## **INTRODUCTION**

The Dabb property covers a large, polymetallic skarn prospect in southern Yukon. It lies near the boundary between Cassiar and Yukon-Tanana terranes – two geological provinces that each host a number of significant silver and base metal occurrences, such as the former Sa Dena Hes mine, Coeur Mining Inc.'s Silvertip mine, Yukon Zinc Corporation's Wolverine mine, and BMC Minerals (No. 1) Limited's Kudze Kayah deposit. The Dabb property is wholly owned by Strategic Metals Ltd.

This report describes geological mapping and geochemical sampling, which were conducted from July 9 to 14, 2017. Archer, Cathro & Associates (1981) Limited managed the program on behalf of Strategic Metals. The author supervised and participated in the exploration program and interpreted all resulting data. The author's Statement of Qualifications is provided in Appendix I, and a Statement of Expenditures appears in Appendix II.

## **PROPERTY LOCATION, CLAIM DATA AND ACCESS**

The Dabb property consists of 68 contiguous mineral claims, which are located on NTS map sheets 105E/09 and 105F/12 at latitude 61°41' north and longitude 134°01' west (Figure 1). The property covers an area of approximately 1410 ha (14 km<sup>2</sup>). The claims are registered with the Whitehorse Mining Recorder in the name of Archer Cathro, which holds them in trust for Strategic Metals. Specifics concerning claim registration are tabulated below, while the locations of individual claims are shown on Figure 2.

| <b><u>Claim Name</u></b> | <b><u>Grant Number</u></b> | <b><u>Expiry*</u></b> |
|--------------------------|----------------------------|-----------------------|
| Dabb 1-42                | YF49951-YF49992            | April 4, 2023         |
| Dabb 43-50               | YE85807-YE85814            | April 4, 2023         |
| Dabb 51-68               | YF56281-YF56298            | April 4, 2023         |

\* Expiry dates include 2017 work which has been filed for assessment credit but has not yet been accepted.

The Dabb property is located 123 km northeast of Whitehorse and 65 km southwest of Faro, the nearest supply centre. It lies outside of the traditional territories of any Yukon First Nation.

In 2017, camp gear, personnel and supplies were mobilized to and from the property using two Bell 206B helicopters, operated by Capital Helicopters (1995) Inc. and Trans North Turbo Air Limited, respectively.

## **HISTORY AND PREVIOUS WORK**

The first recorded work in the Dabb area was performed in 1980 by Amoco Canada Petroleum Company Ltd. Reconnaissance stream sediment sampling returned anomalous lead and zinc values from creeks that drain the current property, as well as from drainages located about 1.5 km to the southeast. As a result, in mid-1980 Amoco staked the Fog Mountain claims, which covered a portion of the current Dabb property, and later that year performed soil geochemical

sampling. This work outlined two strong lead-zinc soil anomalies on either side of a north-flowing creek, and identified skarn-type mineralization in outcrop (Brown, 1981). The claims were subsequently allowed to lapse.

In 1987, Cypress Gold (Canada) Ltd. staked the Helo 1-18 claims over the stream sediment anomalies to the southeast, and in 1988, it performed prospecting and rock geochemical sampling on the property. Prospecting identified skarn-type mineralization associated with high-level felsic dykes, and rock samples returned values of up to 460 g/t silver, 21.10% lead, 10.10% zinc and 1.26% copper (Cuttle, 1988). Further work was recommended, but the claims were allowed to lapse. The Helo occurrence lies within an area that is currently subject to a staking moratorium.

In 1991, Archer Cathro staked the Dab 1-8 claims over the Amoco soil anomalies. The following year, the company performed one day of prospecting and rock geochemical sampling on the property. This work identified widespread skarn-type mineralization in float, concentrated in areas of felsic, tuffaceous talus. Rock samples yielded values of up to 23.7 g/t silver, 1.96% lead, 3.33% zinc and 0.72% copper, as well as strongly elevated values for tungsten (Eaton, 1993). The claims were subsequently allowed to lapse.

Strategic Metals staked the Dabb 1-42 claims in spring 2018 and added more claims later in the year.

### **GEOMORPHOLOGY**

The Dabb property lies within the Big Salmon Range of the Pelly Mountains. It covers the headwaters of Teraktu and d'Abbadie creeks, which flow into the Big Salmon River and are part of the Yukon River watershed. There is abundant water for camp and diamond drilling purposes on the property.

The property covers a series of rugged peaks and saddles along an east trending ridge, with elevations ranging from 1420 to 2080 m. Drainages on the property originate from steep cirques blanketed by thick talus and rock glaciers. Further downstream, valley floors are vegetated by alpine grass and moss. Outcrop exposures are limited to higher elevations and are most common in north-facing cirques.

The climate at the Dabb property is typical of northern continental regions with long, cold winters, truncated fall and spring seasons and short, mild summers. Although summers are relatively mild, snowfall can occur in any month. The property is mostly snow free from early June to late September.

### **REGIONAL GEOLOGY**

The Dabb property lies within a section of carbonate-rich stratigraphy near the boundary between Cassiar and Yukon-Tanana terranes (Figure 3).

