Summary

During the 2017 field seasons, White Gold Corporation ("White Gold") contracted GroundTruth Exploration Inc. ("GroundTruth") to conduct a soil sample survey on the Polar project on the 26-30 August 2017. Polar is a grass roots gold (Au) exploration project in the White Gold District of Yukon, Canada.

The 2017 program consisted of 766 grid soil samples spaced 50m along lines 100m apart.

The 2017 field season identified 2 samples containing Au greater than 12 ppb, with the highest at 16.2ppb.

It is recommended to expand the southeastern grid to the southwest, expanding the identified gold-in-soil anomaly towards a prospective zone of heavy fault activity.

Introduction

During the 2017 field seasons, White Gold Corporation ("White Gold") contracted GroundTruth Exploration Inc. ("GroundTruth") to conduct a soil sample survey on the 26-30 August 2017. POLAR is a grass roots gold (Au) exploration project that has been targeted due to both its proximity to the White Gold Deposit to the west (Figure 1), and to historic work identifying elevated gold-in-soil results.

This report describes the work completed in the 2017 field season, summarizes the results and offers some insight and direction moving forward. The cost of the 2017 program was $55,229.16.

Property Description and Location

The Polar property is located 8 km south of the confluence of the Stewart River with the Yukon River. The property lies within the Klondike Plateau of west-central Yukon on NTS Map sheet 115O/03. Polar is 95 km south of Dawson City, YT (Figure 1). The claims are centered at 585900E/7010500N (Datum: NAD83, UTM zone 7N). The property is surrounded by staked ground, with White Gold Corps 'White Gold' property to the south and west, Pacific Ridge Exploration Ltd.'s 'Gold Cap' claims to the northwest, Erin Ventures' 'AU' claims to the north, Goldstrike Resources Ltd.'s 'Strike' to the east, and Cloudbreak Resources Ltd.'s 'Lucky' to the southeast.

The Polar property is in an unglaciated region of Canada's Boreal Cordillera ecozone. Due to its location in Canada's discontinuous permafrost zone, permafrost is distributed unevenly throughout the property, controlled primarily by elevation, slope, and aspect. The landscape is composed primarily of north facing slopes incised by steep creeks flowing into the Stewart River. Elevations on the property range from 490 to 1067 meters. The north facing slopes are covered in thick moss mats, black spruce, and alder thickets over ice rich permafrost. The east and west facing slopes are typically covered by birch, white spruce, black spruce, trembling aspen and shrubs, sporadically underlain by permafrost depending on localized conditions. Areas near creeks are thick with willows and alders, and generally surrounded by permafrost due to shady location at valley bottoms. Southern slopes are generally more sparsely vegetated with ground leaf cover and white spruce, aspen and birch forests, and seldom underlain by permafrost.

The area experiences typical climatic conditions for central Yukon Territory with short, warm and dry summers and cold winters. Temperatures range from 0˚C to -50˚C in the winter and 0˚C to +32˚C in the summer.

The 2017 program was supported from Dawson City. The soil samplers were camped closer to the property on the Thistle Creek Airstrip, and the project was accessed by helicopter from there.

Claim Information

The property consists of 149 Quartz claims covering 3,033 hectares of ground (Figure 7, Appendix A). The following claims are all 100% held by Ryanwood Exploration Inc.:

History

There is no history of hard rock mining on this property, however there is a long and rich history of placer gold mining in the district.

This property is an amalgamation of smaller claim blocks, the Polar, Sim, Tim, Steward, and Stewart, that have been staked individually and grouped over the years to create a larger conglomerated project named the Polar (figure 7). Previous work done in the vicinity of and within the bounds of the Polar project are summarized as follows (from Zuran 2004)

~1901-1904 The 'Burian' mineral occurrence (115O-009) - probably staked on quartz veins. Claims were staked frequently near the mining recording office at Stewart River, including Great Northern cl (4627) in Jan/1901, 4.8 km up the Stewart River; Victoria cl (4636) in Jan/1901; Alice cl (4805) in Mar/1902, on the southeast side of Henderson Creek; Dauphin by J. Donkin, 2.4 km below Henderson Creek (trenched in 1902); and, Reliance cl (4852) in Mar/1904 near the Great Northern. The mineral occurrence is located 8 km to the northwest of the STEWARD claim block across the Stewart River. Taken from Gordey and Makepeace, 1999 (CD).

1910 The 'Three Sisters' mineral occurrence (115O-007) The area is underlain by Palaeozoic? metasedimentary rocks and gneissic granite. Claims were probably staked on quartz veins. Small outcrops of granodiorite have also been mapped nearby. The mineral occurrence is located approximately 2.5 km to the south of the claim block. Taken from Gordey and Makepeace, 1999 (CD).

1917 The 'Tenderfoot' mineral occurrence (115O-008) - probably staked on quartz veins. The mineral occurrence is located approximately 3 kilometres north-northeast of the claim block on the north side of the Stewart River. Taken from Gordey and Makepeace, 1999 (CD).

