Work Performed between:
22-24 September 2017

Prepared For:
White Gold Corp
800-1199 West Hastings Street
Vancouver, BC, B6E 3T5

Prepared By:
GroundTruth Exploration Inc

Written By: Chad Cote
Date of Report: 10th January, 2018

Summary

During the 2017 field seasons, White Gold Corporation ("White Gold") contracted GroundTruth Exploration Inc. ("GroundTruth") to conduct a soil sample survey on the Yellow project. The surveys were completed on the 22-24 September 2017. Yellow is a grass roots gold (Au) exploration project in the White Gold District of Yukon, Canada.

The 2017 program consisted of 325 soil samples split between two grids with samples spaced 50 m along lines 100 m apart.

The 2017 field season identified 1 samples containing Au greater than 12 ppb, at 13.3 ppb.

Grid B should be expanded to the north and south, connecting the positive gold results from 2009 recce program, in order to examine gold potential of the magnetic high lineament interpreted as a thrust fault or dike.

The 23.0 ppb and 13.9 ppb gold-in-soil anomalies found in the 2009 recce program should be gridded to determine the surface extend and strength, and to test if these samples are controlled by any features identified in previous geophysical surveys.

Introduction

During the 2017 field seasons, White Gold Corporation ("White Gold") contracted GroundTruth Exploration Inc. ("GroundTruth") to conduct a soil sample survey on the Yellow project. The surveys were completed on the 22-24 September 2017. Yellow is a grass roots gold (Au) exploration project that has been targeted due to its proximity and geologic similarities to both the Golde Saddle Deposit 15 km south, and the adjacent QV deposit also to the south.

This report describes the work completed in the 2017 field season, summarizes the results and offers some insight and direction moving forward. The cost of the 2017 program was $25,694.16.

Property Description and Location

The Yellow property is located just north of the Yukon River on Shamrock Creek, between the mouths of the White and Stewart Rivers in the Dawson Mining District, Yukon Territory, Canada. The property lies within the Dawson Range of west-central Yukon Territory on NTS Map sheets 115O/04, 05. Yellow is approximately 80 km south of Dawson City, YT (Figure 1). The claims are centered at 570300E/7017500N (Datum: NAD83, UTM zone 7N).

The Yellow property is in an unglaciated region of Canada's Boreal Cordillera ecozone. Due to its location in Canada's discontinuous permafrost zone, permafrost is distributed unevenly throughout the property, controlled primarily by elevation, slope, and aspect. The landscape is composed of the typical rolling, tree covered hills with some areas of recently burned areas. The center of the property is dominated by an unnamed, twin peak dome in the north central part of the property, with prominent ridges and creeks radiating out from here. Elevations on the property range from 426 to 1158 meters. The north facing slopes are covered in thick moss mats, black spruce, and alder thickets over ice rich permafrost. The east and west facing slopes are typically covered by birch, white spruce, black spruce, trembling aspen and shrubs, sporadically underlain by permafrost depending on localized conditions. Southern slopes are generally more sparsely vegetated with ground leaf cover and white spruce, aspen and birch forests, and seldom underlain by permafrost. Areas near creeks are thick with willows and alders, and generally surrounded by permafrost due to shady location at valley bottoms.

The area experiences typical climatic conditions for central Yukon Territory with short, warm and dry summers and cold winters. Temperatures range from 0˚C to -50˚C in the winter and 0˚C to +32˚C in the summer.

The 2017 program was supported from Dawson City. The soil samplers were camped closer to the property on the Thistle Creek Airstrip, and the project was accessed by helicopter from there.

Claim Information

The property consists of 166 Quartz claims covering 3,362 hectares of ground (Figure 2). All claims are 100% owned by Selene Holdings, which is a wholly owned subsidiary of White Gold Corp

See Appendix B for complete claim listing and expiry dates.

