Charlie Brown

Diamond Tooth Resources Inc.

By

Nicolai Goepfel

September 18, 2018

Summary

The Diamond Tooth Resources 2018 exploration program consisted of prospecting, ground geophysics, rock and soil sampling.

Prospecting was carried out by Leia Ezerza and Charlie Brown at the beginning of the project on June 4th and 5th. Soil sampling was carried out in five different designated areas also by Leia Ezerza and Charlie Brown from June till early August for 16 days. A total of 753 Soils were taken during the 2018 exploration program and sent to Bureau Veritas Labs for assay (assays still pending). A geophysical survey with a GSM 19 Overhauser Magnetometer was carried out by Leia Ezerza on 6 different designated areas on the claim block. Additional prospecting by Nicolai Goepfel and Peter Schwenk starting June 28 for 6 days, included rock and chip sampling with assays submitted to Bureau Veritas (Sheet#, Appendix II).

The 2018 work program was successful in locating new bedrock exposures on Bradley and Shovel creeks and in producing several geophysical and geochemical anomalies. Future work consisting of geochemical sampling and prospecting is recommended to further evaluate the property and delineate mineralized zones.

Introduction

In 1896 gold was discovered on Rabbit Creek, by Skookum Jim, George Carmack and aided by Tagish Charlie. This set-in motion the greatest gold rush in Canadian history; over 100,000 people are estimated to have attempted to reach the Klondike region between 1896 and 1899. This chance discovery by Skookum Jim and George Carmack would result in the production of over 13 million recorded ounces of gold from the Klondike area in the years to follow. In addition, many notable mineral discoveries were made across the Yukon during this time; many recently and currently explored or developed projects owe their original discovery to this era in Yukon's history.

Many veteran hard rock and placer miners from the California gold rush were among those who answered the call to the Yukon. These miners and prospectors who experienced the California rush would have been familiarized with Mother Lode District orogenic gold mineralization. As these early prospectors diligently tested up the creeks they examined the hillsides for potential lode sources. Several notable placer camps and lode gold occurrences through BC discovered in the later 1800s including Bralorne-Pioneer, Erickson lode mining camps and the Cariboo-Bakerville and Atlin placer mining camps display this strong relationship with ophiolite packages and associated orogenic mineralization. As the early pioneers drove farther north similar correlation was noted and pursued on Fortymile and subsequent Dawson area.

The Diamond Tooth Resources Gold Project (DTRGP) composes of 520 contiguous quartz mineral claims located immediately east of Dawson City (Figure 1+2). This property is in good standing which is held by Diamond Tooth Resources owner Charlie Brown. During the time of discovery in the Yukon much of the Diamond Tooth Resources Gold Project, western portion of the claim block was held in a hydraulic concession by Joseph Boyle; Figure 3 displays how the concession was fringed by mineral grants in 1911. Records from this time are scarce; however, research conducted by Charlie Brown and local artist and historian Jim Robb uncovered two articles in reference to the surrounding historic patented claims. The two articles refer to the area west of Thomas Gulch and the north end of the hydraulic concession respectively near Thomas Gulch and Fire Tower respectively (Figure 4 & 5). Under the headline "Good Showing of Quartz Ledges" reads, "Thirty prospect holes have been put down on different leads to locate the walls of ledges... There are six leads running parallel with a general trend of northwest and southeast" and continues to say, "A dyke of bird's eye porphyry of feet in width ... surface assay go \$2.92. The center lead gives an assay of \$85.40 in gold"; The article continues to mention "A body of talc 75 feet in width has been located between two slate walls, which assay \$2 to \$7.48 gold from surface croppings" and "30 tonnes" are ready for the mill.

Gold prices at 1902 averaged around \$18.92 per ounce; \$85.40 would be equivalent to 4.5 ounces per ton (140 g/t) and \$3.10 is equivalent to \$0.16 ounces per ton (5.10 g/t). Another article under the header "Quartz Miners Are Becoming Active" and reads, "An incline of 106 feet in length will be extended for another fifty feet or more on the Matilda Claim" and concludes with "Millions of tons of low-grade gold-bearing quartz and porphyry are now in sight on the Dawson City group". Fascinatingly, prospecting efforts in 2015 uncovered an area scoured with early 1900 test pits which coincide with the fore mentioned report near Thomas Gulch.