1935 H.S. Bostock starting regional 1:250,000 scale geological mapping in 1935 (Bostock, 1942).

1970's Regional exploration related to the discovery of the Burmeister/Lucky Joe mineral occurrence (115O-051) ~36km to the north-northwest for copper-molybdenum mineralization likely occurred in the area of the STEWARD claims.

2002 Geological mapping at 1:100,000 scale as part of a Geological Survey of Canada NATMAP project (Ryan et al, 2002).

2003 Kennecott Canada Exploration Inc. conducted a reconnaissance style multi-element geochemistry soil sampling survey on and adjacent the STEWARD claim block. Shawn Ryan (Yukon prospector) targeted the area utilizing recent low level airborne aeromagnetic survey, conducted jointly by the Geological Survey of Canada and the Yukon Geology Program. Ryan staked 32 claims in April, 2003 making up the STEWARD claim block. Ryan identified soil samples indicating a zinc halo on the south part of the claim block around copper anomalies located at the contact betweenmagnetic high and low areas (See Ryan, 2003).

I

2004 In March of 2004, Copper Ridge Explorations optioned the Thistle Property from Shawn Ryan and funded a property wide soil sampling and prospecting program (see Zuran, 2004). This program defined a strong multi-element soil geochemical anomaly called the “Copper Wall”. While the magnitude of the anomaly was not strong, the anomaly was quite consistent and was coincident the margin of a strong regional airborne magnetic anomaly. In October of 2004, 22 more claims comprising the TIM and SIM blocks were staked.

2005 In May and June, IP geophysical surveying, geochemical soil sampling and reconnaissance geological mapping were conducted on the Thistle Property, now consisting of the STEWARD/STEWART/TIM and SIM claim blocks. The 2005 soil sampling program failed to further define or even confirm the soil anomaly discovered in 2004. This has been attributed to using mattocks exclusively to sample, resulting in shallower samples depths then in previous years where a soil auger was utilized. Of the three IP lines, two had significant zones of moderate to high chargeability coincident with magnetic and soil geochemical anomalies (See Dawson, 2005).

2008 1516 soils were collected in the 2008 field season over an eastern and a western grid. The Eastern Grid had only one spot gold anomaly with a couple of minor arsenic and antimony soil anomalies. The Western Soil Grid had the best results with a couple of anomalous gold clusters results reached up to 292 ppb Au (Ryan 2008).

Geology

Regional Geology

The project is located within the Yukon-Tanana terrane (YT) of the western Yukon and central Alaska (Figure 2). The YT is an accreted terrane of polymetamorphosed and polydeformed metasedimentary, metavolcanic, and metaplutonic rocks of Upper Paleozoic and older ages bound by the Tintina fault to the northeast and Denali fault to the south-west. Overall, it records a prolonged and complex history of tectonic and magmatic processes along the northwestern margin of Laurentia between middle Paleozoic and Early Tertiary time. It has an equally complex metallogenic evolution with at least 10 pulses of mineralization of various styles currently recognized (Nelson et al 2013, Allan et al 2013, Mortensen and Allan 2012).

In the area of the Polar property bedrock consists of meta-sedimentary, meta-volcanic rocks of the Devonian-Mississippian Nasina assemblage and Simpson Range suite that are cross-cut/overlain by the Permian Snowcap and Klondike assemblages. These units underwent ductile (D1/D2) deformation associated with amphibolite facies metamorphism during the Late Permian Klondike orogeny. This event was associated with the accretion of the YT to Laurentia and associated closure of the Slide Mt Ocean and obduction of ophiolitic slices of the Slide Mt terrane.

The area underwent additional compression and ductile deformation (D3) associated with greenschist facies metamorphism during the Late Triassic-Early Jurassic. The event was associated with widespread thrust faulting and imbrication of the Slide Mt. terrane, and the emplacement of felsic to ultramafic intrusions. This transitioned into a period of regional uplift and exhumation and is associated with dominantly east-west oriented sinistral faults, localized north-northwest vergent folds, and high angle reverse faults (D4). This period of deformation spans the ductile to brittle transition and are associated, particularly the E-W sinistral faults, with 'orogenic' style gold mineralization throughout the White Gold district and Klondike.

Renewed northeast dipping subduction under the continental margin during the Late Cretaceous led to renewed magmatism across the YT, and is associated with felsic to intermediate intrusions of the Dawson Range batholith and felsic-mafic volcanic rocks of the Mount Nansen suite. The Early Cretaceous arc activity ceased around 99Ma; at which point it stepped farther inboard and is associated with intrusive suites in the Selwyn Basin (ie. Tombstone suite, etc.). This lull in magmatism was associated with the formation of the Indian River Formation, a coarse clastic sedimentary package deposited in an alluvial/fluvial to shallow marine setting that records approximately 40 million years of sedimentation following the formation of the Dawson Range Arc.

