INTRODUCTION

The CG property is located along the boundary between the Cache Creek and Stikinia Terranes, in southern Yukon. The property covers high-grade gold prospects defined by rock and soil samples. The property is wholly owned by Strategic Metals Ltd.

This report describes geochemical sampling and prospecting performed on August 22, 2016 by Archer, Cathro & Associates (1981) Limited on behalf of Strategic Metals Ltd. The author interpreted results from current and previous work completed on the property, and his Statement of Qualifications is in Appendix I. A Statement of Expenditures appears in Appendix II.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The CG property is located in southern Yukon, at latitude 60°39' north and longitude 134°18' west on NTS map sheet 105D/09 (Figure 1). It comprises 33 contiguous quartz claims that cover an area of approximately 690 hectares (6.9 km²). The claims are registered with the Whitehorse Mining Recorder in the name of Archer Cathro, which holds them in trust for Strategic Metals. Specifics concerning claim registration are given below, while the locations of individual claims are illustrated on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
CG 1-33	YF41861 – YF41893	July 25, 2017

* Expiry dates do not include 2016 work which has not yet been filed for assessment credit.

The CG claims surround two claims owned by an independent prospector, Ron Berdahl.

In 2016, access to the property was provided by a Bell 206B Jet Ranger operated by Capital Helicopters Inc. from its base at the Whitehorse airport. The CG property is situated 40 km east-southeast of Whitehorse, the largest city in Yukon and closest supply centre. The Alaska Highway is located 11 km south of the property.

The CG property lies within the traditional territories of the Kwanlin Dun and Ta'an Kwäch'än First Nations, which have both concluded land claim agreements with Canada and Yukon. Class A lands belonging to the Kwanlin Dun First Nations surround the property to the north, south and west. The closest boundary lies 850 m to the west.

HISTORY AND PREVIOUS WORK

In 1985, the Geological Survey of Canada (GSC) conducted a regional stream sediment and water geochemical reconnaissance survey over NTS map sheet 105D. Three creeks draining the CG claims were sampled and returned anomalous gold values of 60 ppb, 29 ppb and 22 ppb (GSC, 1985).

- Major roads and highways
- Community
- Parks and protected areas

In 1993, prospector Brian Carter staked the historical CG and Carter Gulch claims. Prospecting on those claims identified fractured and re-healed rusty quartz, samples of which returned up to 46,404 ppb gold, 307 ppm silver, 799 ppm copper and 11,716 ppm lead (Carter, 1995).

In 1994, Carter did more prospecting and collected a total of 66 rock samples around a ridgetop on his claims. Visible gold was found in quartz veined shear zones and angular quartz float. The best results were 141,900 ppb gold, 12,770 ppm lead, 10,684 ppm copper, 1,779 ppm arsenic and 25.5 ppm silver from the Carter Gulch (CG) showing (Carter, 1995).

In 2003, independent prospector Ron Berdahl conducted a reconnaissance program in the area. Rock, soil and silt samples were collected around the CG showing and from nearby creeks. Rock sampling yielded up to 562 ppb gold, while silt and soil samples returned up to 33 ppb gold. (Berdahl, 2004).

In 2004, another prospecting and soil geochemical program was conducted by Berdahl. Prospecting discovered a new visible gold showing (Peppy showing) 1,500 m east-southeast of the CG showing. Rock samples from the Peppy showing yielding up to 24,997 ppb gold and greater than 10,000 ppm lead. Soil sampling returned up to 136 ppb gold (Berdahl, 2005).

In 2005, Berdahl completed more prospecting and soil sampling on historical claims, most of which subsequently lapsed and were restaked as the current CG property. Soil sampling was hindered by permafrost, but still returned anomalous values up to 296 ppb gold around the CG and Peppy showings (Berdahl, 2006). Elevated values were also returned for lead and arsenic but they did not correlate with gold anomalies.

In 2009, soil geochemical and geophysical surveys were completed by Berdahl around the CG and Peppy showings. Soil sampling focussed on the two showings, returning peak values of 251 ppb and 24.9 ppb gold at the CG and Peppy showings, respectively. Very-Low-Frequency electromagnetic (VLF) and proton magnetometer surveys were completed over both showings. VLF data was never compiled. Interpretation of data from the magnetometer surveys appear in the Geophysics section of this report, while figures and additional information can be found in Berdahl, 2009.

All of Berdahl's claims, except for two Kiyoko claims, which cover the CG showing, were allowed to lapse without further work.

In July of 2016, Strategic Metals staked the current CG claims around the Kiyoko claims.

GEOMORPHOLOGY AND CLIMATE

The CG property is situated on the Yukon Plateau of southern Yukon. Tributaries of the M'Clintock River and Michie Creek drain the property. Michie Creek and M'Clintock River are tributaries of the Teslin River, part of the Yukon River watershed.

The property lies 15 km northeast of Marsh Lake along an unnamed ridge system. Local topography features broad ridges that are topped with multiple knolls and incised by headwater

creeks. Elevations on the property range from approximately 1,005 to 1,554 m above sea level (asl). Outcrop is restricted to knolls, ridgetops and steep slopes.

Treeline lies at approximately 1,250 m asl on the property. Vegetation consists of stunted spruce and aspen trees at lower elevations, giving way to buckbrush, grasses and moss above treeline. The property was glaciated during the Late Pleistocene, with ice sheets in the area migrating to the northwest through large valleys (Duk-Rodkin, 1999).

The climate is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. The property is mostly snow free from late May to late September.

REGIONAL GEOLOGY

The CG property straddles a thrust fault separating the Stikinia Terrane (STT) to the southwest from the Cache Creek Terrane (CCT) to the northeast, as shown on Figure 3. The CCT comprises a variety of Carboniferous to Lower Jurassic metavolcanic, metasedimentary and metaplutonic rocks, developed from accretionary fore-arc environments (Bickerton, 2014; Bickerton et al., 2013). The STT represents a Paleozoic to Mesozoic island arc composed of metavolcanic, metasedimentary and metaplutonic rocks. The CTT is an exotic fore-arc package that was enclosed by the impingement of STT and Quesnellia island arc terranes during accretion.

A sedimentary basin, known as the Whitehorse Trough, overlaps the CCT and STT. This trough is composed of fore-arc basin metasediments (Mihalynuk, 2004).

In 2003, Gordey and Makepeace completed a Yukon-wide geological compilation that updated lithological unit names in the area. The Yukon Geological Survey (YGS) maintains a website illustrating regional geology, which is periodically updated when new information becomes available (YGS, 2016). The main lithological units are described below in Table I, while regional geology is shown on Figure 4.

Table I – Lithological Units (*Gordey and Makepeace, 2003*)

Unit Name	Age	Map Name	Description
Rhyolite Creek	Lower Paleogene	PRC1	Felsic volcanic rocks (light grey, green, maroon, purple and black rhyolite and dacite; locally flow banded; commonly a breccia with clasts of rhyolite within a crystal-rich matrix; may include intrusive equivalents.
Whitehorse Suite	Early Cretaceous	mKgW	Grey, medium to coarse-grained, generally equigranular granitic rocks of intermediate composition (biotite-hornblende granodiorite, hornblende quartz diorite and hornblende diorite; leucocratic, biotite hornblende granodiorite