The DTRGP claim block overlies accreted Slide Mountain terrane; consisting of an ophiolite oceanic sequence of ultramafic, mafic, volcanic and sedimentary rocks at varying degrees of metamorphism which were intruded by later plutons. Strong indication of Mother Lode orogenic mineralization has been observed on DTRGP. Several notable zones of mineralization have been identified and include the low lying basal thrust contact of a serpentinite unit. Listwanite alteration was observed in outcrop for over 3 meters in width and localized float for over 1.5km along Shovel Creek. Alternate occurrences include a large gossan identified on a Yukon Geological Survey heli-supported property visit in 2015, and a malachite stained and sulfide bearing quartz vein hosted in gabbro with widths of greater than one meter and traceable for approximately 750ft. Highest sample values from DTRGP conducted in recent work by Diamond Tooth Resources Inc. include 782 ppb Au, 1200 ppm As, 0.5 ppm Ag, over 1% Cu, and 8.2 ppm Sb; Figure 6 to 10 shows an overview of the property and several highlighted areas.

The purpose of this report is to summarize the assessment work carried out from June till August 2018 on the Faith 1-4, FAITH IT 1-4, 11-16, 29-35, 37, 39, 41, 43, 45; Good Hope 3, Goodone 1-2, Hope 1-4; HOPE TO 1-18, 21-42, 47-68, 73-94, 99-103, 105, 107, 109, 111, 115-118, 129, 131; Klondike 1-5, 7, 9, 11, 13, 15; Lookout 17-19, 21-62, 69-71; LUVIT 9-11, 13, 15, 17-44; Moosehide 4-5, No Town 2, Steamboat 6-29, 31-38 (See table in Appendix II). Work consisted of prospecting, rock and soil sampling and geophysics. The total assessment valuation for 2018 is \$ 57,924.83.

Location and Access

The Diamond Tooth Resources Gold Project is located in the Dawson Mining District, Yukon. The DTRGP is located on map sheet 116B 03 and centered Latitude of 64°4'23"N, and Longitude 139°11'20"W, immediately east of Dawson City. The property is very accessible with good infrastructure and entry by the Klondike Highway, on site three phase power, and close proximity to the Dawson City Airport (Figure 2). In addition, the project area is dissected with old exploration trails and roads that provide access to all corners of the claim block ensuring cost effective exploration. The northern margin of the claim block is bordered with Tr'ondëk Hwëch'in category A and B settlement lands. Figure 3 details all the claim names and grant numbers for this assessment report.

Previous Work History

Early Work

The earliest evidence of exploration on the property is observed in the numerous prospecting pits and turn of the century cabins at sites across the claim block; old workings likely date back to the late 1800s into the early 1900s. Many pits clearly indicate the prospecting for lode Au sources. Such pits have been observed below the Dome Look Out, along the left limit of Thomas Gulch, and Bradley Creek on the northeast part of the claim block.

The earliest recorded mineral occurrences are Boyle (Minfile,116B009) and Fibre (Minfile,116B011). Boyle was Staked as the Golden Lion claim, in May 1901 by W. Forster who put in numerous shallow shafts and trenches in 1901-05. Fibre (Minfile,116B011) staked as Asbestos and Platinum claims in September 1900, Ophir claim in November 1900 by G.B. Erwin and was restaked as Crow and Platinum claims in December 1900. The west side was extensively staked in 1900-1902 as the Dawson City Group explored with trenching and prospecting and later surveyed as claims in 1908. Figure 3 and 4 are newspaper clippings from the early 1900s recording some activity of quartz miners near Dawson within the TRGP and to the “Dawson City Group”. These articles allude to the origin of some of the observed workings and indicate that several potential lode sources were explored outside of Dawson and yielded up to 4.5 ounces per ton gold. Alternate test pits and shafts have evidently been placed to test underlying placers near drainages and on the benches. In the surrounding area, early hard rock exploration ranged from basic prospects to underground workings and production attempts. Some examples include the Lone Star, Violet, Pioneer, Roach, Robin Egg, Parnell, and others.

Academic and Government Work

Academically the property has been incorporated in several academic studies as a geological reference on a regional scale. Two regional government geological maps cover the KGRP including a 1927 GSC compilation map and R. L. Dibicki 1984 and is the extent of geological mapping on the property. A recent 2014 aeromagnetic survey was carried out on behalf of the GSC in the Dawson area and included the DTRGP claims (Figure 10). The aeromagnetic survey clearly displays the distribution of ophiolite bodies and larger fault structures previously inferred from previous government bedrock mapping.

