INTRODUCTION

The Naws property is located in east-central Yukon, covering the potential source area for a regional silt sample that returned strongly anomalous gold and rare earth element (REE) values. The property lies within the Tombstone Gold Belt, a 550 km long belt that hosts significant gold occurrences across Yukon and Alaska, such as the Fairbanks Gold Mine, the former Brewery Creek Mine, the Eagle Deposit and the recent Plateau discovery, located 10 km south of the Naws property. The property is wholly owned by Strategic Metals Ltd.

This report describes rock and soil geochemical sampling conducted on August 12, 2017 by Archer, Cathro & Associates (1981) Limited on behalf of Strategic Metals. The author did not participate in the exploration program, but he did interpret all results from this work. The author's Statement of Qualifications is presented in Appendix I, while a Statement of Expenditures is located in Appendix II.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Naws property consists of 20 contiguous mineral claims, which are located on NTS map sheet 105N/05 at latitude 63°27' north and longitude 133°46' west (Figure 1). The property covers an area of approximately 400 ha (4 km²). The claims are registered with the Mayo Mining Recorder in the name of Archer Cathro, which holds them in trust for Strategic Metals. Specifics concerning claim registration are tabulated below, while the locations of individual claims are shown on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
Naws 1-20	YF53181-YF53200	March 21, 2023

* Expiry date includes 2017 work, which has been filed for assessment credit, but not yet accepted.

In 2017, access to and from the property was provided by a Bell 206B helicopter operated by Fireweed Helicopters Ltd. of Whitehorse from a temporary base at the Mayo airport. Personnel were flown from a camp at the nearby Lance claims, which lie 35 km east of the property.

The Naws property lies within the traditional territory of the Na-cho Nyak Dun (NND) First Nation. NND has settled land claim agreements with Canada and Yukon.

HISTORY AND PREVIOUS WORK

In 1990, the Geological Survey of Canada (GSC) conducted a reconnaissance stream sediment and water geochemical sampling program across NTS map sheet 105N. A total of 783 silt samples were collected, one of which was located on the Naws property. Analytical results from the sample taken from the Naws property returned 90th percentile values for cerium (130 ppm), europium (1.8 ppm), neodymium (47 ppm), lanathum (66 ppm) and ytterbium (3.8 ppm). A silt sample collected from a creek immediately southwest of the property returned 99th percentile

values for gold (715 ppb), lanthanum (150 ppm), cerium (260 ppm), neodymium (110 ppm), europium (3.9 ppm), ytterbium (7.8 ppm) and lutetium (1.23 ppm) (Friske et al., 1991).

In 1998, the GSC reanalysed the samples collected in 1990 to include bismuth and selenium. The sample on the Naws property returned 0.3 ppm selenium and 0.4 ppm bismuth (Friske et al., 1998).

In 2009, the GSC completed an additional reanalysis of the regional stream sediment and water samples collected in 1990 for 35 elements. This analysis did not retest for gold or most REEs. Reanalysis returned 66 ppm lanathum from the Naws property and 75.8 ppm lanathum from the creek to the southwest (Day et al., 2009).

In 2009, Strategic Metals staked the Rex 1-42 claims, which covered the REE-enriched silt samples collected by the GSC. A silt sample collected from the current Naws property returned 12 ppb gold with only background to weak REE values (pers. comm D. Eaton, 2017). The work was not filed for assessment credit and the claims were allowed to lapse.

In 2017, Strategic Metals staked the Naws property.

GEOMORPHOLOGY AND CLIMATE

The Naws property is located within the Stewart Plateau of east-central Yukon. It is drained by unnamed creeks that flow north into Pleasant Creek. Pleasant Creek runs into the Hess River, part of the Stewart River watershed, which flows west before ultimately discharging into the Yukon River.

The property is characterized by a steep northwest-facing slope that is deeply incised by creeks. Elevations on the property range from approximately 750 to 1400 m above sea level. Most of the property lies below treeline and has been affected by a recent forest fire, which has resulted in abundant deadfall and burn scars amongst stands of alder and spruce. Bedrock exposures are observed at higher elevations and on escarpments at lower elevations.

Most of central Yukon, including the Naws property, was glaciated during the McConnell glaciation approximately 18,000 years ago (YGS, 2017a). Ice sheets in the area generally migrated in a southwesterly direction, following the Stewart River.

Climate in the Naws area is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. Although summers are relatively mild, snowfall can occur in any month.

REGIONAL GEOLOGY

The Naws property is located within the north-central part of Selwyn Basin (Figure 3), a predominantly off-shelf metasedimentary and metavolcanic sequence that accumulated along the North American continental margin during Neoproterozoic to Paleozoic time. The basin is

bound to the northeast by the Mackenzie Platform, a carbonate platform that formed the near-shore facies of ancient North America (Colpron and Nelson, 2011).