The geology of the Dabb area, on NTS map sheets 105F and 105E, was published at 1:250,000 scale by the Geological Survey of Canada (GSC) in 1977 and 1984, respectively (Tempelman-Kluit, 1977, and Tempelman-Kluit, 1984). In 2008, the Yukon Geological Survey (YGS) performed 1:50,000 scale mapping in the immediate vicinity of the property (Westberg et al., 2009), on map sheets 105F/5 and 105E/8. The YGS maintains a website that updates Yukon geology as new data becomes available. The regional geology illustrated on Figure 4 and described below is based on mapping performed by the YGS.

Cassiar terrane rocks were mainly deposited as shallow water sediments during Paleozoic time along the margin of ancestral North America. They were deformed and metamorphosed by arc-continent collision in the early Mesozoic and were subsequently intruded by various plutonic suites.

Earlier mapping by the GSC defined the western limit of the Cassiar terrane as the d'Abbadie fault zone. Rocks west of this fault zone were assigned to Yukon-Tanana – a pericratonic terrane that records the evolution of a Late Devonian to Middle Permian continental arc and back-arc system (Piercey et al., 2006). More recent mapping in the Dabb area has revised the location of this boundary, moving it east of the d'Abbadie fault zone. This work has reassigned the rocks underlying the Dabb property to Yukon-Tanana terrane (Westberg et al., 2009).

Yukon-Tanana terrane is defined by four tectonic assemblages of regional extent: a basal siliciclastic assemblage of continental-margin affinity (Snowcap Assemblage), overlain by three unconformity-bounded, mid- to Late Paleozoic volcanic and volcanoclastic successions of continental arc and back-arc character (Finlayson, Klinkit and Klondike assemblages). The four assemblages have been subjected to four, and locally five, episodes of deformation and are variably metamorphosed up to amphibolite facies (Simard et al., 2007 and Westberg et al., 2009).

The Dabb property is underlain by Snowcap assemblage schists, quartzites and calc-silicate rocks (PDS1) that are intruded to the north and northwest by the western limb of a Cretaceous-aged, arcuate, granitic pluton (mKgC). Six kilometres south of the property, a klippe of Slide Mountain Suite serpentinitized ultramafic rocks structurally overlies Finlayson Assemblage metavolcanic rocks (DMF1), and forms a conspicuous, gossanous mountain referred to as Dunite Peak. West of the property, the north-trending d'Abbadie fault zone – a Late Cretaceous system of brittle-ductile, dextral strike-slip faults – cuts across the regional structural trends (Tempelman-Kluit, 2012 and Westberg et al., 2009).

The main lithological units are described in Table I below.

**Table I – Regional Lithological Units**

| Map Suite     | Age        | Map Unit | Description                                                                                         |
|---------------|------------|----------|-----------------------------------------------------------------------------------------------------|
| Cassiar Suite | Cretaceous | mKgC     | Granodiorite, biotite-muscovite granodiorite, quartz diorite, biotite quartz monzonite and granite. |

|                      |                                  |         |                                                                                                                                                                                                                     |
|----------------------|----------------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      | Cretaceous                       | mKqC    | Medium to coarse grained, equigranular to porphyritic (K-feldspar) granite and biotite quartz monzonite; biotite-hornblende quartz monzonite and granodiorite.                                                      |
| Minto Suite          | Upper Triassic to Lower Jurassic | LTrEJgM | Medium to coarse grained, variable foliated to massive, biotite-hornblende granodiorite; biotite-rich screens and gneissic schlieren; foliated hornblende diorite to monzodiorite with local K-feldspar megacrysts. |
| Slide Mountain Suite | Mississippian to Permian         | CPSM4   | Ultramafic.                                                                                                                                                                                                         |
|                      |                                  | CPSM5   | Diabase and gabbro.                                                                                                                                                                                                 |

|--------------------|----------------------------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Askin Formation    | Silurian to Upper Devonian       | SDA2  | Medium grey to buff weathering, medium to thick bedded dolostone, silty and sandy dolostone, limestone; medium to thick bedded, medium grained mature orthoquartzite; dolomitized, laminated mudstone and dolostone with vugs, birdseye and fenestral cavities. |
| Road River Group   | Ordovician to Upper Devonian     | ODRC2 | Recessive, dark grey to black 'sooty', limy or dolomitic, thin bedded to platy, graphitic siltstone and fine grained impure quartzite with interbedded graphitic silty shale.                                                                                   |
| Snowcap Assemblage | Neoproterozoic to Upper Devonian | PDS1  | Schists, quartzites and calc-silicate rocks, typically with amphibolite-grade metamorphic mineral assemblages; coarse-grained garnet amphibolites.                                                                                                              |
| Rosella Formation  | Cambrian                         | ICR   | Resistant, thick bedded to massive limestone and argillaceous limestone; local archaeocyathid buildups, trilobite fragments, oolites and pisolites; pisolitic massive dolostone and limestone; marble, calc-silicate, calcareous phyllite and minor schist.     |
| Ingenika Group     | Neoproterozoic to Cambrian       | PCI1  | Calcareous sandstone, shale, quartz-eye grit, quartzite, micaceous quartzite and minor grey limestone, generally overlain by phyllite, quartzite and dolomitic marble; muscovite-chlorite schist, biotite schist, meta-sandstone and minor calc-silicate.       |
|                    |                                  | PCI4  | Thin bedded slate, siltstone, quartzite and minor limestone with local, medium to coarse grained, feldspathic sandstone to orthoquartzite; muscovite-biotite-garnet schist, micaceous quartzite, minor amphibolite and marble; rare granodiorite gneiss.        |

### **PROPERTY GEOLOGY**

In 2017, Strategic Metals performed detailed geological mapping at 1:2500 scale in the eastern part of the property (Figure 5). The following is a summary based on this work, as well as observations made by exploration geologists who have worked on the property at various times.