Recent Work

This section summarises and highlights the work carried out by the claim owner over the last several years of exploration. The first claim staked was by Charlie Brown during a minus-30-day in November 2004, the property has in the last 14 years accumulated to 520 quartz claims. Figures 6 to 9 show the geology, regional geophysics, as well as exploration highlights in the different areas. Assay results as well as other relevant data from the various years of exploration are also attached in the Appendix.

A 2012 exploration program focused on areas south of the Klondike river including around the historic Golden Age claim where a two ounces per ton sample was presumed to be taken from a short adit (Mortensen, 1984). In 2012 a total of 17 trenches were dug; 62 soil samples taken on either side of Foster Gulch on 100m sample intervals; and 72 rocks samples from trenches were collected with 17 sent for assay. Two soil samples returned over 100 ppb Au (159 and 179 ppb), three samples with over 10 ppb Au; other soils samples produced strong Ag (0.85ppm), As (192.1 ppm), Cu (534 ppm), Co (48 ppm), Sb (4.2ppm), Pb and Zn. The sample with the highest Au in soil corresponds to high As, Sb, Cr, Ni (745 ppm), and Co. The most notable rock sample was taken from below the soil lines in Foster Gulch, assays yielded 35.6 ppb Au, 0.5 ppm Ag, 681 ppm Cu, and 74 ppm Co. Work carried out was partially supported by the government Yukon Mineral Incentive Program (YMIP). Based off of findings and positive results around Foster Gulch further work was carried out on this area in 2013.

Diamond Tooth Resources was able to secure additional YMIP funding in 2013, which assisted in follow up work on the Foster Gulch soil anomalies and to further prospect and explore the property. The 2013 work program consisted of prospecting, soil sampling, and trenching resulting in 53 days of prospecting and sampling, excavation of eight test pits and trenches, and submittal of 59 soil samples and 84 rock samples. Follow up trenching on the north side of Foster Gulch resulted in the unearthing of the Kormendy showing. 2015 site visit by the author noted the 60 m long trench exposes a mineralized fold hinge within quartz-chlorite-schist consisting of pyrite, chalcopyrite, galena, limonite with quartz and bladed calcite. Mineralizing fluids likely intrusive in origin migrated along foliation were the hinge provided the embayment and site for mineralization. Strongest values from the Kormendy showing include; 272 ppb Au, 0.4 ppm Ag, 5118 ppm Cu, 259 ppm As, 2.0 ppm Sb, and 2339 ppm Zn. During the 2013 season, 59 soil samples were taken to infill previous sampling on the northeast end of Foster Gulch. Several outstanding results from 2013 soil samples include; 35.8 ppb Au, 1.87 ppm Ag, 231.4 ppm As, 264.8 ppm Cu, 41.52 ppm Mo, 2.42 ppm Sb, and 774.8 ppm Zn. Seven pits were dug on the northeast side of Foster Gulch; pits are in proximity to previously elevated soils and near the basal contact between overlaying serpentinite and quartz-muscovite-schist. Several samples from hydrothermally altered serpentinite encountered in the excavations (Foster Child Showing) include; 782 ppb Au, 0.36 ppm Ag, 12400 ppm As, 237 ppm Cu, 154 ppm Co, 1.9 ppm Hg, and 6.27 ppm Sb. Furthermore, regional prospecting on the DTRGP in 2013 resulted in the finding of the "Breccia Zone"; revealing a greater than 100m zone where float samples consisting of sulphide bearing quartz vein breccia yielded up to 139 ppb Au, 0.14 ppm Ag, 346 ppm As, 8.2 ppm Sb, and 531 ppm Zn.

In 2014 no work was recorded, yet additional claims were staked. In early 2015 adjacent claims had come open and were staked to a total of 520 quartz claims and in turn consolidating any available ground on the north side of the Klondike River. Exploration activity for 2015 consisted of approximately two weeks of prospecting by the author and follow up trenching. Prospecting in 2015 investigated regionally mapped contacts and faults as well as magnetic anomalies displayed in the regional geophysics. Prospecting the three-way contact between gabbro and serpentinite and quartz muscovite schist on the western margin of the claim block resulted in discovering a series of old shafts and trenches along the right fork of Thomas Gulch that corresponds to the 1902 newspaper article under the headlined "Good Showing of Quartz

Ledges". Further up slope east of the Dome Lookout revealed two areas of localized quartz boulders with three possible in-situ exposures with evidence of old workings. Majority of quartz bared a "bull" appearance but local samples contained sericite and minor limonite. Samples from this region on Thomas Gulch yielded; 0.19 ppm Ag, 14.8 ppm As, 660 ppm Ba, 50.8 ppm Cu, 3.68 ppm Mo, and 57.5 ppm Zn. An intensively talc and listwanite altered fault which corresponds with a regional geophysics anomaly was located on the historic Matilda Patented claim where a 106ft incline was drove in the early 1900s.