Arc style magmatic and volcanic activity renewed during the Late Cretaceous and is associated with a series of calc-alkaline plutons and high level porphyry dikes, plugs, and breccias in the Casino and Freegold areas, and age equivalent intrusions in eastern Alaska (79 – 72Ma). This event was also likely associated with the initiation of dextral offset along the Big Creek fault and reactivation of older Jurassic age structures in Dawson Range area. It is also associated with variable styles of mineralization ranging from Cu-Au-Mo porphyries (Casino), intrusion-related/epithermal occurrences (Sonora Gulch, Freegold area), and structurally controlled gold /

'orogenic' mineralization (Coffee, Boulevard, Moosehorn). At 72Ma there was a distinct change in magmatism with widespread bi-modal volcanism (Carmacks group) and the emplacement of small, high-level, felsic plugs and stocks (Prospector Mountain suite) throughout the YT. A prominent set of northeast trending normal and sinistrally oblique faults are commonly associated with the intrusive and volcanic rocks of this event and are broadly coeval with magmatism.

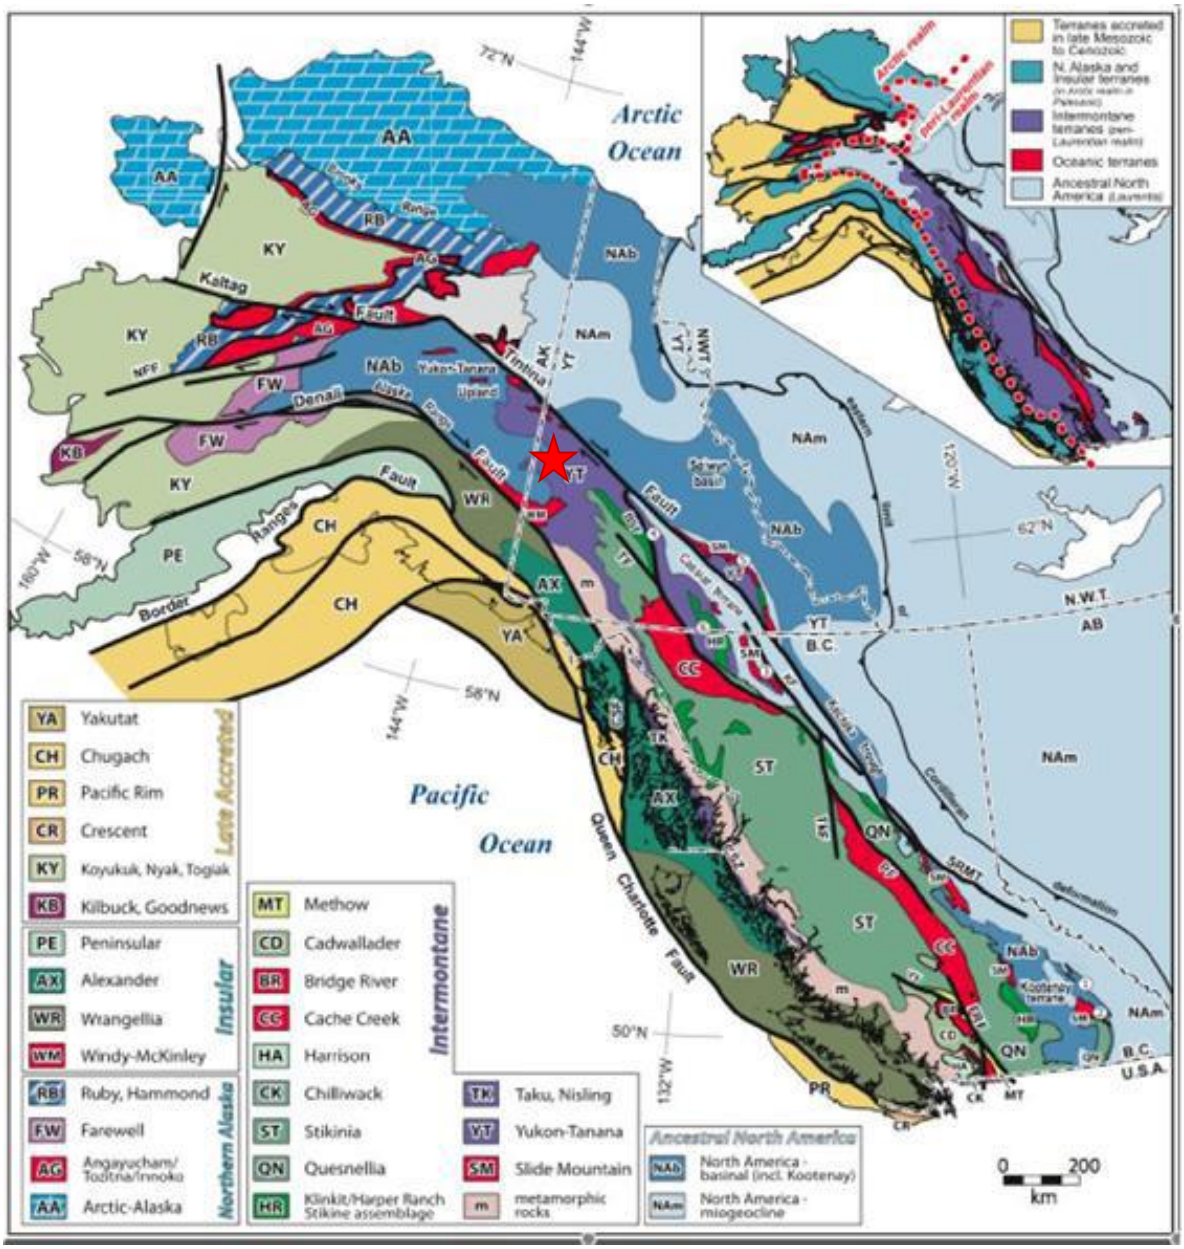

Figure 2: Terrane map of the northern Cordillera (modified from Nelson et al 2013). The red star is the approximate location of the Polar property.