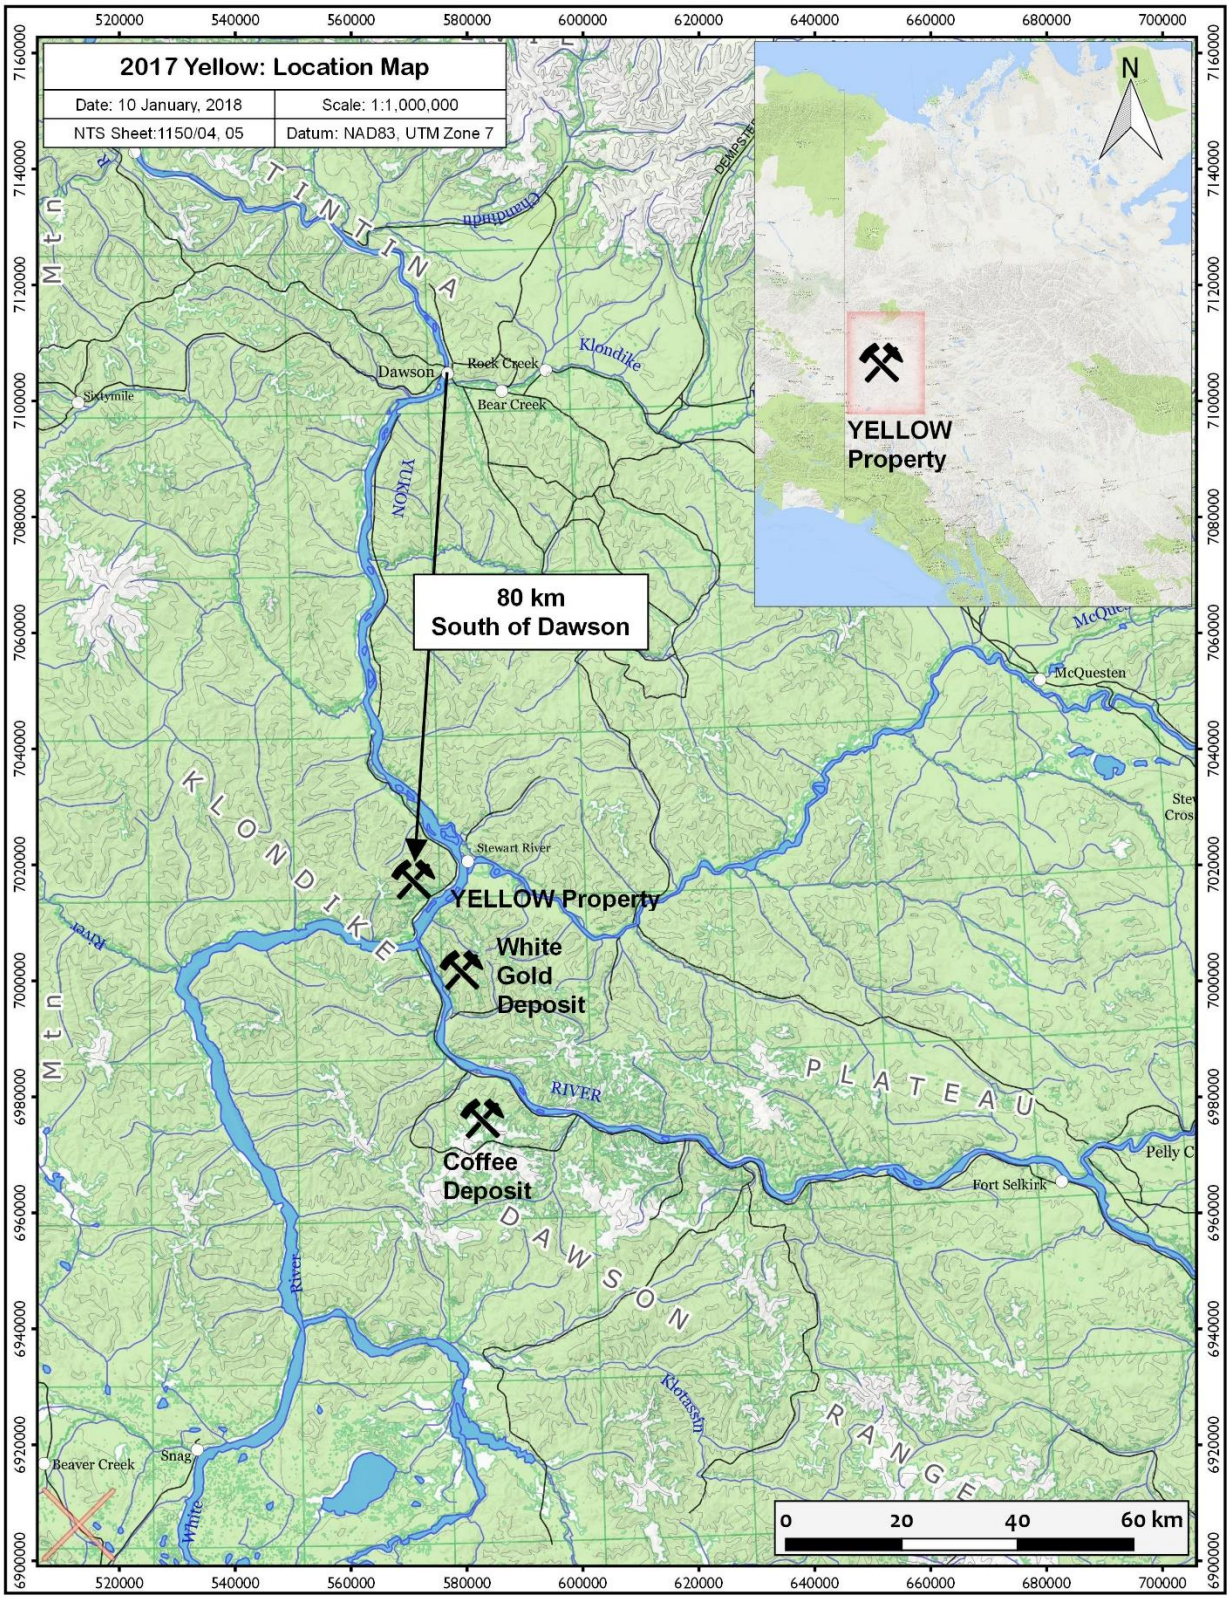

Figure 1: Yellow Location Map

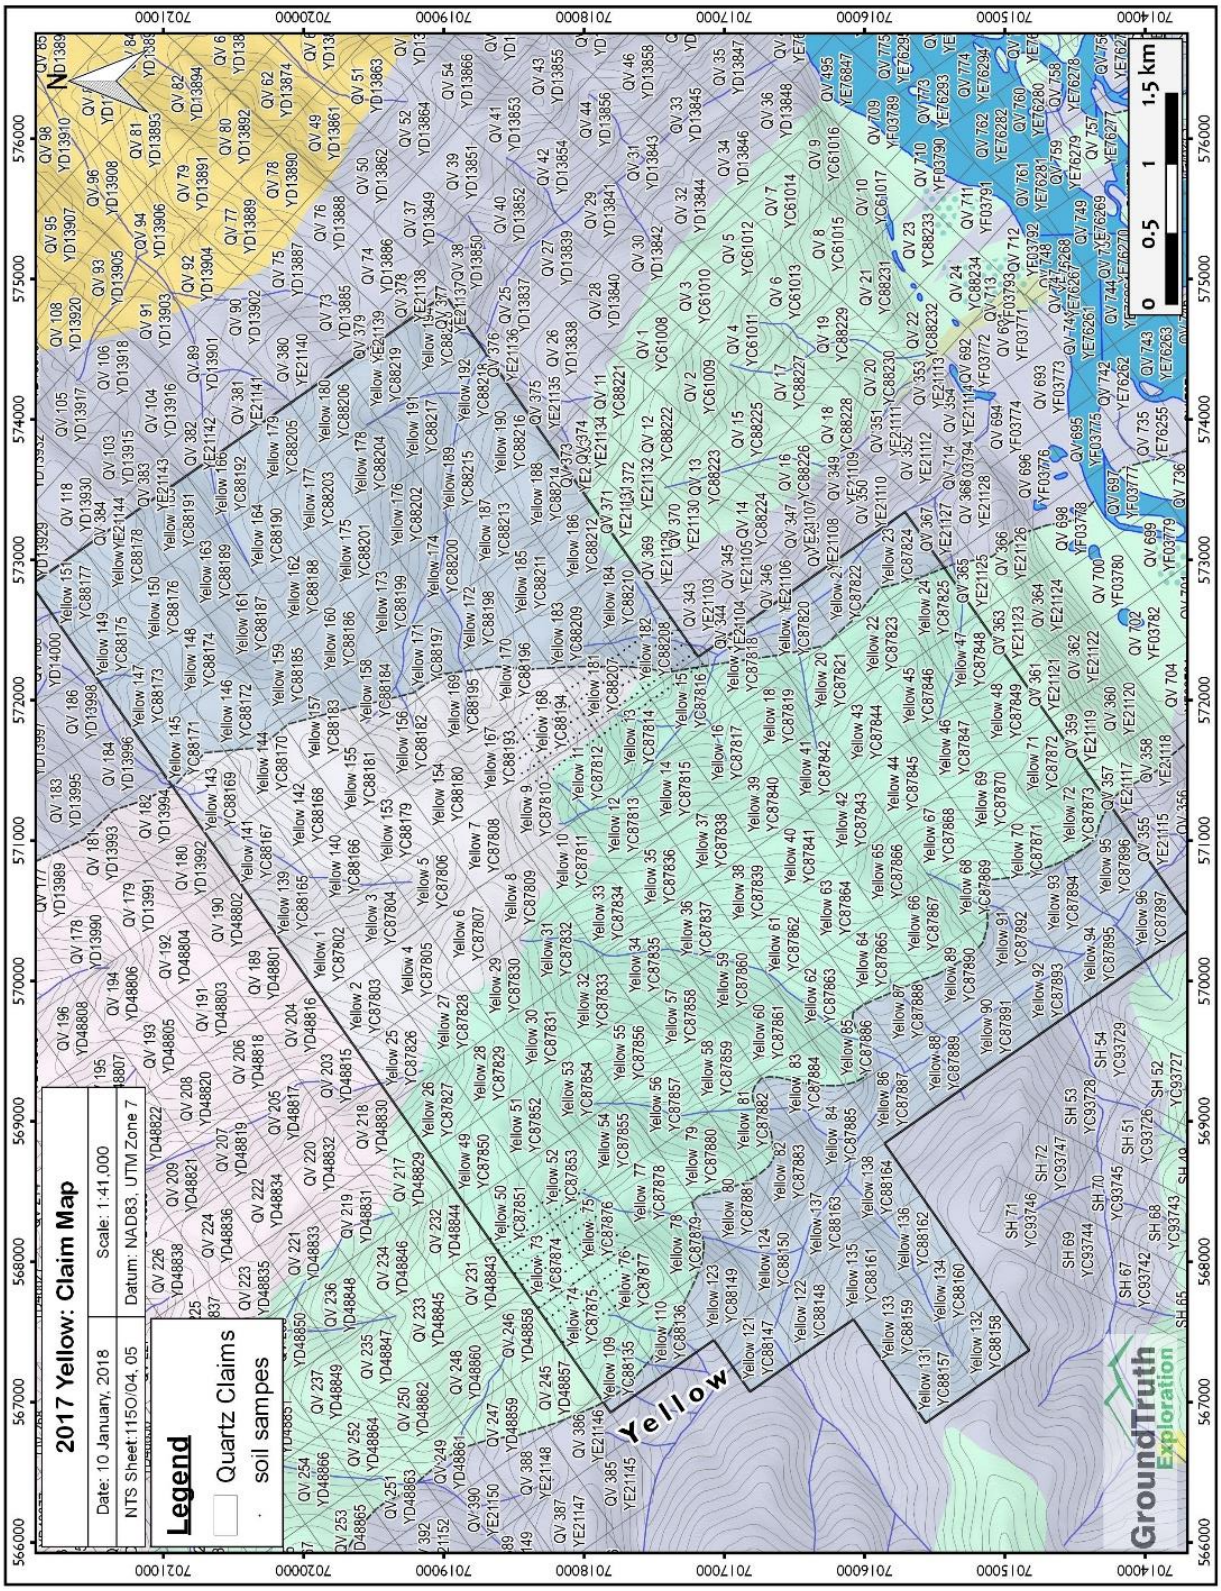

Figure 2: Yellow Claims

History

Historical work summarized from Bailey, 2012 as follows:

> "The earliest documented exploration work in the Yellow area occurred during the initial Klondike Gold Rush. During 1898 and 1900 claims were staked on Shamrock Creek, located in the south-western part of the property (Doherty and Ash, 2005). No recent historical exploration or placer mining is known to have occurred on the Yellow claims prior to the staking and soil sampling conducted by Underworld in 2009.
>
> The geology of the Yellow area was mapped by the Geological Survey of Canada as part of the Stewart River map area (Ryan and Gordey, 2005). This mapping describes the Yellow claims as comprising Devonian to Mississippian quartz-mica schist, amphibolite, and orthogneiss. Paleozoic ultramafic rocks and Jurassic and Cretaceous intrusive rocks are also mapped near the Yellow claims. Most of the lithologic contacts at Yellow were mapped as approximate or assumed by the Geological Survey of Canada mapping.
>
> The Yellow claims were staked by Underworld in 2009 because of their proximity to the White claims and the similarity of mapped rock units to those at White. Initial reconnaissance by Underworld in 2009 consisted of ridge-and-spur soil sampling, a small soil sampling grid, rock chip sampling, and some geologic mapping. This initial work resulted in a few samples containing minor gold-in-soil, but failed to produce a coherent anomaly or target.
>
> Underworld geologists mapped the Yellow area as consisting of metasediment, amphibolite, and felsic orthogneiss, with two small feldspar porphyry units mapped on ridges in the northern part of the claim block. Three zones of sericite-carbonate alteration are also indicated on the 2009 map. These altered zones broadly overlap with weakly anomalous gold values from the initial ridge-and-spur sampling. …
>
> Airborne magnetic and radiometric surveys were flown over the Yellow claim block as part of Kinross' 2010 airborne survey (Figure 4). The survey was flown by helicopter with 75 meter line spacing over the entire Yellow claim block. This survey highlighted several notable features, including: 1) a prominent narrow NNW-trending magnetic high, located very close to the feldspar porphyry units mapped in 2009; 2) a circular body approximately 500 meters diameter located in the north-central part of the property with a magnetic signature similar to that of Cretaceous Carmacks igneous rocks (seen at JP Ross and elsewhere in the Yukon); 3) a zone of highly anomalous potassium (and highly anomalous potassium/thorium) in the north-central part of the property that is approximately 1 by 3 kilometres in size; and 4) several linear magnetic features trending NNW and NE. These linear features are interpreted to represent faults."

Field work in 2011 included geological mapping, prospecting, rock chip sampling (9 samples), and stream sediment sampling (57 samples).

Kinross continued its soil program in 2013, collecting 207 soil samples over 12 lines in the southeast section of the claim block. This is a very coarse grid with samples spaced at 200 m and lines spaced at 400 m (figure 3).

In 2014, Kinross did a small infill grid in the north east corner of the property consisting of 160 samples spaced at 50m along 4 lines, 400 m apart (Figure 3).

The claims were sold by Kinross to Selene Holdings. in 2016.

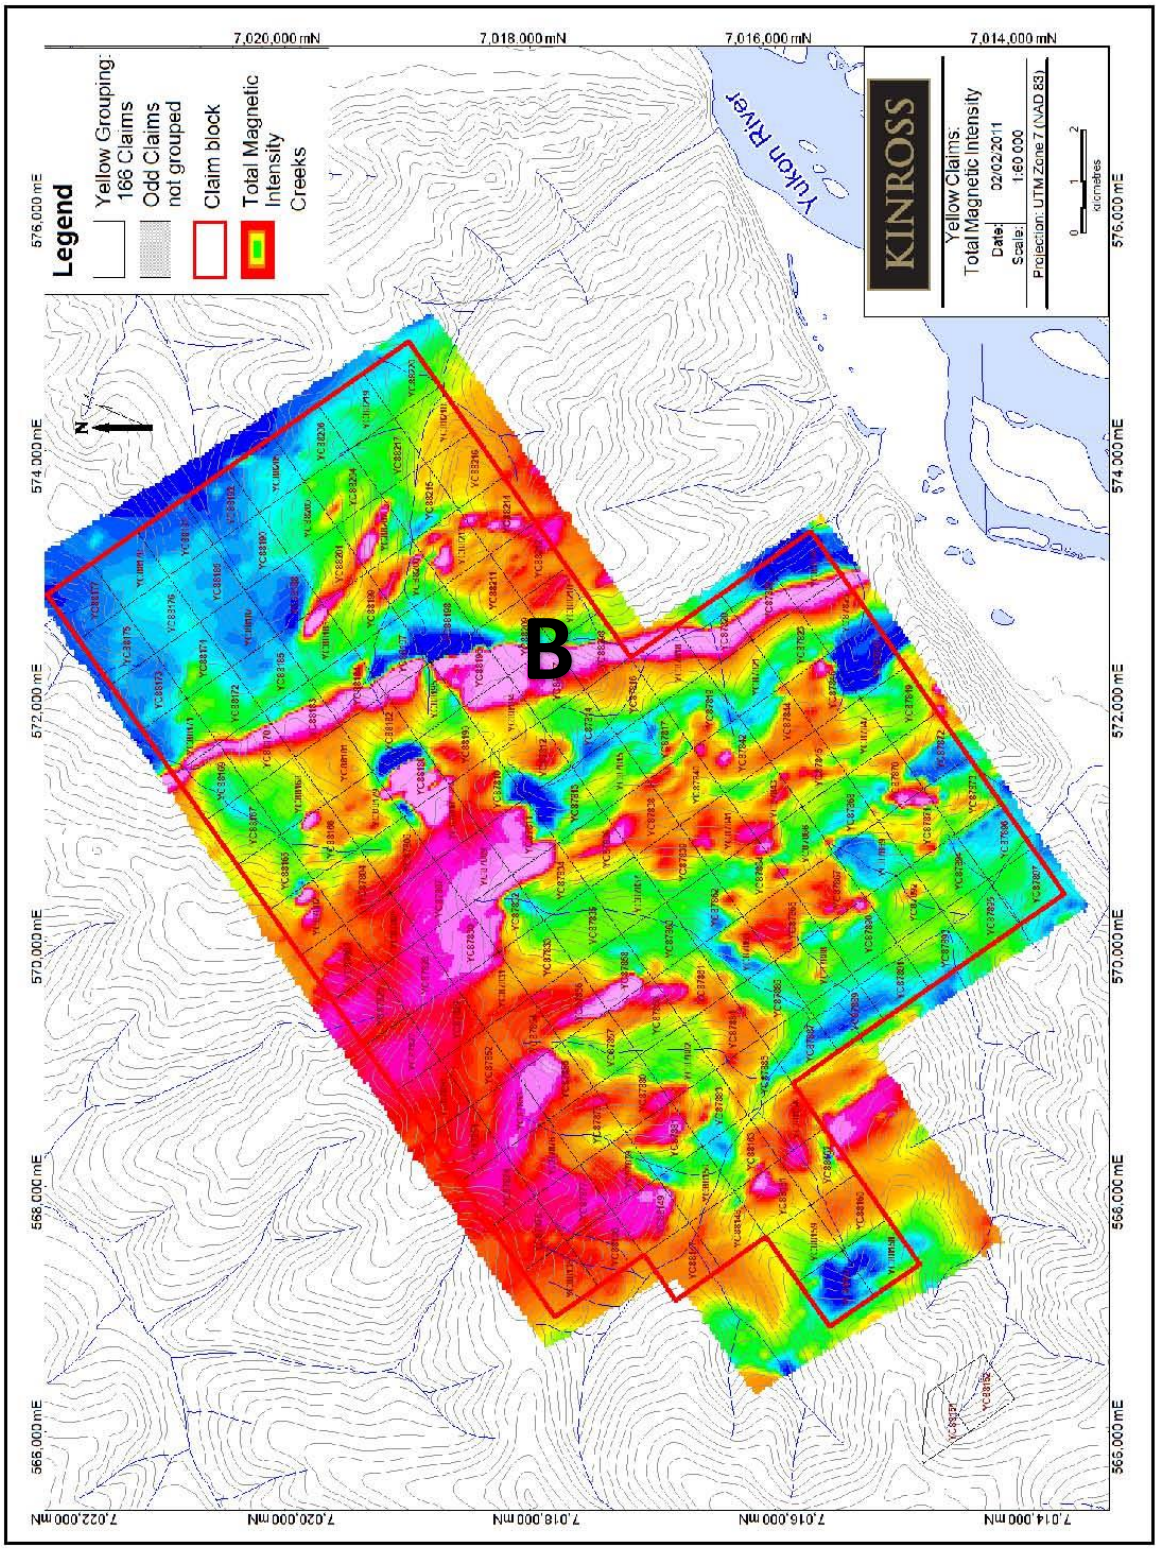

Figure 4: Final Total Magnetic Intensity (TMI) from 2010 airborne survey (Hollis, 2011)