TECTONIC SETTING

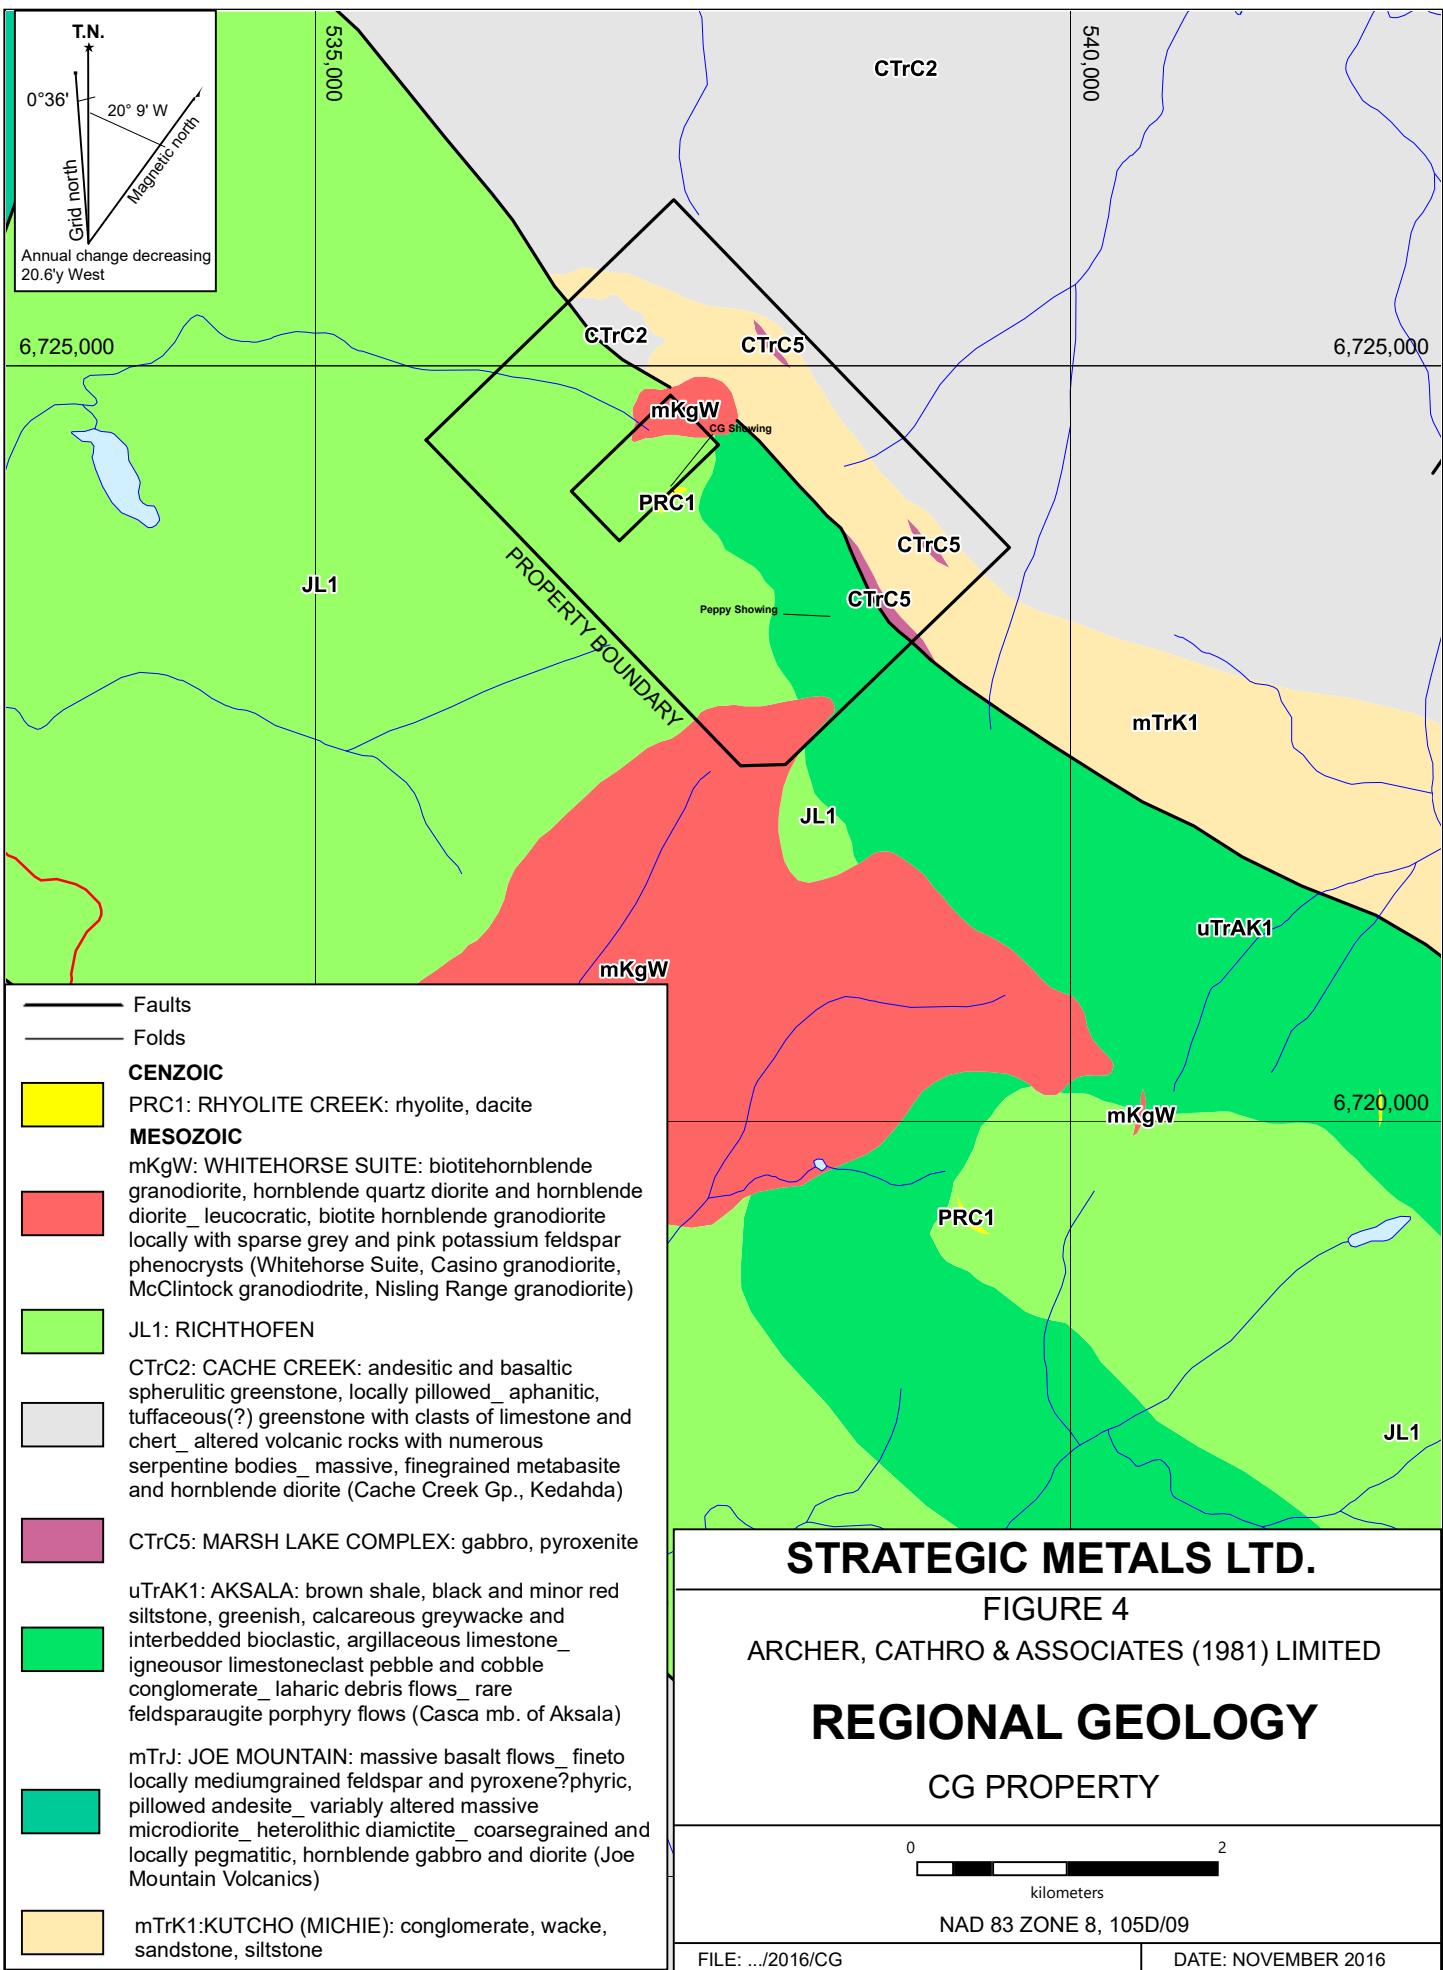

CG PROPERTY

FILE: P:/2016/CG

DATE: NOVEMBER 2016

After Colpron, M. and Nelson, J.L., 2011

			locally with sparse grey and pink potassium feldspar phenocrysts (Whitehorse Suite, Casino granodiorite, McClintock granodiorite)
Laberge	Lower to Middle Jurassic	JL1	Predominantly turbiditic sandstone-siltstone-mudstone (well-bedded, turbiditic sandstone-siltstone-mudstone; dark weathering, massive to finely laminated mudstone and limy mudstone; thick-bedded to massive lenses of polymictic cobble to boulder conglomerate; lithic sandstone; minor limestone (Richthofen formation)
Kutcho	Middle Triassic	mTrK(1)	Dark grey, fine-grained siltstone; buff, coarse-grained calc-lithic sandstone; green-grey wacke to pebble polymictic orthoconglomerate; fine-grained siltstone locally interbedded with thin, argillaceous limestone beds; carbonate-rich debris flows and rare olistoliths(?) (Michie formation)
Cache Creek	Carboniferous to Triassic	CTrC2	Oceanic assemblage of volcanic rocks (andesitic and basaltic spherulitic greenstone, locally pillow; aphanitic, tuffaceous (?) greenstone with clasts of limestone and chert; altered volcanic rocks with numerous serpentine bodies; massive, fine-grained metabasite and hornblende diorite (Cache Creek Group)
		CTrC5	Light green to grey-green, medium to coarse-grained to porphyritic gabbronorite; medium-grained clinopyroxenite; fine to medium-grained diorite; olivine-phyric diabase (Marsh Lake complex)
Aksala	Middle Triassic	uTrAKc	Mixed clastic-carbonate assemblage divisible into three dominant facies including calcareous greywacke (brown shale, black and minor red siltstone, greenish, calcareous greywacke and interbedded bioclastic, argillaceous limestone-clast pebble and cobble conglomerate; lahar debris flows; rare feldspar-augite porphyry flows (Aksala formation)
