Table of Contents

1.0 Introduction

Exploration on the Lone Star Property, which includes the Lone Star and Bonanza claim groupings, in 2015 consisted of 690 line kilometers of ground magnetics surveying completed by Ground Truth Exploration, 19 diamond drill holes completed by Kluane Drilling Ltd. and 85 man days of prospecting, sampling and reclamation work, totaling $290,227.40. Additional work not claimed for credit includes additional prospecting, mapping, trenching, airphoto surveying and orthophoto mosaic creation, and significant remediation of past disturbances. Exploration focused on three main zones, the Nugget Zone, Gay Gulch and the Buckland Zone.

2.0 Property Description and Location

The Lone Star property is centered on 63°52'N, 139°15'W, covers the western portion of the Klondike goldfields, located some 500 km NNW of the territorial capital of Whitehorse, YT. The Lone Star property is comprised of 707 contiguous quartz claims and 14 Crown Grants covering a 135 square kilometer area. The Lone Star property quartz claims are divided for purposes of administration into the Lone Star grouping and the Bonanza grouping. The Lone Star property extends northward along Adams Gulch and the entirety of Bonanza Creek, north to the Klondike River at Bear Creek, east across Chance Creek and Independence Creek, south to Blanche Creek and covering the entirety of Eldorado Creek.

The claims lie on NTS map sheet 115O/14 within the Dawson mining district. Property and claim locations are shown in Figure 1 and Figure 2, and a detailed claim list is located in Appendix II. As of the date of this report all quartz claims are listed and owned 100% by Klondike Gold Corp. without encumbrance or underlying royalty. Klondike Gold also owns 14 crown grants within the Lone Star property. Ownership in one of these crown grants, "Argyle", situated at Adams Gulch has recently (January 2016) been (arbitrarily?) reduced by the Yukon government to 25% from 100%; this is subject to discussion since Klondike Gold purchased 100% and has paid 100% of taxes to the Yukon government since 1980. The remaining 13 crown grants are owned 100% by Klondike Gold without encumbrance or underlying royalty.

3.0 Accessibility, Climate, Local Resources, Infrastructure and Physiography

The Lone Star Property covers the discovery creeks of the Klondike placer goldfields located near Dawson City ("Dawson"), Yukon Territory. Gold in the gravels and bedrock here has been the target of prospectors and placer gold miners since 1896.

Dawson is connected to the territorial capital of Whitehorse via a 540 km sealed, government maintained two-lane highway (the "Klondike Highway"). Electricity in Dawson is supplied by the Yukon Energy Corporation's territorial power grid (connected in 2004) with back-up diesel power. A 5000' x 100' gravel surface lighted Yukon Government airfield at 1214' (370 m) elevation is located on the outskirts of Dawson. Scheduled daily air service to Dawson is maintained by Air North using twin-engine turboprop aircraft from Whitehorse, and seasonally by Boeing 737 jet (with special gravel landing kit installed) from Fairbanks, Alaska for cruise ship tourists. A smaller unmaintained 800' grass/gravel airstrip at 2100' (640 m) elevation suitable for light aircraft is located on the Lone Star property alongside Eldorado Creek. Charter fixed wing light aircraft of various capabilities are available locally or in Whitehorse. In addition, there are two year-round helicopter bases (Trans North Helicopters and Fireweed Helicopters) in Dawson. Other helicopter companies establish seasonal bases as needed. Regular truck freight, parcel and mail, and fuel services supply Dawson via the highway. Dawson offers normal town facilities such as hotels, restaurants, grocery, clothing, building supplies and hardware stores, engineering supplies, four bulk fuel and one bulk propane depot, as well as vehicle and heavy equipment repair capability.

The Lone Star Property lies within the traditional territory of the Tr'ondëk Hwëch'in First Nation. The Tr'ondëk Hwëch'in are based in Dawson with roughly 1,100 members who are descended from the Han-speaking people. Tr'ondëk Hwëch'in began negotiating their individual land claim in 1991. The Tr'ondëk Hwëch'in Final Agreement was signed on July 16, 1998, and came into effect on September 15, 1998.

The Lone Star property has a number of access points. The Bonanza Creek road begins in Dawson, connects south and west to the Hunker Creek road, and is a major government maintained loop which provides access for miners from two points along the Klondike Highway to the centre of the Klondike. This east-west road cuts across the northern part of the Lone Star property. The Eldorado Creek road, a north-south branch off the Bonanza Creek road, runs along Eldorado Creek to its headwater and transects the Lone Star property. The Lone Star Ridge road, one main branch off the Eldorado Creek road, provides access to high ground above both Eldorado and Bonanza Creeks, is a long-used road (in existence at least from 1896) that wears well in summer and is an alternative to the Bonanza Creek road. The Violet road, a second branch off the Eldorado Creek road, loops west on high ground and then runs along the west ridge above Eldorado Creek. The Bonanza and Eldorado creek roads are 2-wheel drive dirt and gravel roads and have significant mining and tourist traffic through the summer. The Bonanza Creek road is ploughed during winter, the other main roads are cleared and graded from April until October. The Lone Star Ridge and Violet roads are maintained privately by Klondike Gold and others as needed. Roads to individual placer claims, old cut roads, and dirt trails, some requiring 4-wheel drive or ATV, branch from these roads. Taken together, there is an extensive road network which allows excellent access by vehicles and heavy equipment throughout the property.

The Lone Star property is within Central Yukon Basin climatic zone, characterized by a sub-arctic climate, with normally low annual precipitation (approximately 400 mm total precipitation). The exploration season typically extends from May through October by which time nightly temperatures are below freezing and there may be a few centimeters of snow on the ground. Winter temperatures may drop to at least -40 °C for up to six weeks in January and February.

The Klondike region consists of rugged topography of rounded hills and V-section valleys since this region was not affected by late Cenozoic glaciation (specifically the Nansen, Klaza, Reid, and McConnell advances (Bostock, 1966)). In-situ weathering of the region has had a lengthy multimillion year history resulting in few natural fresh rock exposures.

Dawson City is on the Yukon River at 1050' (320 m) elevation and the highest point near to the Lone Star property, King Solomon Dome, is at 4032' (1229 m). The highest point on the Lone Star property is at the Eldorado Dome at 1160 m on the "AC" claims. The region surrounding the claims has been historically denuded of large timber by cutting to either supply mines and fuel boilers or by forest fires, and is now covered by regrowth of spruce, poplar, birch and alder. Only the very highest ridges are covered by dwarf willow and birch ("buckbrush").

4.0 History

The Klondike area has been prospected since the discovery of placer gold on Bonanza Creek in 1896. Many small gold showings were investigated by hand-dug pits, trenches, shallow shafts, or short adits driven on notable prospects. Circa 1900 prospecting was most successful locating bedrock gold-bearing quartz veins on/near the ridge crests where colluvium/overburden is generally thinnest. Prospectors dug holes, collected the quartz boulders, crushed them, and panned the crushed material. If gold was visually identified, additional pits, shafts, or adits would be excavated. Notable prospects discovered around 1900 include Lone Star, Pioneer, and Parnell showings situated on the east ridge above Eldorado and Bonanza Creeks (Minfile #'s 072, 150, and 147), Violet on the west ridge above Eldorado Creek (Minfile #146) and the Mitchell and Sheba veins off the property to the east near King Solomon Dome (Minfile #068).

The Lone Star prospect was first staked in 1897 and the adjacent Parnell and Pioneer prospects in 1900. The Violet prospect was first staked in 1901. Lone Star and Violet were both explored by various episodes of underground mining from multi-level drifts between 1910 and 1948.

A summary of exploration work from 1896 to present is listed below.

- 1896: Discovery of placer gold, start of placer exploration and mining, along with quartz exploration. Eldorado and Bonanza Creek drainages which underlie the Lone Star property have been the creeks with the most placer gold production, with mining continuing to the present.
- 1897: Lone Star prospect staked by Messrs. *Chute, Corthay and Stewart*. They prospected the discordant quartz body known as the Corthay vein by shaft sinking and drifting.
- 1909-1914: Lone Star Company developed the 'Boulder Lode' at the Lone Star "mine". The company excavated an open-cut and connected it below to a 225 m adit by means of two ore

passes. An amalgamation plate 4-head stamp mill with Wilfley table was built 1.5 km downslope on Victoria Gulch and a gravity cable tramway connected this to the mine. By 1914 some 7650 tons of rock had been mined and milled (calculated, with approximately a head grade of 0.202 oz/ton Au: Cathro, 1979).

- 1914: GSC investigated and sampled surface and underground at the Lone Star mine (MacLean, 1914).
- 1929-1936: Consolidated Lone Star Ltd conduct limited work at the Lone Star mine.
- 1935: GSC investigated and sampled surface and underground at the Lone Star mine.
- 1946-1947: Yukon Consolidated Gold Corp ("YGCG") conducted cable-driven percussion "churn" drilling and underground examination of the Lone Star mine site, under option.
- 1960-1962: Klondike Lode Gold Mines prospected, bulldozed five contour trenches, and sluiced the ~85 liter size samples collected. Gold concentrations were expressed qualitatively as number of colors. Colluvial gold was found in the 7 Pup-O'Neil area, also Gay Gulch and Oro Grande Gulch. Trenching by engineer Gordon Hilchey was conducted on the Bonanza side of the ridge alongside the Lone Star, and also east of Eldorado Creek at French Gulch (one trench of 2100 ft) and between Gay Gulch and Oro Grande (five smaller trenches). Four churn holes at 7 Pup indicated gold there, including holes VC-10 and VC-11 with 'considerable gold'. Nine churn holes tested Oro Grande; C-1 to C-6 contained 'colours' including C-6 with '40 coarse colours'. Also 160 meters of diamond drilling in 5 holes near French Gulch with no gold result, plus other drilling at Gay Gulch and 7 Pup.
- 1979-1985: Dawson Eldorado Gold Explorations Ltd hired Archer Cathro and Associates Ltd who re-evaluated the Lone Star prospect. Soils, resistivity surveying, and geological mapping were completed. Mapping observed the Lone Star prospect contained gold in vertical quartz 'stringers' that are discordant to the attitude of the dominant foliation of the host schist, hosted within an "F3" antiform fold. The Lone Star mine adit portal was re-opened. Six reverse circulation holes totaling 416 meters were drilled in 1985 between the Lone Star mine and the Hilchey showing. A sixth hole near Oro Grande was 21 meters. All had anomalous results.
- 1983-1986: A claims syndicate, the "Dawson Syndicate" was created by contribution of properties from Arbor Resources (now Klondike Gold), Ebony Gold Corp, Perron Gold Mines, Eastern Mines, Cream Silver Resources, Tiberon Petroleum, Texoro Resources, H-L Corp, Standard Gold Mines, Silver Sceptre, and Dawson Syndicate (as an entity). The collective carried out systematic prospecting that covered much of the Klondike from upper Adams Gulch to Hunker Creek, and from Grand Forks to the Klondike River. Five grids were laid out for soil sampling and geophysics; four on the south side of the Klondike River within 3 km of its valley and the fourth (Penibe claims) south of Hunker on the ridge to the west of Last Chance Creek. Induced polarization surveys detected no response in the Oro Grande to Gay Gulch grids, and a prominent response from the 27 Pup area likely due to outcropping graphitic schist. At the French Gulch / Eldorado junction a split anomaly was defined and at Big Skookum a resistivity anomaly noted. Detailed surveying of the Lone Star grid produced some very distinct responses. Twenty seven diamond drill holes were used to test anomalies over the whole region, with unknown or little result.

