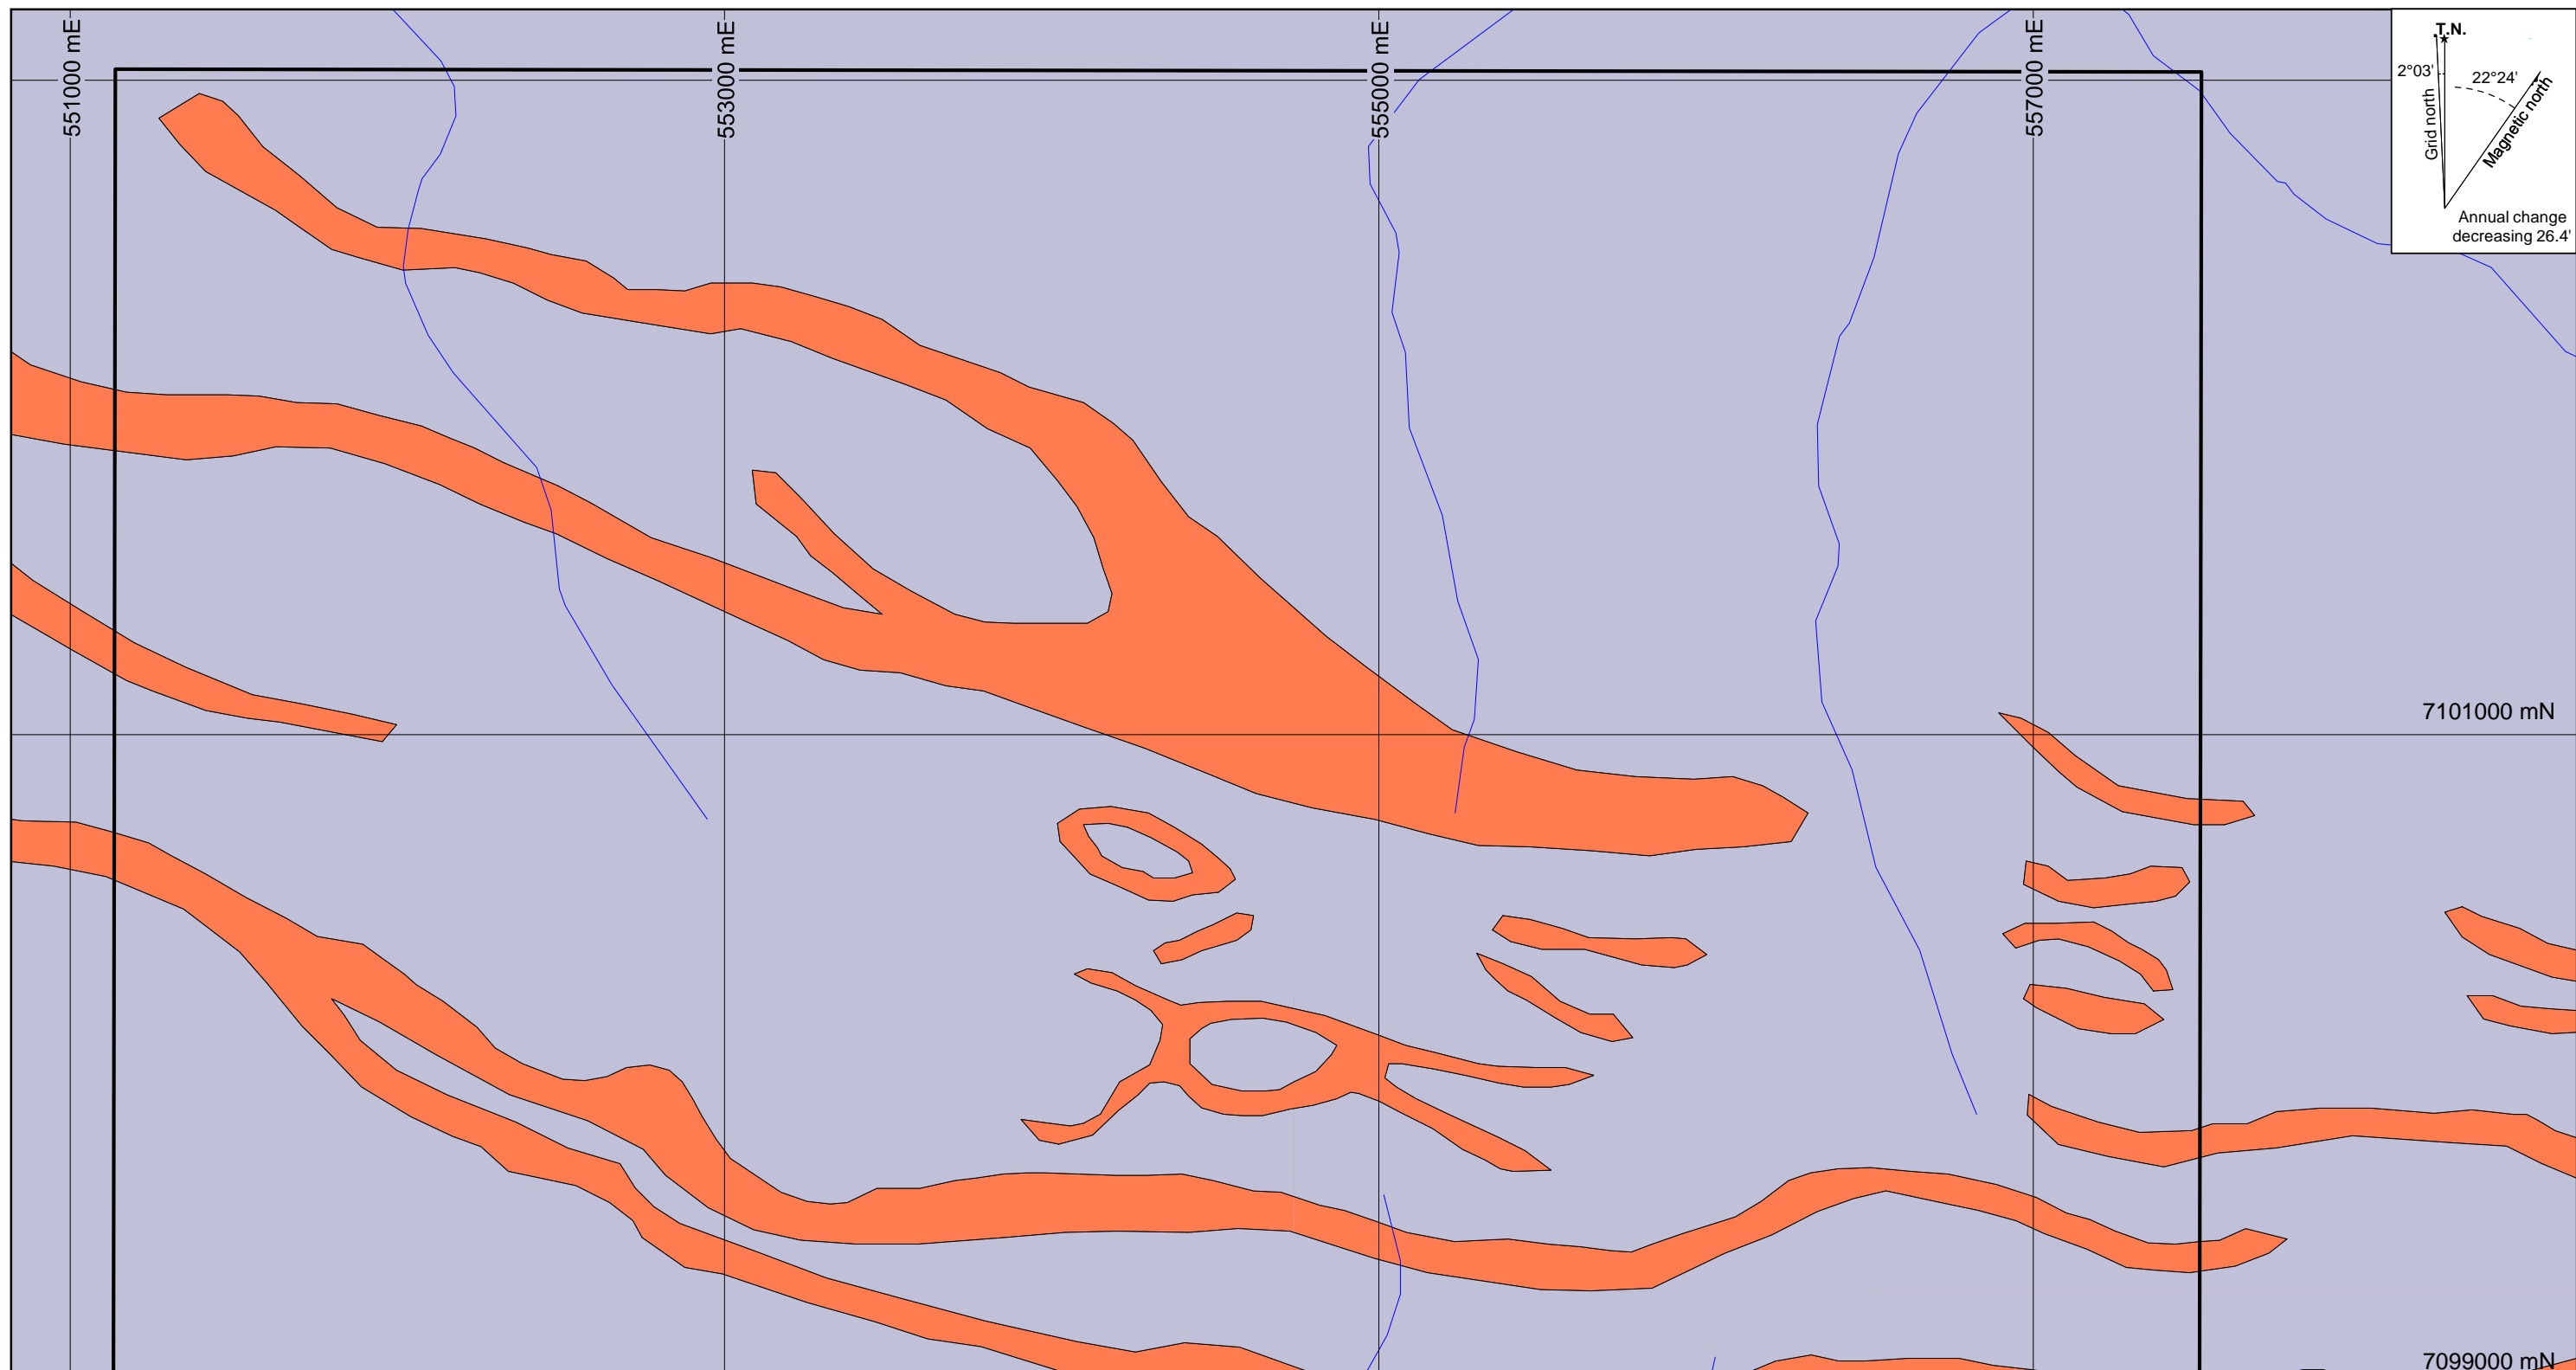

The property is underlain by Earn Group (DME) shale, chert, sandstone and siltstone, which are intruded by Galena Suite (TrG) mafic sills and dykes that have a prevalent northwest to southeast orientation (Figure 5). Surface expression of sills and dykes on the property suggests that the units have been folded. No bedding or structural measurements have been recorded and no faults are mapped locally.

MINERALIZATION

In 2013, Strategic collected 21 rock samples from the Wand property. The 2013 sample locations are plotted on Figure 6. Rock Sample Descriptions are provided in Appendix III and Certificates of Analysis are given in Appendix IV.