I

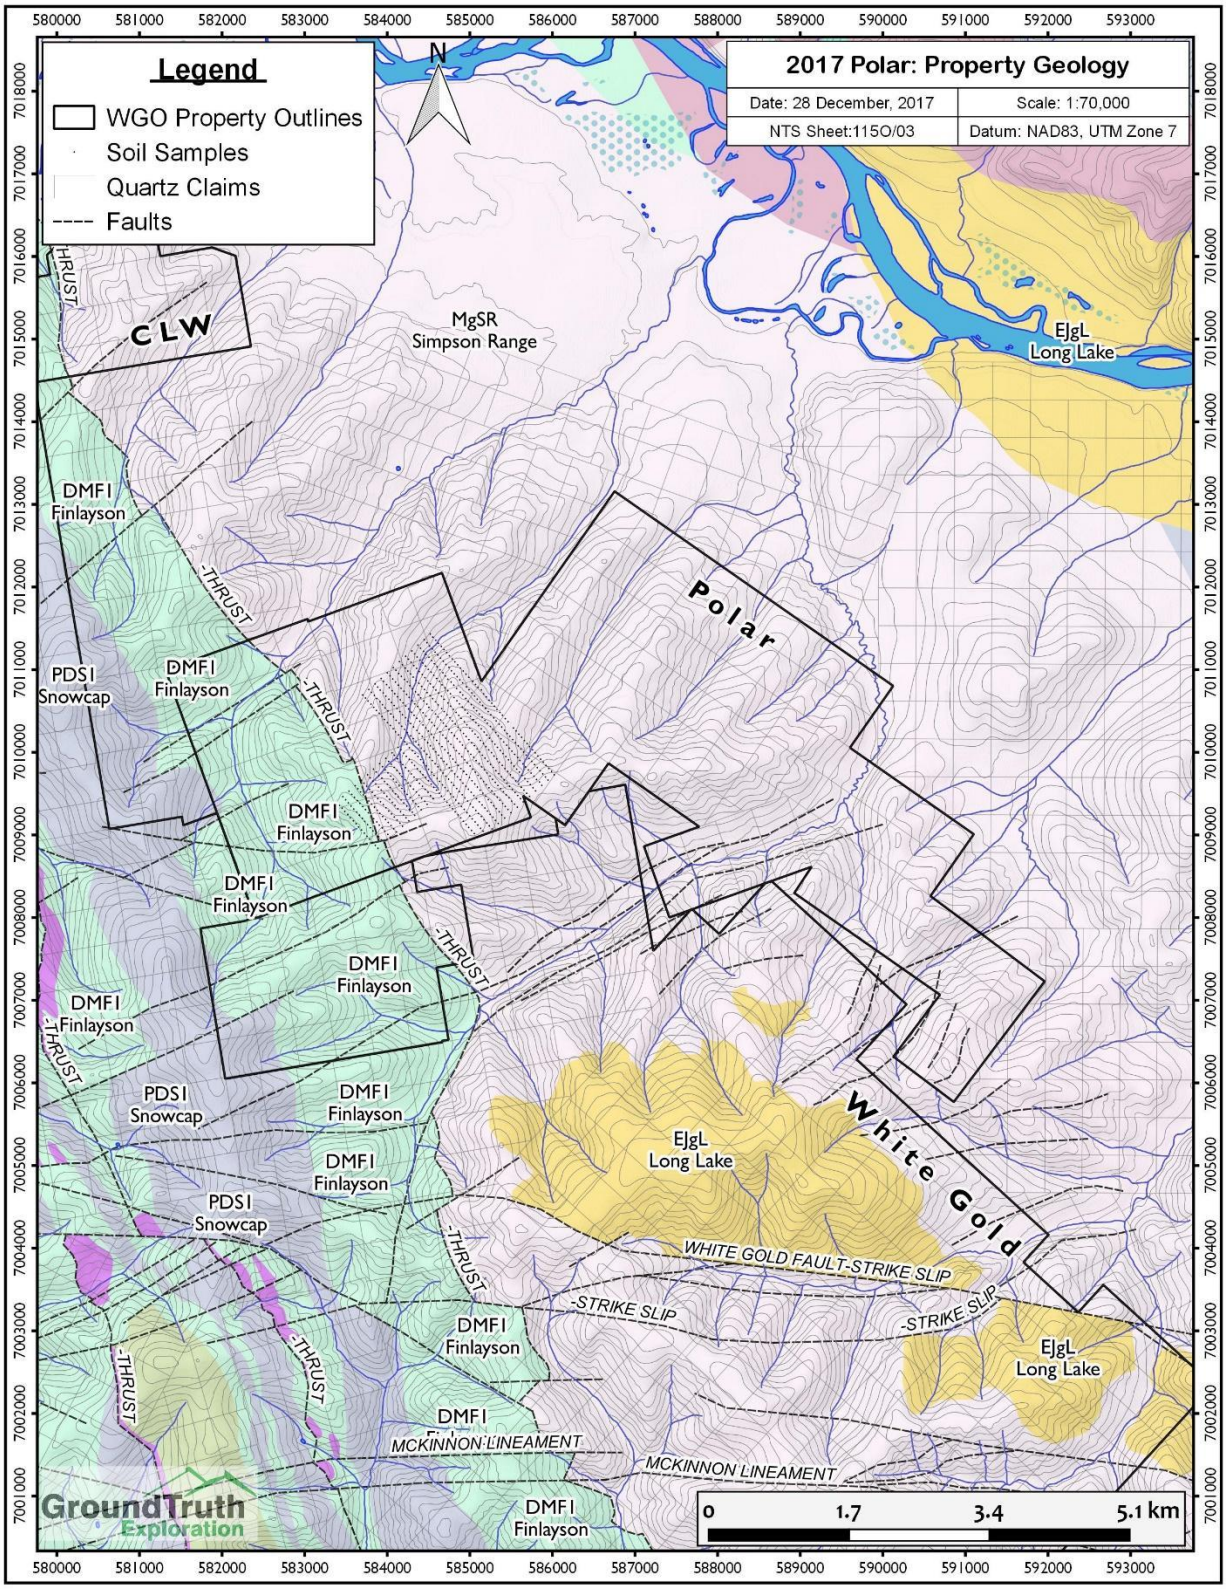

Figure 3: Polar Property Geology with 2017 Soil Sample Locations.

I

A final magmatic event occurred during the Late Tertiary and is associated with the emplacement of bi-modal suite of predominately north-south trending dike swarms, plugs, and local pyroclastic rocks. Gabrielse et al 2006 suggests that the magmatic event was likely coeval with the early stages of dextral offset along the Tintina fault. (Gibson, 2014)

Property Geology

The most recent geologic mapping in the area was performed by Yukon Geological Survey, Colpron et al (2016). The property is located within the Yukon-Tanana terrain and underlain by Finlayson rock suites in the western half of the property, and the Simpson Range suite in the eastern half (Figure 3).

The DMF1 unit is part of the intermontane Finlayson suite of intermediate to mafic volcanic and volcaniclastic rocks such as amphibolite, bt-qtz schist, and mafic gneiss.

The MgSR unit is part of the intermontane Simpson Range suite of metamorphic rocks including Hbl-bearing metagranodiorite, metadiorite and metatonalite.

Structurally, the area is dominated by the north trending geological contacts and thrust faults, offset by northeast striking fault zones. It is on trend with the northwest trending coffee creek fault and numerous other northwest trending structures.

Mineralization