Several alternate zones of mineralization identified on the property include the low lying basal thrust contact of a serpentinite unit where listwanite alteration was observed in outcrop and localized float for over 1.5 km and wider than 3 m in one outcrop near Shovel Creek on the northeast end of the property. Listwanite alteration consists of fuchsite and magnesite occurring with comb and banded chalcedonic quartz; other samples in the 1.5 km stretch displayed clay alteration and minor brecciation with quartz and bladed calcite. Two rock samples were taken from the zone and returned 5.47 ppm Sb, 52.6 ppm As and 1.27 ppm Mo. In the adjacent area a large gossan greater than 100m across with signs of old workings was discovered during a heli-supported property visit by Yukon Geological Survey (YGS) geologist Derek Torgerson and prospected shortly after. Another discovery in 2015 included the "Smoke Stack" quartz vein hosted in gabbro with minor malachite staining and sulfide with widths of greater than one meter and traceable for approximately 750ft, located in the central part of the claim. The gabbro host contains pyrite and is locally stained with malachite: an ideal chemical trigger for gold deposition in any nearby veins. Rock samples from the "Smoke Stack" and gabbro host returned up to 74 ppb Au, 0.45 ppm Ag, over 1% Cu, 51.5 ppm Li, 0.92 ppm Sb and 7.48 ppm Mo. Accessible sites were trenched: 13 representative samples were sent for initial assay and a second batch of 10 samples were submitted on behalf of the YGS. Despite low Au results, several new sizable targets were identified and has outlined the greater potential across the property.

Bedrock Geology

The Diamond Tooth Resources Gold Project is underlain by bedrock comprising of medium-grade metamorphic rocks of the Upper Permian Klondike Schist, middle to late Paleozoic carbonaceous schist of the Finlayson Nasina assemblage, and low-grade metamorphosed greenstone and ultramafic rocks of the Slide Mountain terrane. Lithological units are juxtaposed by regional-scale thrust faults (Mortensen, 2007). These units were emplaced in the Jurassic as a series of kilometre-scale stacked thrust slices that are locally separated by additional ultramafic slices and later unconformably overlain by locally derived sedimentary and volcanic rocks in the Late Cretaceous (Mortensen, 1996). Regional extension and normal faulting continued from Late Cretaceous to early Eocene with initiation of strike-slip movement of proximal Tintina fault, along which rocks of the Klondike District were displaced by approximately 450 km from the rest of the Yukon-Tanana terrane (Gabrielse et al., 2006). A distinctive set of post-metamorphic compressional structures related to thrusting, ductile recumbent folds and associated spaced cleavage is preserved in all thrust slices and is well developed near bounding faults (Mortensen, 2007). This complexly folded and faulted succession of metamorphosed continental margin sediments and ophiolitic rocks are intruded by later Mississippian and Permian plutons.

2018 Work Program

The Diamond Tooth Resources 2018 exploration program consisted of prospecting, ground geophysics, rock and soil sampling. Prospecting was carried out by Leia Ezerza and Charlie Brown at the beginning of the project on June 4 and 5. Additional prospecting by Nicolai Goeppel and Peter Schwenk was completed from June 28 to July 4th for a total of 6 days. Soil sampling followed in designated areas and also carried out by Leia Ezerza and Charlie Brown from June till early August for 16 days. A total of 753 Soils were taken at 5 different areas and sent for assaying to Bureau Veritas. A ground magnetometer geophysical survey was carried out by Leia Ezerza on 6 different designated grids on the claim block, with a GSM 19 overhauser backpack magnetometer.