Rock geochemical sample sites on the property were marked with orange flagging tape labelled with the sample number. The location of each sample was determined using a handheld GPS

unit. Rock sample preparation and multi-element analyses were carried out at ALS Minerals laboratories in Whitehorse, Yukon Territory and North Vancouver, BC. Each sample was dried, fine crushed to better than 70% passing 2 mm and then a 250 g split was pulverized to better than 85% passing 75 microns. The fine fraction was then analyzed for 51 elements using an aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). An additional 30 g charge was further analysed for gold by fire assay with inductively coupled plasma-atomic emissions spectroscopy finish (Au-ICP21).

The 2013 rock samples were primarily Earn Group shale and Galena Suite mafic intrusive, containing trace to minor, fine grained sulphides. The best rock sample consisted of powdery turquoise coated (malachite?) silica-flooded gabbro, which yielded elevated values for copper (849 ppm), lead (2130 ppm), zinc (3170 ppm) and silver (7.58 ppm), but background values for all other elements of interest.

SOIL GEOCHEMISTRY

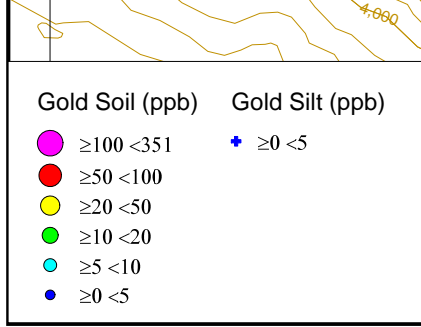

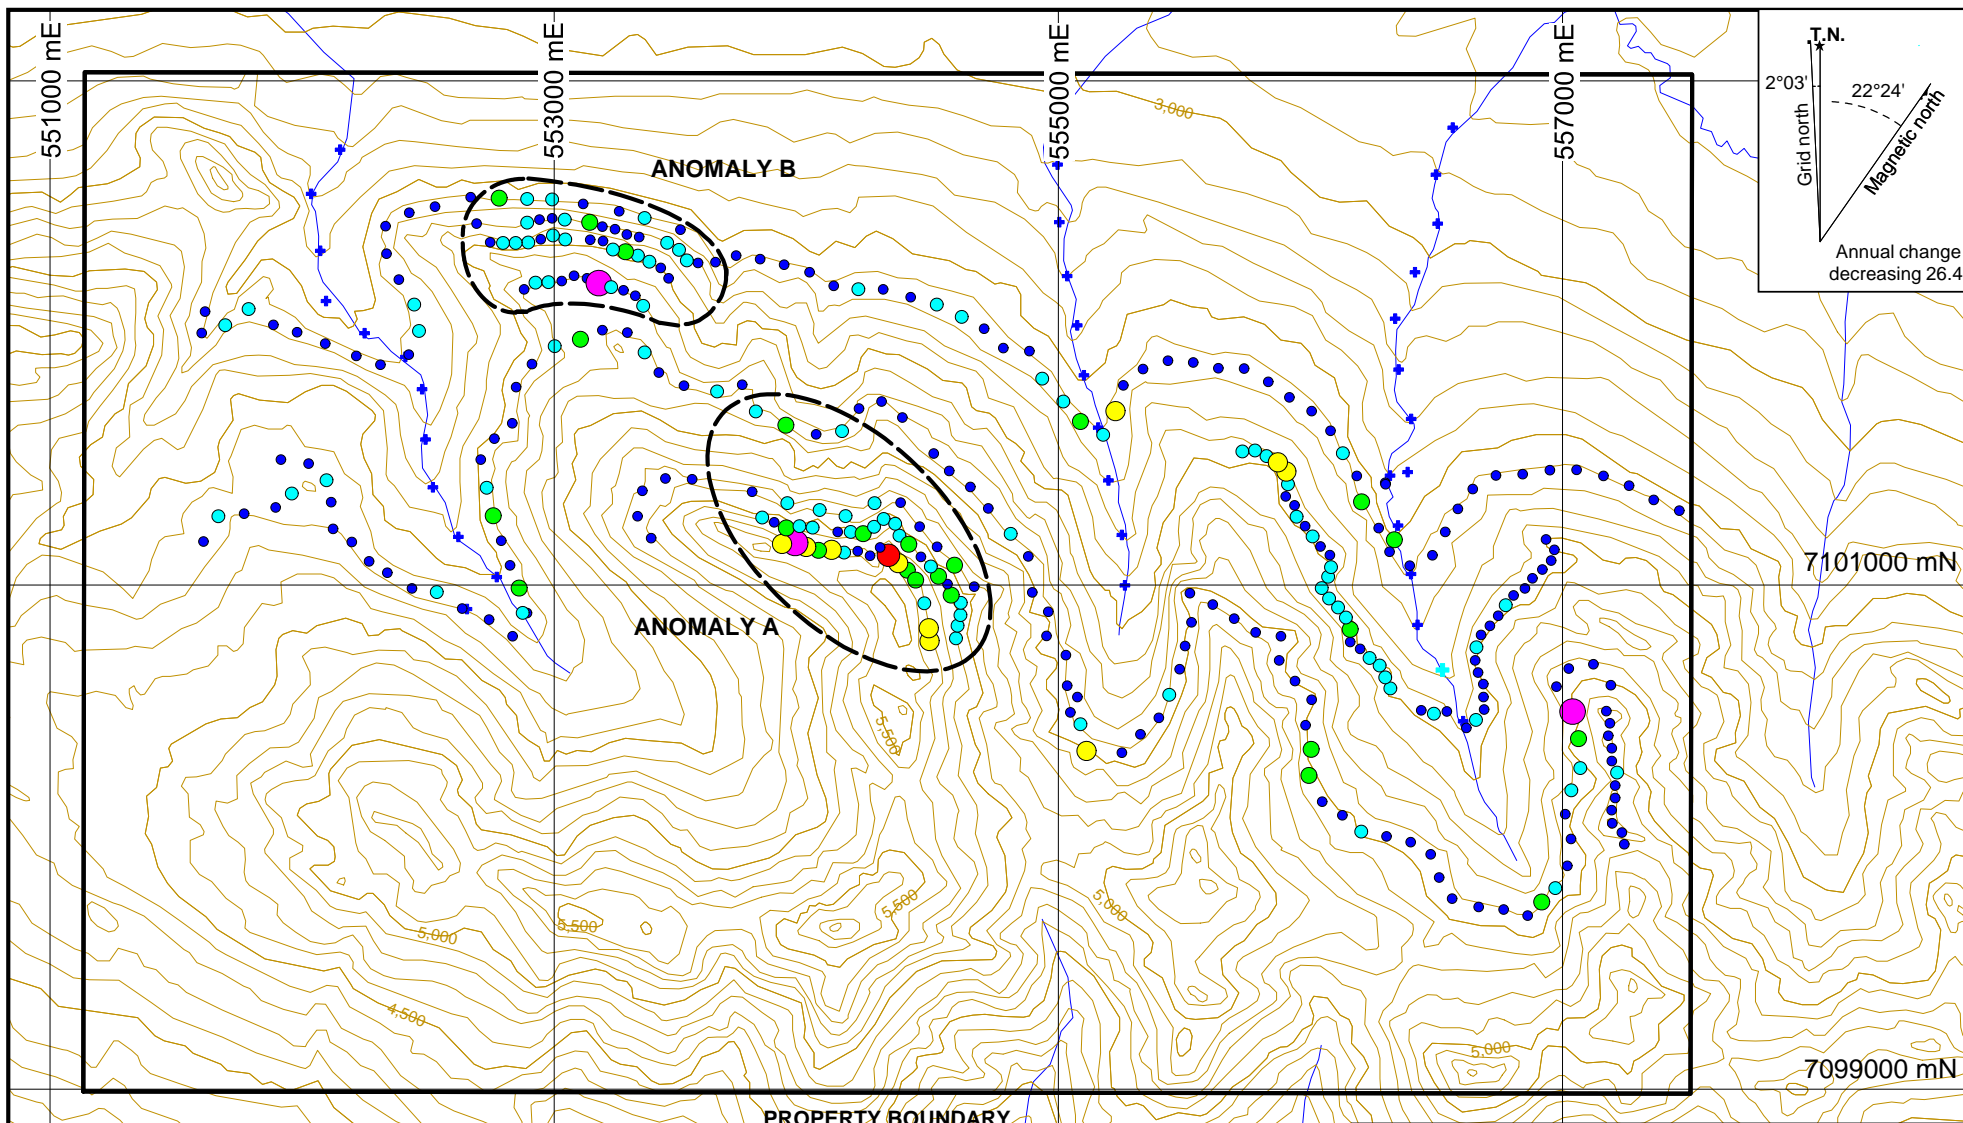

In 2011, Strategic Metals collected a total of 35 silt and 194 contour soils samples on the Wand property. This work identified two areas of anomalous multi-element geochemistry, Anomalies A and B.

In 2013, Strategic Metals collected 139 contour soil samples to better define the tenor and extent of Anomalies A and B. The 2011 and 2013 sample locations are plotted on Figure 7, while results for gold, copper, arsenic, silver, cobalt, lead and zinc are illustrated thematically on Figures 8 to 14, respectively.