This property was targeted due to its proximity to Golden Saddle Deposit, 10km to the south and along structural trend. The main commodity of interest here is gold.

Exploration Program and Results

Geochemical Survey: Soil Sampling

During the 2017 field seasons, White Gold Corporation ("White Gold") contracted GroundTruth Exploration Inc. ("GroundTruth") to conduct a soil sample survey on the Polar project on the 26-30 August 2017.

The 2017 field program consisted of a standard grid with 766 soil samples spaced at 50m along lines 100m apart. This grid expanded the 2008 grid to the south and east.

Method and Approach

Soil surveys are typically conducted by crews of 5 samplers, one of which is the crew boss who oversees the survey. The Crew Boss is responsible for coordinating safe and efficient operation of survey and ensuring survey is conducted as planned. All samplers run solo traverses proximal to each other so that radio contact with other crew members can be maintained.

The following equipment is used for the completion of the survey:

Soil Auger/Mattock:	Eijklcamp hand auger and 5lb mattock
Handheld Datalogger:	Samsung S5: weatherproof handheld with barcode scanner
Camera:	Samsung S5: 16 megapixel camera
GPS units:	Garmin 76cx handheld GPS
Radios:	VHF Radio for helicopter communication
Processing:	Laptop computer
Software	Fulcrum App forms and database, Ozi Explorer for waypoint upload, QGIS Mapping Software.