- 1984: Bedrock geology map, 1:50,000 published (Debicki, Open File 1984-3).
- 1986-present: Arbor Resources (later changes name to Klondike Gold Corp) optioned the Klondike property in 1986 and continued exploration of both the large claim block and the Lone Star Crown Grants (Grunenberg and Gonzales, 1987). At French Gulch, near the junction with Eldorado Creek, ten diamond drill holes were used to investigate I.P. and VLF/EM anomalies close to zones of quartz veins exposed in placer workings. The shear zones intersected did not yield any anomalous geochemistry and pyritic chlorite schists were barren of gold. The geophysical anomalies correlated with graphitic layers and linear magnetic anomalies with diabase dykes that are reverse polarized and hence give very sharp negative anomalies. Five zones of from 1.5 to 8 ft. (0.46-2.4 m) thickness were intersected giving gold grades of 0.01-0.20 oz/t Au, each in quartz veins. Seven holes were drilled along Eldorado Creek between Golden Gulch and Little Eldorado Gulch to test shear zones indicated by geophysics and five holes were abandoned due to 'broken ground'. At Lone Star twelve diamond drill holes were completed; holes 86LS01 to 86LS02 beneath the Lone Star mine workings and the rest to test soil geochemistry or I.P. chargeability/resistivity anomalies. 86LS03 and 86LS11 proved the most promising, with narrow intervals (2.5 ft.) up to 0.345 oz/t Au. Also twenty three rotary drill holes were completed during the 1986-87 winter, mostly between Oro Grande and Gay Gulch. Several 5-10 ft. zones of 0.013-0.23 oz/t Au were intersected.
- 1992: *Kennecott* optioned the Lone Star Property and continued the rotary percussion and reverse circulation drilling started by Arbor Resources. The Lone Star mine mineralization was extended out to 250 meters west-northwest of the open cut, including 92LS14. Doyle (1993) considers this to be part of an alteration zone that trends northwest from the Pioneer prospect (with right hand fault offset) and which continues towards O'Neil Gulch.
- 1993: Kennecott (Finlayson, 1994) prepared heavy mineral concentrates from cuttings of hole 92LS14. Assays of concentrates were lower than the original 1992 drill cutting assays and free gold was not found. Kennecott concluded that coarse free gold was not present and, on the basis of gold content in pyrite, that two generations of sulphides exist in the Lone Star rocks: i.e., that gold mineralization was impressed upon existing pyritic schists. The 1993 drilling tested the gold soil anomaly downslope of the Lone Star workings defined by Arbor Resources. Mineralization encountered in their drilling consisted of intersections of less than 10 m of >1g/t Au (>0.029 oz/t Au) in Boulder Lode drill holes 92LS01, 92LS03, 92LS04, 92LS07, 92LS08 and 92LS09. In the Buckland Zone holes 92LS20 to 92LS22 encountered 3 to 15 meter intersections of >1g/t Au.
- 1994: Kennecott (Cranswick et al., 1995a) targeted the Buckland Zone. Power driven soil augers sampled lines spaced at 1 km intervals down the spurs from the ridge road to Eldorado Creek and over the Lone Star mine. Anomalies up to 500 ppm Au were obtained from spurs between 27 Pup and Oro Grande, the northwest side of Gay Gulch, and directly above O'Neil Gulch. The anomaly at the Nugget Zone was trenched (94TR02). Assays of 2.35g/t Au / 12.0 m and 26.5g/t Au / 2.0 m were obtained. In addition low in Gay Gulch, trench 90GGTR06 was re-cut and sampled, yielding individual assays of 3.71 g/t Au / 2 m; 3.01 g/t Au / 2 m; 1.25g/t Au / 2 m; and 1.17g/t Au / 2 m in discordant pyritic quartz veins. Reprocessed helicopter borne magnetic

survey (?year?) was used to infer the presence of a magnetite-type granitic intrusion at Sourdough Gulch, based upon magnetite-bearing porphyry dykes at 77 Pup and Discovery Pup (off Bonanza Creek). Auger sampling found no significant gold at the other localities. Kennecott terminated the property option in January 1995.

- 1995: Arbor Resources changed name to Klondike Gold Corp. ("KG"). Newmont Exploration evaluated the property, under option, by studying the mineralogy and amenability to milling of bulk samples. Coarse gold >100 mesh was found in lab tests as well as in assays indicating considerably higher numbers compared with rotary drill cutting results. J.E. Tilsley and Associates (Hayden and Tilsley, 1997) carried out surface sampling at the Lone Star mine to investigate techniques to obtain representative assays. Coarse gold was encountered in their large size (≈30kg) samples.
- 1996: Work consisted of trenching at Lone Star, Pioneer, Parnell, Buckland, French Hill, Glacier and Oro Grande showings, together with a reinterpretation of the geology (Van Angeren, 1996) who recommended concentration of work on the Boulder Lode, Buckland Shear and 27 Pup Zones with that work aimed at finding primarily disseminated mineralization rather than crosscutting quartz veins. Also in 1996, Barramundi Gold Ltd staked and optioned much of the Klondike area, over 3000 claims, adjacent to KG's Lone Star property. And YGS produced new bedrock geology maps, 1:50,000 published, including 115O/15.
- 1999: Barramundi commissioned a fixed wing airborne magnetics and VLF-EM survey over a 16 x 24 km area adjacent to Lone Star property. Later, Barramundi optioned all of their Klondike region claims to KSL Exploration (Yukon) Ltd, a private Australian company who conducted airphoto and Landsat interpretation with minor rock and soil sampling (assessment report #094119). Claims that were held by Barramundi under option from JAE Resources and United Keno Hill Mines were excluded from the deal, hence KSL only explored peripheral to the project.
- 2002: Airborne magnetics and radiometrics geophysical survey, 1:50,000 scale published (Shives et. al., GSC Open File 3992). No one from KG looked at this data?
- 2002-2015: Klondike Gold ("KG") optioned a ~50% interest in the property to Klondike Star Mineral Corporation ("KSMC"), which became a 50/50 joint venture in 2005. KSMC worked the Lone Star property until 2008. KG resumed work in 2011. KG purchased KSMC in 2015, thereby restoring a 100% interest.
- 2004: KSMC conducted exploration at the Lone Star mine, Oro Grande and 27 Pup areas. A gravity circuit mill was constructed on Eldorado Creek to process bulk samples of bedrock mineralization. The mill was fed by hand, so bulk samples were limited to ~1,000 kg in size. The 'process plan' circuit consisted of one small jaw crusher, two small ball bills, and a shaker gold finishing table. Tailings were disposed in local placer cuts with placer tailings. Twelve bulk samples ranging in size from 8 kg to 959 kg were processed. Free gold was recovered from all samples, and estimated to constitute between 18 and 81% of the total gold in the samples. Heavy mineral concentrates, dominated by pyrite and iron oxide pseudomorphs of pyrite, contained significant amounts of gold. Tailings from the laboratory table used for cleaning the rough concentrates were also 'high' in gold. The mill tailings were gold bearing, containing between 42% and 76% of the calculated gold head grade. Fieldwork consisted of surveying,

detailed geological mapping and trail construction, and trenching. Seventeen trenches were excavated by backhoe and selectively chip sampled over five meter intervals.

- 2005: By 2005, KSMC had acquired a ~55% interest in the property. Thirty two diamond drill holes totaling 4830 meters were drilled; 27 at the Lone Star mine, 3 at the Veronika showing, and 2 at the Dysle showing, with no significant results. The bulk sampling gravity mill was upgraded in 2005, and processed 18 mini-bulk samples ranging between 1394 and 4111 kilograms in weight, collected from Lone Star, 7 Pup, Nugget, Veronika and Dysle showings. These tests indicated a nugget effect with 50% of the gold present as coarse free gold and about one third of the gold in the mill tailings, and the remainder as fine gold. Fourteen trenches were dug by backhoe at nine locations in 2005. Good results were obtained from the '310 Zone' located on the ridge between Nugget Gulch and French Gulch where some older trenches were re-excavated and sampled, also from the Nugget Zone from the re-excavation of the upper part of 94TR02. The trench below the Chateau at Lone Star, 05TR12 returned a broad mineralized interval corresponding to hole 05LS22 which is angled under the trench.
- 2006: Work included 23 diamond drill holes (17 at Lone Star mine, 3 at O'Neill Gulch, 3 at Nugget Zone), 8 trenches, IP geophysics at Buckland, 139 soil samples on the WIN claims, and 18 bulk samples.
- 2007: Work included remapping trenches and geology data compilation. 6 drill holes totalling 858.4 m targeted the Buckland and Pioneer showings, all with anomalous gold results associated with discordant quartz veins. Seven bulk samples from 3085 kg to 7471 kg and one hand excavated 350 kg bulk sample were processed. Twenty three batches of chips from two rotary drill holes totaling 3892 kg were also processed through the gravity mill. Nugget effects were evident in results; in addition 07-LS-B1 had 96% of its gold reporting to tailings "suggesting the gold may be either of an extremely fine grain size or perhaps bound in silicate minerals to avoid being recovered in the heavies". Or the circuit didn't capture the gold. An induced polarization ("IP") geophysical survey at the "JF showing" consists of eleven lines totaling 9.9 line km oriented northwest to southeast located above Gay Gulch targeted trench 06TR06 area. The IP grid was also soil sampled with 381 samples collected.
- 2008: KSMC conducted geological mapping, trench and rock sampling, and soil sampling on the WIN and LB-LLIB claims.
- 2011: *Klondike Gold Corporation* work consisted of excavating two trenches near the Lone Star mine, and excavating a 6 m vertical section in the Lone Star mine to the depth of the first underground level. At Nugget Zone, trenches were enlarged and deepened. A soil sampling program using an excavator to obtain 1 m deep soil samples was conducted along the ridge road from near Grand Forks to the Calder Summit ridge. No significant new results were obtained.
- 2012: *Klondike Gold Corporation* drilled 4 holes to the southeast of the Lone Star mine. Results found that the low grade gold mineralization present at Lone Star does not extend eastward to the Pioneer Zone. Gold is present in all four holes but is weak and sporadic. The faces of the Lone Star mine excavation were channel-sampled at close spacing. Quartz veins yielded interesting assay values (~10-60 g/t Au). The intervening schist yielded sporadic low grades (typically ≤ 1.0 g/t Au). Surficial terrain mapping was completed by AECOM Consulting based on

1996 1:25000 aerial photographs and 2009 0.5 m resolution satellite image interpretation. This analysis led to a soil sampling program near the upper headwaters of Little Blanche Creek (defining the "Boy" soil anomaly) and a recommendation to similarly sample the southeast of the property in the vicinity of Canyon Creek.

Little Blanche Creek area was tested with 607 soil samples, following up on anomalous soil results obtained by Klondike Star between 2004 and 2008. Results show a strong north-south trending gold anomaly with a width of approximately 400 m and a length of 900 m. Analysis of soil results indicated a high correlation between Au and Ag and no correlation between Au and As in this area.

In 2012 exploration on the Violet to 310 quartz vein trend consisted of soil sampling, prospecting, and rock sampling. Two selected grab samples from the Violet mine ore pile ran 41.25 g/t Au with 524 g/t Ag and 47.4 g/t Au with 894 g/t Ag in agreement with historical reported samples of up to 131.6 g/t Au in surface sampling (Source: Yukon MINFILE 115O 073). Prospecting along the Violet to 310 trend revealed a number of showed historical unmarked pits from the early 1900s. Rock samples from pits show quartz veining and stockworking with common pyrite and limonite with local galena, chalcopyrite, and barite. Results from these samples show anomalous gold. Of the 130 rock samples assayed, 11 returned greater than 1 g/t Au, silver had 14 samples greater than 10 g/t Ag.