Geology

Regional Geology

The project is located within the Yukon-Tanana terrane (YT) of the western Yukon and central Alaska (Figure 5). The YT is an accreted terrane of polymetamorphosed and polydeformed metasedimentary, metavolcanic, and metaplutonic rocks of Upper Paleozoic and older ages bound by the Tintina fault to the northeast and Denali fault to the south-west. Overall, it records a prolonged and complex history of tectonic and magmatic processes along the northwestern margin of Laurentia between middle Paleozoic and Early Tertiary time. It has an equally complex metallogenic evolution with at least 10 pulses of mineralization of various styles currently recognized (Nelson et al 2013, Allan et al 2013, Mortensen and Allan 2012).

The region underwent ductile (D1/D2) deformation associated with amphibolite facies metamorphism during the Late Permian Klondike orogeny. This event was associated with the accretion of the YT to Laurentia and associated closure of the Slide Mt Ocean and obduction of ophiolitic slices of the Slide Mt terrane.

The area underwent additional compression and ductile deformation (D3) associated with greenschist facies metamorphism during the Late Triassic-Early Jurassic. The event was associated with widespread thrust faulting and imbrication of the Slide Mt. terrane, and the emplacement of felsic to ultramafic intrusions. This transitioned into a period of regional uplift and exhumation and is associated with dominantly east-west oriented sinistral faults, localized north-northwest vergent folds, and high angle reverse faults (D4). This period of deformation spans the ductile to brittle transition and are associated, particularly the E-W sinistral faults, with 'orogenic' style gold mineralization throughout the White Gold district and Klondike.

Renewed northeast dipping subduction under the continental margin during the Late Cretaceous led to renewed magmatism across the YT, and is associated with felsic to intermediate intrusions of the Dawson Range batholith and felsic-mafic volcanic rocks of the Mount Nansen suite. The Early Cretaceous arc activity ceased around 99Ma; at which point it stepped farther inboard and is associated with intrusive suites in the Selwyn Basin (ie. Tombstone suite, etc.). This lull in magmatism was associated with the formation of the Indian River Formation, a coarse clastic sedimentary package deposited in an alluvial/fluvial to shallow marine setting that records approximately 40 million years of sedimentation following the formation of the Dawson Range Arc.

Arc style magmatic and volcanic activity renewed during the Late Cretaceous and is associated with a series of calc-alkaline plutons and high level porphyry dikes, plugs, and breccias in the Casino and Freegold areas, and age equivalent intrusions in eastern Alaska (79 – 72Ma). This event was also likely associated with the initiation of dextral offset along the Big Creek fault and reactivation of older Jurassic age structures in Dawson Range area. It is also associated with variable styles of mineralization ranging from Cu-Au-Mo porphyries (Casino), intrusion-related/epithermal occurrences (Sonora Gulch, Freegold area), and structurally controlled gold / 'orogenic' mineralization (Coffee, Boulevard, Moosehorn). At 72Ma there was a distinct change in magmatism with widespread bi-modal volcanism (Carmacks group) and the emplacement of small, high-level, felsic plugs and stocks (Prospector Mountain suite) throughout the YT. A

prominent set of northeast trending normal and sinistrally oblique faults are commonly associated with the intrusive and volcanic rocks of this event and are broadly coeval with magmatism.

A final magmatic event occurred during the Late Tertiary and is associated with the emplacement of bi-modal suite of predominately north-south trending dike swarms, plugs, and local pyroclastic rocks. Gabrielse et al 2006 suggests that the magmatic event was likely coeval with the early stages of dextral offset along the Tintina fault. (Gibson, 2014)

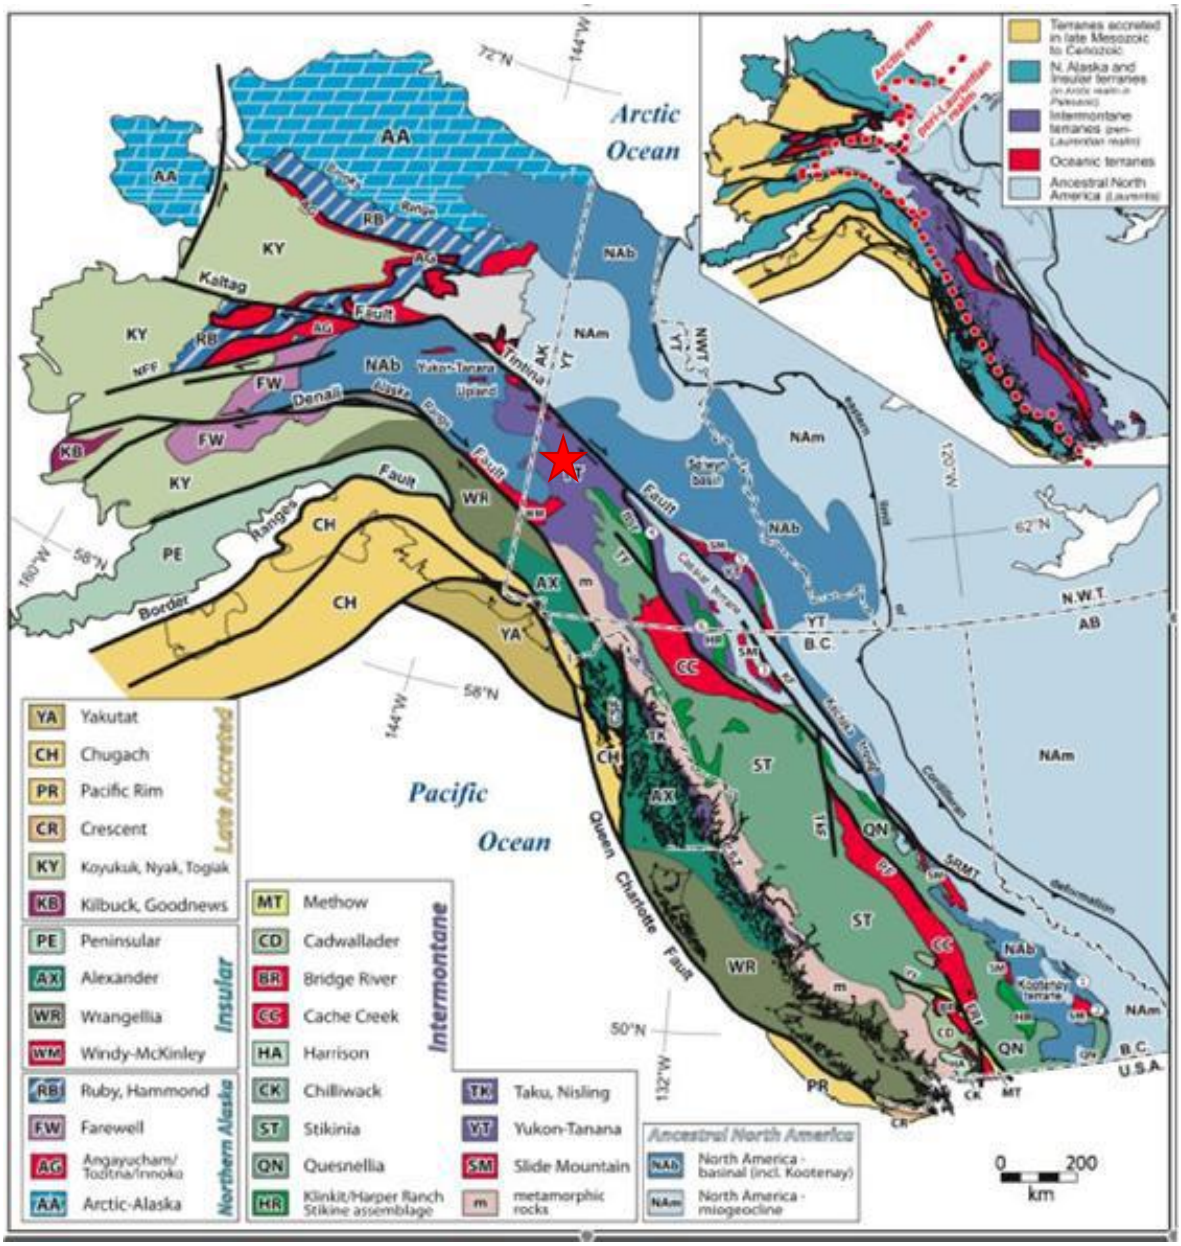

Figure 5: Terrane map of the northern Cordillera (modified from Nelson et al 2013). The red star is the approximate location of the Yellow property.

Property Geology

The most recent governmental geologic mapping in the area was performed by Yukon Geological Survey, Colpron et al (2016). The property is located within the Yukon-Tanana terrain and underlain by alternating bands of Snowcap and Finlayson rock suites in the western half of the property, and the Simpson Range Suite in the eastern half (Figure 6).

The DMF1 unit is part of the intermontane Finlayson suite of intermediate to mafic volcanic and volcaniclastic rocks such as amphibolite, bt-qtz schist, and mafic gneiss.

The PDSI unit is part of the intermontane metamorphic Snowcap assemblage characterized by siliciclastics such as quartzite, psammite, pelite and marble; minor greenstone and amphibolite.

The MgSR unit is part of the intermontane Finlayson suite of metamorphic rocks including Hbl-bearing metagranodiorite, metadiorite and metatonalite.

Kinross produced a revised geological map shown here in figure 7. “This geological map combines mapping by Ryan and Gordey in 2005, by Underworld in 2009, Kinross in 2011, and an interpretation of airborne geophysical data. Lithologic contacts in this revised map do not differ greatly from the previous geologic map by Underworld geologists. The airborne geophysical data was used with a relatively high degree of confidence because rock types were spot-checked in the field, and because the geophysical data has many similarities to the better-studied White property. Many of the geologic contacts and fault structures are based upon geophysical data and/or rock chips from float or dug out of the ground. Because of this, the majority of contacts should still be considered approximate or assumed. This geologic interpretation is overlain on an image of the total magnetic intensity” (Bailey, 2012)

Mineralization

This property was targeted due to its geological similarities and proximity to the Golden Saddle Deposit, 15km along structural trends to the south. The main commodity sought here is gold, however no significant zones of mineralization have been found to date.