Survey Procedure

The survey is completed in the field according to the following procedure:

All sampling traverses are pre-planned, with pre -specified sampling intervals, typically 50m for grid spacing and 100m for ridge and spur recce traverses. Field technicians navigate to sample site using handheld GPS units. The soil sampler arrives at each sample site, identifies the most appropriate location to collect the sample and lays out a sheet of plastic (12"x20" ore bag). The soil sample is taken using an Eijklcamp brand hand auger at a depth of between 20cm and 110cm. Samplers strive to consistently collect C-Horizon sample material. Where necessary (rocky or frozen ground) a prospector's pick ('mattock') is used to obtain the sample.

The soil is laid out on the sheet of plastic in the order it was recovered from the sample hole. Two Standardized photos are taken at each sample site- 1) Sample Location photo: across slope, 5m from sample hole with auger inserted and 2) Sample Profile photo: Close up of sample laid out on ore bag with barcode tag and Munsell color chart in photo.

The sampler places the necessary amount of soil (400-500 grams) from the bottom of the hole into a Kraft sample bag. The bag is labeled with the 3-letter project code. Three identical 7 Digit barcode ID tags are used to identify the sample: One is placed inside the bag, one is tied to the

outside of the bag, and one is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape.

A field duplicate sample is taken once for every 25 samples. Both samples are given unique Sample identification number. The data for both samples is recorded and a note is made indicating the duplicate and its corresponding sample identification number. At client's discretion, standard reference material is inserted into the sample stream at an interval of 1:50.

The GPS location of the sample site is recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD 83 format, and the waypoint is labeled with the project name and the sample identification number. A weather-proof handheld device equipped with a barcode scanner is used in the field to record the descriptive attributes of the sample collected. This includes: sample identification number (scanned into device at sample site), soil colour, soil horizon, slope, sample depth, ground and tree vegetation and sample quality and any other relevant information. As well, the GPS coordinates are entered into the handheld device as a secondary backup in case of GPS failure.

Data Processing

Each night in the field, the GPS, Handheld devices and cameras are downloaded to a laptop computer. The data is verified and mapped on a sampler-by-sampler basis in proprietary database auditing and mapping software by the crew boss. Photos are downloaded and reviewed by the supervisor to ensure quality samples and correct procedures are being followed.

In camp at the end of each day, the crew boss inspects all samples from each sampler for size and consistency as a quality check. Each sampler then repackages all samples for shipping-barcode scanning them as they are placed into a rice bag which is sealed with a barcoded security zip tie. Samples are shipped from the field to the lab on a daily basis when possible, and are tracked by the unique ID on each security seal.

The database is synchronized to the cloud hosted database each night, and photos are stored in the field to be uploaded upon return to the companies central server in Dawson City. In camps that do not have internet, a backup of the sample data is made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion

Description of Assay Methods

The samples were prepared in Bureau Veritas facility in Whitehorse using the SS80 method. Samples are dried at 60 degrees Celsius and sieved such that up to 100 grams of material passes 180 microns (80 mesh). The prepared material was then shipped to Vancouver and analyzed by the AQ201+U method which involves dissolving 15 grams of material in a hot Aqua Regia solution and determining the concentration of 37 elements of the resulting analyte by the ICP-MS technique.

Soil sample descriptions are included digitally with this report, and analytical certificates are compiled in Appendix C.