The property is predominantly underlain by dark green, Snowcap Assemblage biotite-quartz schist and lesser muscovite schist, with intercalated horizons of marble. Although the majority of the marble horizons are metre-scale, a small number of marble horizons have widths greater than ten metres. In the detailed mapping area, bedding, preserved as foliation, dips shallowly to moderately to the south-southeast.

In the western part of the map area, a recessive, north-trending, sub-vertical rhyolite dyke cuts Snowcap Assemblage stratigraphy. The dyke is buff to tan in colour, variably tuffaceous, and weathers to form conspicuous, dark brown talus. Unlike the schistose country rock, it does not exhibit a metamorphic fabric.

High-angle normal faults on the property strike northeast and exhibit a small sense of displacement where they cut a granite pegmatite dyke. A later-stage, porphyry andesite dyke occupies one of the fault planes.

In the northwestern part of the property, Snowcap Assemblage rocks are hornfelsed in proximity to a Cretaceous-aged granitic pluton. The hornfels is visible from afar as a rusty weathering halo surrounding the intrusion.

### **MINERALIZATION**

The Dabb property covers widespread silver and base metal mineralization. Limited prospecting on the property has identified several recessive skarn horizons developed within the limey portions of Snowcap Assemblage. The horizons generally do not outcrop, but are marked by abundant mineralized talus, with a mineral assemblage comprising epidote, actinolite, diopside, magnetite, galena, sphalerite and chalcopyrite. Sulphide minerals are typically weathered to goethite and manganese oxides.

In 2017, Strategic Metals collected a total of 15 rock samples from the property. The 2017 rock sample locations are plotted on Figure 6, with combined lead-zinc values illustrated thematically. Rock Sample Descriptions and Certificates of Analysis for the 2017 samples are provided in Appendices III and IV, respectively.

Rock sample sites were marked with orange flagging tape labelled with the sample number. The location of each sample was determined using a handheld GPS unit. Rock sample preparation and multi-element analyses were carried out at ALS Minerals' laboratories in Whitehorse, Yukon and North Vancouver, BC, respectively. Each sample was dried and fine crushed to better than 70% passing 2 mm, and then a 250 g split was pulverized to better than 85% passing 75 microns. The fine fraction was analyzed for 51 elements using an aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). Overlimit values for lead and zinc were determined by inductively coupled plasma-atomic emission spectroscopy (Pb/Zn-OG46). An additional 30 g charge was further analyzed for gold by fire assay with inductively coupled plasma and atomic emission spectroscopy finish (Au-ICP21).

Prospecting in the eastern part of the property identified silver and base metal mineralization within an approximately 1.5 km by 2.0 km area. Twelve of the fifteen samples collected in 2017 yielded significant results, with samples assaying up to 83.10 g/t silver, 7.29% lead, 6.51% zinc and 1.57% copper. Silver shows a stronger correlation with copper than lead, suggesting the presence of the mineral tetrahedrite or another sulphosalt.

## SOIL GEOCHEMISTRY

Soil samples collected in 1980 by Amoco were analysed for lead, zinc, copper and molybdenum, with some of them further analysed for gold, silver and tungsten. This work identified a broad lead-zinc anomaly, in the eastern part of the Dabb property, bisected by a north-flowing creek. Samples were collected along pace and compass traverses and the exact sample locations are poorly constrained. As a result, this information cannot reliably be plotted on the maps in this report.

In 2017, 412 grid and contour soil samples were collected from the property, with the majority covering the area previously sampled by Amoco. The 2017 soil sample locations are plotted on Figure 7, with results for silver, lead, zinc and copper illustrated thematically on Figures 8 to 11, respectively. Certificates of Analysis are provided in Appendix IV.

Soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Soil samples were collected from 15 to 50 cm deep holes dug by handheld auger. The soil samples were sent to ALS Minerals in Whitehorse, where they were dried and screened to -180 microns. The fine fractions were then shipped to ALS Minerals in North Vancouver where they were analyzed for 51 elements using an aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). An additional 30 g charge was further analyzed for gold by fire assay with inductively coupled plasma and atomic emission spectroscopy finish (Au-ICP21).

Table II below provides geochemical thresholds and peak values for the 2017 soil samples.