In 1997, the GSC conducted a mapping program in the Lansing map area (NTS map sheet 105N) which augmented previous geological mapping (Roots, 1998). In 2003, the GSC published a compiled 1:250,000 scale bedrock geology map of NTS map sheet 105N (Roots, 2003). Gordey and Makepeace (2003) later completed a Yukon-wide geological compilation, which updated the lithological unit names in the Mayo district. Geological unit names and geological maps were most recently updated in 2016 by the YGS (YGS, 2017b). Lithological units occurring near the Naws property are described in Table I, while the regional geology is shown in Figure 4.

Table I– Lithological Units (after YGS, 2017)

Map Suite	Age	Map Unit	Description
Mayo Suite	Late Cretaceous	mKgM	(mKgM) Massive to foliated plutonic rocks of intermediate composition. Variable in texture, hornblende > biotite (± clinopyroxene) quartz monzonite or monzodiorite; granodiorite and quartz diorite; late-stage sub-alkaline kersantite or spessartite to alkali minette lamprophyres.
Gull Lake Formation	Cambrian	ICG1	(ICG1) Dominantly fine clastic assemblage. Shale, siltstone and mudstone, locally bioturbated, with minor quartz sandstone; rare green-grey chert; local basal limestone and limestone conglomerate; phyllite to quartz-muscovite-biotite schist (garnet, sillimanite, staurolite and andalusite)
Hyland Group	Neoproterozoic	PCH1	(PCH1) Thin to thick-bedded, brown to pale green shale, fine to coarse-grained quartz-rich sandstone, grit and quartz pebble conglomerate; minor argillaceous limestone; phyllite, quartzofeldspathic and micaceous psammite, gritty psammite and minor marble. (Yusezyu Fm)

The region is dominated by a basement of Hyland Group (PCH1) metasedimentary rocks. To the north of the property, this basement assemblage is overlain by a sequence of metasiliciclastic rocks belonging to the Gull Lake Formation (ICG1). South of the property, PCH1 is intruded by a younger monzonite to monzodiorite plug of the Mayo Suite (mKgM).

The highly deformed metasedimentary (PCH1) and metaclastic (ICG1) sequences are displaced and deformed by the Robert Service Thrust Fault (RSTF) and the younger underlying Tombstone Thrust Fault (TTF), located 15 km to the north (Roots, 2003). The RSTF underwent at least 150 km of northerly displacement, thrusting Hyland Group rocks to their present level of exposure

(Roots, 1998). Both faults were active from Jurassic to Cretaceous as part of a collision-related deformation regime related to large-scale plate convergence (Mair et al., 2006).

MINERALIZATION

In 2017, five rock samples were collected from the property. All rock samples comprised quartz vein material hosting minor disseminated pyrite. Rock sample locations are plotted on Figure 5. Rock Sample Descriptions and Certificates of Analysis for the 2017 samples appear in Appendix III and Appendix IV, respectively. Results for all elements of interest were low.

All rock sample sites were marked with orange flagging tape labelled with the sample number and recorded using a handheld GPS unit. Rock samples were sent to ALS Minerals in Whitehorse where they were crushed to 70% passing 2 mm before a 250 g split was pulverized to 85% passing 70 microns. Rock sample pulps were then sent to ALS Minerals in North Vancouver where splits of the pulverized fractions were then dissolved in aqua regia and analyzed for 51 elements using inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). An additional 30 g charge was further analyzed for gold by fire assay followed by inductively coupled plasma-atomic emissions spectroscopy (Au-ICP21).

SOIL GEOCHEMISTRY

In 2017, Strategic Metals collected 70 soil and four silt samples from the property. The soil samples were collected at 50 m spacings along two spines located 500 m apart, while the silt samples were collected during a prospecting traverse that crossed four creeks. Soil sample locations are shown on Figure 6, while thematic results for gold, arsenic and nickel are shown on Figures 7 to 9. Certificates of Analysis for the samples are provided in Appendix III. Anomalous thresholds and peak values for soil and silt samples are listed in Table II.

Table II – Geochemical Thresholds

Element	Anomalous Thresholds			
	Weak	Moderate	Strong	2017 Peak
Gold (ppb)	≥ 5 < 10	≥ 10 < 20	≥ 20	99
Arsenic (ppm)	≥ 10 < 50	≥ 50 < 100	≥ 100	114.5
Nickel (ppm)	≥ 10 < 50	≥ 50 < 100	≥ 100	242

Soil geochemical sampling returned encouraging results for gold, arsenic and nickel. In the central part of the property there is good correlation between strongly anomalous values for all these metals. All of the peak values occur within this central area.

A silt sample collected in the central part of the property, immediately east of the best soil geochemical anomaly yielded moderately anomalous gold (13 ppb) and strongly anomalous nickel (242 ppm) values.

