Report Prepared by:

Tony Barresi, PhD., P.Geo.
Graeme Hopkins, B.Sc.

August 14, 2018

Period of Work:
July 11, 2017 to July 15, 2017

Summary

The Toro Property is located in the Dawson Range, approximately 100km northwest of Carmacks, in the Yukon Territory, Canada. Between July 11th and July 15th, 2017 Triumph Gold Corp. conducted geological and geochemical surveys, and reclamation on select claims at the Toro property.

Table of Contents

List of Figures:

List of Tables:

*sections 1-2 are modified from Sexton et al 2012.

Introduction

1.1 Overview

The Toro property is situated along Hayes Creek approximately 100 km northwest of Carmacks, Yukon Territory, and is within the Whitehorse Mining District (Figure 1).

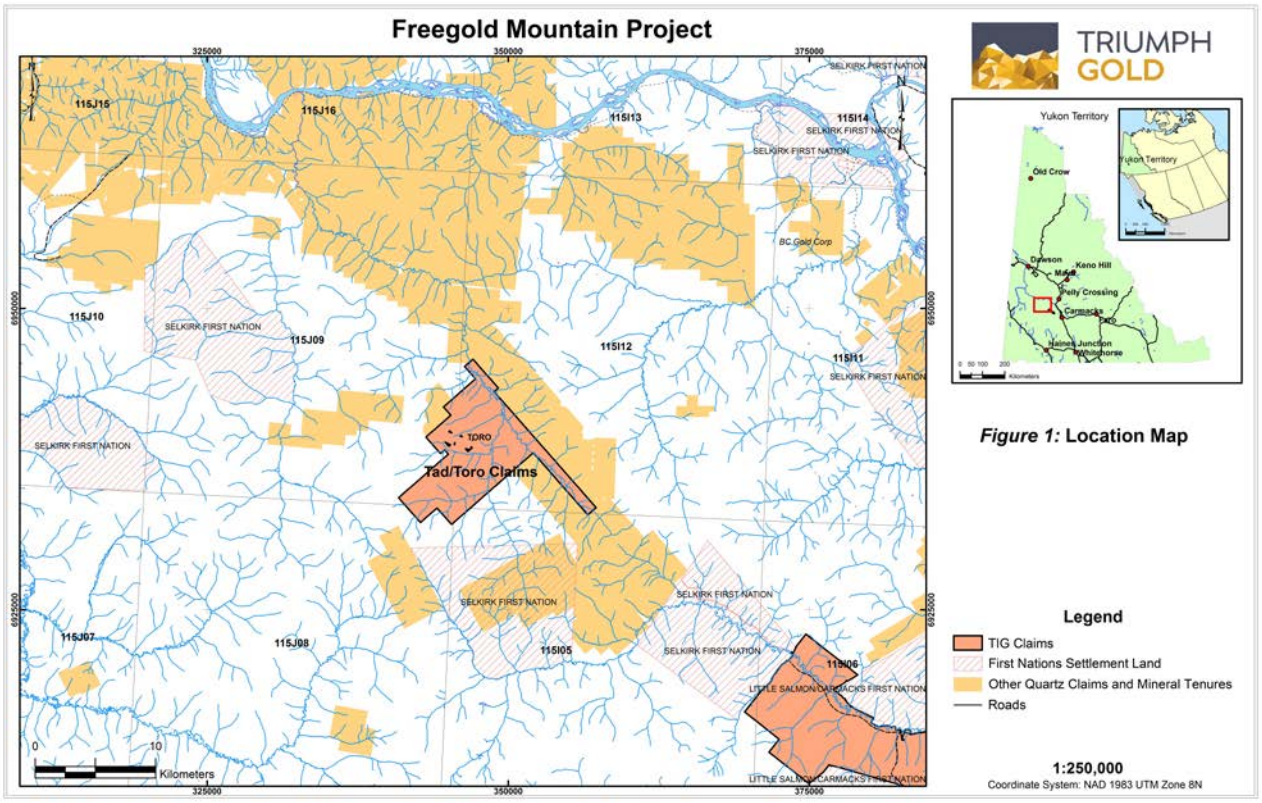

Figure 1: Regional Map of the Toro Property.

The Toro Project comprises 380 contiguous Quartz Mining Claims covering 77 km^2 of prospective ground along the Big Creek Fault in the Dawson Range. The registered owner of the claims is Triumph Gold Corp. (TIG) of Vancouver, British Columbia. A table of claim data is shown as Schedule A in Appendix I. Figure 2 depicts the claims worked in 2017, the claim grouping for assessment purposes as well as the Toro Project overall claims.