All 2013 soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Soil samples were collected from 5 to 80 cm deep holes dug by mattock or hand-held auger. They were placed into individually pre-numbered Kraft paper bags. The soil samples were sent to the ALS Minerals laboratory in Whitehorse, where they were dried and screened to -180 microns. The samples were then shipped to the ALS Minerals laboratory in North Vancouver for analysis for 51 elements using aqua regia digestion followed by inductively coupled plasma and atomic emission spectroscopy technique (ME-MS41). An additional 30 g charge was further analysed for gold by fire assay with inductively coupled plasma-atomic emissions spectroscopy finish (Au-ICP21). Certificates of Analysis are given in Appendix IV, while anomalous thresholds values for the elements of interest are listed in Table II.

Table II - Threshold Values for Soil Samples

Element	Anomalous Thresholds				
	Weak	Moderate	Strong	Very Strong	Peak

Lead (ppm)	≥ 20 < 50	≥ 50 < 100	≥ 100 < 500		154
Zinc (ppm)	≥ 200 < 500	≥ 500 < 1000	≥ 1000 < 2000	≥ 2000	4,820
Cobalt (ppm)	≥ 10 < 20	≥ 20 < 50	≥ 50 < 100	≥ 100	185

Anomaly A is an area of very strongly elevated copper, arsenic, zinc and cobalt geochemistry with strong silver and lead support. This area yielded the properties strongest soil geochemical response for copper, arsenic, silver, lead, and zinc. The anomaly is located along a steep north facing slope with good talus and bedrock exposure. It covers an area of approximately 1000 by 390 m.

Anomaly B includes the single highest gold-in-soil value on the property and features strong to very strong response for copper with moderate cobalt support. Geochemical response for silver, lead, zinc and arsenic is weak. The anomaly is located below tree line and has limited rock exposure. It covers an area of approximately 980 by 410 m.

In addition to the two main geochemical anomalies there are many sample sites that produced strongly elevated values for one or more metal. The best silt results are from two drainages in the eastern part of the property, which have received only cursory soil sampling. None of the geochemically anomalous areas have been systematically prospected.

TYPE DEPOSIT

The geological setting and geochemical response of the Wand property closely resemble those at the volcanogenic massive sulphide Marg deposit, located 30 km west of the Wand claims. The Marg deposit has a long history of exploration by a number of operators, attesting to the difficulty of its discovery and the importance of perseverance.

The deposit is hosted within Earn Group metasedimentary and metavolcanic rocks that have recorded multiple episodes of strain and deformation. Felsic metavolcanic rocks are the primary host of the massive sulphide mineralization and occur in repeated sequences of quartzite, quartz-sericite phyllite and black graphitic phyllite. Ages obtained from the fission-track dating of zircons in the mineralized sequence yield a poorly constrained age date of Middle to Late Devonian (Carne and Giroux, 2007).