Joe Mountain	Middle Triassic	mTrJ1	Basalt (massive basalt flows; fine to locally medium-grained feldspar and pyroxene?-phyric, pillow andesite; variably altered massive microdiorite; heterolithic diamictite (Joe Mountain formation)

Regional-scale mapping shows the CG property covers four stratigraphic units and two intrusive units. South of the major northwesterly trending thrust fault, dominantly clastic sediments of the Richthofen Formation overlie carbonates and greywackes of the Aksala Formation. Northeast of the thrust fault, Cache Creek Group volcanics cap Kutcho Group sediments.

Northwesterly elongated lenses of Marsh Lake Complex gabbronorite, diorite and diabase are found along the thrust fault and within the Kutcho Group sediments. A plug of Whitehorse Suite granodiorite is emplaced along the thrust fault, while a large Whitehorse Suite pluton intrudes the Richthofen and Aksala formations south of the thrust.

PROPERTY GEOLOGY

From 1994 to 2009, geological mapping was conducted by prospectors across parts of the current property. The following descriptions are based on observations made by those prospectors.

The most common rock units reported are andesite and argillite forming outcrops along the main ridgeline. At the CG showing, siltstone, shale and agglomerate are found sporadically across the ridgeline, near the quartz vein exposure and mineralized float. Northwesterly trending, moderately dipping shear zones cross the ridgeline and extend down its northern slope. At the Peppy showing argillite occurs with quartz veins and float.