Results

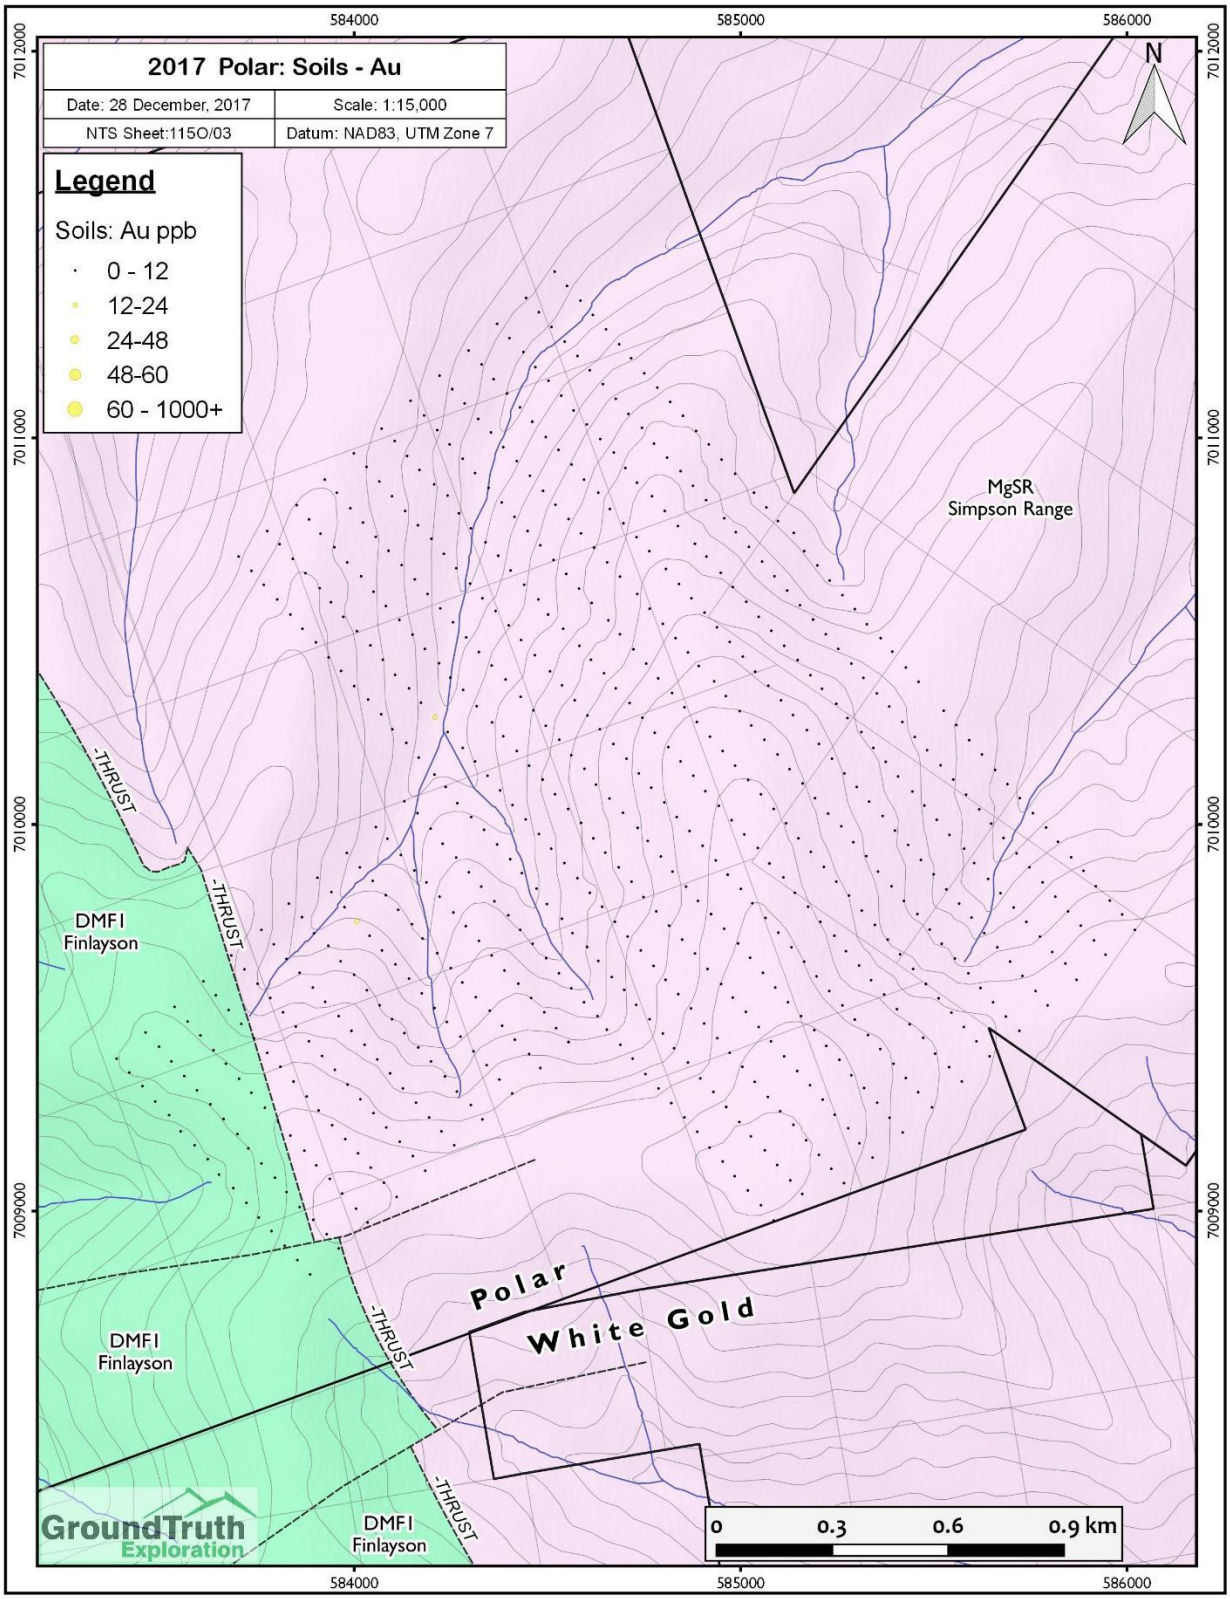

Figure 4: Gold in soil

I

The 2017 field season identified 2 samples out of 766 collected containing Au greater than 12 ppb, with the highest at 16.2ppb (figure 4).

The regional thresholds used in this report are derived from a comparison of over 100,000 soil samples within the region to determine the 50th, 75th, 90th, and 95th percentiles. This examination resulted in regionally significant thresholds of 12, 24, 48, and 60 ppb Au respectively.