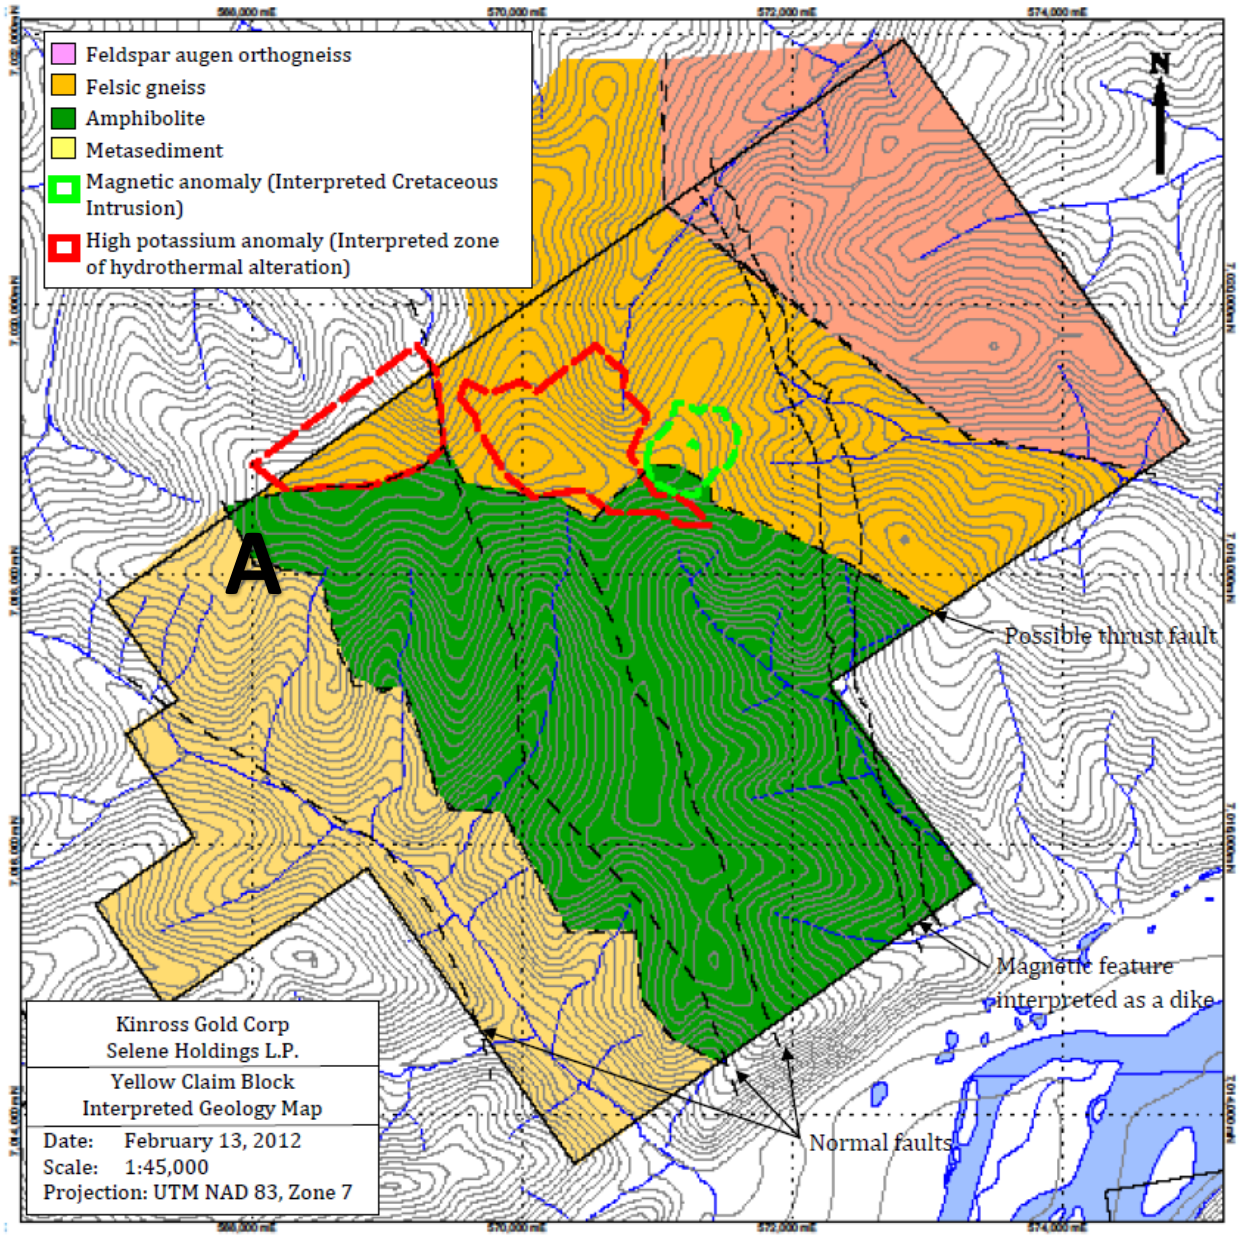

Figure 7: Interpreted geology from Kinross (Bailey, 2012)

Exploration Program and Results

Geochemical Survey: Soil Sampling

During the 2017 field seasons, White Gold Corporation ("White Gold") contracted GroundTruth Exploration Inc. ("GroundTruth") to conduct a soil sample survey on the Yellow project. The surveys were completed on the 22-24 September 2017. Yellow is a grass roots gold (Au) exploration project in the White Gold District of Yukon, Canada.

The 2017 program consisted of 325 soil samples split between two grids with samples spaced 50 m along lines 100 m apart. The northwest grid targeted the contact between the amphibolite and metasedimentary units interpreted by Underworld and Kinross, and indicated with an A in figures 7 and 8. The southcentral grid target the mag high lineament interpreted as a dike, and indicated with a B in figures 4 and 8.

Method and Approach

Soil surveys are typically conducted by crews of 5 samplers, one of which is the crew boss who oversees the survey. The Crew Boss is responsible for coordinating safe and efficient operation of survey and ensuring survey is conducted as planned. All samplers run solo traverses proximal to each other so that radio contact with other crew members can be maintained.

The following equipment is used for the completion of the survey:

Soil Auger/Mattock:	Eijklcamp hand auger and 5lb mattock
Handheld Datalogger:	Samsung S5: weatherproof handheld with barcode scanner
Camera:	Samsung S5: 16 megapixel camera
GPS units:	Garmin 76cx handheld GPS
Radios:	VHF Radio for helicopter communication
Processing:	Laptop computer
Software	Fulcrum App forms and database, Ozi Explorer for waypoint upload, QGIS Mapping Software.

Survey Procedure

The survey is completed in the field according to the following procedure:

All sampling traverses are pre-planned, with pre -specified sampling intervals, typically 50m for grid spacing and 100m for ridge and spur recce traverses. Field technicians navigate to sample site using handheld GPS units. The soil sampler arrives at each sample site, identifies the most appropriate location to collect the sample and lays out a sheet of plastic (12"x20" ore bag). The soil sample is taken using an Eijklcamp brand hand auger at a depth of between 20cm and 110cm. Samplers strive to consistently collect C-Horizon sample material. Where necessary (rocky or frozen ground) a prospector's pick ('mattock') is used to obtain the sample.

The soil is laid out on the sheet of plastic in the order it was recovered from the sample hole. Two Standardized photos are taken at each sample site- 1) Sample Location photo: across slope, 5m from sample hole with auger inserted and 2) Sample Profile photo: Close up of sample laid out on ore bag with barcode tag and Munsell color chart in photo.

The sampler places the necessary amount of soil (400-500 grams) from the bottom of the hole into a Kraft sample bag. The bag is labeled with the 3-letter project code. Three identical 7 Digit barcode ID tags are used to identify the sample: One is placed inside the bag, one is tied to the outside of the bag, and one is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape.

A field duplicate sample is taken once for every 25 samples. Both samples are given unique Sample identification number. The data for both samples is recorded and a note is made indicating the duplicate and its corresponding sample identification number. At client's discretion, standard reference material is inserted into the sample stream at an interval of 1:50.

The GPS location of the sample site is recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD 83 format, and the waypoint is labeled with the project name and the sample identification number. A weather-proof handheld device equipped with a barcode scanner is used in the field to record the descriptive attributes of the sample collected. This includes: sample identification number (scanned into device at sample site), soil colour, soil horizon, slope, sample depth, ground and tree vegetation and sample quality and any other relevant information. As well, the GPS coordinates are entered into the handheld device as a secondary backup in case of GPS failure.

Data Processing

Each night in the field, the GPS, Handheld devices and cameras are downloaded to a laptop computer. The data is verified and mapped on a sampler-by-sampler basis in proprietary database auditing and mapping software by the crew boss. Photos are downloaded and reviewed by the supervisor to ensure quality samples and correct procedures are being followed.

In camp at the end of each day, the crew boss inspects all samples from each sampler for size and consistency as a quality check. Each sampler then repackages all samples for shipping-barcode scanning them as they are placed into a Yellow bag which is sealed with a barcoded security zip tie. Samples are shipped from the field to the lab on a daily basis when possible, and are tracked by the unique ID on each security seal.

The database is synchronized to the cloud hosted database each night, and photos are stored in the field to be uploaded upon return to the companies central server in Dawson City. In camps that do not have internet, a backup of the sample data is made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion

Description of Assay Methods

The samples were prepared in Bureau Veritas facility in Whitehorse using the SS80 method. Samples are dried at 60 degrees Celsius and sieved such that up to 100 grams of material passes 180 microns (80 mesh). The prepared material was then shipped to Vancouver and analyzed by the AQ201+U method which involves dissolving 15 grams of material in a hot Aqua Regia solution and determining the concentration of 37 elements of the resulting analyte by the ICP-MS technique.

Soil sample descriptions are included digitally with this report, and analytical certificates are compiled in Appendix C.

Results

The 2017 field season identified 1 samples containing Au greater than 12 ppb. This sample is located in Grid B and contains 13.3 ppb Au (figure 8). All original tabular soil descriptions and assay results are included as a digital copy with this report.

The regional thresholds used in this report are derived from a comparison of over 100,000 soil samples within the region to determine the 50th, 75th, 90th, and 95th percentiles. This examination resulted in regionally significant thresholds of 12, 24, 48, and 60 ppb Au.