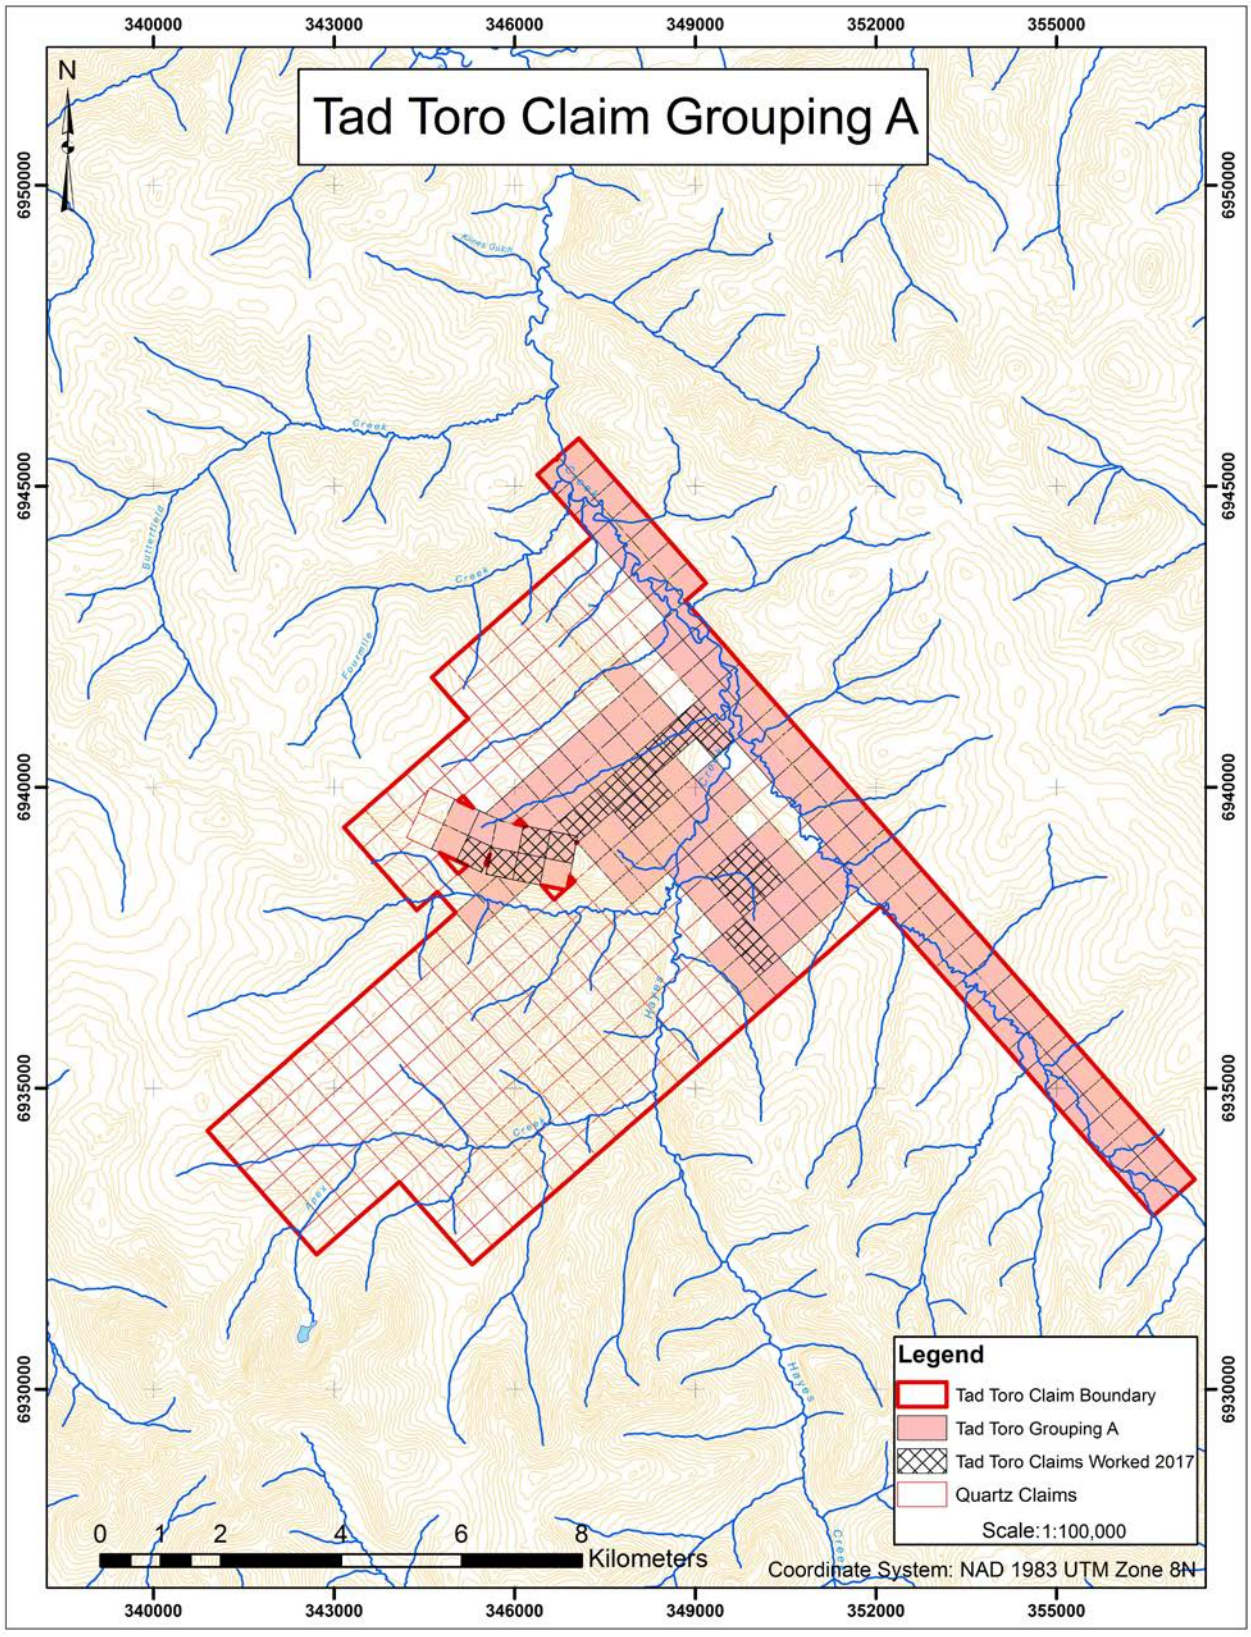

Figure 2: Toro Property claims

The Property is situated in the Dawson Range along a regional trend that hosts a series of deposits and showings with various mineralization styles including copper-gold +/- molybdenum porphyry, intrusion-related gold, epithermal vein-hosted, and breccia hosted gold and silver mineralization. Demonstrated mineralization within lithologies found at the Toro Project include the Casino Copper Porphyry hosted by the Late Cretaceous Prospector Mountain Suite, and Kaminak's Coffee Property largely contained in the mid-Cretaceous Coffee Creek Granite and older biotite schists. Similarities can also be found with mineralization found to the south at the Freegold Mountain property and at Rockhaven's Klaza Mountain project.

1.2 Location and Access

The Toro Property is approximately 100 km northwest of Carmacks, Yukon Territory. Access to the Property is via helicopter or fixed-wing aircraft from Whitehorse or Carmacks. A gravel airstrip, adequate for small fixed wing aircraft, is located on the east side of West Hayes Creek on the TAD 52 claim. Six man-days were spent clearing this strip at the start of the 2010 program. The strip is well constructed and approximately 1,100 m long; it was used during the 2010 season by several plane types up to a Twin Otter. Trees at either end hinder take-off and larger planes.

The Casino Trail crosses much of the Property and passes just 50 m north of camp. This trail connects the Toro project to the Freegold Road approximately 50 km to the southwest. Shifting river morphology has stranded the bridge crossing at Big Creek where the Casino trail meets the Freegold Road. The Casino Trail is not commonly used outside of winter.

Transportation of people and materials to and from the Toro Property in 2017 utilized a helicopter.

The Toro Camp is located at 6940400 N, 349500 E, NAD 83, Zone 8.

1.3 Previous Work

The history of exploration activity at the Toro Property has been extensively researched and documented by Jean Pautler. More detailed information regarding any of this work can be found in her 2010 Technical Report on the Tad/Toro Project.

The Tad/Toro Project includes the Tad claims covering the Tad and Phelps Minfile occurrences (Minfile Numbers 115I 031 and 032), as documented by the Yukon Geological Survey *(Deklerk and Traynor, 2005)* and the Nit claims. The Tad, Phelps and Nit were originally staked as separate properties with separate work programs conducted on each.

Exploration on the Tad/Toro Project, undertaken from 1969 to 2010, has involved approximately 4,596m of drilling in 30 holes, excavator trenching, six grid soil geochemistry programs, rock and soil geochemistry, and ground induced polarization, magnetic and VLF-EM electromagnetic geophysical surveys on the Tad/Toro portion, a magnetic survey on the Phelps portion and a property-wide, helicopter-borne magnetic and radiometric geophysical survey.

1.3.1 Geochemistry

The International Mine Services joint venture discovered disseminated lead-zinc mineralization in an outcrop of gossanous sericite and clay altered quartz monzonite porphyry along Hayes Creek in 1969. The Tad/Toro property was staked and subsequent grid soil sampling in 1969 to 1970 outlined three anomalous zones, a zone with irregular molybdenum (up to 336 ppm) with weak copper values (Zone 1 - Moly Zone), a broad 1.5 km long zinc-lead (with weak copper, silver and molybdenum) anomaly (Zone 2 - Main Zone) and a 2 km long zinc-lead anomaly four km northwest of the Moly Zone *(Waugh, 1970 and 1972)*.

In 1970 copper mineralization was discovered further to the south in the Apex Creek area. Phelps Dodge of Canada Corporation under option from Montana Mining Ltd. completed 120 line miles of grid soil sampling on north trending lines, 400 feet apart with a 100 foot sample spacing. Analyses were performed by Chemex Labs, North Vancouver. The soil geochemistry outlined three small areas of copper and/or molybdenum response *(Hilker et al., 1970)*. Two of the anomalies occur within the property area.

Soil and silt sampling on the Nit property by Nat JV (Armco Ml EL and Chevron Canada Ltd.) in 1980 to 1981 outlined an arsenic geochemical anomaly underlain by Cretaceous granite and schist and gneiss cut by quartz-feldspar porphyry dykes *(Archer, 1982)*. A 1247 ppb Au value was obtained within the upper Waugh Creek drainage. A subsequent 777 sample grid soil program in 1985 by Chevron Canada Ltd. outlined three areas of anomalous gold-silver-lead-arsenic response with maximum results of 1020 ppb Au, 54 ppm Ag, 1550 ppm Pb and 980 ppm As *(Eaton, 1986)*. Anomaly A covers the contact between feldspar porphyry and granite, Anomaly B occurs within the granite and Anomaly C coincides with a 170º/W fault.

A 384 sample soil geochemical survey was undertaken by Noranda Exploration Company in 1986-87, covering the Main Zone area on the Tad/Toro portion. The survey utilized a northerly trending baseline and samples were analyzed for gold-silver-arsenic-copper-lead-zinc. A large gold in soil anomaly ±silver and arsenic was identified somewhat coincidental to the Zone 2 lead-zinc anomaly. Maximum values obtained were 815 ppb Au, 18 ppm Ag, and 530 ppm As *(Hart, 1987)*.