MINERALIZATION

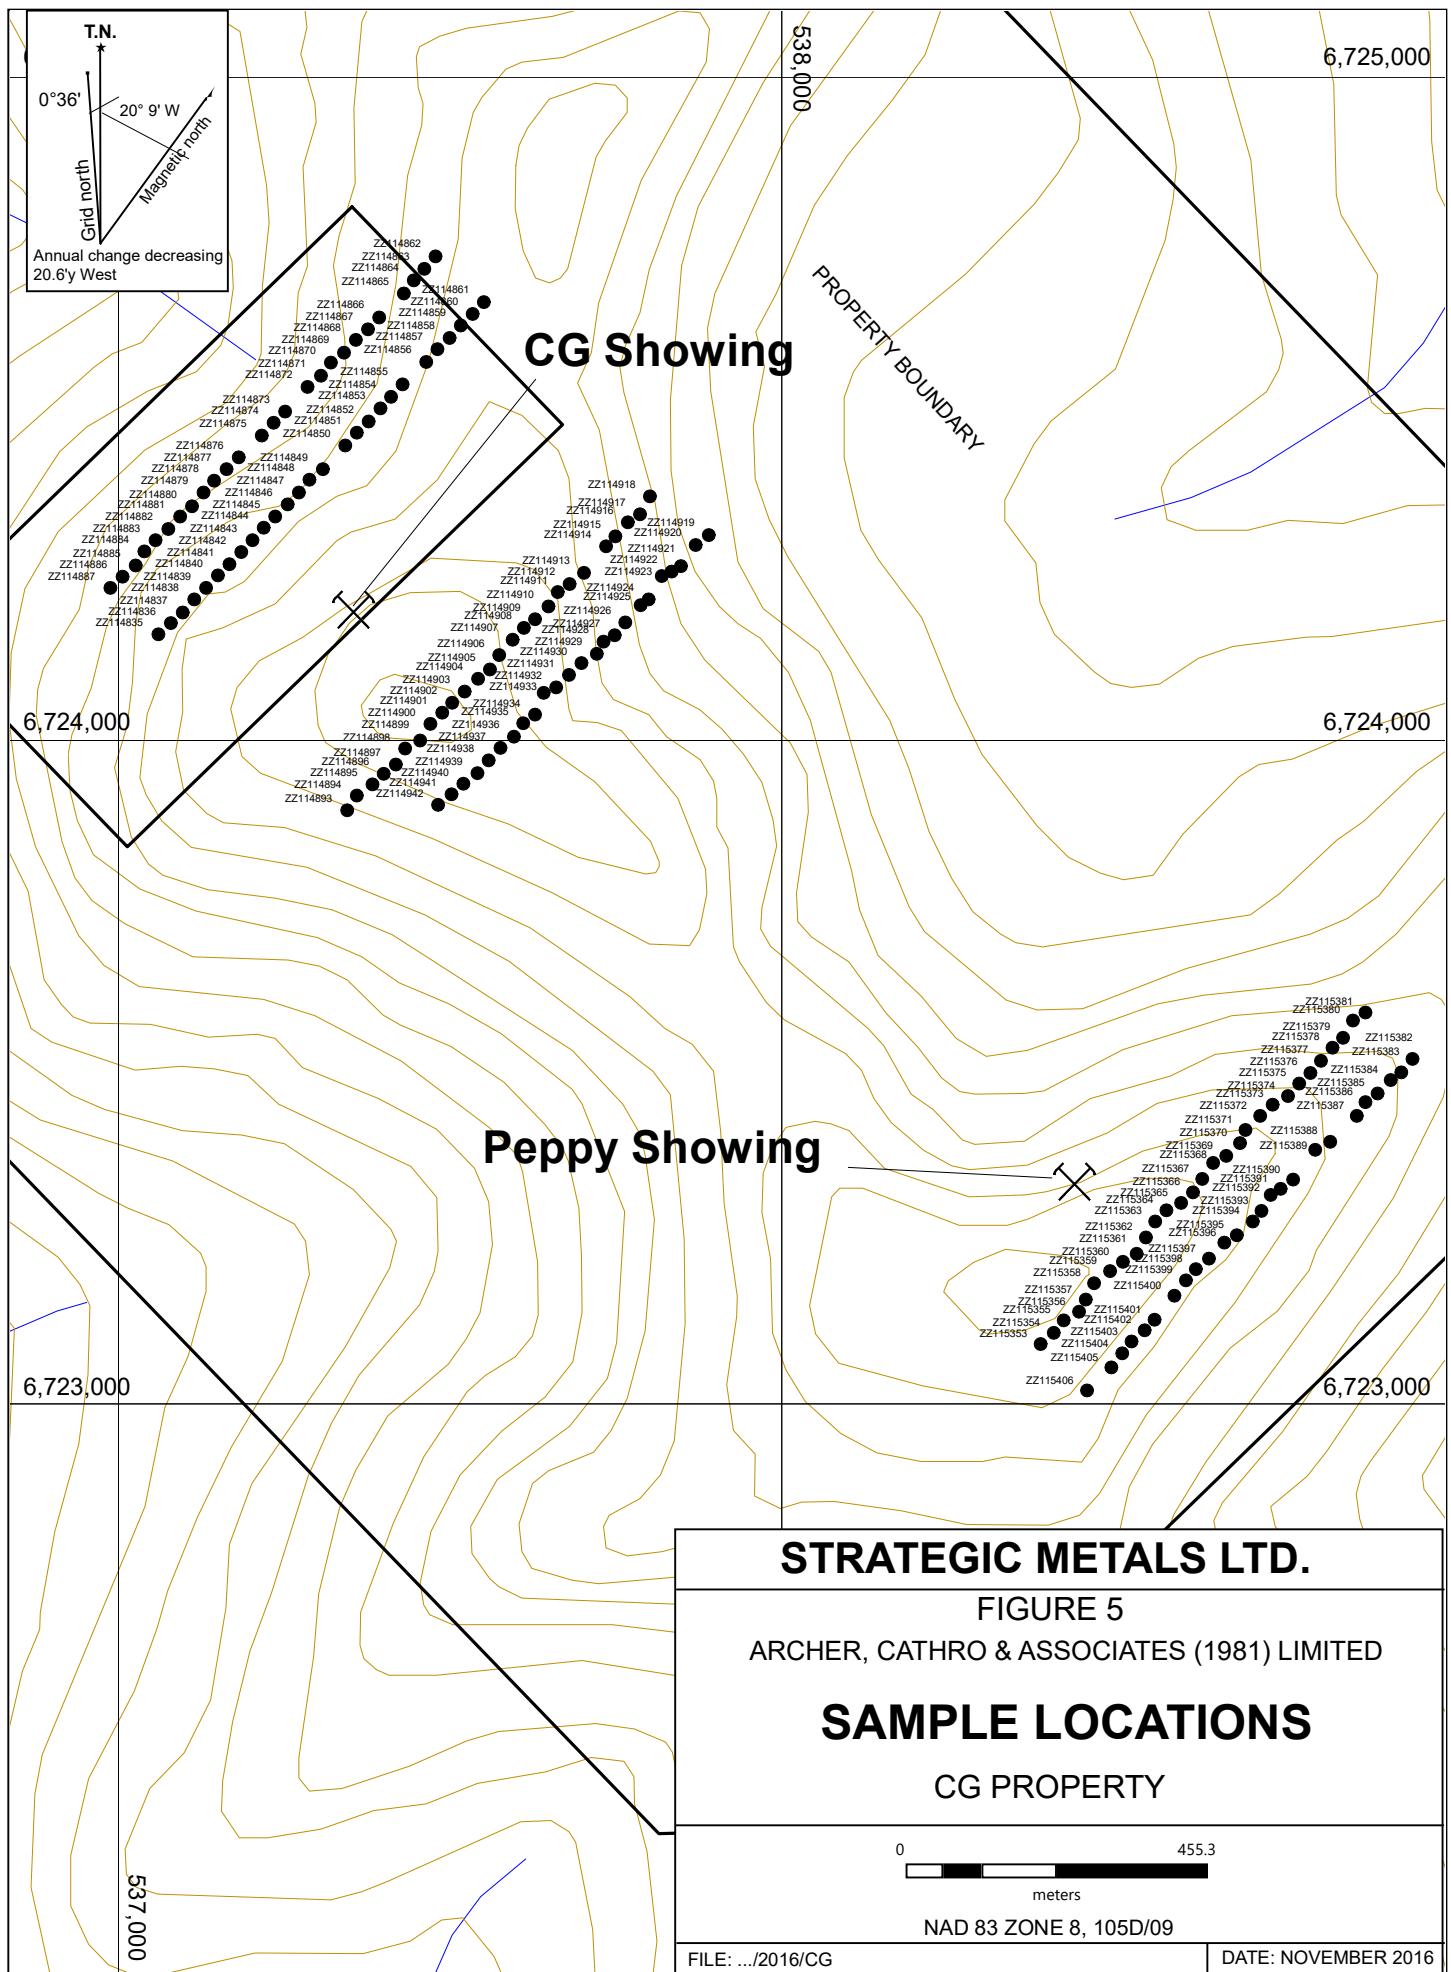

Mineralization on the property is hosted in quartz veins and shear zones within sedimentary and volcanic rock belonging to the Richthofen and Aksala formations. The mineralized quartz is white, grey or occasionally smoky and displays surficial oxidation with minor sulphides. Visible gold occurs in pits and vuggy cavities within quartz veins and float at the CG and Peppy showings.