The JF target is located on the Lone Star Property near the upper headwaters of Gay Gulch and Eldorado Creek and is an area of anomalous gold associated with quartz veining and quartz rich fault gouge. The JF target was first excavated with ultimately a 1.2 km long trench, cut 150 meters wide (could be seen prominently from space; remediated in 2015), and first sampled in 2006. Anomalous gold values at the western end of this trench prompted an extension of the trench in 2007 resulting in a slight increase of the mineralized zone. An IP grid over the trench area was also completed in 2007. In 2012 a portion of the JF trench was deepened significantly to provide better exposure and 67 samples were collected over 101 meter. The new results redefined the anomalous zone to 1.75 g/t Au over 10.2 meters.

Of historical interest, the following map (Figure 3) shows the location of now defunct "surveyed mineral claims" from c.1896-1906 when owners of mineral claims with a decent discovery (in the eye of the beholder) went to the considerable effort of cutting the claim boundary, surveying it, and registering it with the claim. These "surveyed mineral claims" provide another view of the bedrock potential as of 1906. The surveyed mineral claims are shown in relation to Minfile mineral occurrences on the Lone Star property.

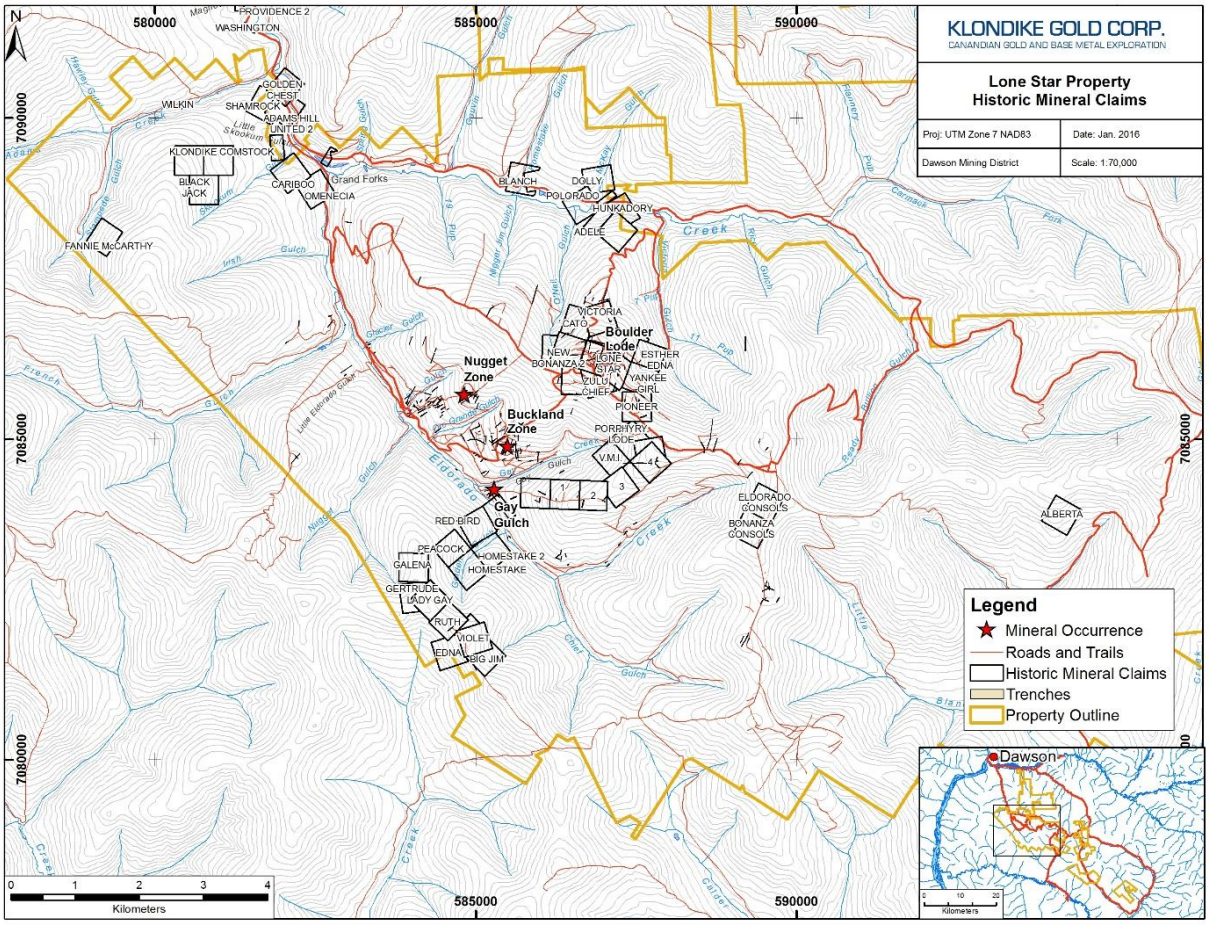

Figure 3: Lone Star Property with historic circa 1908 “surveyed mineral claims” and Minfile occurrences.

5.0 Geological Setting and Mineralization

5.1 Yukon-Tanana Terrane

The Klondike region is underlain by Permian age Klondike Schist, correlative with units of the Yukon-Tanana terrane (“YTT”) which extends from Alaska through the Yukon to British Columbia. The YTT is a diverse lithotectonic terrane of continental affinity consisting primarily of quartzitic, pelitic and calcic metasedimentary rocks, and local mafic and felsic meta-igneous rocks. These protoliths are intruded by Mesozoic and Cenozoic granitic rocks. The YTT is bound to the north by the Tintina-Kaltag fault system, to the south by the Tanana-Denali-Farewell fault system, and is cut in the middle by the Teslin fault system. These fault systems form zones of major right lateral strike-slip movement. Units of YTT are polydeformed and, over a regional scale, show a range of metamorphic grade from lower green schist to amphibolite facies. Structural styles are consistent with deformation during east to northeast directed accretion and crustal shortening. In part, the Yukon-Tanana terrane forms the basement for Quesnellia, and the existence of mid-Jurassic plutons that intrude both terranes indicates they were sutured by that time (Nelson and Friedman, 2004). Current Klondike Gold exploration thinking links a northwesterly

extension/termination of the Teslin fault system during the mid-Jurassic to orogenesis and emplacement of gold-bearing quartz veins in the Klondike area.

Igneous rocks are widespread throughout the YTT, but are most abundant in the eastern portion of the province. Age dates of plutonic rocks in the YTT generally cluster into three distinctive groups: 1) 215-188 Ma (Late Triassic–Early Jurassic), 2) 110-85 Ma (mid- to Late Cretaceous), and 3) 70-50 Ma (Latest Cretaceous-Eocene).

5.2 Geology and Structure

Late Permian back-arc volcanism related to subduction beneath the Slide Mountain ocean produced the rocks of the Klondike schist within the Lone Star property. The Klondike schist represents a Permian transition from plutonism, represented by the Sulphur Creek orthogneiss on the Violet ridge along the western portion of the property, to arc volcanism and related volcaniclastic rocks extending through the Lone Star property eastward 50 km to Dominion Creek.

Obduction of the Klondike schist arc terrane onto cratonic North America created pervasive S1+S2 foliation(s) from deformation and metamorphism of these units. Continued ductile deformation produced a spaced crenulation cleavage across the region. Medium to large scale folds verge to the NE; this phase of folding produced an asymmetric anticline along the Lone Star ridge, associated with regional thrusting and imbrication within the Klondike schist.

In the mid-Jurassic, Slide Mountain terrane mafic and ultramafic rocks were underthrust beneath the Klondike schist which produced angular kink folds, reverse faults, and subsequent quartz veining. Devolatilization of the Slide Mountain underthrust slab produced volumes of carbonate and gold bearing fluids which ascended into the Klondike schist. Uplift and brittle deformation produced conduits for gold-bearing fluids which channeled and formed the distinctive discordant gold-bearing quartz veins.

Northward trending faults within the YTT are a result of transpression and initiation of the Tintina fault in the Tertiary. Late Cretaceous felsic and mafic intrusions (Carmacks Group) and Eocene bimodal dykes emplaced in these N-S structures. Lamprophyre dykes, another phase of intrusion, are known from drill core at the Nugget zone to also intrude along N-S structures.

Within the western end of the Klondike schists in the vicinity of Eldorado Creek (Lone Star property), quartz augen schist representing a deformed subvolcanic dacitic intrusion, outcrops along the west side of Eldorado Creek. Graphitic schist outcrops beneath and immediately adjacent to Eldorado Creek. Felsic tuffaceous volcanics and sediments, locally cherty, outcrop on the hills east of Eldorado Creek and into the high ground south of Bonanza Creek. Further east the ridge is largely chlorite schist derived from mafic tuffaceous volcanic and intrusive rocks.

5.4 Quartz Veining and Mineralization

Two types of quartz veins are common in the Klondike, and are distinguishable by not being an exploration target (no gold), or being an exploration target (with gold) respectively:

a) foliaform veins that are typically concordant with transposed bedding and which may be meters thick, but which are usually lenticular and have subtle to prominent foliation(s). These are always barren of gold and,

b) discordant veins that carry sulphide mineralization (pyrite, with rare galena, chalcopyrite and tetrahedrite) and visible gold which is both commonly contained in selvages of pyrite (or after weathering, pseudomorphs of goethite/limonite) and as free gold grains in the white quartz. Discordant veins are rarely up to 2-3 meters thick and can persist for hundreds of meters strike length (eg. Violet-310). Some spectacular gold grades are reported from this vein type (Rushton et al., 1993; Klondike Gold NR 14-Jan-2015 results from Lone Star mine of 1,766 g/t Au grab sample(s); Klondike Gold NR 26-Oct-2015 results from Gay Gulch of 75.6 g/t Au over 2.8m drill hole).

5.5 Quaternary Geology

The Lone Star property lies in unglaciated terrain, near the western margin of the Cordilleran ice sheet limits. It is in the zone of widespread discontinuous permafrost, with permafrost generally present on north and east facing slopes.

The upland soils in the area, dominated by colluvium have been described by Bond and Sanborn (2006): "... a thin veneer (<25 cm) of loess is preserved on moderate upland slopes. On slopes with a south-facing aspect the loess forms a distinct unit at the top of the B horizon. A minor component of coarser locally derived colluvium appears to have been incorporated in the loess by slope processes in many places. On north-facing slopes, permafrost is commonly present (or has been present), which enhances the colluviation of the surficial deposits. On these slopes, the loess has been incorporated in the underlying colluvium by cryoturbation." The dominant soil types on ridge crests and south facing slopes are dystric brunisols. The dominant soils on north facing slopes are turbic cryosols.

5.6 Property Geology

The geology of the Klondike district which is underlain by Permian age Klondike Schist is poorly known due to a paucity of outcrop. As such, the Klondike Schist has not been subdivided despite indications the eastern end near Dominion Creek exhibits amphibolite facies metamorphism while rocks at the western end near Eldorado Creek exhibit greenschist facies.

In general the Klondike Schist lithologies are comprised of typical island arc volcanic lithologies including mafic and felsic tuffaceous rocks and derived sediments, plus interlayered graphitic schists. The western end of the belt is bounded by the Jim Creek pluton, described as an orthogneiss, which outcrops along Violet ridge west of Eldorado Creek.