In 1996 International Kodiak Resources Inc. conducted a 398 sample soil geochemical survey on the Tad/Toro portion (collected at 25m spacing's on lines 50m apart on a 10 line km grid with a northwest trending baseline). The more detailed survey reproduced the gold in soil anomaly obtained by Noranda, with moderately coincident arsenic and a lesser correlation with silver. A strong north trending L-shaped gold anomaly (Anomaly A) was defined *(Davidson, 2000)*.

In the 2010 exploration program, by Dawson Gold Corp., 578 soil samples were taken over 7 separate study zones. Two clusters of anomalous results were identified. A tightly spaced group of anomalous gold-in-soil values covering ~300m wide and 150m in length. The second target presented values of up to 540ppb gold-in-soil and measures ~550m by 400m (McLaughlin & Hasek, 2011).

1.3.2 Geophysics

Magnetic and induced polarization geophysical surveys were carried out by International Mine Services in 1969 on the Tad/Toro portion. Three induced polarization chargeability anomalies were outlined; two with coincident zinc-lead soil geochemical anomalies one of which corresponds to the Main Zone, another 500m west of the Main Zone. A magnetic high anomaly was outlined along the south side of the Main Zone chargeability anomaly *(Waugh, 1970 and 1972)*.

In 1970 Phelps Dodge of Canada Corporation under option from Montana Mining Ltd. completed a 120 line mile magnetic survey further to the south in the Apex Creek area (Phelps prospect). The survey was useful in differentiating rock units but did not suggest a typical porphyry copper signature *(Hilker et al., 1970)*.

In 1987 Noranda Exploration Company completed limited VLF electromagnetic and magnetic geophysical surveys over the Tad/Toro portion *(Starr, 1987)*, but results were not reported and could not be located by the present operators.

A high level multi-parameter airborne geophysical survey (magnetic, VLF electromagnetic and radiometric) was flown over the Hayes Creek area by the Geological Survey Canada in 1994 with a 0.5 km line spacing. The survey outlined an L shaped 2 km by 1 km magnetic high in the Main Zone area and a 1 km diameter circular magnetic high anomaly in the Moly Zone *(see Davidson, 2000)*. A large Th/K ratio low was identified

over the Tad Porphyry. The signature was considered similar to, although larger and slightly less intense, than the Casino copper-molybdenum-gold deposit, 55 km to the northwest *(Hart, 1998)*.

Ten line km magnetic and VLF-EM surveys were conducted over the Tad/Toro portion by International Kodiak Resources Ltd. in 1996 under option from Davidson and B. Harris. The data from this survey was never published and could not be located by the present operators.

In 2009 a helicopter-borne magnetic and radiometric geophysical survey over the Tad/Toro Project, covering approximately 93 km^2, was undertaken in October 2009 by Precision GeoSurveys Inc. and funded by 0851045 BC Ltd. The survey was flown along northwest trending lines with 100m line spacing, covering an area slightly larger than the property boundary.

The data from the survey was supplied by Precision GeoSurveys Inc. to Paolo Costantini, a consulting geophysicist, Zurich, Switzerland, for interpretation and target definition, which was also funded by 0851045 BC Ltd.

From July 27, 2010 and August 25, 2010 Frontier Geosciences conducted an IP survey on three grids on the Toro Property. The grids totalled 14 lines at 1.4km lengths and spaced at 200m intervals. The purpose was to explore the extent and geometry of potential porphyry-style copper mineralization. Results did identify large chargeability anomalies, but encompass enough ground to adequately define the porphyry mineralization potential (McLaughlin & Hasek, 2011).

Quantec Geosciences worked on the Tad/Toro property from August 18th, 2011 to September 9th, 2011, completing a Titan-24 DC-IP Survey, on behalf of Dawson Gold Corp.

The survey included 14 north-south lines evenly spaced at 500m, and is located 100km northwest of Carmacks, Yukon, in the Whitehorse Mining District. Each Titan-24 spread was surveyed using a pole-dipole configuration with a diploe size of 100m. The final coverage of each of the 14 lines was 2.4m. For the location of the surveyed lines please refer to Figure 5.

The objective of the survey was to detect and map any gold and silver mineralization for future drilling, as well as to identify delineation and structural controls on the Tad/Toro Project. The quality of data was very good, and the data were inverted using the 2D inversion algorithms to produce sections of the resistivity and chargeability distributions of the subsurface.

A total of 24 anomalies have been identified. Nine of these anomalies (L01-IP1, L01-IP3, L04-IP1, L07-IP1, L08-IP1, L09-IP2, L10-IP3, L11-IP1) were classified as first priority, depending on their occurrence and associated DC resistivity and IP chargeability. Anomalies L07-IP1, L08-IP1, L09-IP1, L09-IP2, and L10-IP3 cover a large zone of mineralization and depict strong IP chargeability, which seems to extend deeper. Another group of 15 anomalies were classified as second priority targets for drilling or for other geophysical surveys.

1.3.3 Trenching

Trenching was conducted on the Tad/Toro portion in 1970 by International Mine Services and in 1987 by Noranda Exploration Company.

In the 1970 trench program samples were collected at 25 foot intervals from the regolith at the bottom of the trenches *(Waugh, 1970)*. In the 1987 Noranda program, 64 overburden and only four rock samples were collected from ten trenches due to poor rock exposure in the trenches. Results closely matched results from the soil geochemical survey, with slightly higher values in the trench samples *(Starr, 1987)*.

The Cp trenches, six or seven bulldozer trenches reportedly excavated in 1969 *(Eaton, 1986),* were located in 2007 around 6940448mN 346190mE, Nad 83, Zone 8. The Cp trenches appear to be 500m further northeast than previously shown. Precise locations for the individual trenches could not be discerned but the general area of disturbance was visible. Trace chalcopyrite is reported from the trenches but sufficient time was not available to adequately evaluate the trenches.

Bulldozer trenching was conducted on the Nit property by Silverquest Resources Ltd. under option from Chevron Canada Resources Ltd. in 1986 to investigate three gold in soil geochemical anomalies (defined by 50 ppb gold or greater). Although over 8,300 cubic meters of material was excavated in 11 trenches with an average depth of 1m, only five trenches reached bedrock and were subsequently sampled. Trenching was constrained by extensive permafrost and only a small portion of the three anomalies were tested. However, significant values were returned as tabulated below *(Carne, 1986)*.

Table 1.0: Trench results Nit Zone

Geochemistry	Trench No.	Width	Type	Au g/t	Ag g/t	Comment
Anomaly B	"F"	30.0 m	Chip	0.32	32.2	Western extent-open
Anomaly B	"F"	7.8 m	Channel	1.03	2.7	Quartz Vein/faulting
Anomaly B	"F"	37.8 m	Combined	0.46	26.1	Combined
Anomaly B	"BW-4"	2.1 m	Channel	0.79	120.0	Quartz Vein/faulting
Anomaly C	"BW-2"	30.0 m*	Chip	0.55	106.6	Eastern extent

* Trench map shows and reports a sample width of 30m but text reports a width of 15m *(Carne, 1986)*.

A hand pit was excavated in 1986 at the 1080 ppb gold in soil anomaly in Anomaly A with soil values decreasing with depth, suggesting a source upslope.

1.3.4 Drilling

Two diamond drill programs totaling 3,080 m in 22 holes were completed on the Tad/Toro property in 1969 to 1970 and in 1987. The following two tables summarize the drill programs, the drill hole locations and specifications.

Table 1.1: Summary of diamond drill programs

Year	Company	Core	Holes	Length (m)
1969-70	International Mine Services*	NQ-BQ	18	2708
1987	Noranda Exploration Co.	NQ	4	372
2010	Dawson Gold Corp.	NQ	8	1516
TOTAL			**30**	**4596**

*joint venture included International Mines Services Ltd, Indian Mountain Metal Mines Ltd, Lion Nickel Mines of Canada Ltd, Prado Explorations Ltd and Gui-Por Uranium Mines and Metals Ltd.

* collars located in 2006

The 1969-70 drilling tested the Main Zone (with 1,755.8m in 12 holes covering the Zone 2 zinc-lead geochemical anomaly) and the Moly Zone (with 952.2m in 6 holes covering the Zone 1 molybdenum ± copper geochemical anomaly). Core recovery was poor and only 111 samples were collected from the 22 holes with seven holes not sampled. Gold was not analyzed in the samples from DDH T69-01 and from the Moly Zone.