All 2018 soil and rock samples submitted for assay were brought to the Bureau Veritas prep facility in Whitehorse prep facility in Whitehorse. Analytical tests were conducted by Bureau Veritas in Vancouver, BC, which is ISO accredited. Samples are crushed to 70% less than 2 millimetres, and a 250-gram sample is split with a riffle splitter. The split is pulverized to 85 per cent less than 75 microns, and 30 gram charges go through a multi-element assay with ICP-AES finish. Samples with gold, silver, copper, lead, or zinc exceeding the upper detection level are reanalyzed with ore grade determinations that are deemed most appropriate by the lab. Rigorous procedures are in place regarding sample collection, chain of custody and data entry. Certified assay standards, duplicate samples and blanks are routinely inserted into the sample stream to ensure integrity of the assay process.

2018 Results and Interpretation

Prospecting 2018

2018 prospecting by Leia Ezerza and Charlie Brown at the beginning of the project on June 4th and 5th; lead to the discovery of abundant quartz float along the fire tower road. The area was followed up after with a soil geochemical survey and a ground magnetometer survey (Grid E). Prospecting completed by Nicolai Goeppel and Peter Schwenk focused on following up on the Smoke Stack vein, Bradley Creek gossan, Shovel Creek listwanites, and Breccia zone.

This resulted in new exposures of listwanite alteration with quartz-calcite stockwork on Shovel Creek. The total length of the zone is 1.6km and remains open in all directions. Listwanite alteration occurs along a low angle thrust fault that separates underlying quartz-chlorite-schist and the overlying serpentinite. The 1.6 km zone is evident in localized float and in various bedrock exposures occurring along and on both sides of Shovel creek. Only 3 samples were taken from the zone in 2018; assay produced high Ni, Co and Cr values.

In addition, 2018 prospecting identified sulfide mineralization in the Bradley Creek area in 3 locations (Figures 71 – 77). Four rock samples were taken at the Bradley creek gossan and yielded values up to 6 ppb Au, 285ppm Cu, 22ppm Pb and 11ppm As. The gossanous zone is orange-red and highly weathered,

oxidized, pitted and clay altered. The gossan is encompassed by quartz-sericite-pyrite alteration with locally highly silicified zones. The zone is approximately 250 x 350m in dimension and limited by lack of bedrock exposure. Approximately 2km west on Bradley creek disseminated pyrite in quartz-chlorite-muscovite schist was found in float adjacent to a collapsed pingo. One sample was taken and returned 15ppb Au and 33ppm As.

In the Breccia zone, samples of chalcedonic quartz matrix with banding, display indications of epithermal boiling textures. Abundant limonitic quartz breccia with fragments of carbonaceous shale was found along a road cut, one sample was taken and returned 29ppb Au and 27ppm As. 2018 geophysics highlighted a significant anomaly in the same area. 2018 soil sampling also highlighted several elevated Au-Ag-As sites in the area. Based on limited exposure the Breccia zone lies on the contact zone between carbonaceous shales and serpentinite, a favourable setting for gold mineralization.

Several chip samples of the upper Smoke Stack vein identified chalcopyrite globules locally occurring in the 1-2m wide quartz vein. Samples returned 3786ppm Cu, 1.5ppm Ag, 39ppm As and 27ppb Au. A total of 11 rock samples were taken in 2018. Samples returned elevated Au, Ag and other base metals values. Analytical results, coordinates and descriptions are located in Appendix II of this report.

Ground Magnetometer Survey 2018

In 2018, a total of approximately 30-line km of ground magnetics was done in 6 different grids by geologist Leia Ezerza. Magnetic intensity measurements were taken every 12.5 meters with 50-meter line spacing to identify distribution of magnetic minerals and zones of hydrothermal alteration. Magnetic data provides a useful mapping tool to distinguish rock types and to identify faults, bedding, structure and alteration zones in areas obscured by overburden. The 2018 survey utilized a Gem Systems GSM-19 overhauser ground magnetometer and bay station. The rover unit digitally records the survey line, station, total magnetic field (nT) and time of day at each station. Each station location was located using a hand held garmin gps. Routinely data was downloaded to a computer for archiving and further processing. The Gem Systems GSM-19 overhauser ground magnetometer has an accuracy of +/- 1/100th of a gamma. The base station was used to monitor and correct for the diurnal variation during the course of the survey. This instrument reads to 1/10th of a gamma resolution and cycled at 10-second intervals. Unfortunately, bay station readings were corrupted and unusable for the diurnal data correction.

Grid A (Figure 14 & 15) was placed to survey an area with abundant 'turn of the century' trenches and short shafts (Figure 4 & 5). The area is underlain by quartz-chlorite-muscovite-schist, based on the low range of values (nT) in the magnetics there is likely no major contacts or lithological changes through the grid area. Missing data through the center of the grid would also affect results.