Gordey and Makepeace (2001) indicate a small andesite porphyry of Upper Cretaceous age in their compilation of the geology of the Lone Star property area, as originally mapped/reported by Mortenson (1996). The andesite porphyry corresponds to a magnetic 'high' in GSC airborne surveying (2002) and Klondike Gold's 2015 more detailed ground magnetic survey. In YT MINFILE records, the area is named the Jen zone (Minfile ID 115O078).

6.0 2015 Exploration Program

Exploration in 2015 consisted of 690 line km of ground magnetics surveying completed by Ground Truth Exploration, and 19 diamond drill holes completed by Kluane Drilling Ltd. Additional work not claimed for credit includes prospecting, mapping, trenching, airphoto surveying and orthophoto mosaic creation, and significant remediation of past disturbances.

A minimum total of $308,515.28 consisting of approximately $72,500 was spent on magnetics surveying for work performed between June 2 and August 21, 2015, as well as approximately $158,000 on diamond drilling performed between August 10 and September 7, 2015.

Assessment credit claimed on 747 claims is 2 years (1494 claim years) plus 325 claims for 2.5 years (812.5 claim years) for a total of 2306.5 claims years.

Exploration of the Lone Star property was based from accommodations in Dawson with daily access to the property via 2WD and 4WD trucks. The exploration program consisted of prospecting and mapping work performed by Klondike Gold employees, ground magnetic, induced polarization, and orthophoto surveys conducted by GroundTruth Exploration of Dawson, diamond drilling by Kluane Drilling of Whitehorse, dozer rental for diamond drilling and remediation work by Gimlex Enterprises of Dawson, and remediation of trenches and old camp sites using Klondike Gold excavators and personnel.

6.1 Prospecting

Prospecting on the Lone Star Property was completed between May 14 and August 2, 2015, with daily access to the property via company truck and based from accommodations in Dawson. No company exploration camp is located on the property.

Prospecting was guided by interpreted magnetics and investigated areas of faulting with the objective of documenting gold-enriched quartz veins and distinguishing them from unmineralized quartz and carbonate veins. 464 prospecting samples of all types of quartz veins were collected for assay from throughout the Lone Star property and submitted to Bureau Veritas Labs in Whitehorse for analysis.

Ninteen samples submitted had gold assay results above 0.5 g/t Au with eight samples assaying greater than 5 g/t au up to 55.34.4 g/t au. (see Appendix III and IV for rock sample data and assay data).

Additionally, at the Nugget zone, Klondike Gold completed detailed representative chip sampling perpendicular to veining across 14 individual lines over 38 meters strike length of outcropping quartz veins and adjacent host rock. A total of 45 chip samples were collected and analyzed by metallic screen assaying. Thirteen samples were of wall rock and thirty two samples were of quartz veins. Only seven samples had gold values under 0.1 g/t Au (detection limit is 0.01) suggesting gold enriched wall rock. Sixteen samples had values between 5 g/t Au and 30.5 g/t Au. A summary of results is shown in the Table below.

The intent of the survey was to assess the variability of gold content along the strike of the veining, the distribution of gold in light of potential coarse-gold 'nugget' effects, and the gold content (if any) of the adjacent host rock. The reader is cautioned that the results herein, while methodically collected, should be regarded as an estimate only with potentially high variability.

The table below presents results of sampling the Nugget vein array which is comprised of a series of semi-parallel, anastomosing 0.1 to 1.0 meter individual quartz veins over a width of ~5.0 meters. Individual chip lines are across areas only where outcrop occurs on that line, and so sample lines only partially cover the full width of the veining-plus-host rock on any line. The most continuous exposure of outcrop on Line 36 returned a weighted gold assay of 8.0 g/t Au over 4.3 meter interval.

Table 1: Chip sampling results at the Nugget Zone

Line (m)	Type	g/t Au	Width (m)

Line 36	QV+host rock	8.0	4.3
Line 38	QV	12.4	0.9

Extensional quartz veins of economic interest sampled at the Lone Star property are ascribed to late or post-D4 veining; all have similar observed textural features, structural characteristics, and geochemistry, and are interpreted to be generated by an extensional fault system documented by Company and GSC airborne magnetics.

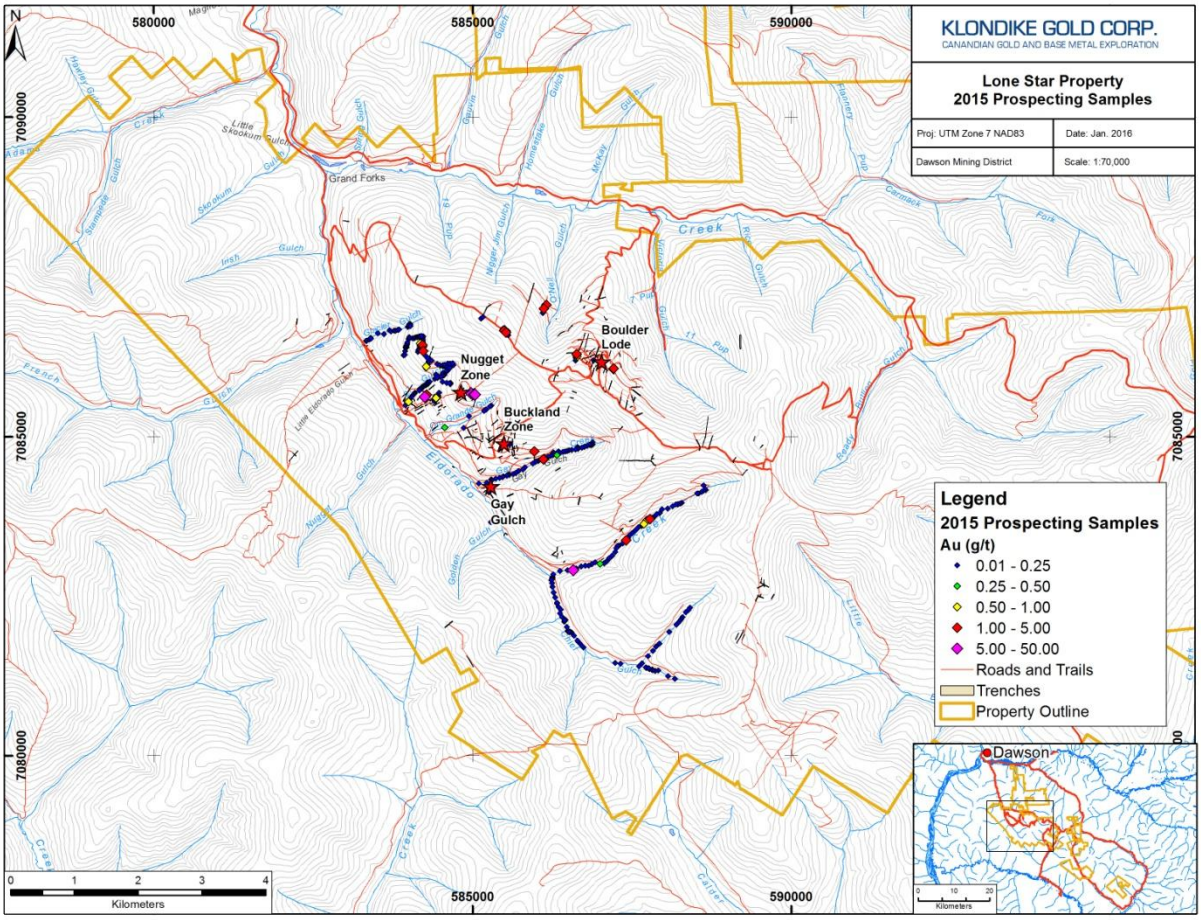

Figure 5: Gold Prospecting Results

6.2 Ground Magnetics

During 2014 Klondike Gold completed an interpretation of Geological Survey of Canada ("GSC") airborne magnetics (published 2002), particularly relying on first vertical derivative data, and discerned a dextral shear fault which transects the area of the Klondike goldfields from Eldorado Creek to Dominion Creek. A significant proportion of this fault system, including the horsetail pattern termination, runs through the Lone Star property. GroundTruth Exploration Inc. of Dawson, YT was engaged to run a ground magnetic program on the property to map this inferred structure and investigate any pinnate fractures or splays which may indicate faulting and help with exploration targeting.

The magnetic program began on June 2nd, 2015. A total of 535 line kilometers of walking magnetics covering a ~54 square kilometer area was completed between June 2 and August 21, 2015 and totaled 77 man days to complete. Two portable Gem Systems Overhauser proton magnetometers plus one base station were utilized to conduct the survey. Survey data was collected by walking in an E-W direction at nominal 50 meter spaced lines. The magnetometers were set up to "walk" mode and set to record reading every two seconds. The GPS location of the walking line was recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD 83 format and was merged with the magnetic data based

on the reading times which were synchronized daily. The data was collected in the field and then sent to Dawson daily via satellite. The data was then de-spiked, corrected for IGRF values and diurnal variation, and then leveled for plotting as the final total field magnetic product. The final product was delivered in a ".grd" format which can be plotted and viewed by most standard mapping programs (see figure 6 and appendix XXX).

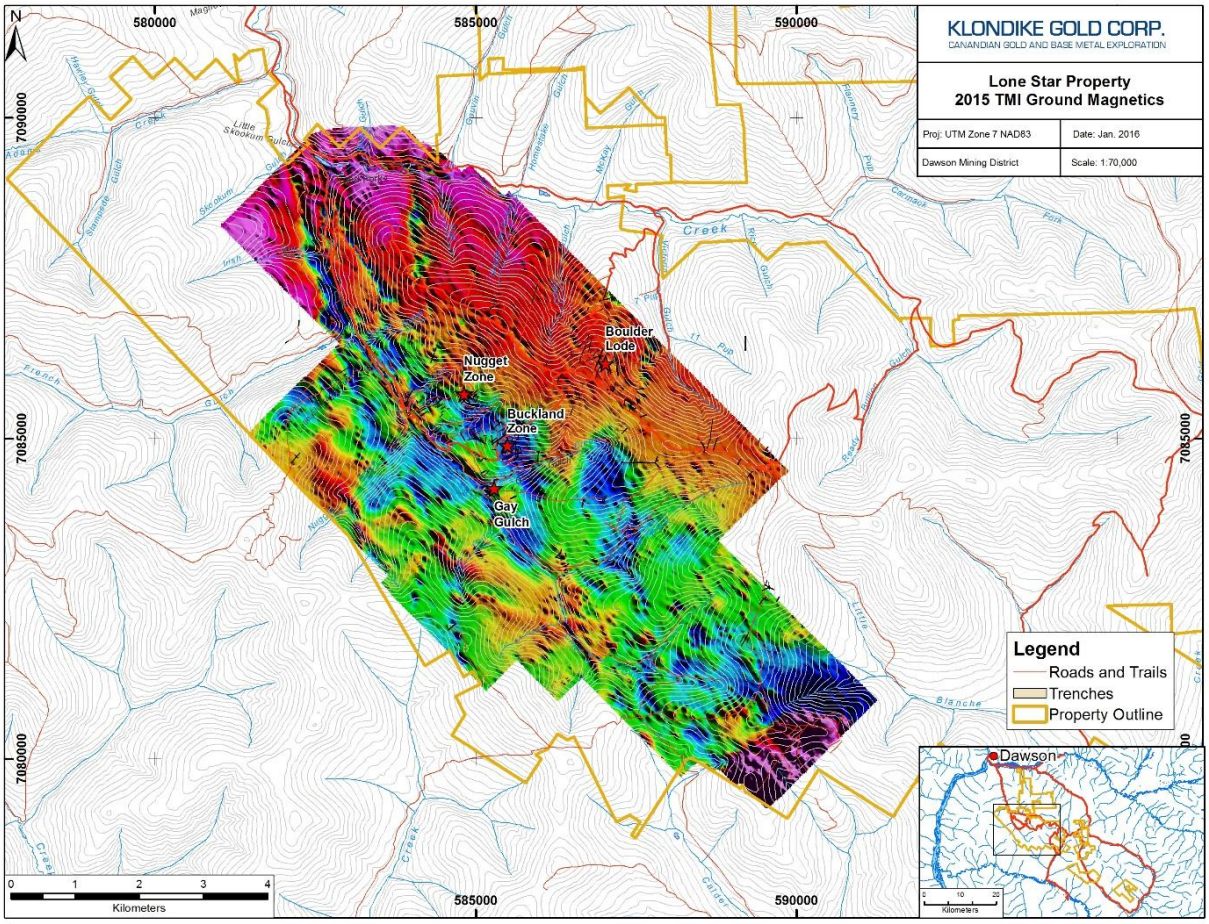

Figure 6: Lone Star property ground magnetic survey - total magnetic intensity

6.3 Orthophoto Survey

GroundTruth Exploration Inc. of Dawson, YT was contracted to fly a drone orthophoto survey of the Lone Star property in order to create an orthophoto mosaic to support in mapping historical work and help with future exploration programs. This program was flown on May 21 – 22, 2015.