**Table II – Soil Geochemical Thresholds**

| Element      | Anomalous Thresholds |              |               |             |      |
|--------------|----------------------|--------------|---------------|-------------|------|
|              | Weak                 | Moderate     | Strong        | Very Strong | Peak |
| Silver (ppm) | ≥ 0.2 < 0.5          | ≥ 0.5 < 1    | ≥ 1 < 2       | ≥ 2         | 4.21 |
| Lead (ppm)   | ≥ 100 < 200          | ≥ 200 < 500  | ≥ 500 < 1000  | ≥ 1000      | 5750 |
| Zinc (ppm)   | ≥ 200 < 500          | ≥ 500 < 1000 | ≥ 1000 < 2000 | ≥ 2000      | 4570 |
| Copper (ppm) | ≥ 50 < 100           | ≥ 100 < 200  | ≥ 200 < 500   | ≥ 500       | 576  |

Soil sampling in 2017 confirmed the historical results, identifying a 750 m by 1900 m silver-lead-zinc-copper geochemical anomaly. The anomaly covers two opposing slopes on either side of a north-flowing drainage, and remains open to extension to the west and southwest. Soil development on this part of the property is highly variable. This may explain why values are strongest on the western slope, which is underlain by rock debris shed from ridge-forming outcrop, and suppressed on the eastern slope, where the soil profile is better developed. Reconnaissance contour soil samples collected elsewhere on the property yielded only background to moderately elevated values for all elements of interest.

## **DISCUSSION AND CONCLUSIONS**

The Dabb property is located in southern Yukon and covers a broad area of skarn-type silver and base metal mineralization. It lies near the boundary between Cassiar and Yukon-Tanana terranes – two geological provinces that each host a number significant silver and base metal occurrences.

Work in 2017 identified a large multi-element soil anomaly, located along both sides of a north-flowing drainage, which remains open to the west and southwest. cursory prospecting within this anomaly has identified multiple horizons of skarn mineralization, with rocks assaying up to 83.1 g/t silver, 7.29% lead, 6.51% zinc and 1.57% copper. Preliminary geological mapping suggests that multiple, stacked, well mineralized skarn horizons are associated with a sub-vertical rhyolite dyke; however, silver and base metal mineralization have been identified as far as 1.5 km away from the dyke, implying the presence of a larger magmatic-hydrothermal system.

Further work on the Dabb property should be designed to delineate the size and tenor of the skarn horizons and to expand the geochemical coverage to other parts of the property. Grid soil sampling should extend the 2017 soil grid west and southwest, while reconnaissance-scale soil geochemical coverage should be expanded to cover the entire property. Systematic prospecting and hand trenching should be directed toward uncovering the source of mineralized float, and prospecting in conjunction with geological mapping should be extended outward from the 2017 mapping area. Following this work, diamond drilling should be performed to target the down-dip extensions of mineralized skarn horizons.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