The location of grid B (Figure 16 & 17) was determined by abundant quartz boulders and float that was observed in previous exploration, several 'turn of the century' trenches were also noted in the area. The preliminary magnetics data illustrates the distribution of the more magnetically susceptible ultramafic

units to the west and less susceptible quartz-chlorite-muscovite-schist to the east. The contact area is inferred as a fault contact and appears to have the lowest magnetic susceptibility; this is likely due to hydrothermal alteration and magnetite destruction and offers a potential source of abundant quartz float. It should be noted that one partial line in the center of the grid is missing in the data and would affect results.

Geophysical survey grid C (Figure 18 & 19) was placed near the approximate inferred location of the Matilda showing and where previous exploratory trenching revealed a strongly talc altered structure within a fuchsite-muscovite-schist. Preliminary results indicate a linear magnetic anomaly trending north east. The anomaly corresponds with a thrust fault from regional mapping and likely representative of a faulted mafic or ultramafic sliver. The different response to the east and west displays the change of lithology across the contact.

The area designated for grid D (Figure 20 & 21) encompassed several notable airborne geophysical anomalies from a 2014 government funded survey and the Breccia zone area. The response in grid D indicates a prominent contact between the ultramafic units and carbonaceous shales. The very low response generated in this contact area may be representative of a high degree of hydrothermal alteration and potential source of quartz breccia float that is observed in the vicinity. Another contact may exist towards the south west fringe of the survey area. Several isolated lows may display smaller areas of localized hydrothermal activity, but should be checked to ensure confidence value of the readings. It should be noted that a partial survey line was not completed or data was lost.

Survey grid E (Figure 22 & 23) was placed based on prospecting results from Charlie Brown and Leia Ezerza that located abundant quartz float in the area. This grid indicates minimal variation in readings and the region is likely underlain by a single unit, likely a quartz-chlorite-muscovite-schist that has been observed in the vicinity. Two isolated magnetic lows may represent more silicified sections; however, the northern low is at the edge of the survey grid and is likely exaggerated and stretched.

The final grid F (Figure 24 & 25), was not completed with majority of the readings missing. There is not an appropriate number of stations to delineate geological features. However, the higher magnetic response to the south compared to lower magnetic response to the north would suggest a possible contact exists in the survey area.

Soil Sampling 2018

In 2018, a total of 753 soil samples were taken from 5 different designated locations, grids were set at a 50m by 50m grid with line oriented perpendicular to the strike of the geology or regional structures. Soils were taken using a hand soil auger to the "C" horizon and maximum obtainable depth. When "C" horizon material was not obtained "B" horizon material was taken instead. All soil samples have been sent to Bureau Veritas prep facility in Whitehorse for analytical testing. All soil sample grids were also covered with a ground magnetometer survey.

Soil grid A (Figures 27 – 33) soil consisted of 81 soils taken at 50x50m interval and returned elevated Au, As, Ni, and Pb values. Steep topography would suggest a higher degree of downslope dispersion. The data displays a northwest trending arsenic anomaly with values that include 109.6, 63.8 and 57.9 ppm. Gold is also elevated with As in the northeast trend with values ranging up to 10.6 ppb. Soil data displays a secondary northwest anomaly towards the southern margin of the grid with values up to 15 ppb Au. Elevated gold is likely attributed to discontinuous quartz veins that range up to 1 m in width and occur locally in bedrock. Turn of the century workings consisting of hand dug trenches and shafts have also been observed in the area often with quartz in the dump piles or nearby exposed bedrock. Elevated Ni up to 2540.9 ppm occurs in the northwest corner of the soil grid and likely represents mafic to ultramafic underlying geology. Elevated Ni values correlate to a magnetic high displayed in the 2018 magnetometer survey.

Soil grid B (Figures 34 – 40) consisted of 103 soils in a 50x50m grid and returned elevated Au, As and Ni. Elevated Ni was returned in the western quadrant of the soil grid likely indicating the boundary of serpentinite bedrock and can be observed at the Midnight Dome in outcrop. Ni values range up to 1552.6 ppm and correspond with a high and abrupt low in 2018 geophysics. Since Ni values have also been returned from the magnetic low, this would suggest the contact ultramafics have undergone a higher degree of hydrothermal alteration or serpentinization. Along the boundary of this northwest trending magnetic high and low, As is elevated in a similar north west direction up to 213.8 ppm. Gold values range up to 31.8 ppb and have a more sporadic distribution. The Au values concentrate proximal to the eastern margin of the magnetic low with some slight elevations where the magnetic high occurs in the western portion of the grid. The compiled soil and magnetics data suggest a prominent contact with potential mineralization proximal to the contact and likely hosted in the quartz+/-chlorite+/-muscovite schist. This is further evident, based on the proximity of quartz float and old workings that also occur locally in the grid area.