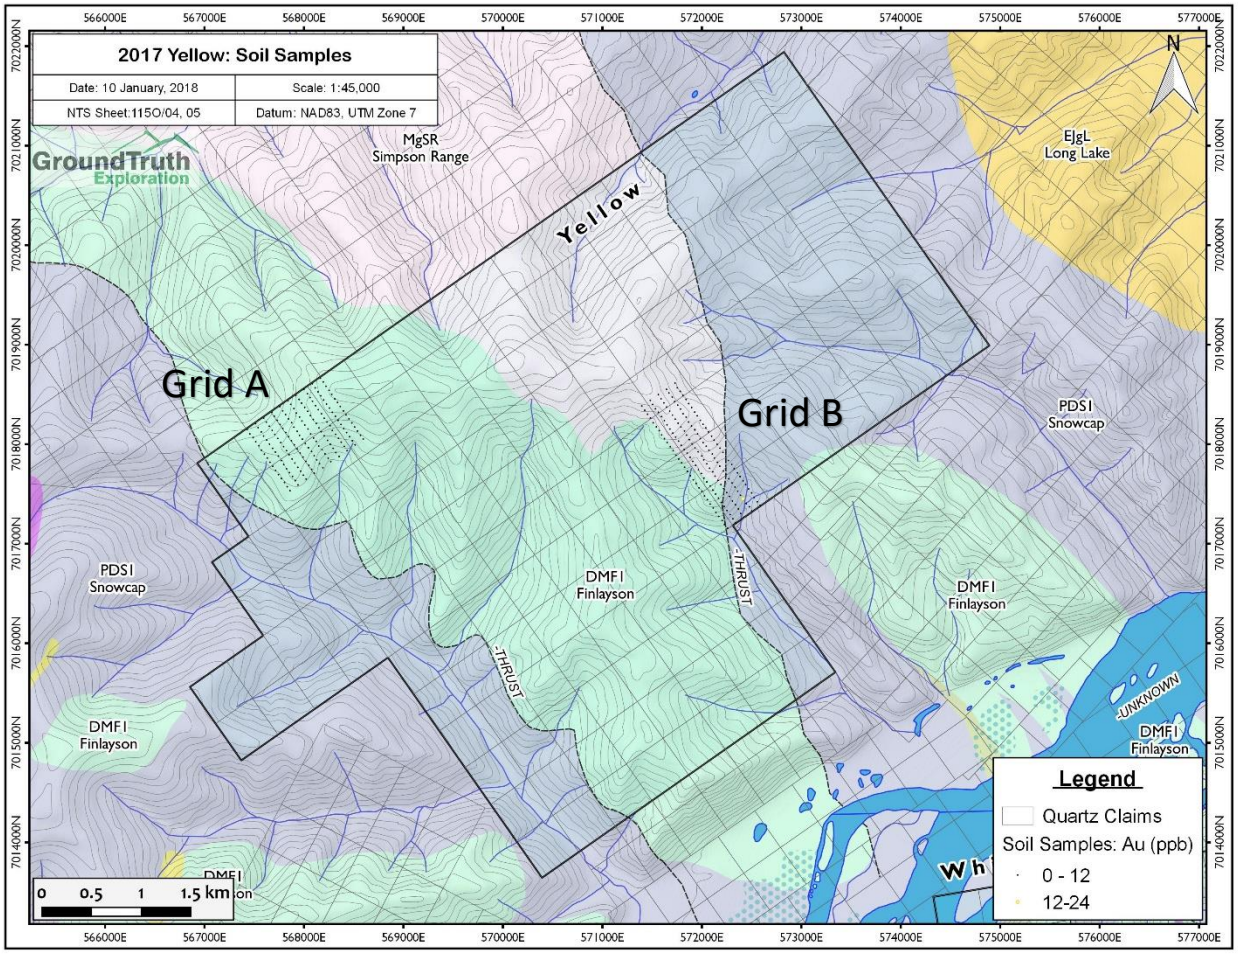

Figure 8: Gold in soil, regional scale used. Grids A and B used as reference in this report only.

Discussion and Interpretation

The Yellow samples to date have returned gold values of a low grade when compared to the regional thresholds identified above, however the sample density to date is very low, and the structural and geologic similarities with the Arc Deposit 15 km south remain very compelling to hold this property and continue follow up work.

Figure 9 shows the gold-in-soil results using percentile breaks from the Yellow property. This breakdown shows all samples greater than 4 ppb Au lie within the 90th percentile, which falls within our experience as worth following up on a reconnaissance sample.

Grid A shows some gold-in-soil elevation from the 2017 sampling, with the highest sample at 11.1 ppb. Grid B straddles either the interpreted thrust fault or dike depending on the source (Yukon Geological Society 2017, Bailey 2012). This grid shows minor elevated gold-in-soil anomalies on both sides of the interpreted thrust fault within a 300 m buffer. This is of particular interest, as it corresponds well with results from 2009, where the highest Au sample on the property (71.3 ppb) and the third highest at 18.4 ppb are both within 200 m of the same thrust fault to the north and south respectively. This is good evidence that this structural feature may be an important component of gold mineralization on the property.

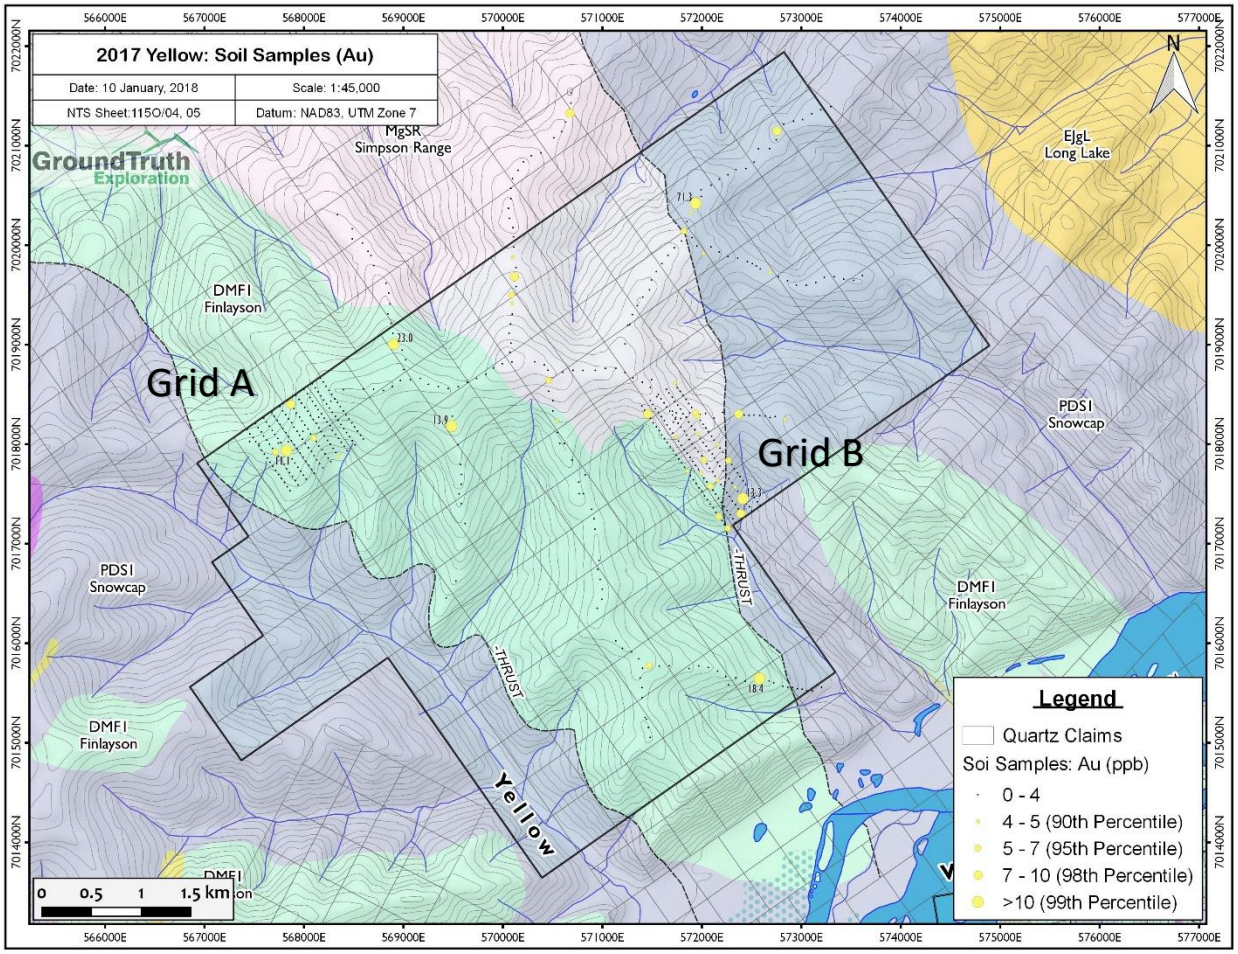

Figure 9: Gold in soil, project percentiles used.

Recommendations

Grid B should be expanded to the north and south, connecting the positive gold results from 2009 recce program, in order to examine gold potential of the magnetic high lineament interpreted as a thrust fault or dike.

The 23.0 ppb and 13.9 ppb gold-in-soil anomalies found in the 2009 recce program should be gridded to determine the surface extend and strength, and to test if these samples are controlled by any features identified in previous geophysical surveys.

Statement of Costs

Statements of Qualification

I, Chad Cote, located in Dawson City, Yukon work as a Geophysical Project Manager for GroundTruth Exploration Inc.

I have worked in the mineral exploration field since 2007. From 2007 to 2010 I worked for RyanWood Exploration for the summer field seasons as a soil sampling crew boss, MAG operator, and prospector. I joined GroundTruth Exploration for full time employment when it formed in 2010, expanding my role into GIS mapping and data management, and leading the expansion of our geophysics branch to include high resolution DC resistivity/IP and GPR surveys.

I graduated from the University of Victoria in December of 2010 with Bachelor of Science in Geography, specializing in physical systems and GIS.

Dated this 11th of January 2018 in Dawson City, YT.

Respectfully submitted

Chad Cote

CERTIFICATE OF ANALYSIS WHI17000942.1

CLIENT JOB INFORMATION

Project: YEL
Shipment ID: YEL-20170926-001-SOIL
P.O. Number
Number of Samples: 119

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
DY060	119	Dry at 60C			WHI
SS80	119	Dry at 60C sieve 100g to -80 mesh		Completed	WHI
AQ201	119	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
SHP01	119	Per sample shipping charges for branch shipments			VAN

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS WHI17001012.1

CLIENT JOB INFORMATION

Project: YEL
Shipment ID: YEL-20171003-001-SOIL
P.O. Number
Number of Samples: 206

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
DY060	206	Dry at 60C			WHI
SS80	206	Dry at 60C sieve 100g to -80 mesh			WHI
AQ201	206	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
SHP01	206	Per sample shipping charges for branch shipments			VAN

Yukon Bedrock Geology - Legend 2016

Yukon Geological Survey

Yukon Energy, Mines and Resources

SOUTHWEST — NORTHEAST — NORTH

A

QUATERNARY
Qs — **Q** — **QUATERNARY:** *unconsolidated glacial, glaciofluvial and glaciolacustrine deposits; fluvatile silt, sand, and gravel, and local volcanic ash, in part with cover of soil and organic deposits*

MIOCENE TO PLIOCENE AND(?) YOUNGER
Tvs — **Nw** — **WRANGELL LAVAS:** *mafic to felsic volcanic rocks (1) with local conglomerate (2)*
1, rusty red-brown, physic and non-physic basaltic andesite flows (minor pillow lava), interbedded with felsic tuff, volcanic sandstone and conglomerate; acid pyroclastics related to intra-Wrangell intrusions; thin basaltic andesite and andesite flows **(Wrangell Lavas)**
2, volcanic conglomerate; clasts all Wrangell derived **(Wrangell Lavas)**

MID TO LATE MIOCENE
Nb — **MW** — **WRANGELL SUITE (16-6 Ma):** *fine to medium-grained, hornblende ± biotite granodiorite and porphyritic (K-feldspar) hornblende granodiorite; medium-grained, uniform biotite diorite and pyroxene gabbro; subvolcanic hornblende ± biotite rhyolite, rhyodacite, dacite*

OLIGOCENE
Ti — **OT** — **TKOPE SUITE (64-57 Ma):** *light pinkish-grey, medium to coarse-grained, homogeneous, biotite and/or hornblende granite (locally miarolitic); lesser light creamy-grey biotite hornblende granodiorite, dark grey biotite hornblende quartz diorite and gabbro-diorite* **(Tkope Suite)**

PALEOCENE TO OLIGOCENE
Tvs — **OA** — **AMPHITHEATRE:** *yellow-buff to grey-buff sandstone, pebbly sandstone, polymictic conglomerate, siltstone, mudstone; minor brown-grey carbonaceous shale and thin lignitic coal; minor tuffaceous and tuffaceous deposits, local debris-flow deposits; some shallow marine* **(Amphitheatre Fm; Kulthieth)**

EOCENE
Ep — **ES** — **SEWARD SUITE (52-41 Ma):** *non to weakly foliated, light to mid-brownish-grey, medium-grained, biotite and hornblende-biotite tonalite and granodiorite; rarer granite and quartz diorite* **(Seward Suite)**

LATE EARLY CRETACEOUS
mKp — **EKK** — **KLUANE RANGES SUITE (124-115 Ma):** *mid-grey, medium to coarse-grained, biotite hornblende granodiorite, quartz diorite, quartz monzonite, and hornblende diorite* **(Kluane Ranges Plutonic Suite)**

EKP — **PYROXENITE CREEK SUITE (124-113 Ma):** *medium-grained hornblende pyroxene gabbro and hornblende diorite; olivine and hornblende clinopyroxenite* **(Pyroxenite Creek Ultramafic)**