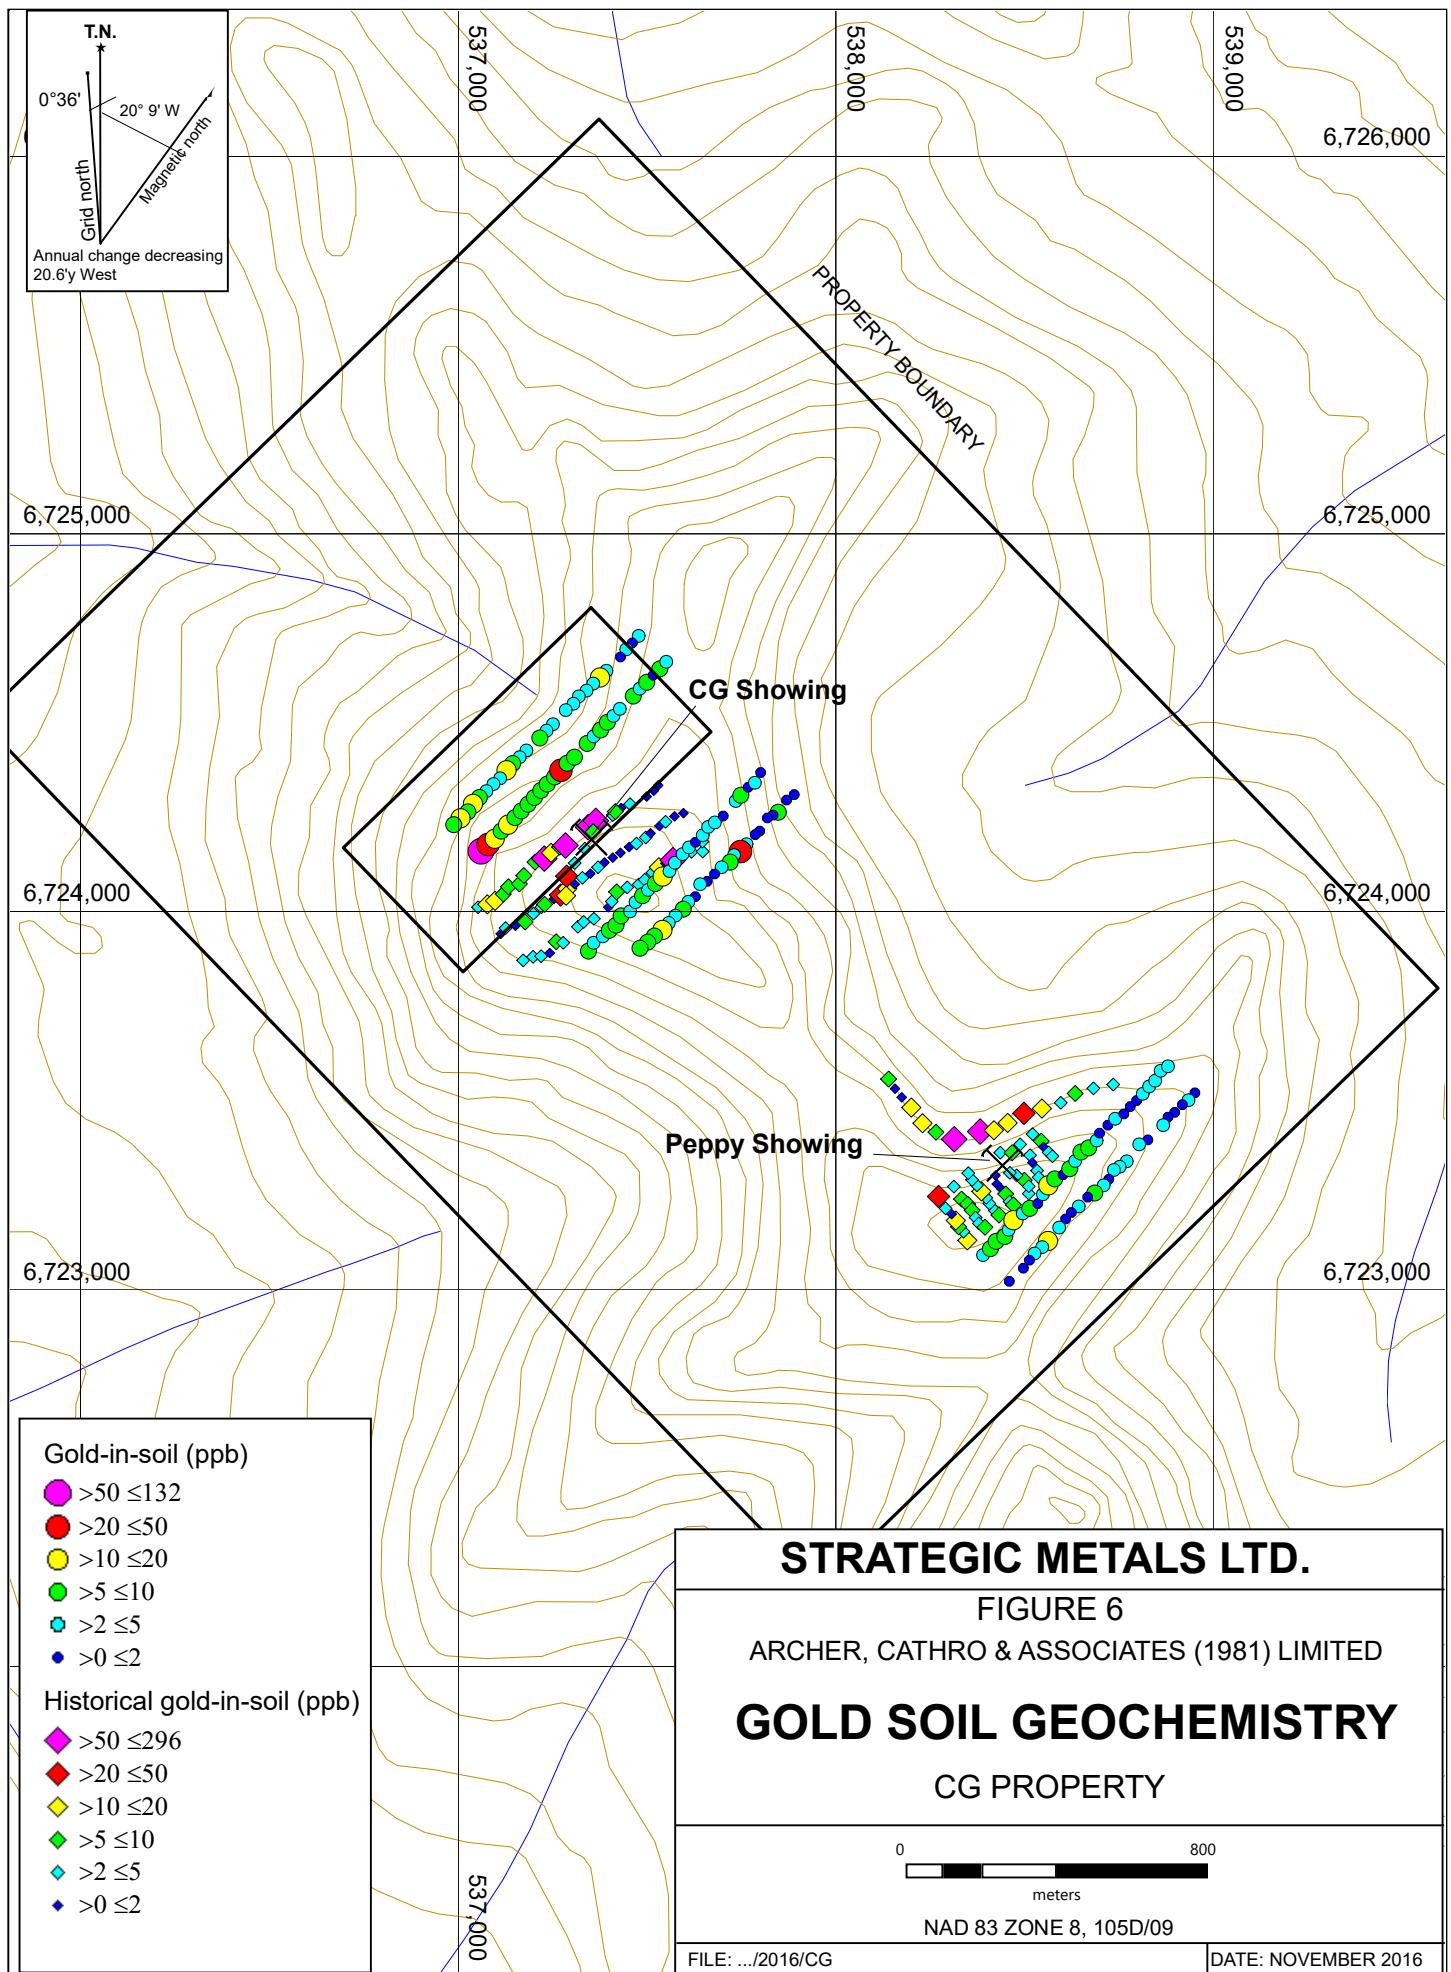

In 2016, three rock samples were collected from the CG property. The best result is from a subcrop sample of magnetite skarn collected from near the Peppy showing, which yielded 2,680 ppm copper and less than 50 ppb gold. Rock sample locations are plotted on Figure 5. Rock Sample descriptions and Certificates of Analysis for the 2016 samples appear in Appendix III and Appendix IV, respectively.