The drill program intersected intensely altered and oxidized granitic rock with narrow intervals of anomalous gold within the Main Zone, despite poor core recovery and incomplete sampling. The best intersection from the Main Zone was 7.2m grading approximately 1.5% combined Pb-Zn, 19.5 g/t Ag, and 1.05 g/t Au from DDH T69-02, including 4.11 g/t Au, 50 g/t Ag, 3.06% Zn, 0.07% Cu over 1.06 m. Petrological studies indicated the presence of strong argillic to weak phyllic alteration. Mineralization was found to consist of minor amounts of sphalerite, galena, chalcopyrite, arsenopyrite, tetrahedrite and molybdenite.

Minor molybdenite mineralization was discovered in four holes drilled on the Moly Zone. The mineralization occurs as small specks and flakes of molybdenite primarily in quartz veinlets and as lesser disseminations in the reddish hematite altered potassium feldspar megacrystic quartz monzonite, commonly with minor associated pyrite and rare chalcopyrite. It was noted that molybdenite increased in abundance in the highly sheared and chloritized sections near the bottom of DDH T70-13 and T70-18 *(Waugh, 1970)*.

Significant drill results are summarized in the following table.

Table 1.3: Significant drill intersections

In 1986, Noranda undertook a sampling program of the 1969-70 on-site drill core to assess the oxide gold potential of the property, collecting 114 drill core samples. Samples were analyzed for gold and silver from 11 drill holes (DDH T-1 to -6, T-8 to -10, T-12 and T-14) with As, Cu, Pb, Zn added in DDH T-2, -9 and -14 and Mo in DDH T-9 and -14 *(Hart, 1987)*. The samples were considered representative of core lengths between 1.2 and 5.0 m returning intervals with up to 2080 ppb Au with 7.4 g/t Ag (DDH T-14). A selected sample gave a result of 3100 ppb Au, 20 ppm Ag and 2.68% Zn over 0.5 m *(Starr, 1987, and Hart, 1998)*. Although results were reported over specific intervals, an examination of the core in 2007 indicated that only minor select specimens were collected over those intervals and can only be regarded as grab samples, not to be considered representative of the entire interval. Significant results are summarized below.

Table 1.4: Significant drill specimen results from 1986 re-sampling by Noranda

DDH No.	Interval From (m)	Interval To (m)	Reported Width (m)*	Au g/t	Ag (g/t)	MoS_2 (%)	Cu (%)

Dawson Gold Corp. drilled eight holes totalling 1516m in 2010, using targets identified by gold-in-soil anomalies, geophysical anomalies and known mineralization. The first five holes of the drill program were designed to test the ground on which previous work has outlined several discreet, strong, gold-in-soil geochemical anomalies.

Holes **TT-101, TT-102** and **TT-105** comprised long, consistent sections of Coffee Creek phase granites cut by few meter-scale felsic dykes. Narrow zones of mineralization appear to be related to mm-scale quartz-sulfide veinlets (TT-102 and TT-105) or by a structural feature (TT-101). Holes **TT-103** and **TT-104** were collared from the same pad which was constructed 300 m north of hole TT-102. Both holes encountered Coffee Creek phase granite intruded by long intervals of a newly identified polymictic hydrothermal breccia hosting well-developed sulphide mineralization including pyrite, arsenopyrite, sphalerite and galena. Despite the very propitious suite of sulphide mineralization within the breccia, Au mineralization appears to be found primarily in the granite sections of these holes, associated with narrow sulphide veinlets and variably healed structural zones.

TT-106 was collared to test the strong chargeability anomaly identified by the first complete 2010 IP survey grid. This hole encountered K-feldspar-rich granitoid of the Dawson Range Batholith throughout the hole with a down-hole increase in grain size. Moderately developed clay-alteration, disseminated pyrite, and a significant amount of faulting found in this hole may explain the strong chargeability anomaly identified by the IP study. No significant gold mineralization was discovered.

Holes **TT-107** and **TT-108** were targeted within the historic Main Zone to expand on known gold mineralization. Both holes encountered narrow zones of gold mineralization with values up to 1.49g/t Au over 1 meter. Gold mineralization in both holes is situated in zones of faulting and in the presence of gouge. Hole TT-108 was terminated earlier than intended due to severe weather conditions and did not reach the depth at which mineralization was expected.

Table 1.6: 2010 Significant Drill Intersections

DDH No.	From (m)	To (m)	Width (m)	g/t Au (ICP)	g/t Au (Fire)

1.4 Claims Worked and Filed On

Figure 2 shows the location of the claims that the 2017 prospecting program were conducted over. See Schedule A in Appendix I for a list of claim with grant numbers and the name of registered claim holder.

2. Regional and Property Geology

Adapted from Mineral Deposit Research Unit (MDRU), 2013 after M. Allan et al..

2.1 Regional Geology

The Toro Property is located within the Dawson Range in Yukon-Tanana Terrane (Figure 3). The Dawson Range is a northwesterly trending package that is characterized by metamorphosed basement rocks of the Yukon-Tanana Terrane with numerous and voluminous Jurassic to Cretaceous intrusions. The belt extends 250 km northwest from Mount Freegold into Alaska and has been relatively undisturbed by recent glaciation.