GroundTruth utilized a SenseFly eBee drone to capture the airphotos. The eBee drone nominally flies at 100-150m above the ground and captures high definition airphotos utilizing its onboard 18.2 MP WX RGB Camera. This allows for a ground resolution of ~4cm depending on the flight altitude. The photos are then geolocated internally to approximately 3m horizontal and vertical accuracy. Ground control points can be added in post processing to ensure accurate georectification of the images.

The drone flight path was programmed using the supplied eMotion software to maximize coverage of the property while allowing the entire property to be flown in two days. This resulted in a flight altitude of ~600m and a resulting average ground sampling distance of 15.4cm (pixel size). A total of 27 flight lines totaling 2,494 images were needed to create the optimal 60% forward overlap and 30% side overlap suitable for stereoscopic viewing and orthophoto creation.

The data was then transported to Dawson where it was processed using the Postflight Terra 3D program. A single ortho-rectified mosaic, point cloud and digital elevation model ("DEM") was then created and delivered in ".Tiff" format (see Figure 7).

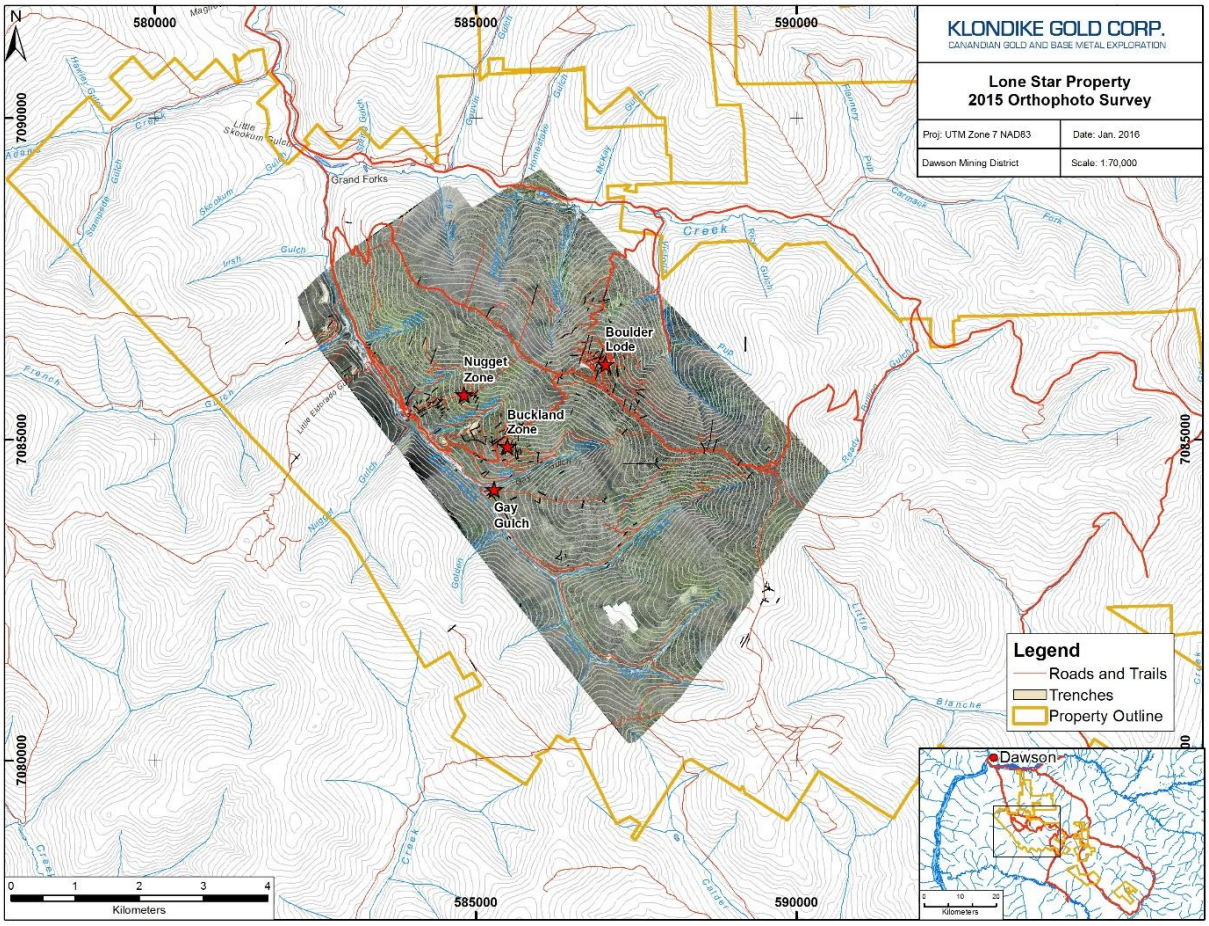

Figure 7: Orthophoto survey

6.4 Diamond Drilling

A total of 1,369.30 meters of diamond drilling, was completed on the Lone Star property in 2015. Resulting in 580 core samples, blanks, and standards submitted to Bureau Veritas Lab for analysis. Kluane Drilling of Whitehorse, YT was contracted to supply the diamond drill. Gimlex Enterprises of Dawson, YT provided a Komatsu dozer which was used to move the drill, prepare drill pads, and in many places for reclamation work backfilling old trenches.

Three general areas, Nugget, Buckland, and Gay Gulch respectively, were drill tested as shown below grouped north to south.

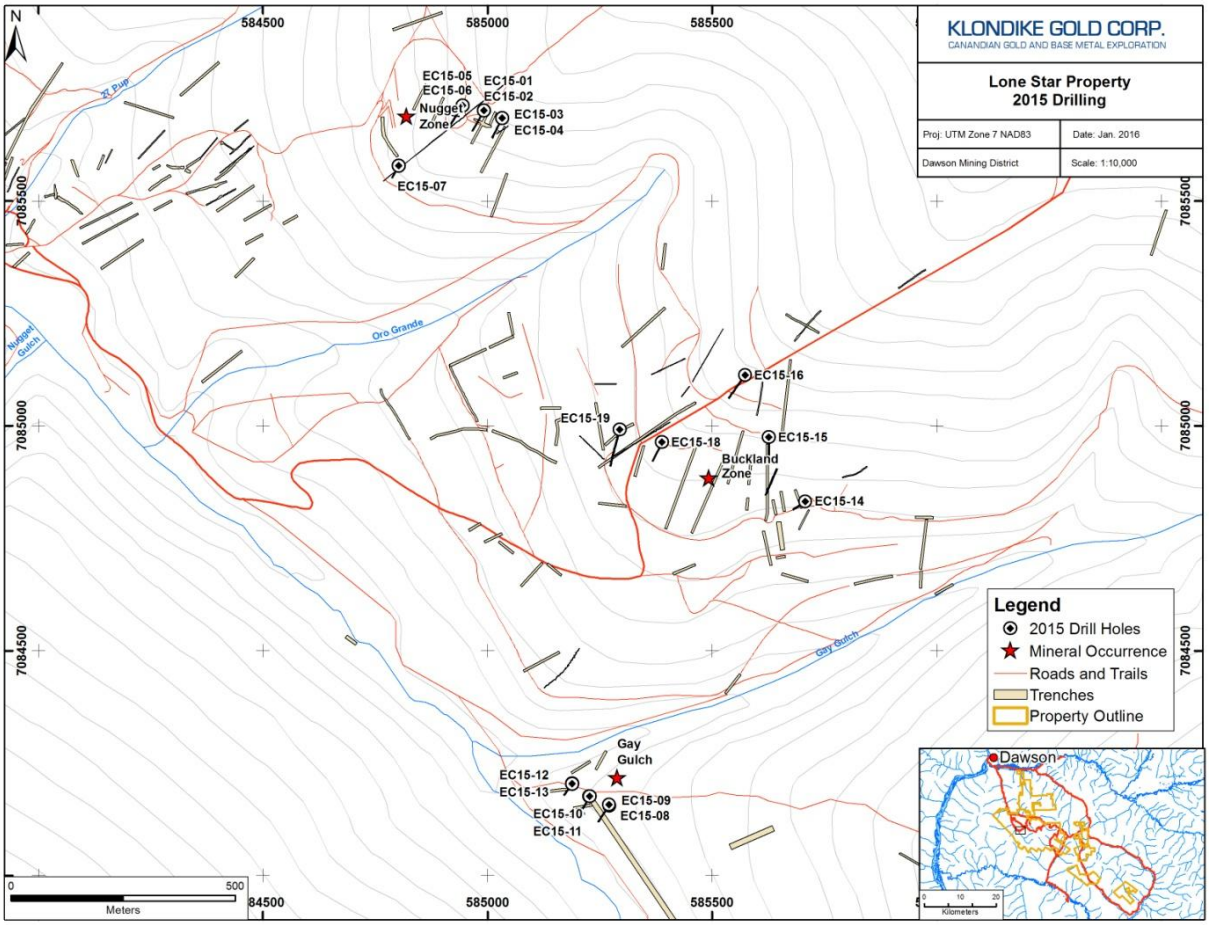

Figure 8: 2015 Lone Star drill areas

2015 exploration drilling tested several zones including Nugget (EC15-01 to EC15-06), Lower Nugget (EC15-07), Gay Gulch (EC15-08 to EC15-13), and various targets in the Buckland area (EC15-14 to EC15-19) with outcrop or sub-crop quartz veining containing visible gold (see table 2). Core logging results show that individual quartz veins with visible gold can be 0.05 to 1.0 meters in thickness and that "zones" are comprised of several to many related quartz veins ("vein arrays") occurring over widths of up to ~10 meters true thickness and which exhibit along-strike and down-dip continuity. The volume of quartz veining relative to wallrock, expressed as "% quartz veining" or "% QV" is an exploration indicator relating to gold grade.

Table 2: Diamond Drill Locations

TOTAL									**1369.30**

Nugget Zone Drill Results

The first six holes of the 2015 drill program tested the Nugget showing, following up surface chip sampling results. Holes 1 through 5 all intersected quartz veining with visible gold.