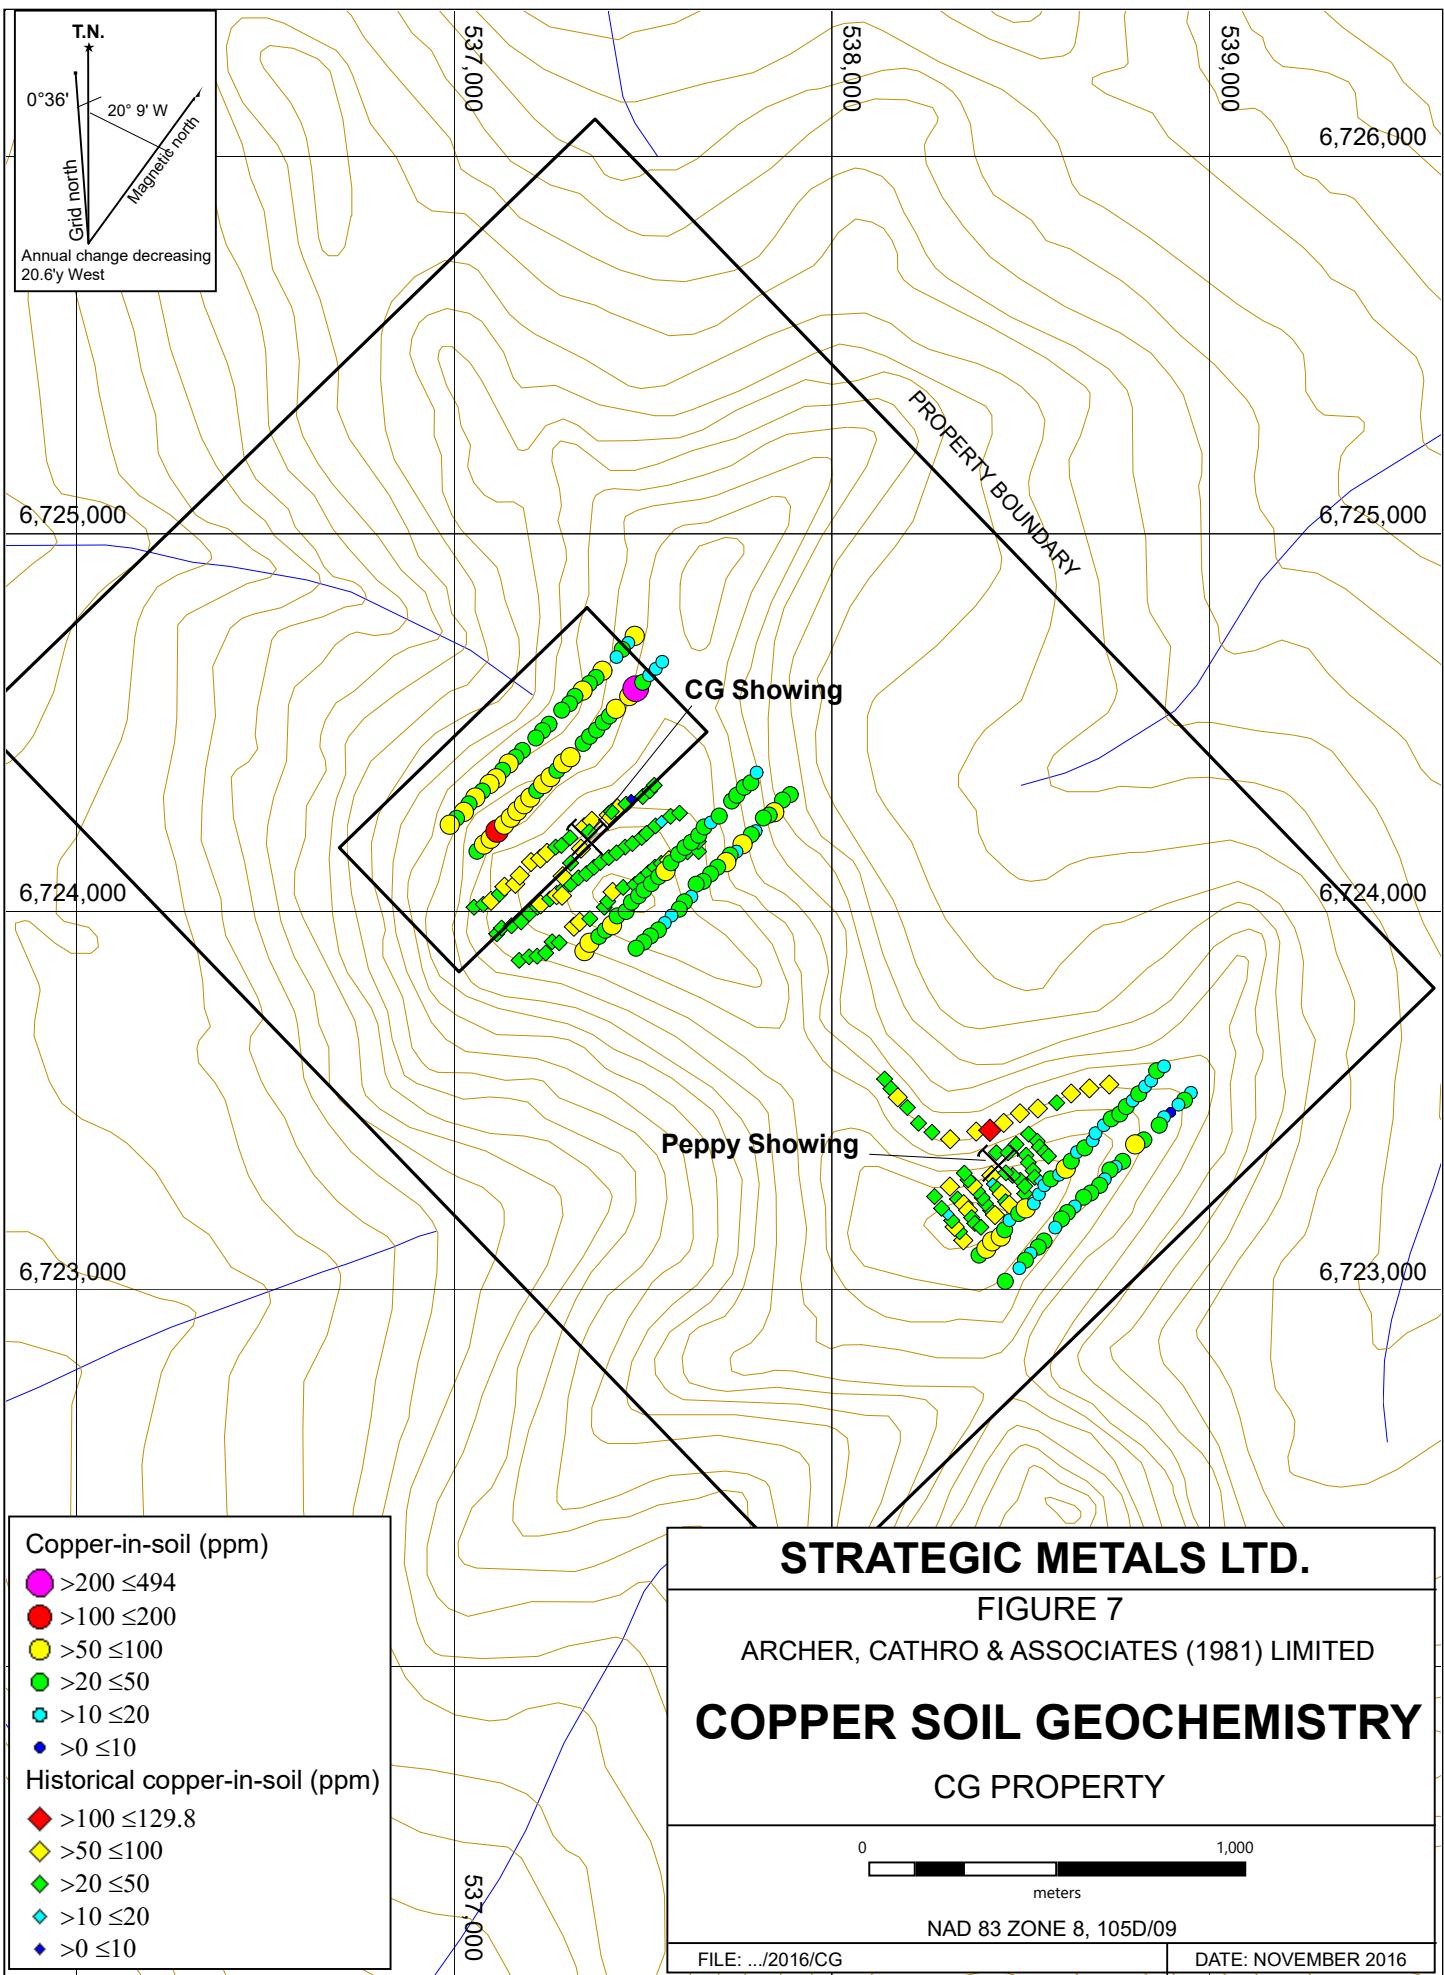

All rock sample sites were marked with orange flagging tape labelled with the sample number and recorded using a handheld GPS unit. Rock samples were sent to ALS Minerals in North Vancouver, B.C., where they were crushed to 70% passing 2 mm before a 250 g split was pulverized to 85% passing 70 microns. Splits of the pulverized fractions were then dissolved in a four acid solution and analyzed for 48 elements using inductively coupled plasma-mass spectroscopy and inductively coupled plasma-atomic emission spectroscopy techniques (ME-MS61). An additional 30 g charge was further analysed for gold by fire assay with inductively coupled plasma-atomic emissions spectroscopy finish (Au-GRA21).