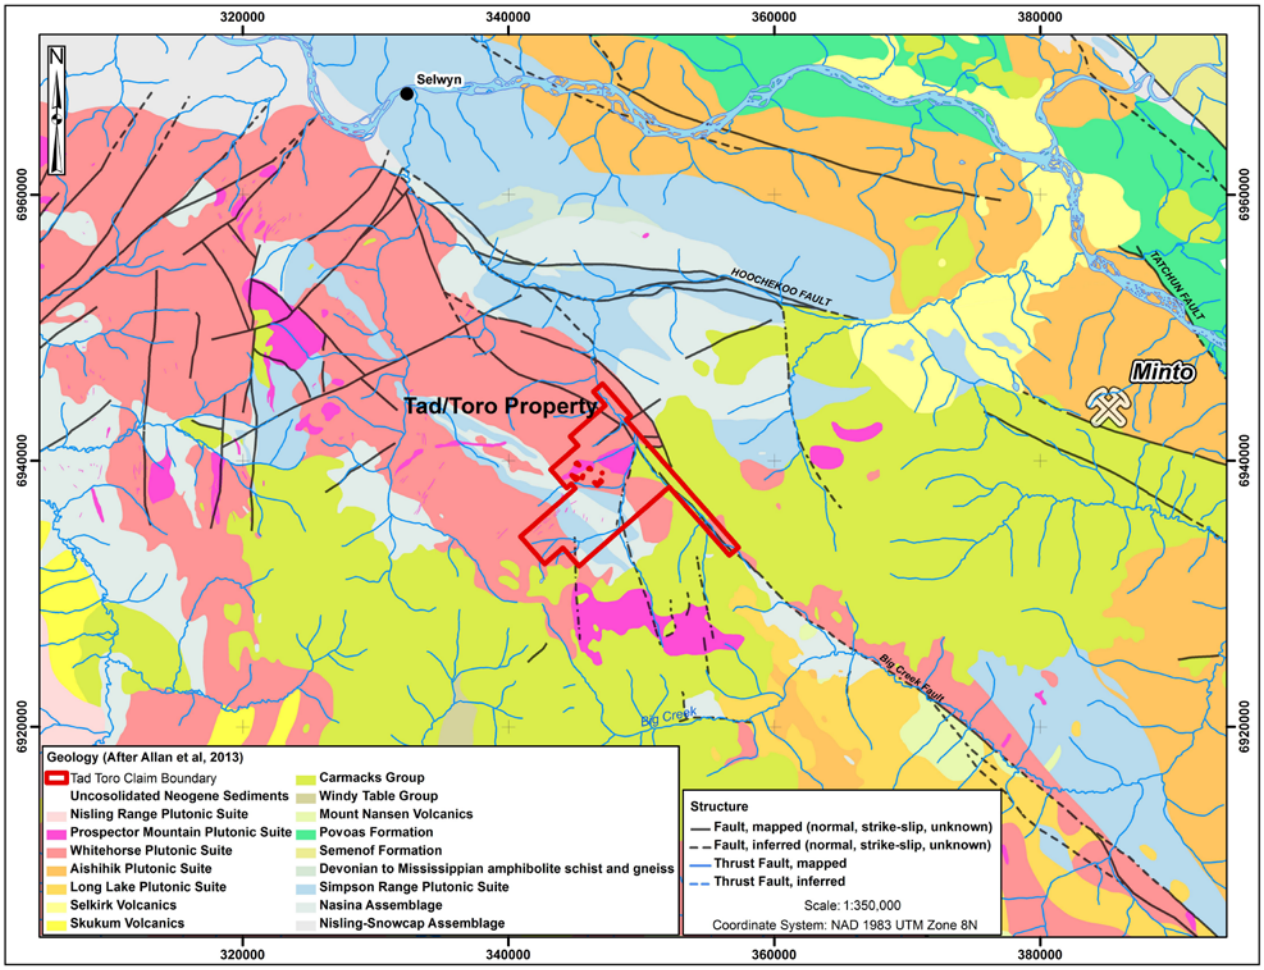

Figure 3: Toro Property, Regional-scale Geology

In the region the Yukon-Tanana Terrane consists of the Nasina Subterrane, which includes dominantly Mid Paleozoic basement schists and gneisses of continental margin origin (**DMgPW**) superposed with Devono-Mississippian arc volcanic to plutonic rocks (**DMN**). Plutonic rocks, mainly granodiorite of the Mid Cretaceous Dawson Range Batholith **(mKp)** intrude these and cover most of the district. A series of Late Cretaceous rocks, primarily plugs, sills and dikes of the Prospector Mountain Suite (**LKp**), intrude the older plutonic and metamorphic units. The youngest rocks in the district are Carmack's Group volcanic rocks (**uKCv**), mainly mafic flows and pyroclastic units. Regional geological units are presented in Table 1 below.

The major structural feature in the region is the northwest trending Big Creek Fault which extends from Freegold Mountain in the Southeast to the Casino Deposit in the northwest, a distance of 100 km (Pautler, 2010). This structure follows in part the Hayes Creek Valley and crosses the Toro property at its Eastern edge. Mineralization associated with the Big Creek Fault is recognized at many properties in the region including Mount Freegold, Revenue Creek, Prospector Mountain, and Toro (Davidson, 2000).

The table below shows the regional geological units in the area of the Tad/Toro Property and the regional geology is illustrated on Figure 3.

Table 2.0: Regional Geological Units – From Gordey and Makepeace (2003)

UNIT	AGE	DESCRIPTION
uKC – Carmacks	Upper Cretaceous	a volcanic succession dominated by basic volcanic strata, but including felsic volcanic rocks dominantly (?) at the base of the succession and locally, basal clastic strata
mKqW - Whitehorse Suite	mid-Cretaceous	biotite quartz-monzonite, biotite granite and leucogranite, pink granophyric quartz monzonite, porphyritic biotite leucogranite, locally porphyritic (K-feldspar) hornblende monzonite to syenite, and locally porphyritic leucocratic quartz monzonite (Mt. McIntyre Suite, Whitehorse Suite, Casino Intrusions, Mt. Ward Granite, Coffee Creek Granite)
mKgW - Whitehorse Suite	mid-Cretaceous	biotite-hornblende granodiorite, hornblende quartz diorite and hornblende diorite; leucocratic, biotite hornblende granodiorite locally with sparse grey and pink potassium feldspar phenocrysts (Whitehorse Suite, Casino granodiorite, McClintock granodiorite, Nisling Range granodiorite)
LKfP - Prospector Mountain Suite	Late Cretaceous to Tertiary	quartz-feldspar porphyry
DMgPW - Pelly Gneiss Suite	Devonian to Mississippian	foliated medium grained, homogeneous biotite granite gneiss to biotite or hornblende granodiorite gneiss; massive to strongly foliated dioritic to granodioritic gneiss; includes interfoliated amphibolite, quartz-mica schist and phyllites
DMN – Nasina Assemblage	Devonian, Mississippian and(?) older	graphitic quartzite and muscovite quartz-rich schist, and with interspersed marble and probable correlative successions

2.2 Property Geology

Adapted from MDRU, M. Allan et al. (2013).

The Tad/Toro Project consists primarily of quartz-hornblende-biotite granitic rocks of the Mid Cretaceous Dawson Range Batholith (**mKp**) that intrude Devono-Mississippian meta-igneous and meta-sedimentary rocks of the Yukon-Tanana Terrane (**YTT**) (mainly quartz biotite schist, hornblende schist, gneissic equivalents, quartzite and minor limestone, with a northwest trending foliation) (Figure 4). Within the Toro Property claim boundary the Dawson Range Batholith includes a biotite>hornblende granodiorite phase (**mKgD**), the Casino granodiorite phase, and a biotite rich leucocratic quartz monzonite to granite phase (**mKfD**), referred to as the Coffee Creek granite phase.