Table 3: Summary of Nugget Zone Drilling Assay Results

Hole ID	Dip	From (m)	To (m)	Interval (m)	True Thickness (m)	Grade Au g/t	% QV	Vein Array
EC15-01	-45	3.8	11.45	7.65	7.65	4.6	27	Upper
EC15-02	-85	4.4	11.6	7.2	5.7	2.3	15	Upper
EC15-03	-85	4.4	12.0	7.6	6.1	5.3	22	Upper
EC15-03	-85	47.8	49.6	1.8	1.4	7.4	27	Lower
EC15-04	-45	21.1	24.1	3.0	3.0	5.7	58	Lower

The Nugget Zone was tested from pairs of holes at 50 meter spaced intervals along a 100 meter total length. Each drill pad had a -45 and a -85 dipping hole collared from it. All holes were drilled at 210 azimuth. Along the strike of the outcropping Nugget showing, holes 1 and 2 tested the easterly end (section 450E), holes 3 and 4 tested the middle (section 500E), and holes 5 and 6 tested the westerly end (section 550E).

Drilling encountered a previously unknown 'upper vein array' at the bedrock surface at the start of holes 1 through 4. Holes 5 and 6 collared forward of the 'upper vein array'. The target for holes 1 through 6 was the 'lower vein array' which is the Nugget "vein" target which all six holes tested.

Individual quartz veins in holes 1 to 4 assay 5 g/t Au up to 40 g/t Au and most of the visible gold identified occurs within this group of quartz veins.

The 'upper vein array' expresses between 25% and 40% quartz vein to form the array interval. The 'lower vein array' in holes 1 through 4 expresses between 5% and 25% quartz vein to form the array interval. Although individual vein gold assays in the lower vein array are as high as for the upper veins, so far there are fewer veins in the lower vein array to meaningfully carry a weighted average.

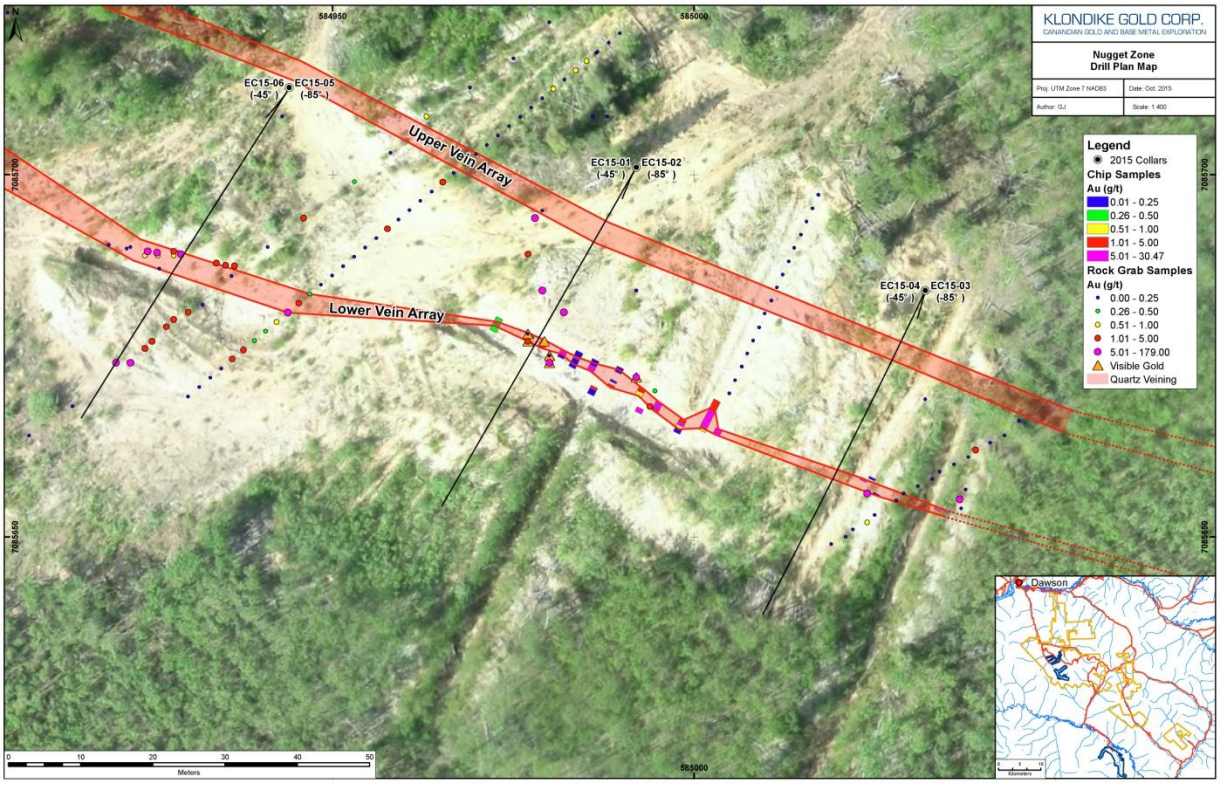

Figure 9: Nugget Zone plan map

Lower Nugget Zone Drill Results

One hole (EC15-07) tested an area of outcropping quartz veining containing numerous sights of visible gold in mafic volcanics. The hole intersected a quartz vein at the target depth containing visible gold, however there is no structure present nor is there an array of quartz veining present. The interval of interest in the hole occurs from 5.50 to 8.35 meters downhole however the few veins in the 'array' do not have sufficient grade to carry a weighted average.

Gay Gulch Drill Results

A new discovery of a gold-bearing quartz veining was made near Gay Gulch along Eldorado Creek in drill hole EC15-10. A 2.8 meter zone including a 0.5 meter quartz vein was intersected that contains coarse clots of gold up to 2.5 cm in size.

After removing all the coarse visible gold clots from the assay sample, the remaining split interval assayed 420 g/t Au over 0.5 meter, within an extended interval that averaged 75.6 g/t Au over 2.8 meters.

The Gay Gulch Zone was tested from pairs of holes at 50 meter spaced intervals along a 100 meter total length. Each drill pad had a -50 and a -85 dipping hole collared from it. All holes were drilled at 210 azimuth. Along the strike of the locally sub-cropping Gay Gulch quartz veining, holes EC15-08 and EC15-09 tested the easterly end (section 950E), holes EC15-10 and EC15-11 tested the middle (section 1000E), and holes EC15-12 and EC15-13 tested the westerly end (section 1050E).

Drilling encountered brittle felsic volcanics, fractured and cut by a quartz vein array. The quartz veining is likely related to a nearby prominent (magnetic low) fault that extends for 2,600 meters from Gay Gulch. The Gay Gulch drilling was done adjacent to Eldorado Creek on the right limit bank of Eldorado placer claim 36. By 1900, a 34 ounce gold nugget had been discovered on placer claim 36 and a larger 72 ounce nugget was discovered on placer claim 34 located 250 meters downstream. The Gay Gulch fault transects both of these placer claims.

Table 4: Summary of Gay Gulch Drilling Assay Results

Hole ID	Dip	From (m)	To (m)	Interval (m)	True Thickness (m)	Grade Au g/t	% QV
EC15-08	-85	41.90	47.25	5.35	4.00	1.6	16
EC15-09	-50	19.30	20.40	1.10	1.10	1.9	18

EC15-13	-50	19.45	21.00	1.55	1.55	10.9	10

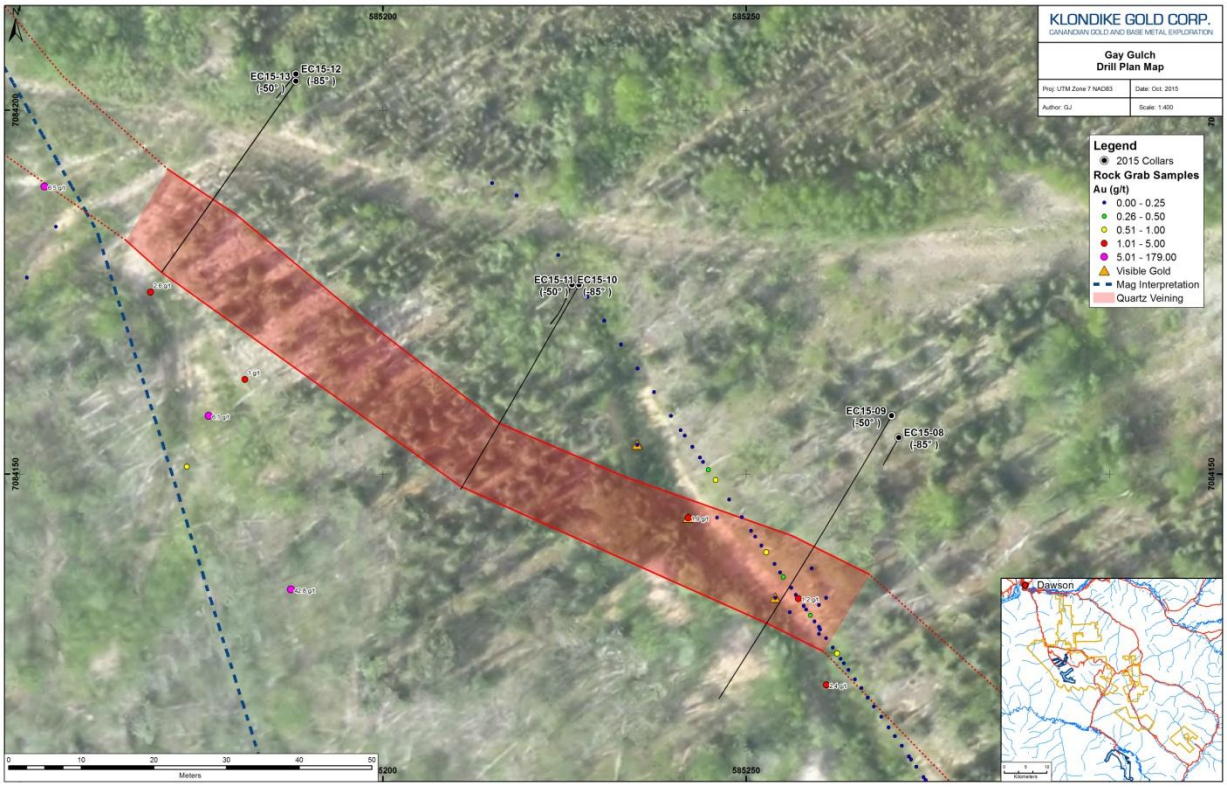

Figure 10: Gay Gulch zone plan map

Buckland Zone Drill Results

Six holes (EC15-14 to EC15-19) tested individual quartz vein targets within a 1000 square meter area collectively known as the Buckland Zone. The zone is characterized by extensive fracturing developed in mafic volcanics. The fractures commonly contain quartz veins, many with visible gold. The area is an intense, widespread magnetic low, interpreted as a large and long-lived zone of faulting. It is believed that faulting is synchronous to post-gold mineralization, but continued post-mineralization movement disrupted the earlier mineralized quartz veins.