UPPER JURASSIC TO LOWER CRETACEOUS
JKs — **JKD** — **DEZADEASH:** *clastic succession (1) but locally including undifferentiated younger mafic (2)*
1, **interbedded light to dark buff-grey lithic greywacke, sandstone, siltstone, thin dark grey shale, argillite, argillite and conglomerate; rare tuff (Dezadeash Fm)**
2, **sandstone, conglomerate, shale, siliceous tuff; shallow marine shelf deposits**

LATE JURASSIC TO EARLIEST CRETACEOUS
JKp — **JKS** — **SAM'S CLASS SUITE (154-143 Ma):** *nonporphyritic and porphyritic (K-feldspar), biotite hornblende granodiorite; lesser nonporphyritic biotite and/or hornblende tonalite; locally includes biotite hornblende quartz monzodiorite, quartz diorite, granite, and quartz monzonite* **(Saint Elias Suite)**

CRETACEOUS AND (?) OLDER
YA (YAKUTAT) — **KV** — **YAKUTAT:** *greywacke and conglomerate in thick members or interbedded with siltstone, argillite, or slate; mélange with blocks (to several km) of greenstone, limestone, marble, granitic rocks, chert, and greywacke in a matrix of cherty and tuffaceous pelite* **(Yakutat Gp)**

CG (CHUGACH) — **KV** — **VALDEZ:** *dark grey and argillite and greywacke: includes granitoid dikes, sills, and locally plugs, green pillow lava, breccia, and tuff; metamorphosed equivalents include brown schist, granitoid gneiss and dark green amphibolite* **(Valdez Gp)**

UPPER TRIASSIC TO (?) CRETACEOUS
uKT — **uTAT** — **TATAMAGOUCHE:** *dark to light grey pitvfille, medium to coarse-grained sandstone, minor greywacke and pebble conglomerate, may include upper parts of McCarthy Fm*

LATE TRIASSIC
LTB — **LTB** — **MT. BEATON SUITE (ca. 217 Ma):** *medium to coarse-grained, unfoliated, hornblende diorite to hornblende-biotite quartz diorite, salt and pepper appearance; locally abundant dark grey fine-grained gabbro; may include parts of the Early Cretaceous Kluane Ranges Suite*

UPPER TRIASSIC
uTM — **MCCARTHY:** *light to dark grey calcareous to carbonaceous mudstone and shale; locally interbedded with buff-coloured limestone giving the rock as striped appearance*

UPPER TRIASSIC
uTC — **CHITISTONE:** *thin interbedded light to dark grey calcareous limestone and dark grey argillite; massive light grey limestone, limestone breccia and darker grey, well-bedded limestone; white to creamy-white gypsum and anhydrite* **(McCarthy, Chitistone and Nizina limestones)**

uTN — **NIKOLAI:** *basalt, andesite (2), basal conglomerate (1) and minor limestone (3)*
1, volcanic breccia, pillow lava and conglomerate at base
2, amygdaloidal basaltic and basaltic andesite flows, with local tuff, breccia, shale and thin-bedded bioclastic limestone **(Nikolai Greenstone)**
3, locally includes dark grey phyllite and minor thin grey Middle Triassic limestone

LATE TRIASSIC
LTK — **KLUANE ULTRAMAFIC SUITE (232-228 Ma):** *mafic to ultramafic intrusions including peridotite, dunite (1) and gabbro (2)*
1, cheery black peridotite, rare dunite **(Kluane-type Mafic-Ultramafics Gabbro-Diabase Sills)**
2, medium grey-green, massive, medium-grained, pyroxene gabbro and greenstone sills **(Maple Creek gabbro)**

MIDDLE TRIASSIC
mTH — **CREEK:** *dark grey to black siltstone and mudstone; locally limy; grey, thinly-bedded limestone* **(Hoge Creek Fm)**; *difficult to distinguish from parts of the Hasen Creek Fm*

LOWER PERMIAN
CPh — **SKOLAI - HASEN CREEK:** *fine-grained clastic rocks (1) and carbonate (2)*
1, **interbedded dark grey and brown-weathered siltstone, mudstone and medium to coarse-grained sandstone; local conglomerate; rare tuff; local tuff and rare basaltic flows; rare dark grey to black chert beds and chert-pebble conglomerate** (Hasen Creek Fm)
2, **light to medium grey, massive to bedded limestone; locally fossiliferous; fossils include corals and crinoids - CPhc**

MISSISSIPPIAN TO PENNSYLVANIAN
CPS — **SKOLAI - STATION CREEK:** *volcanic rocks succeeded upward by clastic strata and including minor limestone*
1, undifferentiated Skolai Gp; includes variably metamorphosed and deformed Hasen Creek and Station Creek fms; meta-pelite, metavolcanic rocks and marble
2, dark green to black-weathering and black basalt flows; rare felsic flows and hyaloclastics; red, magnetite-rich jasper found locally as interstitial material between pillows and within pillow breccia, thick accumulations of laminated jasper rarely occur **(Station Creek Fm)**
3, thinly bedded, laminated to massive chert interbedded with crystal tuff; chert is mainly light to dark grey, locally red and green; beds are well-bedded with local black and dark brown massive beds; tuff ranges from maroon to green, fine grained and laminated with phenocrysts of quartz ± plagioclase **(Station Creek Fm)**
4, interbedded volcanic breccia, agglomerate and volcaniclastic sandstone; dominated by pyroxene-phyric volcanic breccia; rare light grey-weathered, dark green to black, fresh, pyroxene-phyric flows **(Station Creek Fm)**
5, **laminated to thinly bedded, light grey to light green volcanic tuff and volcaniclastic siltstone, local crystal tuffs interbedded with fine-grained volcanic ash**

PENNSYLVANIAN TO EARLY PERMIAN
AXp — **CPi** — **ICEFIELD RANGES SUITE (308-285 Ma):** *mid to dark greenish-grey, medium-grained, nonfoliated and foliated, biotite hornblende quartz monzodiorite-quartz diorite-tonalite, veined and intruded by hornblende diorite; olivine and hornblende clinopyroxenite* **(Pyroxenite Creek Ultramafic)**

DEVONIAN TO UPPER TRIASSIC AND (?) OLDER
AX — **DKT** — **SCHEIDLER:** *fissile, dark grey to grey-brown argillite and phyllite; Paleozoic partly equivalent strata subdivided into three dominant facies including pelitic rocks (1), carbonate (2) and volcanic rocks (3)*
1, thin to medium-bedded, fine to medium-grained, quartz-rich, micaceous, calcareous siltstone to sandstone, mica quartzite, or schist; minor interbedded pelitic, argillite and schist; rare limestone, marble, basic volcanic rocks, and gypsum-anhydrite
2, **white to creamy-white gypsum and anhydrite; thin-bedded to massive, light grey to dark bluish-grey limestone or marble; minor dark grey calcareous argillite, calcareous siltstone-sandstone, local buff-grey-weathered limestone**
3, dark green (locally purple), porphyritic (augite) and non-porphyritic basaltic to andesitic flows, and subordinate volcaniclastic sediments, agglomerate, breccia, cherty tuff, grey limestone or marble, gypsum and basic intrusions

LATE DEVONIAN
DSC — **SCHEEL CREEK SUITE (ca. 364 Ma):** *massive medium to coarse-grained, rusty grey-green hornblende pyroxene gabbro, minor medium grained gabbro-diabase and gabbro-pegmatite intrusions; rare pods of black peridotite; screens of flows, volcaniclastic rocks; minor argillite, and rare chert* **(Mt. Cairnes Gabbro-Greenstone Complex; Steel Creek-Mt Constantine Gabbro Complex)**

SILURIAN AND DEVONIAN
SDB — **BULLION:** *a grouping of carbonate (1) and clastic (2) strata that may be in part equivalent*
1, massive to well-bedded light grey limestone or marble, thin-bedded dark grey limestone or marble; minor dark blue-grey calcareous argillite or phyllite **(Bullion Creek Limestone)**
2, dark blue-grey argillite, phyllite, and minor greywacke siltstone-sandstone; upper part more calcareous, lower part more greywacke; locally may include massive limestone and greenstone

LOWER ORDOVICIAN TO DEVONIAN AND (?) OLDER
AX (ALEXANDER) — **ODG** — **GOATHERD:** *a grouping of clastic (1) and carbonate (2) strata that may be in part equivalent*
1, yellow to ochre-buff calcareous mudstone-siltstone, grey silty limestone and platy to massive-bedded, cryptocrystalline limestone; local well-bedded, limestone; thick to massive-bedded limestone in upper parts of unit probably equivalent to SDBl
(Goatherd Mbr, assemblage)
2, dull rusty-buff or green-grey greywacke siltstone-sandstone, and argillite or phyllite; minor grit; rarer limestone, pebble conglomerate, conglomeratic; locally includes quartzite

CAMBRIAN TO ORDOVICIAN AND (?) YOUNGER
COD — **DONJEK:** *greywacke-greenstone assemblage (1) with minor carbonate (2)*
1, massive to well-bedded, fine to medium-grained greywacke, minor siltstone-sandstone, argillite, phyllite or schist, and basic intrusions; conglomeratic, basic flows (some pillowed), pyroclastic rocks(?), and volcanic breccia; greenstone, amphibolite **(N. Aitsek Ranges Greywacke-Greenstone assemblage; Donjek Range Greywacke-Greenstone assemblage; Field Creek Volcanics)**
2, light grey to rusty brown laminated and bedded limestone and limy siltstone, and well-bedded limestone or marble; minor greenstone - CODc

TRIASSIC - JURASSIC
uTB — **BEAR CREEK:** *greenstone (1), metaclastic rocks (2) and local mélange unit (3)*
1, fine to medium-grained, strongly foliated to massive intermediate to mafic metavolcanic rocks; greenschist near fault zones; interlayered with metasedimentary rocks and thin carbonate horizons; locally pillowed
2, fine-grained meta-siltstone, mudstone and sandstone; phyllitic to schistose, locally more massive; abundant pyrite cubes observed in mudstone
3, foliated and faulted mélange-like assemblage of medium to dark green, medium to coarse-grained clastic or volcaniclastic rocks and lesser grey chert and mudstone, with local highly foliated, cm to dm scale, cream-coloured layers and lenses of more felsic

LATE TRIASSIC
LTK — **KLUANE ULTRAMAFIC SUITE (232-228 Ma):** *mafic to ultramafic intrusions including peridotite, dunite (1) and gabbro (2)*
1, cheery black peridotite, rare dunite **(Kluane-type Mafic-Ultramafics Gabbro-Diabase Sills)**
2, medium grey-green, massive, medium-grained, pyroxene gabbro and greenstone sills **(Maple Creek gabbro)**

MIDDLE TRIASSIC
mTH — **CREEK:** *dark grey to black siltstone and mudstone; locally limy; grey, thinly-bedded limestone* **(Hoge Creek Fm)**; *difficult to distinguish from parts of the Hasen Creek Fm*

LOWER PERMIAN
CPh — **SKOLAI - HASEN CREEK:** *fine-grained clastic rocks (1) and carbonate (2)*
1, **interbedded dark grey and brown-weathered siltstone, mudstone and medium to coarse-grained sandstone; local conglomerate; rare tuff; local tuff and rare basaltic flows; rare dark grey to black chert beds and chert-pebble conglomerate** (Hasen Creek Fm)
2, **light to medium grey, massive to bedded limestone; locally fossiliferous; fossils include corals and crinoids - CPhc**