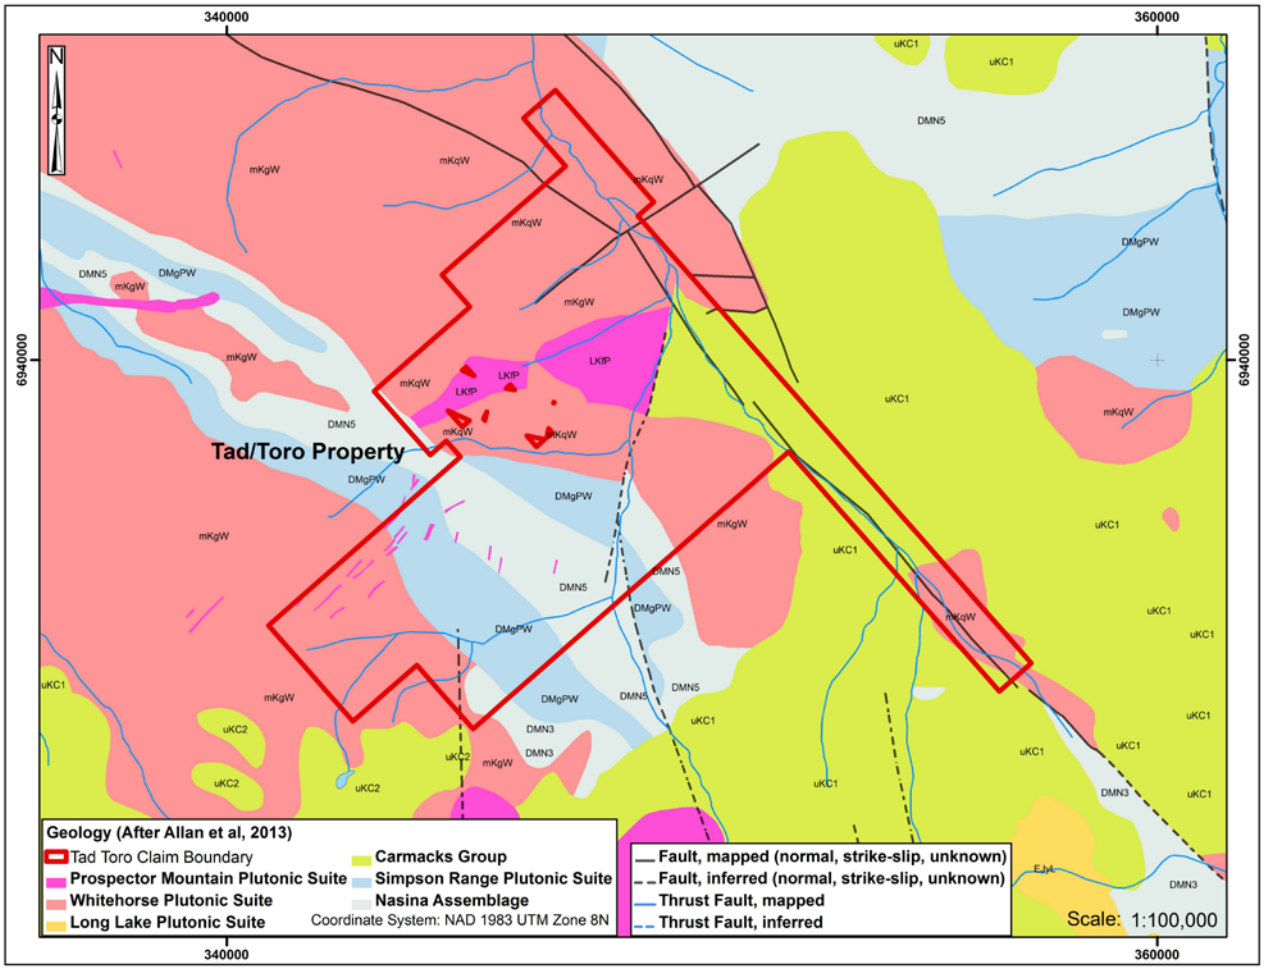

Figure 4: Toro Property, Property-scale Geology

The above units are intruded by granite to quartz monzonite stocks and dykes of the Late Cretaceous Prospector Mountain Suite (**LKp**). The largest body of this rock type, of which the Main Zone is primarily composed, is referred to as the Tad Porphyry. It consists of quartz-feldspar-biotite porphyry with clear quartz and feldspar phenocrysts and lesser biotite. Two phases of the Tad Porphyry have been recognized, a quartz monzonite porphyry and a biotite granite porphyry. Fresh specimens of quartz monzonite are typically pale gray with abundant muscovite. Extensive argillic and propylitic hydrothermal alteration, and iron oxide staining of this unit is found in situ along the north trending Hayes Creek Fault; alteration and brecciation of this unit is extensive in the 1969-70 drill core from the Main Zone

An arm of the Tad Porphyry, or possibly an elongate, second body of the same porphyry, extends to the southwest of the main zone and crosses the Ridge Zone. Aplite dykes are noted cutting medium to coarse grained quartz monzonite in the Nit trenches and a north-northeasterly trending dyke swarm (**LKp**) has been mapped extending to the south of the ridge zone for at least 1.5 km. Additionally, two small leucocratic stocks were identified in the Phelps area during a previous program *(Hilker et al., 1970)*.

The metamorphic and igneous rocks are intruded by mafic dykes and are overlain by basalt flows of the Upper Cretaceous Carmacks Group (**uKCv**) primarily on the north side of Hayes Creek. These weather brown to reddish-brown and vary from olivine-rich to feldspathic.

The northwesterly trending North Big Creek Fault trends across the northeastern edge of the property, following Hayes Creek. The sub-parallel South Big Creek Fault lies 5 to 6 km to the southwest. A northerly trending extensional fault follows the West Branch of Hayes Creek. Work during the 2010 season suggests a northeasterly trending structural corridor is also present running along the Waugh Creek valley, between the North and South Big Creek Faults, and may represent a dilation zone which was exploited by the 74 M Tad Porphyry. Drilling in this area in 2010 identified a polymictic, hydrothermal breccia hosting well-developed sulphide mineralization including pyrite, chalcopyrite, arsenopyrite, sphalerite and galena within the matrix.

3. Exploration Program 2017

3.1 Prospecting

Two traverses were conducted on the Tad Toro claims in 2017. One spanned from the area drilled in 2010 to the Main Zone, through to the main camp location, and the other across the Moly Zone on the south-eastern portion of the property (Figure 4). The purpose of the traverses was to examine and verity described geology, identify areas with mineralization and identify future exploration opportunities. In addition, opportunities for reclamation of historical exploration work were recorded. Station notes are in Table 3.1 and the traverse locations and station locations are marked on Figure 4. No significant zones of mineralization were identified. The observed geology was consistent with M. Allan et al. (2013). Samples mainly consisted of bedrock or subcrop with quartz veins or pyrolusite coatings.

Table 3.1: Prospecting Stations and Notes (T. Barresi, 2017)

Station	SampleID	Notes
1310		Western edge of long trench. All ash and crystal (feldspar and quartz) + lapilli tuff. Poorly lithified In places laminated. Lapilli are angular and breccia like - monolithic but different Iron carbonate alteration defines outline of the lapilli. On eastern side of trench medium grained granite but only in blocks, possibly transported. The trench is full of rusty red overburden.
1311		Medium grained granite in open trench. Quartz + fractures are coated with pyrolusite.
1312		Trench/road with medium grained granite.
1313		Collar for TT104. Messy needs cleanup. Targeting granite contact? Soil anom?
1314		All the way up this slope unmineralized tuff in OC and subcrop
1315		All float and subcrops medium grained granite
1316	C491358	Subcrop of tuff + granite. Very heavily coated with >1mm rind of pyrolusite. Also on fractures. Maybe the assay will help determine rock composition as well.
1317	C491359	Sample of granite subcrop with 1-7mm pyrolusite rims and fracture coating, and coating quartz crystals.
1318		Dill pad. Minor clean up needed. No collar located.
1320		Minor chlorite veining in medium grained quartz rich granite. Trench is below grade with material bulldozed to the ends of the trenches. Very hard to reclaim.
1321	C491360	Loose bull quartz scattered over approximately 10 meters in trench. Possibly from trench or transported down slope. Coarse white to gray translucent margin with coarse felspar is highly irregular; possibly part of a pegmatite, or quartz segregation in granite.
1322		Fine grained quartz porphyritic aplite in felsenmeer

Station	SampleID	Notes
1323		20 full fuel drums with seals + 4 empty drums + 1 partly used. Blue painted. Minor dents in some. These should be (*and have now been*) slung down to the winter road.
1324		The felsenmeer here has abundant dark gray plagioclase phenocrysts. Phaneritic granular groundmass.
1325	C491361	Still in uninteresting quartz rich granite with minor biotite. Sample of bull white to gray semi translucent quartz in subcrop.
1326		Granite appears to be becoming coarser farther from the southern contact
1327		35% orange iron carbonate altered anhedral blobby feldspar in a dark gray phaneritic sucrosic groundmass. A different rock type - probably hypabyssal/volcanic
1328		Similar type of rock as 1327, but with shiny quartz eyes and euhedral hornblende crystals. Possibly more felsic
1329		Pink porphyritic granite. Probably station 1328 was granite as well, just too altered and weathered to make out much more than the phenocrysts. Fine grained groundmass with 8% 3-8mm anhedral to euhedral quartz crystals + 5% subhedral to euhedral hornblende crystals. Feldspar phenocrysts are subhedral to euhedral but are difficult to distinguish from the groundmass.
1330	C491362	This is a contact zone that is exposed in debris in the road (e.g. not outcrop). To south quartz porphyry, to north coarser granite. Lots of quartz veins with hematite and boxwork. Some quartz breccia.
1331		7 Barrels of fuel, not great shape. Full.
1332		Possible drill collar site
1333		End of road.
15-Jul		Moly Zone Tad Toro
1349		Quartz syenite to syenogranite. Not mineralized. Some mafic minerals altered to chlorite
1350		Subcrop of medium grained quartz-rich granite. Weak sericite alteration.
1351		Slump crop. Medium grain syenogranite. Weak sericite + chlorite alteration.
1352		Unmineralized syenogranite
1353	C491365	Banded medium gray very fine grained quartz vein/rhyolite dykelette in syenogranite. Possibly fine moly?
1354		Subcrop of a variety of syeno-granite. quartz vein material. Rhyolite? No sulfide
1355		Angular boulder of fine grained dark gray/green strongly magnetic microdiorite?
1356		Trench identified in air photo. Entirely composed of rounded riverstone. No outcrop or subcrop.