Table 5: Summary of Buckland Zone Drilling Assay Results

Hole ID	Dip	From (m)	To (m)	Interval (m)	True Thickness (m)	Grade Au g/t	% QV
EC15-15	-50	54.70	56.50	1.8	1.80	3.7	Unknown

7.0 Sample Preparation, Quality Assurance and Quality Control, Analysis, and Security

Rock/Prospecting Grab Sample Assay Protocols

Prospecting samples are selective in nature, non-representative rock grab samples of bedrock or boulders collected to test for the presence or absence of gold and other economic minerals. Systematic additional test results may vary significantly. Samples are usually 0.5 kg to 2.0 kg in weight. The Company's samples are spatially located to within 5 meters using a hand-held Global Positioning System ("GPS") in NAD83 datum, assigned a unique assay tag, described, photographed using a GPS-enabled camera, then placed in a plastic bag and sealed. Groups of sealed sample bags are aggregated in large fiber bags then security sealed for shipment. For samples collected in 2015, the fiber bags were retained in locked storage in the Company's Dawson office until after the end of the field season before being delivered by Company personnel directly to the lab. Samples were submitted to Bureau Veritas Mineral Laboratories ("BV Labs") (formerly Acme Labs) preparation facility in Whitehorse, YT with chemical analysis of sample pulps completed in Vancouver, British Columbia. Bureau Veritas Labs is an accredited ISO 9001:2008 full-service commercial laboratory.

At BV Labs each 1 kg rock sample is crushed to 80% passing 2 mm size. A 250 g subsample is pulverized to >85% passing -75 microns size (Code PRP70-250). A 30 g (1 assay ton) subsample is assayed for gold by fire assay ("FA") fusion with an atomic absorption ("AA") finish (Code FA430). All over-limit results in excess of 10 ppm (10 g/t) for both silver and gold are re-assayed. The re-assay uses a 30 g subsample and is assayed by FA with a gravimetric finish (Code FA530-Au/Ag). Samples were also analyzed for multi-element chemistry by ICP-MS analysis (AQ200+U code).

No Company standards, blanks, or duplicates or blank samples were inserted into the sample stream in 2015, as it was not considered necessary for a small program of early stage work. BV Labs inserted and completed analyses on 17 duplicates, 28 blanks, 21 Au-only standards, 18 Ag-Au standards, and 18 ICPMS standards as part of QA/QC process on Klondike Gold's 2015 submitted samples. All results were within expected bounds and within error limits of detection.

Drill Core and Assay Protocols

All drill holes are photographed wet and dry. Magnetic susceptibility, foliation, and rock quality determination ("RQD") measurements are systematically collected. All cross-cutting (potentially mineralized) quartz veins and adjoining alteration envelopes are individually photographed and upper and lower contact angles measured. Core logging records lithology, structure, and alteration. Visible gold is identified, measured, photographed, and then excluded from the assay sample for that interval. Assay samples from drill core are cut using a diamond saw. Half the core sample interval is bagged, tagged, and sealed; the other half is returned to the core box with a corresponding tag and retained for reference. Sample bags are aggregated into rice bags, sealed, and submitted by Klondike Gold personnel to Bureau Veritas Mineral Laboratories ("BV Labs") (formerly Acme Labs) preparation facility in Whitehorse, YT with chemical analysis of sample pulps completed in Vancouver, British Columbia. Bureau Veritas Labs is an accredited ISO 9001:2008 full-service commercial laboratory.

At BV Labs each rock sample is crushed to 80% passing 2 mm size. A 500 g subsample is pulverized to >85% passing -75 microns size (Code PRP70-500). The 500 g subsample is then sieved to 106 microns (140 mesh) for "metallic screen" assaying. The plus 140 mesh fraction is then weighed and assayed for gold by fire assay ("FA") fusion with a gravimetric finish (Code FS631). A 30 g subsample of the minus 140 mesh fraction is assayed for gold by fire assay ("FA") fusion with an atomic absorption ("AA") finish (Code FA430). All over-limit results in excess of 10 ppm (10 g/t) for both silver and gold are re-assayed using a 30 g subsample and assayed by FA with a gravimetric finish (Code FA530-Au/Ag). Total gold grade is then calculated using a weighted average of the plus and minus fraction assay results. Samples were also analyzed for multi-element chemistry by ICP-MS analysis (AQ200+U code). Samples over-limit in lead are rerun by a high-detection limit ICP-ES procedure (Code MA370). QA/QC includes the insertion and continual monitoring of numerous standards, blanks, and duplicates within each batch. Blanks and standards are obtained commercially from Canadian Resource Laboratories of Langley, British Columbia. In 2015, the Company inserted blank BL-10, and standards GS-7F, GS-5J, & GS-2K. Analytical certificates for these are available at http://www.cdnlabs.com/Certificates.htm.

8.0 Interpretation and Conclusions

The Lone Star property covers a 135 square kilometer area in the vicinity of Eldorado Creek and Bonanza Creek underlying the western half of the Klondike placer goldfields. The area is prospective for orogenic gold deposits that have an implied mid-Jurassic age and are analogues of similar mineralization in the White Gold district.

Interpretation of GSC airborne magnetics flown in 2002, particularly first vertical derivative data, suggests a main WNW-ESE dextral fault runs the 50 km length of the Klondike goldfields and terminates in a NNW horsetail pattern within the Lone Star property in a series of sub-parallel structures near Eldorado Creek, as well as NNW oriented pinnate faults east of Eldorado Creek. One such NNW trending pinnate extensional fracture fault extends northerly from the main WNW-ENE dextral fault and transects the Boulder Lode occurrence. This extensional fault system, a late deformational event, is assumed to be the source of extensional quartz veining containing gold found in outcrop and float on the property. These veins have similar physical and chemical characteristics throughout the Klondike area.

Ground magnetics surveying collected this year images the WNW-trending fault system in much greater detail than the 2002 GSC survey. In the Eldorado Creek area, a series of 'horse-tail splays' terminate the regional dextral fault. The 'horse-tail' structures occur on both sides of Eldorado Creek; as far west as the Violet ridge and as far east as the top of the Lone Star ridge. Examination of outcrops in drilling areas at Gay Gulch and Nugget zones suggests conjecturally there could be both a shear component and thrust component to movement along these structures, although vein textures in most places are open-space filling and thus extensional in nature.

Currently ground magnetic survey coverage stops along the bottom of Eldorado valley leaving a 2 km by 7 km area of no data between the creek and the claim boundary. This area includes the Violet mine occurrence and associated untested soil anomaly which remains a prospective exploration target. Geologically the detailed geology of the Violet mine area could be reinterpreted. The historically reported "late" feldspar porphyry dykes which "disrupt" the gold-bearing quartz veins near Violet appear to be earlier than the gold-bearing vein at the Violet trench. If confirmed, this would be consistent with vein paragenesis documented in the Golden Saddle gold deposit.

Conventional IP data (collected during the 2000's) in the Buckland area has shown the technique can image smaller fault structures that are not evident in the magnetic data. At Buckland the decades old IP was useful in imaging faulting in an area of uniform low magnetism. The IP suggests that gold-bearing quartz vein arrays at Buckland have been severely disrupted and have limited strike length continuity; a result corroborated by 2015 drill results.

The limited detailed IP data (collected during 2015) in the Nugget and Gay Gulch areas is inconclusive in the primary aim of imaging individual meter-scale quartz veins, or equivalent 4-5 meter quartz vein arrays with 25% quartz in the interval. The detailed IP data does however appear to image discordant-to-foliation structures, which may be useful when dealing with larger, more prominent faults.

Diamond drilling was successful in intersecting gold-bearing quartz vein arrays in a variety of lithologic and structural environs. Discovery holes at Gay Gulch zone (EC15-10: 75.6 g/t Au over 2.8 meters) and Nugget zone (EC15-03: 5.3 g/t Au over 7.6 meters) indicate potential for economically interesting grades and widths can be generated by quartz vein arrays. At both zones, follow-up drilling yielded gold mineralization propagating along-strike also. All zones targeted by drilling in 2015 yielded interesting gold assays. Visible gold was identified in 14 of the 19 holes drilled.

In general, the Lone Star property is considered to have potential for gold-bearing extensional quartz vein arrays and brecciation in proximity to the main WNW-ESE dextral fault, also the NNW-SSE trending pinnate extensional fault, and in areas where these two structures intersect. The intersection of the main and pinnate faults should be targeted. Areas of extension versus compression along the major faults should be targeted. Different host lithologies along these faults, particularly in extensional settings, should be targeted. Pervasive silicification and other types of alteration around quartz veining would be a positive exploration indicator.

9.0 Recommendations

The property-wide ground magnetics survey should be completed to the western claim boundary on the west side of Eldorado Creek. More detailed prospecting and geological work is required along this trend following acquisition of magnetic data targeting areas interpreted to be 'extensional', and the area of gold-bearing quartz subcrop (to 13.9 g/t Au) between French Gulch and Nugget Gulch along the Violet trend.

Conventional IP should be considered as a secondary targeting tool useful in defining the geometry of individual fault structures, particularly in areas to be tested with follow-up drilling like at Gay Gulch and/or Nugget prospects.

Detailed IP could be considered to help define geometry and extent of major vein arrays identified by drilling adjacent to the major faults which are the prime exploration targets at this time.

The 2015 drill program has shown that previous exploration, including trenching, reverse circulation drilling, and some diamond drilling has been inadequate and falsely sterilized areas with abundant gold hosted by vein arrays with interesting economic characteristics.

Diamond drilling is recommended to test outcropping and subcropping gold-bearing quartz vein arrays wherever identified on the Lone Star property, irrespective of host rock or associated structural features. The intent of this drill program is to document the geological and economic characteristics of a wide range of gold-bearing mineralization, although any of these could be economically interesting. Specific potential targets under consideration at this time include, but are not limited to: Violet shaft, French hill trench, Glacier gulch hill, upper 27 Pup, the Christy pit area, and possibly O'Neill shaft.

Diamond drilling is recommended to follow up 2015 drill discoveries of gold-bearing quartz vein arrays at Nugget zone. Step out drilling should test to the northwest where gold is known to occur in old

trenches, to the south east which is open, and step down and back to test behind and down dip underneath the best intersections.

Diamond drilling is recommended to follow up 2015 drill discoveries of gold-bearing quartz vein arrays at Gay Gulch. Here a prominent structure approximately 2.5 km long appears to be the primary control on orogenic quartz veining. Drilling is recommended to specifically follow up 2015 drill discovery of 75.6 g/t Au over 2.8 meters be drilling along strike and down dip, and also to test along the outlined structure in locations interpreted to be extensional, or in locations that test for vein arrays in different host lithology along the structure.

Geostatistical work is recommended examining domains of quartz veins for correlations between gold and other elements, and for groupings of gold plus high correlation elements in veins with geographic location. Academic speculation has implied there are geochemically different sources to the gold within the Klondike source rocks. Does the Company's data support this concept, and can it used as an exploration targeting tool?

10.0 Statement of Qualifications

I, Peter Tallman, of Vancouver, British Columbia hereby certify that:

- I am a graduate of the University of Western Ontario with a Bachelor of Science (Geology) degree (1984).
- I am a practicing Professional Geoscientist (#02366) with the Professional Engineers and Geoscientists of Newfoundland and Labrador (PEGNL) since May 1991.
- I have practiced my profession as a geologist in Canada, throughout the America's as well as Australia and Africa continuously since graduation.
- I have held the position of executive officer and/or director of various publically listed Canadian corporations since 1995.
- I currently hold the position of President and Chief Executive Officer with Klondike Gold Corp., a company listed publically on the TSXV Exchange.
- I own shares and have been granted options to purchase shares in Klondike Gold Corp.
- I directed work on the Lone Star Property and am the designated Qualified Person as defined by National Instrument 43-101 policy.