Soil grid C (Figures 41 – 47) consisted of 60 soils taken at 50x50m interval and returned elevated Au, As and Ni. The grid covers a northeast trending magnetic high that corresponds with a thrust contact. Elevated Ni occurs over the central magnetic high and proximal where a moderate to weak magnetic response was returned. One soil with 25.6 ppm As was returned from the core magnetic high; whereas, gold ranges up to 21.6 ppb with elevated values enveloping the central magnetic high. Elevated gold forms a northeast trending anomaly that occurs close to previous trenching that uncovered an extensively talc altered fault and fuchsite-muscovite schist. This likely indicates the presence of an off shooting or paralleling structure and may be more mineralized than the primary structure.

Soil grid D (Figures 48 – 63) is the largest grid completed in 2018 consisting of 388 soils. Results returned elevated Au, Ag, As, Cu, Mo, Ni and Pb. Magnetic results from the 2018 magnetometer survey indicates a prominent magnetic high with a magnetic low envelope 200m x 400m in the Breccia zone; soil survey results from the zone returned elevated Au up to 16 ppb, Ag up to 2 ppm and As up to 115.8 ppm. A prominent 200m x 300m polymetallic anomaly with elevated Au-Ag-As-Pb-Mo occurs in the eastern margin of the grid area covering a localized magnetic low. Values ranged up to 11.9 ppb Au, 87.5 ppm As, up to 31.7 ppm Mo, up to 24.9 ppm Pb and 1.3 ppm Ag. The northeast quadrant returned high Ni corresponding with a high magnetic response. Several elevated Au-As values were returned from area of high Ni corresponding areas with lower magnetic response.

Soil grid E (Figures 64 – 70) consisted of 117 soil samples. Soil sampling results yielded only slight localized sporadic elevations in Au, Ag, As and Pb. Geochemical results for grid E produced up to 12.1 ppb Au, 143.5 ppm As and 1.3 ppm Ag from different sample locations.

Conclusion and Recommendations

In 2018 Diamond Tooth Resources completed soil geochemical sampling, ground magnetometer surveys, and limited prospecting on its Gold Project. Based on prospecting, geochemical and geophysical results further work is warranted. The bedrock geology forms a suitable geological setting for orogenic "Motherlode" style gold mineralization. Soil geochemical results produced values elevated with Au, Ag, As, Cu, Ni, Co, Mo and Pb. Values ranged from detection up to 31.8ppb Au, 2.1ppm Ag, 231.8ppm As, 112ppm Cu, 43.1 ppm Pb, 31.7ppm Mo, 13.2ppm Sb and 2540ppm Ni. The 2018 ground magnetometer survey identified several anomalies in grids B, C and D. Future in fill soil sampling and hand or mechanical test pitting is recommended for geochemical anomalies in Grids B, C and D that also correspond to magnetic lows produced in the 2018 ground magnetometer survey. Of particular interest the geophysical and polymetallic soil anomalies produced in Grid D. Specifically, this would include follow up on Au-As-Ag-Pb anomalies produced in 2018 soil sampling. Mo anomalies in grid D is of particular interest and may suggest presence of intrusive geology and not present in any other grid.

Geophysical anomalies produced in grids B, C, and D offer targets for future hand or mechanical trenching. Further magnetic surveys should be completed to extend the strike on these grids, based on positive geochemical soil results. Any future ground magnetics should be done at a 25m line interval rather than the 50m to improve resolution of results. Soil grids or contour intervals are recommended in the Bradley creek gossan region and the Shovel creek listwanite area to determine mineralized zones in the large alteration zone. Listwanite alteration typically forms an envelope or along one side prospective mineralized veins. Hand trenching should be conducted in the Shovel Creek area around observed listwanite alteration to expose the primary fault zone and possible veins adjacent to the alteration.