Mineralization in the Marg deposit occurs as a series of discontinuous stacked sheets that have been structurally dismembered from one or more originally deposited layers. The mineralized horizons are individually up to 23 m thick, averaging 3 m to 4 m. They and the enclosing metavolcanic rocks are recessive and not exposed at surface. Mineralogy consists of fine grained pyrite with interstitial sphalerite, chalcopyrite, galena and minor tetrahedrite with rare arsenopyrite in a gangue of quartz, ferroan carbonate, muscovite and rare barite. Magnetite is notably absent (Carne and Giroux, 2007).

The Marg area was first staked in 1965 by Canadian Superior Exploration Ltd. to cover a 1964 GSC stream sediment anomaly of 300 ppm lead, 2400 ppm zinc and 240 ppm copper (Cathro

and Main, 1982). Intermittent exploration between 1967 and 1984 revealed strong multi-element geochemical anomalies locally but failed to uncover in-situ mineralization.

The main portion of the deposit was discovered in 1988 by drilling beneath a 120 m wide gold and arsenic anomaly, with arsenic-in-soil response of up to 300 ppm and gold-in-soil response of up to 143 ppb. There is no anomalous copper and zinc response in the soil directly above the deposit. Hydromorphically dispersed lead anomalies occur a considerable distance downhill from the deposit, and a much stronger multi-element anomaly is present about 1200 m to the west where a relatively narrow sulphide zone is blanketed by thin overburden. The surface geochemistry on the Marg deposit is muted, because the mineralization is deeply weathered and is capped by a thick layer of glacial drift (Cathro, 1988).

In 2011 Redtail Metals Corp. negotiated a deal to acquire a 100% undivided interest in the Marg property, which was completed in 2012. Redtail recalculated the resource in 2011 and announced an indicated resource of 3.96 Mt of 1.57% copper, 1.92% lead, 3.90% zinc, 49.40 g/t silver and 0.79 g/t gold, and an inferred resource of 7.78 Mt of 1.12% copper, 1.36% lead, 2.89% zinc, 34.88 g/t silver and 0.52 g/t gold (Burgoyne and Giroux, 2011).

DISCUSSION AND CONCLUSIONS

The Wand property lies within the Rackla Belt, a district containing a number of advanced exploration prospects.

Strategic Metals' 2013 exploration program successfully followed up two areas of anomalous multi-element geochemistry that were detected in 2011 (Anomaly A and B). The 2013 soil sampling expanded the two zones and identified higher gold, silver, arsenic, lead and zinc values than were obtained from previous geochemical sampling. Limited prospecting has not adequately explained the elevated metal response in soil.

Future work on the property is definitely warranted, and should include: 1) geological mapping of the entire property; 2) systematic prospecting within the anomalous zones and hand trenching where mineralized float is discovered; 3) grid soil sampling to better define the tenor and extent of the two main anomalous zones; and 4) continued reconnaissance prospecting and contour soil sampling in other parts of the property where geochemical data is sparse or non-existent.

Respectfully submitted,

APPENDIX I
STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Jack Morton, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Vancouver, British Columbia, hereby certify that:

1. I graduated from Simon Fraser University in 2013 with a B.Sc. in Earth Science.
2. From 2007 to present, I have been actively engaged in mineral exploration in Yukon Territory, British Columbia, and Northwest Territories
3. I am a Geoscientist in Training (G.I.T.) with the Association of Professional Engineers and Geoscientists of British Columbia.
4. I supervised the field program and have interpreted all data resulting from this work.

A handwritten signature in blue ink, appearing to read 'J. Morton', with a long horizontal line extending to the right.

APPENDIX III
ROCK SAMPLE DESCRIPTIONS

Sample Tag: M896140

UTM: Easting: 553318 Northing: 7101635

Description: Float grab of weathering buff and with a rusty tarnish, marginal gabbro-quartz vein material.

Sample Tag: M896141

UTM: Easting: 553118 Northing: 7101895

Description: Float grab of weathering brown and with a rusty tarnish, fresh light grey-green, shale, full of disseminated sulphides (arsenopyrite, pyrite?)