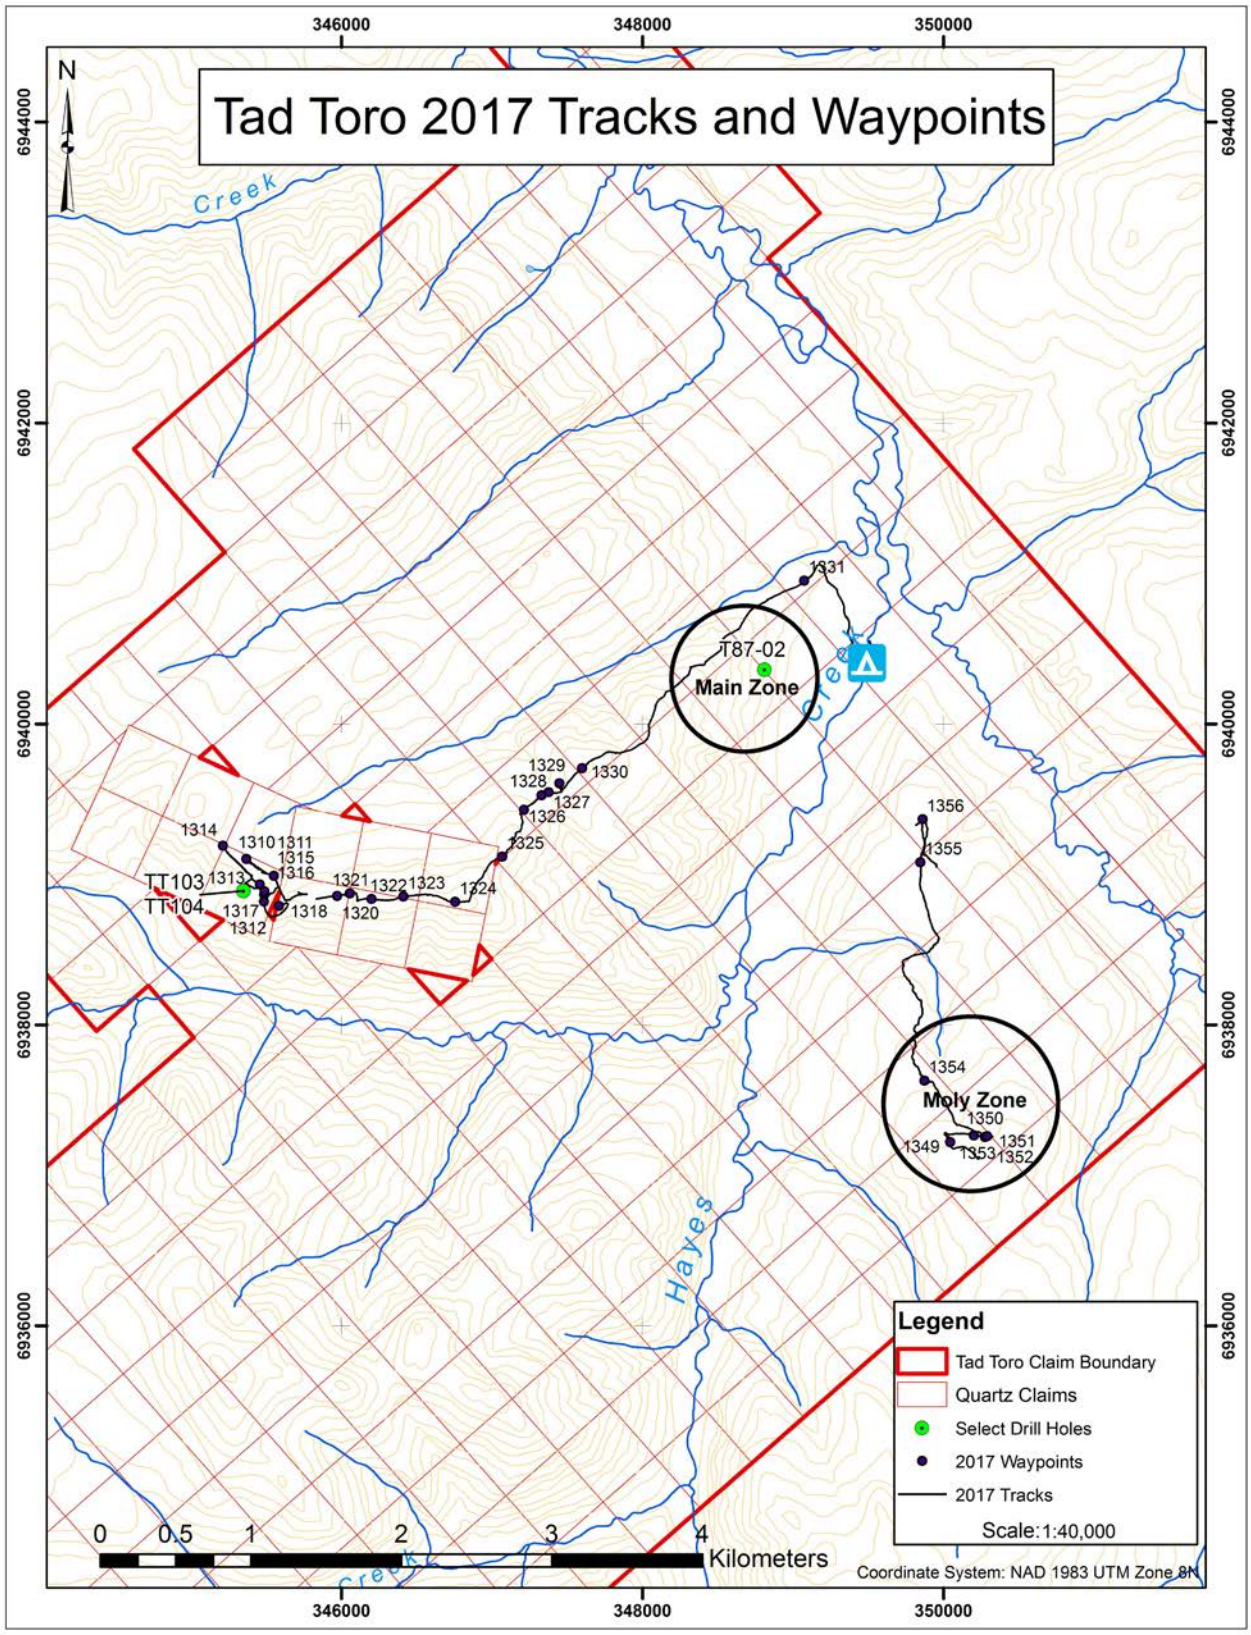

Figure 4: Toro Property, Waypoints and Traverses

3.2 Core Review

One day was spent evaluating historical drill core that is stored on site at the historical Tad Toro camp. Although core is generally stored properly it has weathered poorly and most of the core from drilling pre-2010 has suffered from exposure. Both the boxes and the core are strongly effected by decomposition and the majority of labels are missing or illegible. Core from 2010 drilling was palletized and wrapped in plastic. The plastic was removed as it was causing premature rotting of the core boxes. Despite this, the core boxes and core are still intact. Higher grade intersections from 10 holes were targeted for geological review but only intersections from three holes were located and/or had core that was not completely decomposed. Notes on these intersections are in Table (3.2). Of particular interest is the sulfide rich hydrothermal breccia in diamond drill hole TT104. This could potentially be part of a mappable and semi-contiguous zone of mineralization that is not currently well known and could represent a significant target for future exploration. However, some of the gold mineralization in TT104 is not necessarily related to the hydrothermal breccia but rather small sulfide rich quartz veins in the host granite.

Table 3.2: Core Review Notes (T. Barresi, 2017)

	July 13, Notes on Tad Toro Core
TT104	
38-69	From at least 38m, maybe higher there are nice breccia textures. Likely hydrothermal breccia. Most clasts are coarse to med. granite. Clasts range from angular to sub rounded to partly rounded and partly shattered. Matrix ranges from quartz rich to sulfide rich and sometimes maybe a gray aplitic/magmatic matrix that weathers brown. Some domains have large quartz and feldspar crystals rather than granite clasts. The breccia is intercalated with competent granitoid that has abundant sulfide rich quartz veins at high angle TCA with pyrite-sphalerite-marcasite and an abundant dark gray mineral.
69-77	Granite with pyrite stringers and occasional polymetallic, sphalerite rich, quartz vein.
77-79	Black sulfide matrix breccia with 40% clasts of mostly wall rock (pyritic granite), and some fine grained granite.
79-95	Granite with frequent black sulfide breccia style veins and stringers that coalesce into breccia. At 90m there is a different vein with medium grained pyrite in the center, arsenopyrite on edge and in a silicified selvage. Small fault zone at@ 91m
95-96	Aplite with dark gray brecciated margins. Graphic texture
96-118	Granite - at top minor granophyre-aplite alteration/infiltration. Moderate to high density of black sulfide stringers. @ 108m 60 cm of core gone but one chunk of massive galena + sphalerite + pyrite. Mostly in and out of biotite destructive alteration. Some locations with primary biotite look like they might have biotite on mineral fractures (e.g. biotite alteration?). Patchy breccia zones with silicification and clay altered primary feldspar.
118-122.5	Well developed black matrix (quartz-sulfide) breccia.
122.5-126	Coarse Bt. Granite with sericite altered feldspar and biotite. Low to moderate black quartz sulfide stringers.
126-145	Less altered granite with very little black matrix breccia or veins. Feldspar less altered. Remnant Biotite. @128-129.5 fault zone. @237-238.5 High gold section
145-150	faulted zone with sulfides
150-159	Granite with 1/m pyrite arsenopyrite sphalerite veins. Not black matrix. Weakly sericite altered
159-160	Black matrix breccia. Silicified.
160-167	Fault

T87-02	
80-85	Prospector Mtn feldspar biotite muscovite quartz porphyry with big quartz eyes in a beige aphanitic groundmass. Mineralization looks unimpressive with dis. pyrite to <1% + minor pyrite stringers.
TT103	Mineralized section is sulfide rich fault zone.