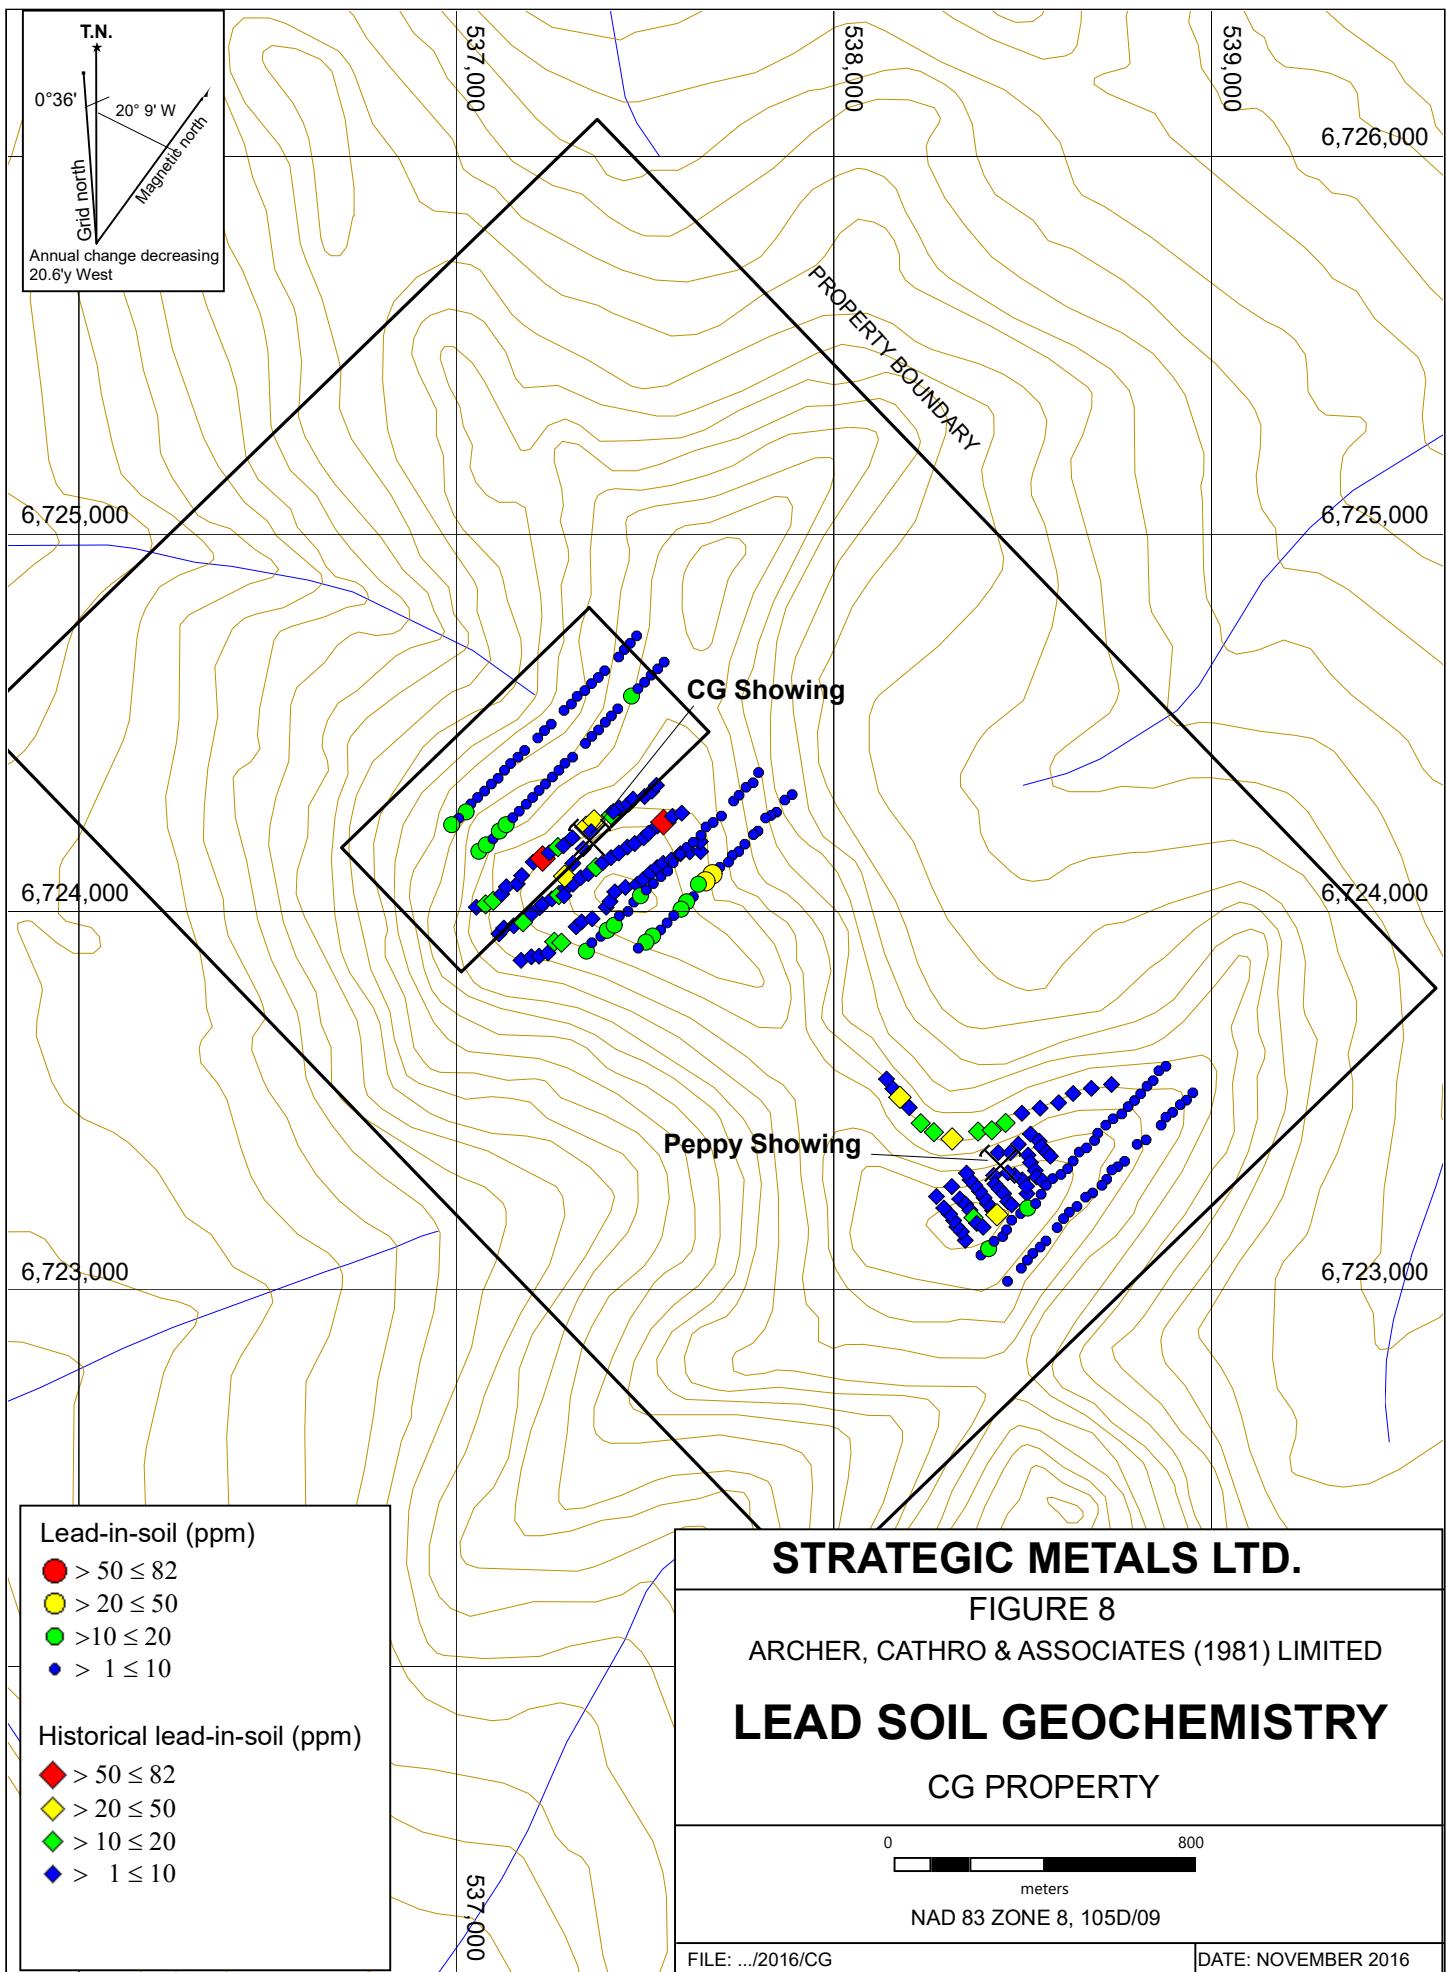

SOIL GEOCHEMISTRY

In 2016, Strategic Metals conducted a one day soil geochemical survey, collecting 157 soil samples. Permafrost and rocky terrain hindered soil sampling, which had an average sample depth of 20 cm. Figure 5 shows 2016 soil sample locations, while thematic results for gold, copper and lead are illustrated on Figures 6 and 8, along with historical sample values.

The 2016 soil samples were collected at 25 m spacing along grid lines approximately 100 m apart. Handheld geotuls were used to collect samples, while locations were recorded using handheld GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath. Upon collection, samples were placed into individually pre-numbered Kraft paper bags. All samples were sent to ALS Minerals in North Vancouver, B.C., where they were dried, screened to -180 microns, and then analysed for 35 elements using the inductively coupled plasma-atomic emission spectroscopy technique (ME-ICP41). An additional 30 g charge was further analysed for gold by fire assay with inductively coupled plasma-atomic emissions spectroscopy finish (Au-ICP21). Certificates of Analysis appear in Appendix IV.

Anomalous thresholds and peak values for the metals of interest are listed in Table II.

Table II – Soil Geochemical Thresholds

Element	Weak	Moderate	Strong	2016 Peak results	Peak historical results
Gold (ppb)	$\geq 2 < 10$	$\geq 10 < 20$	$\geq 20 < 270$	132	296
Copper (ppm)	$\geq 10 < 50$	$\geq 50 < 100$	$\geq 100 < 495$	494	120.5
Lead (ppm)	$\geq 10 < 20$	$\geq 20 < 50$	$\geq 50 < 82$	30	81.6

Geochemical results from 2016 expanded the anomalous areas around the CG and Peppy showings.

The CG showing lies within a 500 by 500 m area extending down the north side of the main ridge. The anomaly is characterized by anomalous gold up to 252 ppb, with elevated copper and lead support reaching maximums of 117 and 30 ppm, respectively. The 2016 soil samples yielded up to 132 ppb gold, 117 ppm copper and 19 ppm lead. The showing and much of the soil anomaly lies within Berdahl's claims.

The Peppy showing is a 350 by 400 m area situated along the main ridgeline, southeast of the CG showing. The 2016 samples from this area yielded maximums of only 15 ppb gold, 72 ppm copper and 18 ppm lead, but peak values from historical samples were 296 ppb gold, 79 ppm copper and 21 ppm lead.

GEOPHYSICS

In 2009, magnetometer surveys were performed over the CG and Peppy showings. Survey lines were walked at 100 m and 25 m spacing across the CG and Peppy showings, respectively. Data interpretation from these surveys can be found below, while figures and additional information can be found in Berdahl (2009).

The magnetic survey at the CG showing identified three north-south trending magnetic highs across a 650 by 280 m area. The largest magnetic high is located 35 m to the west of the CG showing. The showing lies within an intermediate gradient zone between the western high and a large eastern low.