## TECTONIC SETTING

### DABB PROPERTY

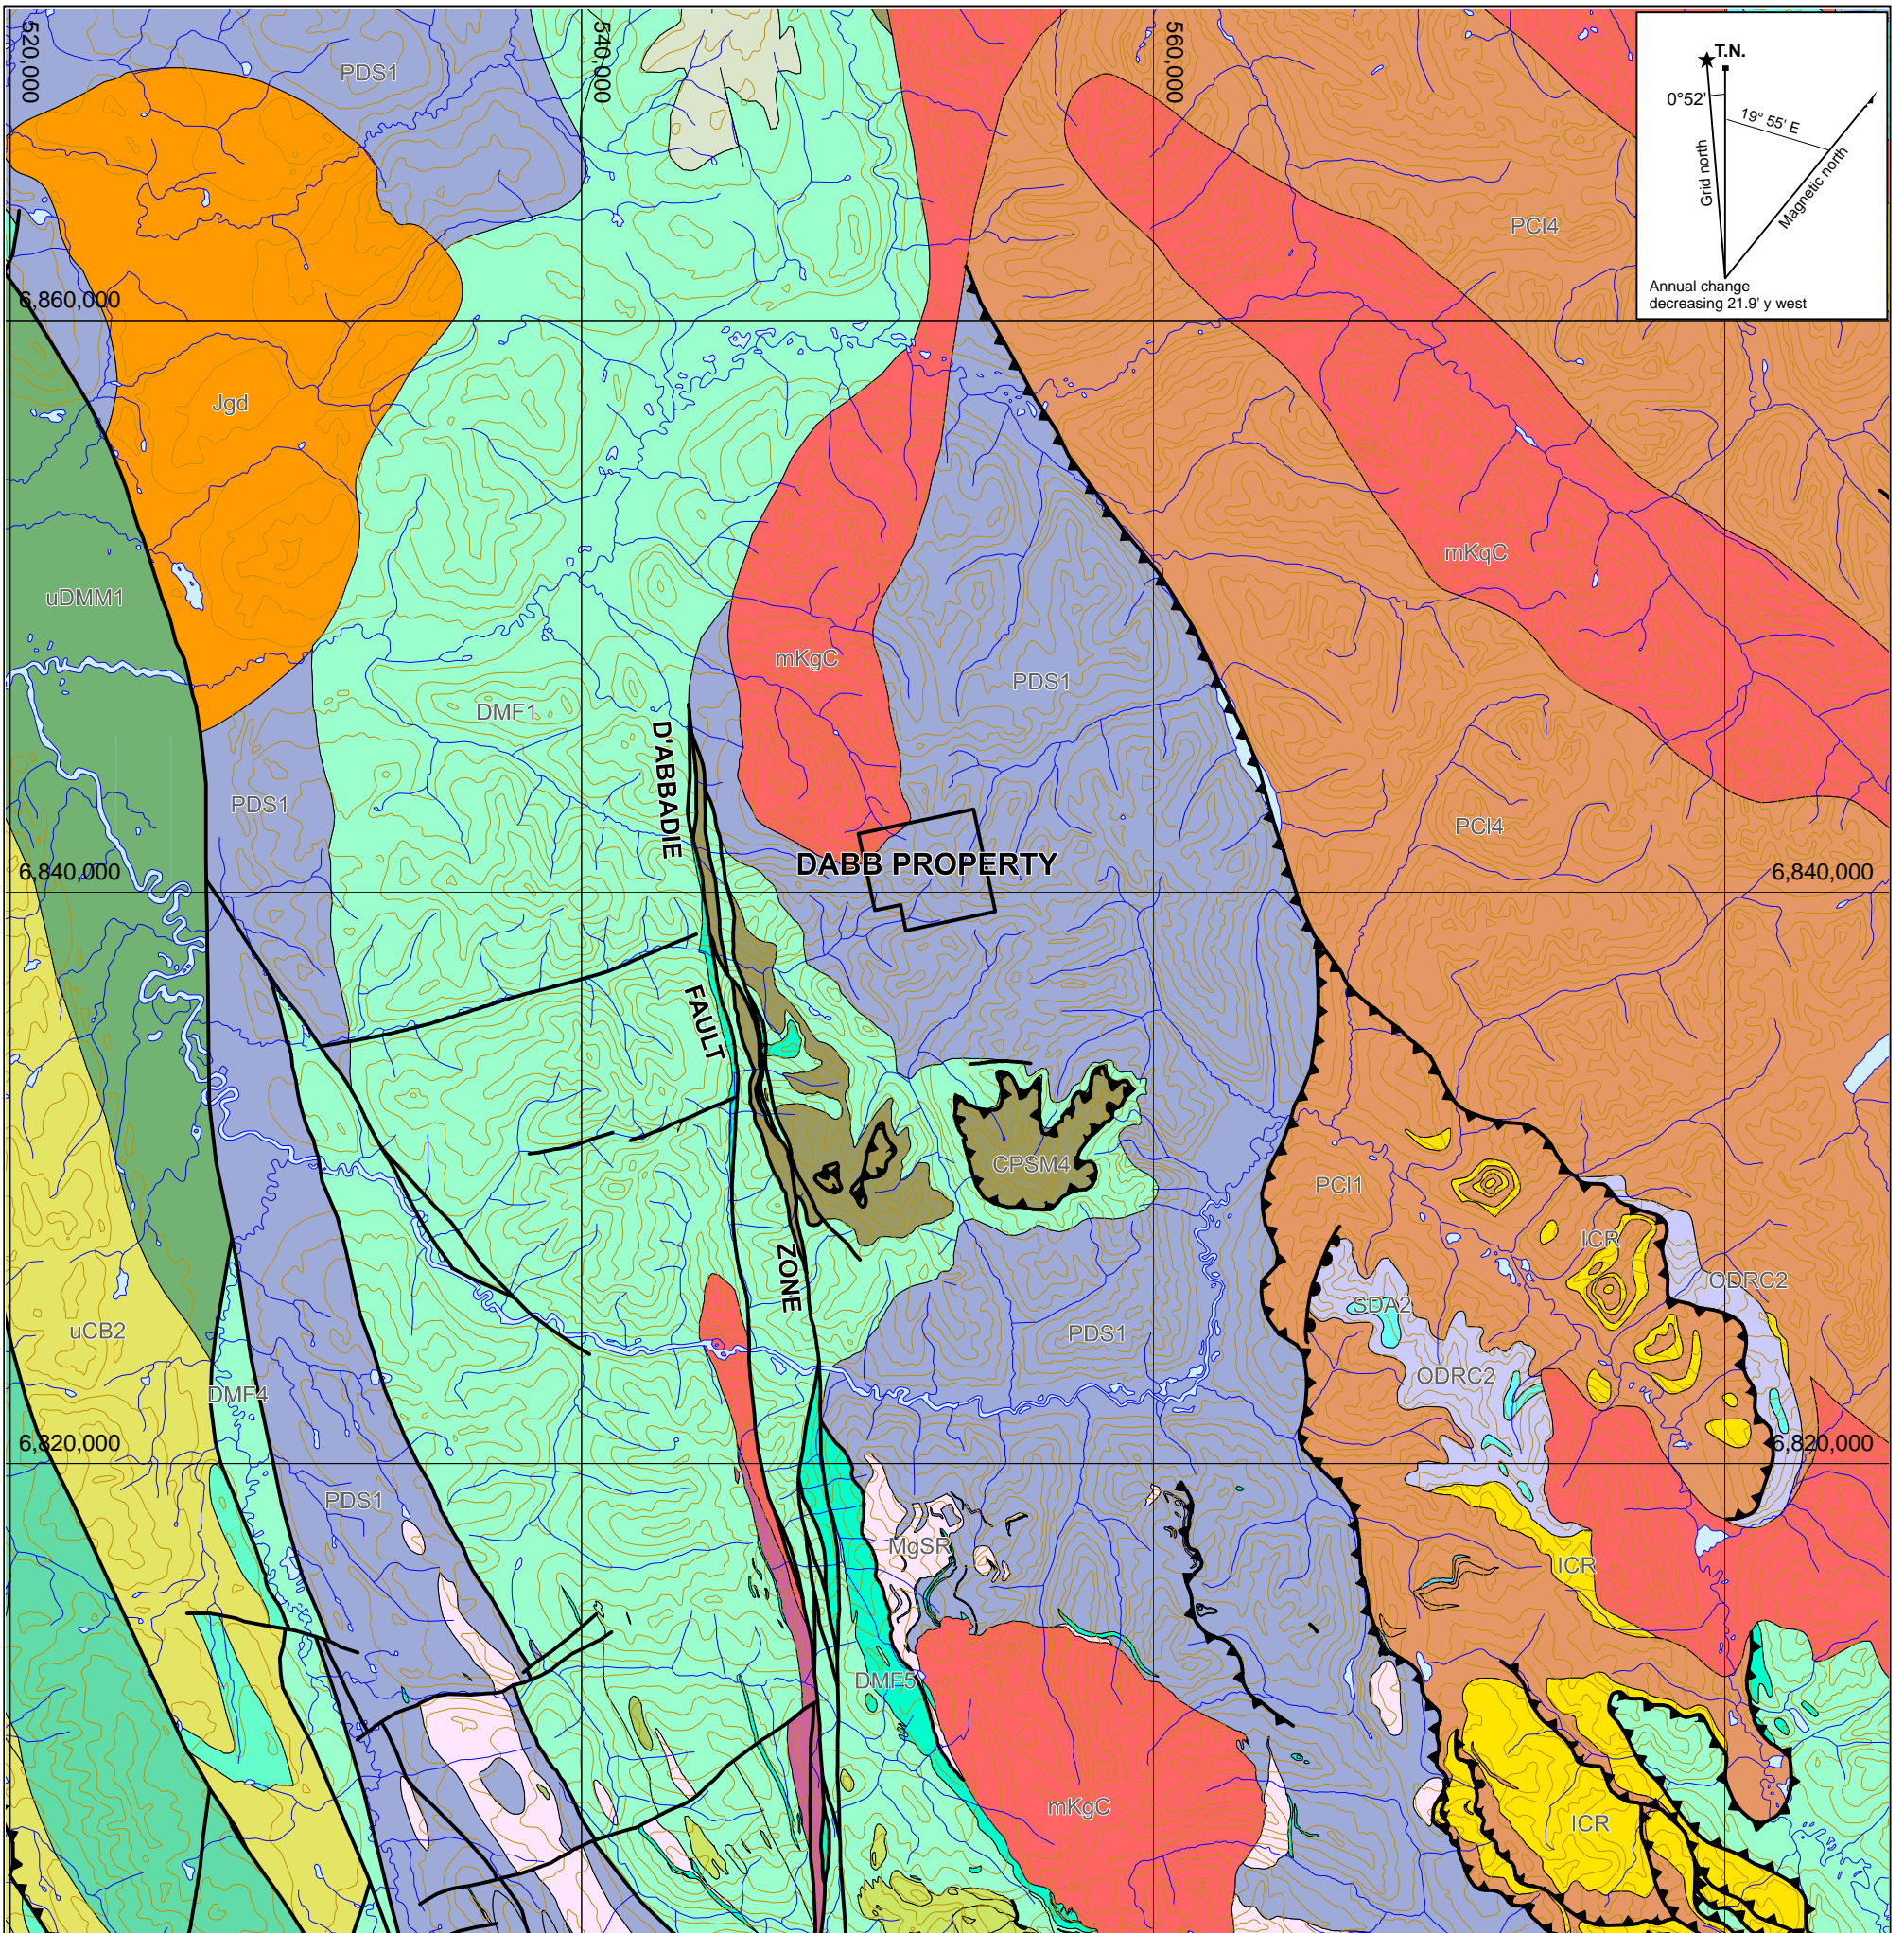

FILE: 2017\DABB

DATE: MARCH 2018

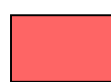

After Colpron, M. and Nelson, J.L., 2011

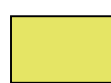

**CRETACEOUS**

 Cassiar Suite:  
 mKgC: Granodiorite, biotite-muscovite granodiorite, quartz diorite, biotite quartz monzonite, granite.  
 mKqC: Equigranular to porphyritic (K-feldspar) granite and biotite quartz monzonite; biotite-hornblende monzonite and granodiorite.

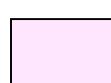

**MISSISSIPPIAN TO PERMIAN**

 Slide Mountain Suite:  
 CPSM4: Ultramafic.  
 CPSM5: Diabase and gabbro.

**PENNSYLVANIAN**

 Boswell Formation: Resistant, massive, altered basalt, volcanic breccia and greenstone.

**MISSISSIPPIAN**

 Simpson Range Suite: Foliated meta-granite, quartz monzonite and granodiorite; augen granite.

**DEVONIAN TO MISSISSIPPIAN**

 Moose Formation: Basalt, greenstone.

 Finlayson Assemblage:  
 DMF1: Mafic volcanic rocks;  
 DMF3: Carbonaceous phyllite, quartzite; chert;  
 DMF4: Siliciclastic and meta-volcaniclastic rocks, psammitic schist;  
 DMF5: Carbonate, marble.