Sample Tag: M896142

UTM: Easting: 553118 Northing: 7101895

Description: Float grab of rock with the same lithology as sample M896140, but with trace amounts of very fine grained pyrite disseminated throughout.

Sample Tag: M896143

UTM: Easting: 552942 Northing: 7102250

Description: Subcrop grab of weathering orange-buff and with a rusty tarnish, fresh light green-grey, bleached/silicified shale, with disseminated medium to coarse grained pyrite and trace fine grained chalcocite throughout.

Sample Tag: M896144

UTM: Easting: 552897 Northing: 7102318

Description: Float grab of weathering brown and with a rusty tarnish, fresh medium green, medium grained gabbro with disseminated very fine to fine grained arsenopyrite throughout.

Sample Tag: M896145

UTM: Easting: 552898 Northing: 7102536

Description: Float grab of weathering brown and with a rusty tarnish, marginal gabbro-quartz vein material with fine grained masses of sulphides (arsenopyrite, chalcopyrite) throughout. Collected at soil sampled CC102904.

Sample Tag: M896146

UTM: Easting: 553263 Northing: 7102485

Description: Subcrop grab of weathering brown to buff and with a rusty tarnish, fresh light green-grey siltstone. Removed from a shallow pit at soil sample CC102907.

Sample Tag: M896147

UTM: Easting: 553259 Northing: 7102480

Description: Float grab of rock with the same lithology as sample M896145, but more tarnished/weathered.

Sample Tag: M896148

UTM: Easting: 554223 Northing: 7101222

Description: Outcrop grab of weathering orange-brown, limonitic, and with a rusty tarnish, brecciated light green-grey shale.

Sample Tag: M896149

UTM: Easting: 553907 Northing: 7101276

Description: Composite float grab of rock with the same lithology as sample M896145.

Sample Tag: M896150

UTM: Easting: 553780 Northing: 710373

Description: Composite float grab of rock with the same lithology as sample M896145. Removed from a shallow pit at soil sample ZZ16221.

Sample Tag: M896151

UTM: Easting: 554081 Northing: 7101306

Description: Float grab of weathering dark brown-green, brecciated quartz-carbonate-gabbro with no visible mineralization.

Sample Tag: M896152

UTM: Easting: 554496 Northing: 7101099

Description: Composite float grab of rock with the same lithology as sample M896145, with powdery turquoise-blue mineralization on fracture surfaces (chrysocolla?)

Sample Tag: M896153

UTM: Easting: 557178 Northing: 7100472

Description: Subcrop grab of weathering punky and orange-brown, fresh pale white-green, silicified gabbro with no visible mineralization.

Sample Tag: M896154

UTM: Easting: 557040 Northing: 7100493

Description: Composite subcrop grab of dark grey-black shale with a rusty tarnish. Removed from a 4 ft. pit at soil sample DD00004.

Sample Tag: M896155

UTM: Easting: 556334 Northing: 7101168

Description: Float grab of powdery grey shale.

Sample Tag: M896156

UTM: Easting: 556337 Northing: 7101167

Description: Composite float grab of brown and rusty weathering gabbro. Removed from a shallow pit.

Sample Tag: M896157

UTM: Easting: 556128 Northing: 7101521

Description: Composite float grab of rock with the same lithology as sample M896140.

Sample Tag: M896158

UTM: Easting: 554342 Northing: 7101079

Description: Outcrop grab of rock with the same lithology as sample M896145.

Sample Tag: M896159

UTM: Easting: 554001 Northing: 7101148

Description: Outcrop grab of weathering orange-brown, punky and limonitic, quartz-carbonate-gabbro breccia with no visible mineralization.

Sample Tag: M896160

UTM: Easting: 554550 Northing: 7101054

Description: Float grab of weathering brown and with a rusty tarnish, fresh medium green, coarse grained gabbro with disseminated very fine to fine grained arsenopyrite and pyrrhotite throughout.