The 2017 soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Soil samples were collected from holes dug by hand-held auger. They were placed into individually pre-numbered Kraft paper bags. The soil samples were sent to ALS Minerals in Whitehorse, where they were dried and screened to -180 microns. The fine fractions were then shipped to ALS Minerals in North Vancouver where they were analysed for 51 elements using an aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). An additional 30 g charge was further analysed for gold by fire assay with inductively coupled plasma-atomic emissions spectroscopy finish (Au-ICP21). Samples collected in 2017 by Strategic Metals were not analysed for REEs.

DISCUSSION AND CONCLUSIONS

The Naws property is situated within the Tombstone Gold Belt, which contains a number of significant gold occurrences, including Goldstrike Resources Ltd.'s Plateau prospect located approximately 10 km to the south.

The Naws property has a similar geological setting to the Plateau property. Both properties are underlain by Hyland Group siliciclastic rocks with nearby Mayo Suite intrusions. The Plateau property hosts orogenic-style mineralization that occurs within north to northwesterly trending shear zones cutting folded clastic sediments. Localized diamond drilling along these shear zones has identified native gold-bearing quartz veins, with results up to 6.05 g/t over 45.5 m (Goldstrike, 2016).

Preliminary soil sampling conducted on the Naws property in 2017 identified anomalous gold, arsenic and nickel values in the central part of the property. Due to the positive results and low sample density, additionally work is warranted to fully delineate the soil geochemical anomaly. Future work on the property should include, but not be limited to: 1) surficial geology and/or geomorphological studies to better understand the effects of glaciation and to identify linear topographic features that could mark shear zones; 2) closely spaced contour or grid soil sampling in the central part of the property; 3) systematic geological mapping; and 4) prospecting.

Respectfully submitted,

CERTIFICATE WH17161586

Project: Naws

This report is for 5 Rock samples submitted to our lab in Whitehorse, YT, Canada on 3- AUG- 2017.

The following have access to data associated with this certificate:

ANDREW CARNE	JOAN MARIACHER	JACK MORTON
--------------	----------------	-------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 21	Sample logging - ClientBarCode
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- MS41	Ultra Trace Aqua Regia ICP- MS	

To: **STRATEGIC METALS LTD.**
ATTN: JOAN MARIACHER
C/ O ARCHER, CATHRO & ASSOCIATES (1981) LIMITED
1016- 510 W HASTINGS ST
VANCOUVER BC V6B 1L8

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

Account: MTT

Project: Naws

CERTIFICATE OF ANALYSIS WH17161586

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).
ME- MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.
CRU- 31 CRU- QC LOG- 21 PUL- 31
PUL- QC SPL- 21 WEI- 21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.
Au- ICP21 ME- MS41

APPENDIX IV
ROCK SAMPLE DESCRIPTIONS

Rock Sample DescriptionsProperty: Naws

Sample Number: S053470 UTM: 561521 mE Nad83, Zone 8
Elevation: 1248 m UTM: 7036417 mN

Comments: Light brown weathered, white vuggy quartz with pervasive limonite and goethite with weathered pyrite grains. No measurements taken.

Sample Number: S053471 UTM: 561079 mE Nad83, Zone 8
Elevation: 951 m UTM: 7037404 mN

Comments: Bright red/orange weathered, yellow stained white quartz with pervasive oxidation and minor pyrite. Vein hosted in red weathered, grey/green phyllite. No measurements

Sample Number: S053472 UTM: 561252 mE Nad83, Zone 8
Elevation: 1018 m UTM: 7037345 mN

Comments: Red/yellow weathered, massive quartz veins with rare pyrite. Oriented at: 280/22. 3-5cm thick, 3-4m long. Hosted in red weathered phyllite.

Sample Number: S053473 UTM: 561362 mE Nad83, Zone 8
Elevation: 999 m UTM: 7037510 mN

Comments: Yellow/red weathered, massive white quartz with abundant oxidation and moderate limonite. No measurements. See REP for S053472.

Sample Number: S053474 UTM: 562095 mE Nad83, Zone 8
Elevation: 1011 m UTM: 7037539 mN

Comments: Orange/yellow weathered, orange stained white massive quartz with minor limonite. No measurements taken. Hosted in chlorite schist.

MESOZOIC
 mKgM: MAYO SUITE: Massive to foliated, variable in texture, hornblende > biotite quartz monzonite or monzodiorite; granodiorite and quartz diorite; late-stage sub-alkaline kersantite or spessartite to alkali minette lamprophyres

PALEOZOIC
 ICG1: GULL LAKE: Shale, siltstone and mudstone, locally bioturbated, with minor quartz sandstone; rare green-grey chert; local basal limestone and limestone conglomerate; phyllite to quartz-muscovite-biotite schist (garnet-sillimanite-staurolite-andalusite) (Gull Lake)

NEOPROTEROZOIC
 PCH1: HYLAND: Thin to thick bedded, brown to pale green shale, fine to coarse grained quartz-rich sandstone, grit, and quartz pebble conglomerate; minor argillaceous limestone; phyllite, quartzfeldspathic and micaceous psammite, gritty psammite and minor marble (Hyland Gp., Yusezyu)