**SILURIAN TO UPPER DEVONIAN**

 Askin Formation: dolostone, silty and sandy dolostone and limestone; orthoquartzite; dolomitized mudstone.

**ORDOVICIAN TO UPPER DEVONIAN**

 Road River Group: imey graphitic siltstone and fine grained quartzite, with interbedded silty shale.

**NEOPROTEROZOIC TO UPPER DEVONIAN**

 Snowcap Assemblage: schists, quartzites and calc-silicate rocks, typically with amphibolite-grade metamorphic mineral assemblages.

**CAMBRIAN**

 Rosella Formation: thick bedded to massive, fossiliferous, dolostone and limestone; marble, phyllite and minor schist.

**NEOPROTEROZOIC TO CAMBRIAN**

 Ingenika Group:  
 PCI1: Calcareous sandstone, shale, quartz-eye grit, quartzite and minor limestone; schist, meta-sandstone and minor calc-silicate.  
 PCI4: Slate, siltstone, quartzite and minor limestone; local feldspathic sandstone to orthoquartzite; schist, minor amphibolite and marble.

**APPENDIX I**  
**STATEMENTS OF QUALIFICATIONS**

## STATEMENT OF QUALIFICATIONS

I, Jack Morton, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Vancouver, British Columbia, hereby certify that:

1. I graduated from Simon Fraser University in 2013 with a B.Sc. in Earth Science.
2. From 2007 to present, I have been actively engaged in mineral exploration in Yukon Territory, British Columbia, and Northwest Territories.
3. I am a Professional Geologist (P.Geol.) with the Association of Professional Engineers and Geoscientists of British Columbia (License Number 45807).
4. I supervised the field program and have interpreted all data resulting from this work.

J. Morton, B.Sc., P.Geol.

**APPENDIX III**  
**ROCK SAMPLE DESCRIPTIONS**

---

**Rock Sample Descriptions**

---

Property: Dabb

---

Sample Number: S053420 UTM: 553606 mE Nad83, Zone 8

Elevation: 5369 m UTM: 6840062 mN

Comments:

---

Sample Number: S053420 UTM: 553606 mE Nad83, Zone 8

Elevation: 5369 m UTM: 6840062 mN

Comments: Float grab of dark brown biotite-quartz schist with abundant very fine grained epidote throughout, and moderate disseminated very fine grained chocolate-brown oxide (after chalcopyrite?) with sparse rimming malachite. Collected near the top of a large talus field.

---

Sample Number: S053421 UTM: 553078 mE Nad83, Zone 8

Elevation: 5145 m UTM: 6840230 mN

Comments:

---

Sample Number: S053421 UTM: 553078 mE Nad83, Zone 8

Elevation: 5145 m UTM: 6840230 mN

Comments: Float grab of dark chocolate-brown, earthy, calcareous oxide, with white (zinc?) precipitate and very fine grained epidote on outside surfaces, as well as moderate disseminated fine grained galena and live limonite throughout. Abundant in float at the top of a large talus slope, below cliffs.

---

Sample Number: S053422 UTM: 552948 mE Nad83, Zone 8

Elevation: 5361 m UTM: 6840226 mN

Comments:

---

Sample Number: S053422 UTM: 552948 mE Nad83, Zone 8

Elevation: 5361 m UTM: 6840226 mN

Comments: Subcrop grab of chocolate-brown weathering, pale green, manganese-diopside skarn with abundant, disseminated, fine grained galena and pits of live limonite. Collected at the skarn/granite dyke contact and very abundant in talus.

---

---

**Rock Sample Descriptions**

---

Property: Dabb

Sample Number: S053423 UTM: 552943 mE Nad83, Zone 8

Elevation: 5347 m UTM: 6840220 mN

Comments:

---

Sample Number: S053423 UTM: 552943 mE Nad83, Zone 8

Elevation: 5347 m UTM: 6840220 mN

Comments: Outcrop source of S053422, excavated from a small pit, comprising chocolate brown weathering, banded manganiferous calcite-galena-quartz, minor diopside skarn, with abundant (5%) bands of fine grained galena with rare rimming canary yellow plumbogjarosite throughout, pink calcite, and masses of fine grained epidote on weathered surfaces.

---

Sample Number: S053424 UTM: 552270 mE Nad83, Zone 8

Elevation: 6257 m UTM: 6840830 mN

Comments:

---

Sample Number: S053424 UTM: 552270 mE Nad83, Zone 8

Elevation: 6257 m UTM: 6840830 mN

Comments: Outcrop sample, removed from ~1m wide lens, of dark chocolate brown massive magnetite-goethite-diopside skarn, with sparse clots of fine grained chalcopyrite rimmed by malachite. Removed from a thick horizon of marble along the ridge-top, with a dip-slope along the south facing slope.

---

Sample Number: S053425 UTM: 552287 mE Nad83, Zone 8

Elevation: 6226 m UTM: 6840822 mN

Comments:

---

Sample Number: S053425 UTM: 552287 mE Nad83, Zone 8

Elevation: 6226 m UTM: 6840822 mN

Comments: Subcrop sample of banded limonite and goethite, possibly from a skarn horizon that is stratigraphically lower than sample S053424.