Dawson, Yukon Territory

Peter Tallman, P.Geo.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

BRITISH COLUMBIA CERTIFIED ASSAYER
MARCUS LAU
Geochemical Laboratory Manager

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS WHI15000049.1

CLIENT JOB INFORMATION

Project: LS
Shipment ID: LS15-02
P.O. Number
Number of Samples: 32

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	32	Crush, split and pulverize 250 g rock to 200 mesh			WHI
FA430	32	Lead Collection Fire - Assay Fusion - AAS Finish	30	Completed	VAN
AQ201	32	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
FA530	5	Lead collection fire assay 30G fusion - Grav finish	30	Completed	VAN

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS WHI15000049M.1

CLIENT JOB INFORMATION

Project: LS
Shipment ID: LS15-02
P.O. Number
Number of Samples: 5

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SPTRF	5	Split samples by riffle splitter			VAN
PUL85	5	Pulverize to 85% passing 200 mesh			VAN
FS631	5	Metallic Sieve 500g to 150 mesh			VAN
Split +150 mesh	5	Analysis sample split/packet			VAN
Split -150	5	Analysis sample split/packet			VAN
FS631	5	Metallics Fire Assay for Au	30	Completed	VAN
FA530	2	Lead collection fire assay 30G fusion - Grav finish	30	Completed	VAN

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS WHI15000108.1

CLIENT JOB INFORMATION

Project: LS
Shipment ID: LS15-04
P.O. Number
Number of Samples: 42

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-500	42	Crush, split and pulverize 500g rock to 200 mesh			WHI
FS631	42	Metallic Sieve 500g to 150 mesh		Completed	VAN
Split +150 mesh	42	Analysis sample split/packet			VAN
Split -150	42	Analysis sample split/packet			VAN
FS631	42	Metallics Fire Assay for Au	30	Completed	VAN
AQ201	42	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS WHI15000115.1

CLIENT JOB INFORMATION

Project: LS
Shipment ID: LS15-05
P.O. Number
Number of Samples: 30

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-500	30	Crush, split and pulverize 500g rock to 200 mesh			WHI
FS631	30	Metallic Sieve 500g to 150 mesh			VAN
Split +150 mesh	30	Analysis sample split/packet			VAN
Split -150	30	Analysis sample split/packet			VAN
FS631	30	Metallics Fire Assay for Au	30	Completed	VAN
AQ201	30	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

APPENDIX VII

DIAMOND DRILL GEOLOGICAL LOGS

Hole ID	From (m)	To (m)	Rock Code	Description	Alteration 1	Alteration 2	Alteration 3	Mineralization	VG	Structure
EC15-01	0	3.7	99	Casing						
EC15-01	3.7	27.75	1U	Mafic schist: strongly foliated medium green schist with spotted dark green chl alt (mottled appearance). Moderate sericite alt (mus), locally strong, most visible on fol planes. Local lime green epitode alt. Local patches of orange iron alt. 7% QV-ing parallel to fol, 1-15mm thick, white, locally deformed with host. Younger, x-cutting veins see QV tab. VG at 5.6m and 5.9m, on edge of host and QV . Trace cubic py up to 5mm; rusted with fresh specks. One spot of galena in QV.	mod chl	mod ser		tr py, gn, au	Y	str fol
EC15-01	27.75	35.5	Fault	Fault breccia zone hosted in mafic schist: upper and lower contacts are broken core fault, the rest of the zone is ductile deformation. QVs show increase in orange/borwn iron alt. Fol is elongated parallel to long core axis.	mod chl					
EC15-01	35.5	49.9	1U	Mafic schist: moderately fol, grey-green, unit is fairly homogenous looking, 3% QV. Weak-mod chl alt as darker green banding.	mod chl			tr py		mod fol
EC15-01	49.9	52.1	Fault	Fault zone: core pieces range from 1cm to 20 cm of whole core. Hosted in mafic shit above and below. Fol is sub-parallel to parallel to long core axis.	mod chl					
EC15-01	52.1	64.6	1U	Mafic schist: moderately fol, grey-green, unit is fairly homogenous looking, 3% QV, fol and deformed with host, 1-15mm. Weak-mod chl alt as darker green banding. Tr py as fresh cubes up to 3mm, locally rusted. Last two meters of unit is bleached in approach to lower contact with fault zone.	mod chl			tr py		mod fol
EC15-01	64.6	73.8	Shear	Zone of deformation: hosted in below mafic ser schist unit. Schist is deformation, QVs are broken. Schist is folded or fol is parallel to long core axis, str ser alt. Core ranges from 1 cm pieces to whole core of 40cm.	str ser					
EC15-01	73.8	76.2	1U	Mafic schist: strongly foliated medium grey (green/blue) schist. Mod ser alt, mod chl alt. Unit is homogenous. Tr py; fresh cubes sub-mm to 3mm, locally rusted.	mod ser	mod chl		tr py		str fol
EC15-02	0	3.05	99	Casing						
EC15-02	3.05	13.75	1U	Mafic schist: strongly foliated medium green schist with spotted dark green chl alt (mottled appearance). Moderate sericite alt (mus), locally strong, most visible on fol planes. 8% QV-ing parallel to fol, 1-25mm thick, white, locally deformed with host. Younger, x-cutting veins see QV tab. VG at 2.55m and 4.6m, on edge of host and QV . Trace cubic py up to 5mm; rusted with fresh specks. Last meter of the unit is tuffaceous.	mod chl	mod ser		tr py, au	Y	str fol
EC15-02	13.75	28	1U	Mafic schist: strongly foliated medium green schist with lime green epitode alt overprinting chl alt. 5% Qvs parallel fol, deformed with host, 5-20mm (see QV tab for x-cutting veins). Trace cubic py up to 5mm; rusted with fresh specks.	mod epi	mod chl				str fol
EC15-02	28	31.7	Fault	Fault breccia zone hosted in mafic schist: zone contains broken core as well as whole pieces of core displaying more ductile deformation, QVs show increase in orange/borwn iron alt.	mod chl					
EC15-02	31.7	40.5	1U	Mafic schist: moderately fol, grey-green, unit is fairly homogenous looking, 3% QV, fol and deformed with host, 1-15mm. mod chl alt as darker green banding. Tr py as fresh cubes up to 3mm	mod chl			tr py		mod fol

Hole ID	From (m)	To (m)	Rock Code	Description	Alteration 1	Alteration 2	Alteration 3	Mineralization	VG	Structure
EC15-02	40.5	42.4	shear	Zone of deformation: increased deformation of fol, host is mafic schist above and below. At 42m 50 cm of rubble/gouge. Increase in orange/brown iron alt.	mod chl					
EC15-02	42.4	50.3	1U	Mafic schist: moderately fol, grey-green, unit is fairly homogenous looking, 3% QV, fol and deformed with host, 1-15mm. mod chl alt as darker green banding. Local areas of lime green epidote alt. Sharp alt contact at 49.4 Local areas (up to 2-3m) of dark green chl blebs; mottled appearance. Tr py as fresh cubes up to 3mm.	mod chl	wk epi		tr py		mod fol
EC15-03	0	3.1	99	Casing						
EC15-03	3.1	18.75	1U	Mafic (intermediate) schist: strongly foliated medium green (blue) schist with spotted moderate to strong chlorite alteration, moderate sericite alt (mus), most visible on fol planes. Local lime green epitode alt. 10% QV-ing parallel to fol, 1-15mm thick, white, locally deformed with host. Younger, x-cutting veins see QV tab. VG at 4.55m 1mm nugget. Trace cubic py up to 5mm; rusted with fresh specks.	mod chl	mod ser		tr py, au	y	Str fol
EC15-03	18.75	22.85	4U	Sediment: massive grey folded layered siliceous sediment. Locally deformed (shearing, folding). Tr rusted and fresh py cubes up to 3mm. Moderate dark green chl alt. Local QV parallel fol, 1-50mm thick, milky white.	mod chl			tr py		mod fol
EC15-03	22.85	26.3	Shear	Zone of deformation, fault breccia: host is above below, brecciated, foliation and parallel fol QVs are folded. Local fault gouge.	mod chl					
EC15-03	26.3	28.8	4U	Tuffaceous sediment: grey (brownish) fine grained - gritty apprerance. Str fol, tr py rusted cubes up to 2mm. Local 2-3mm qtz eyes deformed in the direction of fol. 5% qtz veining parallel fol 1-4mm.	mod ser			tr py		str fol
EC15-03	28.8	30.6	4U	Fine grained grey sediment: layered, siliceous. Unit is fol. 5% QV parallel fol, 1-3mm thick. Patchy dark green chl. Tr py rust cubes 1mm	mod chl			tr py		mod fol
EC15-03	30.6	34.25	Shear	Zone of deformation, hosted in the unit above and below. Zone of increased folding and QVs. QVs up to 20cm, irrgular contacts, x-cutting fol. ``W`` shaped folding of QVs. Tr py, rusted and fresh up to 12mm cubes.	mod chl			tr py		
EC15-03	34.25	35.25	4U	Fine grained grey sediment: layered, siliceous. Unit is fol. 3% QV parallel fol, 1-3mm thick. Patchy dark green chl.	mod chl					mod fol
EC15-03	35.25	51.8	4U	Sediment (or schist): grey-blue (green) locally tuffaceous sediment. 5% QV-ing as 1-8mm veins parallel fol and as QVs up to 45 cm x-cutting fol. Mod ser alt, locally str to very str. Iron alt overprinting associated with x-cutting QVs. Local lime greeen epidote alt in last 2 m of unit. Unit is stronly fol. VG is two spots (see QV log) as specks. Local patches of increased ductile deformation associated with x-cutting veins. Tr py as rusted (locally fresh) cubes up to 4mm.	mod ser	mod chl	mod Fe	tr py, au	y	str fol

CERTIFICATE OF ANALYSIS WHI15000172.1

CLIENT JOB INFORMATION

Project: LS
Shipment ID: LS15-05
P.O. Number
Number of Samples: 149

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-500	142	Crush, split and pulverize 500g rock to 200 mesh			WHI
FS631	149	Metallic Sieve 500g to 150 mesh			VAN
Split +150 mesh	149	Analysis sample split/packet			VAN
Split -150	149	Analysis sample split/packet			VAN
FS631	142	Metallics Fire Assay for Au	30	Completed	VAN
AQ201	149	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
FA530	6	Lead collection fire assay 30G fusion - Grav finish	30	Completed	VAN

ADDITIONAL COMMENTS

Invoice To: Klondike Gold Corp.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS WHI15000190.1

CLIENT JOB INFORMATION

Project: LS
Shipment ID: LS15-07
P.O. Number
Number of Samples: 141

SAMPLE DISPOSAL

RTRN-PLP Return
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-500	132	Crush, split and pulverize 500g rock to 200 mesh			WHI
FS631	139	Metallic Sieve 500g to 150 mesh			VAN
Split +150 mesh	139	Analysis sample split/packet			VAN
Split -150	139	Analysis sample split/packet			VAN
FS631	132	Metallics Fire Assay for Au	30	Completed	VAN
AQ201	139	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
FA530	1	Lead collection fire assay 30G fusion - Grav finish	30	Completed	VAN

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS WHI15000201.1

CLIENT JOB INFORMATION

Project: LS
Shipment ID: LS15-08
P.O. Number
Number of Samples: 163

SAMPLE DISPOSAL

PICKUP-PLP Client to Pickup Pulps
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-500	147	Crush, split and pulverize 500g rock to 200 mesh			WHI
FS631	163	Metallic Sieve 500g to 150 mesh			VAN
Split +150 mesh	163	Analysis sample split/packet			VAN
Split -150	163	Analysis sample split/packet			VAN
FS631	147	Metallics Fire Assay for Au	30	Completed	VAN
AQ201	161	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