MISSISSIPPIAN TO PENNSYLVANIAN
CPS — **SKOLAI - STATION CREEK:** *volcanic rocks succeeded upward by clastic strata and including minor limestone*
1, undifferentiated Skolai Gp; includes variably metamorphosed and deformed Hasen Creek and Station Creek fms; meta-pelite, metavolcanic rocks and marble
2, dark green to black-weathered and black basalt flows; rare felsic flows and hyaloclastics; red, magnetite-rich jasper found locally as interstitial material between pillows and within pillow breccia, thick accumulations of laminated jasper rarely occur **(Station Creek Fm)**
3, thinly bedded, laminated to massive chert interbedded with crystal tuff; chert is mainly light to dark grey, locally red and green; beds are well-bedded with local black and dark brown massive beds; tuff ranges from maroon to green, fine grained and laminated with phenocrysts of quartz ± plagioclase **(Station Creek Fm)**
4, interbedded volcanic breccia, agglomerate and volcaniclastic sandstone; dominated by pyroxene-phyric volcanic breccia; rare light grey-weathered, dark green to black, fresh, pyroxene-phyric flows **(Station Creek Fm)**
5, **laminated to thinly bedded, light grey to light green volcanic tuff and volcaniclastic siltstone, local crystal tuffs interbedded with fine-grained volcanic ash**

PENNSYLVANIAN TO EARLY PERMIAN
AXp — **CPi** — **ICEFIELD RANGES SUITE (308-285 Ma):** *mid to dark greenish-grey, medium-grained, nonfoliated and foliated, biotite hornblende quartz monzodiorite-quartz diorite-tonalite, veined and intruded by hornblende diorite; olivine and hornblende clinopyroxenite* **(Pyroxenite Creek Ultramafic)**

DEVONIAN TO UPPER TRIASSIC AND (?) OLDER
AX — **DKT** — **SCHEIDLER:** *fissile, dark grey to grey-brown argillite and phyllite; Paleozoic partly equivalent strata subdivided into three dominant facies including pelitic rocks (1), carbonate (2) and volcanic rocks (3)*
1, thin to medium-bedded, fine to medium-grained, quartz-rich, micaceous, calcareous siltstone to sandstone, mica quartzite, or schist; minor interbedded pelitic, argillite and schist; rare limestone, marble, basic volcanic rocks, and gypsum-anhydrite
2, **white to creamy-white gypsum and anhydrite; thin-bedded to massive, light grey to dark bluish-grey limestone or marble; minor dark grey calcareous argillite, calcareous siltstone-sandstone, local buff-grey-weathered limestone**
3, dark green (locally purple), porphyritic (augite) and non-porphyritic basaltic to andesitic flows, and subordinate volcaniclastic sediments, agglomerate, breccia, cherty tuff, grey limestone or marble, gypsum and basic intrusions

LATE DEVONIAN
DSC — **STEEL CREEK SUITE (ca. 364 Ma):** *massive medium to coarse-grained, rusty grey-green hornblende pyroxene gabbro, minor medium grained gabbro-diabase and gabbro-pegmatite intrusions; rare pods of black peridotite; screens of flows, volcaniclastic rocks; minor argillite, and rare chert* **(Mt. Cairnes Gabbro-Greenstone Complex; Steel Creek-Mt Constantine Gabbro Complex)**

SILURIAN AND DEVONIAN
SDB — **BULLION:** *a grouping of carbonate (1) and clastic (2) strata that may be in part equivalent*
1, massive to well-bedded light grey limestone or marble, thin-bedded dark grey limestone or marble; minor dark blue-grey calcareous argillite or phyllite **(Bullion Creek Limestone)**
2, dark blue-grey argillite, phyllite, and minor greywacke siltstone-sandstone; upper part more calcareous, lower part more greywacke; locally may include massive limestone and greenstone

LOWER ORDOVICIAN TO DEVONIAN AND (?) OLDER
AX (ALEXANDER) — **ODG** — **GOATHERD:** *a grouping of clastic (1) and carbonate (2) strata that may be in part equivalent*
1, yellow to ochre-buff calcareous mudstone-siltstone, grey silty limestone and platy to massive-bedded limestone; cryptocrystalline limestone; local well-bedded, limestone; thick to massive-bedded limestone in upper parts of unit probably equivalent to SDBl
(Goatherd Mbr, assemblage)
2, dull rusty-buff or green-grey greywacke siltstone-sandstone, and argillite or phyllite; minor grit; rarer limestone, pebble conglomerate, conglomeratic; locally includes quartzite

CAMBRIAN TO ORDOVICIAN AND (?) YOUNGER
COD — **DONJEK:** *greywacke-greenstone assemblage (1) with minor carbonate (2)*
1, massive to well-bedded, fine to medium-grained greywacke, minor siltstone-sandstone, argillite, phyllite or schist, and basic intrusions; conglomeratic, basic flows (some pillowed), pyroclastic rocks(?), and volcanic breccia; greenstone, amphibolite **(N. Aitsek Ranges Greywacke-Greenstone assemblage; Donjek Range Greywacke-Greenstone assemblage; Field Creek Volcanics)**
2, light grey to rusty brown laminated and bedded limestone and limy siltstone, and well-bedded limestone or marble; minor greenstone - CODc

B

QUATERNARY
Qs — **Q** — **QUATERNARY:** *unconsolidated glacial, glaciofluvial and glaciolacustrine deposits; fluvatile silt, sand, and gravel, and local volcanic ash, in part with cover of soil and organic deposits*

UPPER CRETACEOUS
uKC — **CARMACKS (DONJEK):** *volcanic succession dominated by basic volcanic strata (1), but including intermediate volcanic rocks (2) dominantly at the base of the succession, and locally, basal clastic strata (4) (ca. 72-68 Ma)*
1, augite olivine basalt and basaltic andesite; hornblende feldspar porphyry andesite and dacite flows; vesicular, augite phyric andesite and trachyte; minor sandy tuff, granite boulder conglomerate, agglomeratic and associated volcaniclastic rocks **(Carmacks Gp, Little Ridge Volcanics, Casino Volcanics)** - uKCv
2, andesite, porphyry - uKCa
4, medium-bedded, poorly sorted, coarse to fine-grained sandstone, pebble conglomerate, shale, tuff, and coal; massive to thick-bedded locally derived granite or quartzite pebble to boulder conglomerate **(Carmacks Gp; Colorado Creek Conglomerate)** - uKCs
5, gabbro and monzonite bodies near Carmacks - uKCg

LATE TRIASSIC
uKT — **TLANSANLIN:** *fine-grained basalt and basaltic andesite; plagioclase and hornblende-phyric andesite, dacite, welded tagiil tuff (ca. 78-74 Ma)*

uKW — **WINDY-TABLE:** *resistant, columnar jointed, quartz-phyric dacite flows, ash and lapilli tuff; maroon weathering, basal sedimentary and epiclastic rocks; dacite flows and flow breccia; brown basalt flows; includes dikes of quartz feldspar porphyry (ca. 85-80 Ma)* **(Open Creek Volcanics)**

LATE CRETACEOUS
LKP — **PROSPECTOR MOUNTAIN SUITE (72-68 Ma):** *grey, fine to coarse-grained, massive, granitic rocks of felsic (q) intermediate (g) rarely mafic (d) composition and related felsic dikes*
d, coarsely crystalline gabbro and diorite
g, hornblende-biotite granodiorite, hornblende diorite, quartz diorite **(Wheaton Valley granodiorite; Katrina Creek suite)**
q, quartz monzonite, biotite quartz-rich granite; porphyritic alaskite and granite with plagioclase and hornblende; rare phenocrysts; biotite and hornblende quartz monzodiorite, granite, and leucocratic granodiorite with local alkali feldspar phenocrysts **(Prospector Mountain Suite; Carmacks Gp)**
y, syenite
t, quartz-feldspar porphyry

LKG — **SUITE (79-72 Ma):** *grey, fine to coarse-grained, massive, granitic rocks of intermediate (g) composition and related felsic dikes (f)*
g, hornblende-biotite granodiorite, hornblende diorite, quartz diorite **(Wheaton Valley granodiorite)**
f, quartz-feldspar porphyry

LKg — **UNDIVIDED SUITE - COAST MOUNTAINS:** *fine to coarse-grained granitic rocks of intermediate (g) composition and probably related orthogneiss*
gd, *fine to coarse-grained hornblende diorite to tonalite with dominant garnet; locally grading into garnet amphibolite, local garnet pegmatite*
gm, medium to coarse-grained, mylonitic to weakly deformed, biotite, quartz ± garnet, orthogneiss; dark grey weathered, dark grey to pale grey banded fresh; commonly interlayered with similar but more leucocrap assemblage (?), inferred Late Cretaceous, but could be as old as Permian (?)*

MESOZOIC
Kk — **KLUANE SCHIST:** *dark purplish brown staurolite cordierite biotite hornfels with relict schistose texture; quartz-sericite-chlorite schist; minor quartzite* **(Kluane Schist)**
i, undifferentiated Kluane Schist
2, dark grey to black-weathered, dark grey to black, fine-grained, quartz-biotite schist; local garnet and plagioclase porphyroblasts
3, light to dark grey, fine-grained, quartz-muscovite schist; variably carbonaceous; rare light grey carbonate lenses may be part of Snowcap or Finlayson assemblages of Yukon-Tanana terrane
4, gneissic equivalents of Kluane Schist and undifferentiated Yukon-Tanana terrane; migmatite, paragneiss and orthogneiss near the lower contact between Ruby Range Batholith and Kluane Schist

EARLY JURASSIC
EJL — **LONG LAKE SUITE (192-180 Ma):** *intermediate (g) to felsic (q) granitoid rocks*
g, *medium to coarse-grained, massive to weakly foliated biotite-hornblende granodiorite, with local K-feldspar megacrysts*
q, *massive to weakly foliated, fine to coarse-grained biotite, biotite-muscovite and hornblende-biotite granite; porphyritic granite; fine-grained, banded grey to dark grey metasedimentary rocks*
2, fine to medium-grained, garnet-biotite schist and metasedimentary rocks; brown to rusty weathered, dark grey fresh; layers variably richer in quartz or biotite; may result from partial anatectic metamorphism of part of the Dezadeash Fm

MIDDLE TRIASSIC - EARLY JURASSIC
mTkEJM — **MINTO SUITE (234-195 Ma):** *mostly intermediate (g) to felsic (q) granitoid rocks but locally grading to syenite (y) or hornblende gabbro (gb)*
g, *medium to coarse-grained, foliated biotite-hornblende granodiorite; biotite-rich screens and gneissic schlieren; foliated hornblende diorite to monzodiorite with local K-feldspar megacrysts* **(Minto, Granite Mountain, Tatchun plutons)**
q, *massive to weakly foliated, fine to coarse-grained biotite, biotite-muscovite and biotite-hornblende quartz monzonite to granite, including abundant pegmatite and aplite phases; commonly K-feldspar megacrystic* **(Aishihik batholith)**

LOWER CRETACEOUS
mKN — **MOUNT NANSEN:** *massive aphyric or feldspar-phyric andesite to dacite flows, breccia and tuff; massive, heterolithic, quartz and feldspar-phyric, felsic lapilli tuff; flow-banded quartz-phyric rhyolite and quartz-feldspar porphyry dikes, sills and breccia* **(Mount Nansen Gp, Byng Creek Volcanics, Hutshi Gp)**

mKs,v — **IKIR** — **INDIAN RIVER:** *clast-supported pebble to cobble conglomerate with clasts of vein quartz and foliated quartzite; coarse-grained sandstone; minor tuff*

EARLY CRETACEOUS
mKW — **WHITEHORSE SUITE (112-105 Ma):** *grey, medium to coarse-grained, generally equigranular granitic rocks of felsic (q), intermediate (g), locally mafic (d) and rarely syenitic (y) composition*
d, hornblende diorite, biotite-hornblende quartz diorite and mesocratic, often strongly magnetic, hornblende-biotite diorite, quartz diorite and gabbro **(Whitehorse Suite, Coast Intrusions)**
g, biotite-hornblende granodiorite, hornblende quartz diorite and hornblende diorite; leucocratic, biotite hornblende granite and granodiorite; rare biotite and pink to pinkish-buff feldspar phenocrysts **(Whitehorse Suite, Casino granodiorite, McClintock granodiorite, Nisling Range granodiorite)**
q, biotite quartz-monzonite, biotite granite and leucogranite, pink granophyric quartz monzonite, porphyritic biotite leucogranite, locally porphyritic (K-feldspar) hornblende monzonite to rhyolite and leucocratic biotite-hornblende quartz monzonite **(Mt. McIntyre, Whitehorse plutons, Casino intrusions, Mt. Ward granite, Coffee Creek granite)**