---

---

**Rock Sample Descriptions**

---

Property: Dabb

Sample Number: S053426 UTM: 552316 mE Nad83, Zone 8  
Elevation: 6127 m UTM: 6840713 mN  
Comments:

---

Sample Number: S053426 UTM: 552316 mE Nad83, Zone 8  
Elevation: 6127 m UTM: 6840713 mN

Comments: Subcrop sample of dark green diopside-skarn with abundant fine grained epidote throughout, and brown oxide with encrusting malachite on outside surfaces. Abundant in float along the ridge top from a narrow skarn horizon within the biotite-quartz schist.

---

Sample Number: S053427 UTM: 552639 mE Nad83, Zone 8  
Elevation: 5485 m UTM: 6840691 mN

Comments:

---

Sample Number: S053427 UTM: 552639 mE Nad83, Zone 8  
Elevation: 5485 m UTM: 6840691 mN

Comments: Float grab of massive dark brown magnetite-goethite with encrusting sparse limonite and malachite, removed from a 20 cm by 15 cm by 10 cm boulder in a schist talus field with abundant float of this type.

---

Sample Number: S053428 UTM: 554007 mE Nad83, Zone 8  
Elevation: 5958 m UTM: 6840707 mN

Comments:

---

Sample Number: S053428 UTM: 554007 mE Nad83, Zone 8  
Elevation: 5958 m UTM: 6840707 mN

Comments: Subcrop sample of rock with the same lithology as S053427, removed from a 60 cm by 40 cm by 35 cm boulder located on the ridge top above a ~20m tall outcrop of marble/limestone. No rep.

---

---

**Rock Sample Descriptions**

---

Property: Dabb

---

Sample Number: S053429 UTM: 552754 mE Nad83, Zone 8

Elevation: 5294 m UTM: 6840987 mN

Comments:

---

Sample Number: S053429 UTM: 552754 mE Nad83, Zone 8

Elevation: 5294 m UTM: 6840987 mN

Comments: Composite sample of earthy, chocolate brown, calcareous oxide, with sparse clots of fine grained chalcopryrite with encrusting malachite and pits filled with live limonite. Collected on a grassy talus slope of mostly schist, some rhyolite.

---

Sample Number: S053430 UTM: 552756 mE Nad83, Zone 8

Elevation: 5260 m UTM: 6840978 mN

Comments:

---

Sample Number: S053430 UTM: 552756 mE Nad83, Zone 8

Elevation: 5260 m UTM: 6840978 mN

Comments: Float grab of brown weathering, pale green, siliceous skarn with abundant pits filled with limonite and earthy green mineralization (diopside?). No rep. Collected on a grassy talus slope of schist, some rhyolite.

---

Sample Number: S053431 UTM: 552637 mE Nad83, Zone 8

Elevation: 5461 m UTM: 6840989 mN

Comments:

---

Sample Number: S053431 UTM: 552637 mE Nad83, Zone 8

Elevation: 5461 m UTM: 6840989 mN

Comments: Float grab of orange-brown weathering, banded green skarn with abundant encrusting epidote, sparse pits filled with limonite and fine grained galena in bands throughout. Collected near marble in outcrop in a grassy talus slope. No rep.

---

Sample Number: S053432 UTM: 552274 mE Nad83, Zone 8

Elevation: 6246 m UTM: 6841012 mN

Comments:

---

---

**Rock Sample Descriptions**

---

Property: Dabb

Sample Number: S053432 UTM: 552274 mE Nad83, Zone 8  
Elevation: 6246 m UTM: 6841012 mN

Comments: Subcrop sample of rusty orange weathering, medium-green, diopside skarn with disseminated fine grained galena throughout. Collected from a ~1m wide ridge-top horizon of gossanous soil and magnetite-goethite boulders, but galena-bearing material is very sparse. No rep and rep on site is not of the same type.

---

Sample Number: S053433 UTM: 552286 mE Nad83, Zone 8  
Elevation: 6063 m UTM: 6840705 mN

Comments:

---

Sample Number: S053433 UTM: 552286 mE Nad83, Zone 8  
Elevation: 6063 m UTM: 6840705 mN

Comments: Float grab of rock with the same lithology as S053427. Very abundant in talus slope and assumed to have a relatively local source. No rep.

---

Sample Number: S053434 UTM: 553368 mE Nad83, Zone 8  
Elevation: 5097 m UTM: 6840571 mN

Comments:

---

Sample Number: S053434 UTM: 553368 mE Nad83, Zone 8  
Elevation: 5097 m UTM: 6840571 mN

Comments: Float grab of earthy, chocolate-brown, calcareous oxide with sparse pits filled with live limonite, and with abundant medium grained galena (4%) throughout. Collected on a grassy talus slope with schist boulders and below schist outcrop.

---

**CERTIFICATE OF ANALYSIS WH17147586**

**CERTIFICATE COMMENTS**

**ANALYTICAL COMMENTS**

Applies to Method: Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).  
ME- MS41

**LABORATORY ADDRESSES**

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.  
LOG- 22 SCR- 41 WEI- 21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.  
Au- ICP21 ME- MS41

**CERTIFICATE OF ANALYSIS WH17148641**

**CERTIFICATE COMMENTS**

**ANALYTICAL COMMENTS**

Applies to Method: Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).  
ME- MS41

**LABORATORY ADDRESSES**

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.