Magnetic data at the Peppy showing covered a 350 by 200 m area and revealed clusters of magnetic highs and lows. The Peppy showing is positioned within the intermediate gradient zone between a north-south trending magnetic low to the west and a magnetic high to the east.

DISCUSSION AND CONCLUSIONS

Work completed by Strategic Metals during the 2016 exploration program extended areas of anomalous soil geochemistry, but the effectiveness of sampling was hampered by the presence of permafrost and felsenmeer. Most of the anomalies are located near visible gold occurrences at the Peppy showing, which lies on the claims, and the CG showing which is located on two claims surrounded by the CG property.

Additional exploration is needed on the CG property to identify the source and ultimate extent of the soil geochemical anomalies. Follow up work should include but not be limited to: 1) closely spaced soil sampling between the known geochemical anomalies; 2) hand trenching along defined trends to identify bedrock sources and establish the character of the mineralization; and 3) detailed geological mapping and prospecting around the showings and geochemical anomalies to better understand the geological setting and trace known structures.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions

Property: CG (Carter Gulch)

Sample Number: K282989 UTM: 538572 mE Nad83, Zone 8
Elevation: 1521 m UTM: 6723348 mN

Comments: Subcrop sample of pale grey-green, calcite-hedenbergite(?)-magnetite skarn, (strongly magnetic w/ disseminated f.g. magnetite), collected from a ~30cm horizon within a large boulder.

Sample Number: K282990 UTM: 538652 mE Nad83, Zone 8
Elevation: 1500 m UTM: 6723418 mN

Comments: Specimen sample of orange-brown weathering, pale grey argillite? hosting numerous sub-parallel, mm-scale, quartz veinlets. Abundant live limonite, as well as patches of black manganese? on fx. surfaces.

Sample Number: K282991 UTM: 537812 mE Nad83, Zone 8
Elevation: 1495 m UTM: 6723707 mN

Comments: Specimen sample of brecciated and drusy quartz hosting cm-scale angular clasts of dark grey-green (volcanic) sandstone.

CERTIFICATE WH16141610

Project: CG

This report is for 3 Rock samples submitted to our lab in Whitehorse, YT, Canada on 24-AUG-2016.

The following have access to data associated with this certificate:

HEATHER BURRELL

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% < 75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
ME-MS61	48 element four acid ICP-MS	
Au-GRA21	Au 30g FA-GRAV finish	WST-SIM

To: STRATEGIC METALS LTD.
ATTN: JOAN MARIACHER
C/O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016-510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.