EKP — **TESLIN SUITE (123-115 Ma):** *leucocratic, fine to coarse-grained, equigranular, hornblende-biotite granite, granodiorite, quartz monzonite and quartz monzodiorite, locally with gray to green, felsic lapilli tuff and potassium feldspar phenocrysts; associated aplitic phases and dikes* **(Deadman Creek batholith)**

UPPER JURASSIC AND LOWER CRETACEOUS
JKT — **TANTALUS:** *massive to thickly bedded chert pebble conglomerate and gritty quartz-chert-feldspar sandstone; interbedded dark grey shale, argillite, siltstone, arkose and locally, at or near the base, volcaniclastic rocks and flows* **(Tantalus Fm)**

JKs — **MJB** — **BRYDE-BENNETT SUITE (178-160 Ma):** *undeformed granitic rocks of predominantly felsic (g) and intermediate composition (g); rare syenite (y)*
g, medium to fine-grained, equigranular, leucocratic monzogranite, syenite and granite and related dikes of ducite to andesite porphyry with euhedral andesine, hornblende and locally quartz in aphanitic groundmass; or grey groundmass **(Teslin Crossing stock)**
g, medium-grained, hornblende monzodiorite, hornblende-biotite quartz monzodiorite and minor hornblendite; pink, potassium feldspar megacrystic, hornblende granite to granodiorite and equigranular to porphyritic granite; rare dikes of lamprophyre **(Hancock mb of Aksala fm)** - uTAm
y, *corase-grained to pegmatitic phlogopite-nepheline syenite* **(Marsh Lake pluton)**

LOWER TO MIDDLE JURASSIC, SETTANGIAN TO BAJOCIAN
JKp — **LABERGE:** *predominantly turbiditic sandstone-siltstone-mudstone in the south (1) passing to shallow-marine sandstone-shale-conglomerate in the north (2)*
1, well-bedded, locally bioturbated, turbiditic sandstone-siltstone-mudstone; dark weathering, massive to finely laminated mudstone and limy mudstone; thick-bedded to massive lenses of polymictic pebble to boulder conglomerate; lithic sandstone; minor limestone **(Laberge Gp, Richthofen fm)** - Jlr
2, poorly sorted, medium-bedded to massive arkosic sandstone and minor shale with interbedded and thick members of pebble to boulder conglomerate; well-bedded, locally bioturbated, recessive, dark brown weathering, thin-bedded, dark brown to greenish, silty shale **(Laberge Gp, Tarsnikh fm)** - Jlt

UPPER JURASSIC, PLEINSBACHIAN TO TOARCIAN
JLN — **NORDENSKIOLD:** *resistant, reddish brown weathering, massive, khaki-green dacite crystal tuff and volcaniclastic sandstone, with fresh plagioclase, hornblende and biotite; grades locally to dacite green, punky weathering, salt and pepper textured, massive lithic sandstone; interbedded conglomerate* **(Nordenskiold dacite)**

MIDDLE TRIASSIC TO LOWER JURASSIC
mTkJC — **CACHE CREEK:** *well bedded ribbon chert interbedded with shale, siltstone and greywacke* **(Cache Creek Gp; equivalent in part to Laberge Gp)**

MIDDLE TRIASSIC
mTkC — **KUTCHO:** *dark grey, fine-grained siltstone; buff, coarse-grained calc-lithic sandstone; green-grey wacke to pebble polymictic orthoconglomerate; fine-grained siltstone locally interbedded with thin, argillaceous limestone beds; carbonate-rich debris flows and rare olistoliths(?)* **(Michie fm)**

CARBONIFEROUS TO TRIASSIC
CC (CACHE CREEK) — **CTCc** — **CACHE CREEK:** *ocean assemblage of ultramafic rocks (1), volcanic rocks (2), carbonate (3) and ribbon chert (4)*
1, dark green to black, fine to medium grained, commonly magnetic, variably tectonized, serpentinized and chloritized ultramafic rocks including medium to coarse-grained hornblende-pyroxene diorite gabbro, peridotite, dunite, serpentinite, and pyroxenite **(Cache Creek Gp, Nakina fm)** - CTCu
2, andesitic and basaltic spherulitic greenstone, locally pillowed; aphanitic, fulliaceous(?) greenstone with clasts of limestone and chert; altered volcanic rocks with numerous serpentine bodies; massive, fine-grained metabasite and hornblende diorite **(Cache Creek Gp, Nakina fm)** - CTCv

CTCum — **CTCum**

CTCc — **CTCc** — **CACHE CREEK:** *ocean assemblage of ultramafic rocks (1), volcanic rocks (2), carbonate (3) and ribbon chert (4)*
3, massive to thick-bedded limestone; minor thin-bedded argillaceous to sooty limestone; coarsely crystalline, massive dolostone; minor laminated chert; massive to poorly bedded, limestone conglomerate debris flows and fanglomerate **(Hancock mb of Aksala fm)** - uTAn
4, red and green chert, exhalite - Cxs

LATE MISSISSIPPIAN
MqT — **TATLMAIN SUITE (340-336 Ma):** *mainly granite (q), granodiorite (g), minor gabbro (gb)*
q, *variably foliated to unfoliated, coarse-grained granite* **(Tatlmain batholith)**
g, *medium-grained hornblende quartz diorite, tonalite; hornblende-biotite granodiorite*
gb, *medium to coarse-grained, biotite gabbro*

UPPER DEVONIAN TO LOWER MISSISSIPPIAN
DMF — **FINLAYSON:** *assemblage of mafic (1) to felsic (2) metavolcanic rocks of arc and back-arc affinities; greenstone-chlorite-sericite schist, metachert (3); minor quartzite, metavolcanic-stic rocks (4); marble (5); ultramafic rocks and metagabbro (6)*
1, mainly basaltic to dun brown weathering, strongly magnetic, variably tectonized, serpentinized and chloritized ultramafic rocks including medium to coarse-grained hornblende-pyroxene diorite gabbro, peridotite, dunite, serpentinite, and pyroxenite **(Cache Creek Gp, Nakina fm)** - CTCu
2, andesitic and basaltic spherulitic greenstone, locally pillowed; aphanitic, fulliaceous(?) greenstone with clasts of limestone and chert; altered volcanic rocks with numerous serpentine bodies; massive, fine-grained metabasite and hornblende diorite **(Cache Creek Gp, Nakina fm)** - CTCv

DMFc — **DMFc** — **CHERT:** *dark grey to black siltstone and metavolcaniclastic rocks, metachert* **(Nasina, Swift River, Grass Lakes, Wolverine fms)** - DMFbp

DMFum — **DMFum** — **UNDIVIDED SUITE - members of chert pebble conglomerate:** *black siliceous siltstone; nodular and bedded barite; rare limestone* **(Earn Gp, Portrait Lake and Prevost fms)**

EARLY MISSISSIPPIAN
PgK — **SIMPSON RANGE SUITE (ca. 355-345 Ma):** *foliated granitoid of mainly granodiorite to tonalite composition (g), locally syenite and augen granite (q), rare gabbro (gb)*
g, *foliated to strongly foliated, fine to medium-grained, hornblende-bearing metagranodiorite, metadiorite and orthogneiss*
q, *foliated metagranite, quartz monzonite and granodiorite; augen granite*
gb, *locally, metagabbro*

LATE DEVONIAN TO EARLY MISSISSIPPIAN
DMG — **GRASS LAKES SUITE (ca. 365-357 Ma):** *mainly augen granite (q), granodiorite (g); locally syenite and quartz monzonite (y)*
q, *foliated, coarse-grained, K-feldspar-augen metagranite*
g, *fine to medium-grained, foliated granodiorite, granite, quartz monzonite*
y, *locally, unfoliated, coarse-grained to pegmatitic syenite, quartz monzonite (Ragged Lake pluton)*

UPPER DEVONIAN AND OLDER
PDs — **SNOWCAP:** *assemblage of dominantly metasiliciclastic rocks (1); minor marble (2), mafic metavolcanic rocks (3) and ultramafic rocks (4); intruded by Devonian-Mississippian calc-alkalic plutons of the Grass Lakes and Simpson Range suites; locally metamorphosed to blueschist and eclogite facies (5)*
1, polydeformed and metamorphosed quartz-mica psammite, pelite and marble; minor garnet amphibolite **(Snowcap, Donjek, part of Big Salmon complexes; Earn Group)**
2, light grey to buff weathering marble, generally lenticular and discontinuous - PDSc
3, medium to coarse-grained amphibolite, commonly garnet-bearing; greenstone; minor mafic **(Snowcap, Donjek, part of Big Salmon complexes)** - PDSv
4, ultramafic rocks, serpentinite; metagabbro; metapyroxenite **(Dorsey complex)** - PDSm
5, metasiliciclastic and mafic meta-igneous rocks locally metamorphosed to eclogite, blueschist (Quiet Lake, Faro-Ross River, Simpson Lake) - PDSe

PDSc — **PDSc**

PDSv — **PDSv**

PDSm — **PDSm**

PDSe — **PDSe**

UPPER DEVONIAN TO LOWER PERMIAN
CPSm — **SLIDE MOUNTAIN:** *assemblage of chert, argillite, minor sandstone and conglomerate (1,3), basalt (2), serpentinite (4), gabbro (5), rare felsic metavolcanic rocks (6)*
1, variably deformed, dark grey to black carbonaceous phyllite, chert and argillite; grey, green and white chert; minor chert-sandstone and pebble conglomerate; locally fossiliferous (Permian radiolarians); rare phyllitic metavolcanic rocks **(Fortin Creek gp)** - CPSms
2, dark green to black basalt, greenstone, locally pillowed; hyaloclastite; generally weakly deformed and metamorphosed **(Campbell Range fm)** - CPSmv
3, grey, red and green chert and argillite; local dolostone, sandstone **(Campbell Range fm)** - CPSmc
4, brown weathering, dark green to black, variably serpentinized ultramafic rocks; metapyroxenite, dunite, harzburgite - CPSum
5, medium to coarse-grained gabbro; quartz monzonite; locally rodingite - CPgSm
6, muscovite-quartz phyllite, augen schist **(felsic metavolcanic rocks in Fortin Creek gp)** - CPSfm
7, gabbro, gabbro, diabase; rare plagiogranite - CPlgSm

D

QUATERNARY
Qs — **Q** — **QUATERNARY:** *unconsolidated glacial, glaciofluvial and glaciolacustrine deposits; fluvatile silt, sand, and gravel, and local volcanic ash, in part with cover of soil and organic deposits*

EOCENE
Tp — **EBR** — **BLACK RIVER SUITE (49-47 Ma):** *peraluminous, sub-porphyry to medium-grained, K-feldspar-phyric, biotite (± trace muscovite) monzogranite and leucogranite*

LATE CRETACEOUS
LKp — **LKR** — **RANCHERIA SUITE (82-77 Ma):** *medium to coarse-grained granitoid of intermediate (g) to felsic (q) compositions*
g, *medium to coarse-grained, equigranular biotite-muscovite granodiorite and monzogranite*
q, *medium-grained, equigranular biotite granodiorite, tonalite, monzogranite (± muscovite); coarse-grained biotite monzogranite with 1-5 cm K-feldspar megacrysts; quartz feldspar porphyry, aplite and kersantite dikes*

MID-CRETACEOUS
mKS — **SKULL SUITE (103-94 Ma):** *fine to medium-grained equigranular biotite (± muscovite) leucogranite to monzogranite; variable textures and grain-sizes; locally partially developed rapakivi; minor stocks of lepidolite–(zinnwaldite)–albite–topaz leucogranite and