Discussion and Interpretation

The 2017 grid did not identifiy any new areas of gold in soils.. The gold-in-soil results were very low when compared to regionally significant thresholds as identified above, with only 0.26% of the results anomalous.

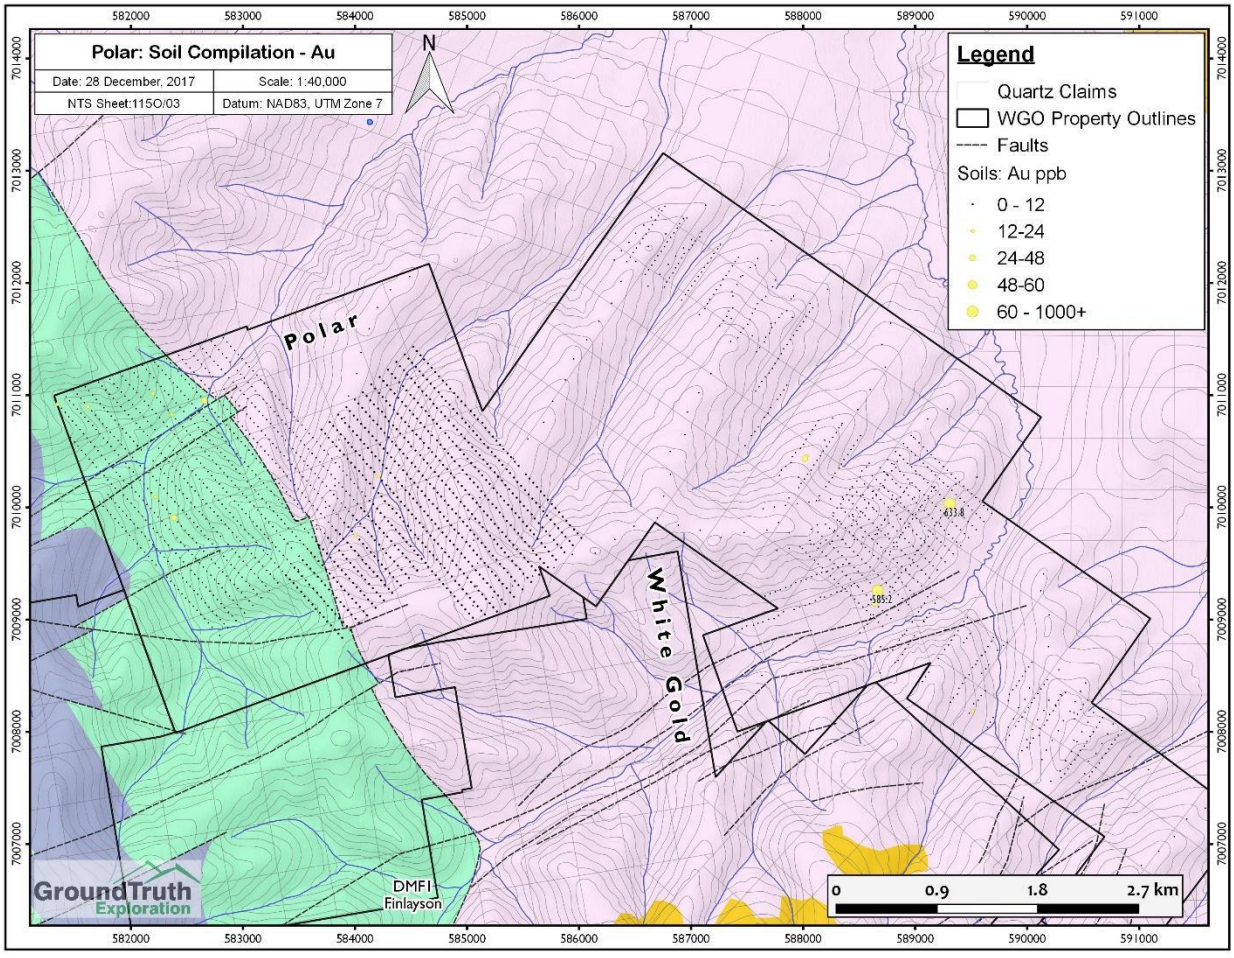

Figure 5: All Soil Samples on Polar (2007-2017)

Recommendations

A more through statistical evaluation of the combined and historic dataset for the just the Polar property is recommended. This work may identify more trends of anomalous gold and pathfinder elements that are lost in the higher regional statistical background. Also, before more grid soil sample work is performed, it is important to spend some time in the field investigating the results to date. An IP survey or pits/small trenches should be dug to bedrock at the two historic samples >100 ppb Au in order to determine why these samples are significant.

A detailed soil grid could be useful around the 585.2 ppb Au sample identified in previous samples and seen in figure 5, as it is surrounded by slightly elevated gold-in-soil values and maybe a trend could be discovered for future investigation with geophysical techniques.