3.3 Rock Sample Preparation and Analysis

The 2017 rock samples were delivered directly to ALS Global prep-lab in Whitehorse, YT, and sent for preparation and analysis at ALS Canada Ltd. in North Vancouver, BC. In total, 6 samples were submitted for analysis and were prepared following the ALS method package Prep35 (methods CRU-31, SPL-21 and PUL-35); that is, fine crushing (70% < 2mm), split sample (using riffle splitter) and pulverization of 250g split to 95% <106µm. Analysis of ore grade elements and ore grade Cu was conducted on the pulverized splits using Aqua Regia ICP-AES (methods ME-OG46 and Cu-OG46). Analysis of Au was conducted by using Au 30g fire assay with Atomic Absorption finish (AAS; method Au-AA23) and the remaining 35 elements were analyzed using ICP-AES after an Aqua Regia digestion (method ME-ICP41).

3.4 Quality Control and Data Verification for Rock Samples

Quality assurance and control (QAQC) is maintained at the ALS lab through rigorous use of internal standards, blanks and duplicates.

3.5 Results

Table 3.3: Rock Samples and select results

Waypoint	SampleID	Easting	Northing	Au_ppm	Ag_ppm	Cu_pm	Mo_ppm	Comments
1316	C491358	345489.5	6938887	0.007	1.2	6	1	Subcrop of tuff + granite. Very heavily coated with >1mm rind of pyrolusite. Also on fractures. Maybe the assay will help determine rock composition as well.
1317	C491359	345486.6	6938819	<0.005	0.2	2	1	Sample of granite subcrop with 1-7mm pyrolusite rims and fracture coating, and coating quartz crystals.
1321	C491360	346056.1	6938873	<0.005	<0.2	1	2	Loose bull quartz scattered over approximately 10 meters in trench. Possibly from trench or transported down slope. Coarse white to gray translucent margin with coarse felspar is highly irregular; possibly part of a pegmatite, or quartz segregation in granite.
1325	C491361	347069.4	6939118	<0.005	<0.2	1	2	Still in uninteresting quartz rich granite with minor biotite. Sample of bull white to gray semi translucent quartz in subcrop.
1330	C491362	347598.8	6939704	<0.005	<0.2	2	11	This is a contact zone that is exposed in debris in the road (e.g. not outcrop). To south quartz porphyry, to north coarser granite. Lots of quartz veins with hematite and boxwork. Some quartz breccia.
1353	C491365	350290	6937260	<0.005	<0.2	1	12	Banded medium gray very fine grained quartz vein/rhyolite dykelette in syenogranite. Possibly fine moly?

None of the samples collected contained potentially economic grade mineralization. High manganese in some samples may indicate that the dark staining that was identified as pyrolusite may instead be a manganese-bearing mineral. Sample C491359 contained anomalous Ag, As and Zn (1.2 ppm Ag, 112 ppm As, and 119 ppm Zn), possibly representing a distal expression of some of the hydrothermal breccias encountered in nearby drill holes.

3.4 Reclamation

Historical drill pads, trenches, fuel caches and a camp were observed, evaluated and photo documented to facilitate future reclamation. Reclamation conducted in 2017 included:

1. Removing and disposing of propane tanks and derelict camp equipment from the historical camp (last occupied in 2010), via helicopter.
2. Removing useable gear and equipment from historical camp, via helicopter.
3. Slinging (via helicopter) twenty full or partly full fuel barrels from the top of the mountain to an area easily accessed via the Casino Trail for possible removal during winter.

4. Conclusions and Recommendations

Numerous previously identified exploration targets at Tad Toro remain open for expansion. The hydrothermal breccias identified during 2010 drilling represent a new and significant target which could be part of a larger porphyry style mineralization system. Soil anomalies have proven to be highly effective at identifying buried mineralized zones on the property, however much of the property is not covered by a soil grid. Therefore expanding the soil grid should be a priority for future exploration.

Statement of Qualifications – Tony Barresi, PhD., P.Geo.

I, Tony Barresi certify that:

1. I am employed by Triumph Gold Corp. as Vice President of Exploration. 1100 – 1111 Melville St., Vancouver BC, V6E 3V6.

2. I graduated from Dalhousie University in 2015 with a Ph.D. in Earth Science and I graduated from Saint Mary's University in 2004 with a B.Sc. in Geology.

3. I am a Professional Geoscientist registered with Geoscientists Nova Scotia since 2016.

4. Since 2004 I have been at minimum seasonally employed in the exploration for base and precious metals in North America, and since 2015 I have been continuously employed.

5. I supervised and participated in the 2017 exploration program at Tad Toro amd am therefore personally familiar with the geology of the property and the work conducted in 2017. I have co-prepared all sections of this report.

Dated this 17th Day of August, 2018.

Tony Barresi, Ph.D., P. Geo.

Statement of Qualifications – G. T. Hopkins, B.Sc.

I, Graeme Hopkins, of the city of North Vancouver, in the Province of British Columbia, HEREBY CERTIFY:

1. That I worked on the Assessment Report for the 2017 Geologic Surveys on the Toro Property for Triumph Gold Corp., from Aug 13, 2018 to August 18, 2018.

2. I graduated from the University of Victoria in 1994 with a Bachelor of Science in Geography and from the BCIT Advanced Diploma Program in Geographical Information Systems in 2000.

3. I have been employed in the mineral exploration sector since 2008 and in GIS since 2000 based in Vancouver, BC.

4. I am employed at Triumph Gold Corp as a GIS/Database Manager with a business address located at:
   1100 – 1111 Melville St.
   Vancouver, BC, Canada
   V6E3V6

Dated this 17th Day of August, 2018.

Graeme Hopkins, B.Sc.

Appendix II: Statement of Expenditures

Toro Project Exploration Costs from July 11, 2017 to July 15, 2017.

PROFESSIONAL FEES AND WAGES:	
Wages	3,720.00
EQUIPMENT RENTALS:	
Truck	740.00
EXPENSES:	
Assaying and Geochemistry	330.00
Automotive Fuel	945.00
Camp cost	2,700.00
Helicopter	6,583.50
Report Writing	1,100.00
TOTAL:	16,118.50

Appendix III: Certificate of Analysis

CERTIFICATE WH17164170

Project: Freegold Mountain

P.O. No.: 1005139- NOFREG- R1

This report is for 175 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 4- AUG- 2017.

The following have access to data associated with this certificate:

TONY BARRESI	JESSE HALLE	GRAEME HOPKINS

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 21	Sample logging - ClientBarCode
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 35	Pulv 250 g Split to 95%<106 um
LOG- 23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Ag- OG46	Ore Grade Ag - Aqua Regia	ICP- AES
ME- OG46	Ore Grade Elements - AquaRegia	ICP- AES
Cu- OG46	Ore Grade Cu - Aqua Regia	ICP- AES
Pb- OG46	Ore Grade Pb - Aqua Regia	ICP- AES
Au- AA23	Au 30g FA- AA finish	AAS
ME- ICP41	35 Element Aqua Regia ICP- AES	ICP- AES

To: TRIUMPH GOLD CORP.
ATTN: TONY BARRESI