Statement of Qualifications

I Nicolai Goepfel am a local Yukon prospector/geologist and owner to Higher Ground Exploration Services. I'm born and raised in the Yukon with placer roots in the Freegold Mountain area near Carmacks. Earliest involvement in geology includes two field seasons with the Yukon Geological Survey and three years as senior project manager at All-In Explorations. More recently includes managing multiple placer and hard rock projects for Midnight Mining Services and alternate exploration companies. In the last seven field seasons I've encountered and worked in skarn, porphyry, epithermal and intrusive related vein systems, vms, magmatic Cu-Ni mineralization, and Carlin as well other types of mineralization for various commodities. In terms of orogenic lode Au/Ag mineralization, I worked on number of projects in the Cache Creek terrane in southern Yukon and northern BC. This includes work in Newfoundland, where I recently completed a BSc in Earth Sciences at Memorial University in January 2015.

QUARTZ MINERS BECOMING ACTIVE

Work Commenced on Dawson City Property North of Town—Tests to Be Made.

The increasing interest being taken in quartz properties about Dawson is resulting in preliminary development work that may prove some of the rock to be very rich. Wilson Foster, president of the Dawson City Quartz Mining Company Limited, states that work has been resumed on this company's properties, located just north of and adjoining the northern city limits.

"An incline 106 feet in length," Mr. Foster states, "will be extended for another fifty feet or more in depth on the Matilda claim. A similar incline shaft is now being driven on the Agnes claim, which the company purchased last year from Miss Richardson.

"I intend to have at least two mill tests made from the property before leaving for the fair. I will take 100,000 shares of the treasury working stock of the company to St. Louis with me to sell, if possible, and raise capital enough to install an immense stamp mill on the Klondike at the mouth of Thomas gulch. Millions of tons of low grade gold-bearing quartz and porphyry are now in sight on the Dawson City group."

1902

Time and again the big fellow brought down his boots upon his prostrate foe, and as many times did the latter try to rise, but his shoulder had been broken and he was helpless. For a minute or two he struggled, and then lay perfectly still. The conqueror gave the carcass one last contemptuous kick and then crashed off into the woods."

JOE BARRETT'S SWELL ROADSTERS

Arrives From Whitehorse With Palo Alto Thoroughbreds—Makes a Grand Appearance.

Joe Barrett and his niece, Miss Barrett, arrived yesterday from Whitehorse with his span of standard bred horses and handsome two-wheeled sleigh. Upon alighting Mr. Barrett was greeted by a number of friends. The first thing the old scoundrel had to say was the old familiar statement, known only to the friends of Joe: "Hello! Hello!"

Furting up at "Hutch's" livery on Third avenue, he said: "Give them three quarts of hay and two pounds of oats, and if they don't go in half-past two, I give you to her."

This fine pair of driving horses imported by Mr. Barrett, are standard bred colts from the Leland Stanford stables of Palo Alto, California.

Joe has not quit growing sideways, and the only kick he has coming is that the White Pass, with its fast stages, has not brought in his trunk of tailor-made clothes and plug hat, and Joe, as usual, will appear in corduroy suit of knee breeches, which he wore on leaving Dawson two months ago. Hence his handsome form will not be seen on the streets until after the arrival of the trunk.

The sleigh is one of the most up-to-date rigs that was ever brought into this city. The seats are adjustable and so arranged that those who sit in the rear are closed in, as if in an open back. The rig is the best turned out by the Studebaker Bros. of South Bend, Ind.

LOCAL MENTION.

Mrs. Mamie O'Day and Mrs. Dudson arrived from Seattle yesterday and are registered at the Klondike.

Nick Gough, an old timer, has been laid up in the hospital for several days

GOOD SHOWING OF QUARTZ LEDGES

Wilson Foster Reports Finding the Walls and Rich Vein Matter on Dome Back of Dawson.

Wilson Foster, the manager of the Dawson City Quartz Mining Company Limited, has just visited the hill back of town where the work of the company is being done. Mr. Foster says: "Thirty prospect holes have been put down on the different ledges to locate the walls of the ledges. On one ledge a hole twelve feet deep has been put down and the wall and lead found so satisfactory that further work would be unnecessary. There are six lead-veins running parallel with a general direction of northwest and southeast.

"A dyke of bird's eye porphyry of feet in width is in between two leads. Its surface assays go \$932. The center lead gives an assay of \$85.40 in gold, with traces of iron and copper. Assays of the other leads go \$14, \$4 and \$5.

"A body of talc 75 feet in width has been located between two shale walls, which assays from \$2 to \$3.10 gold from surface croppings.

"Work will be continued as soon as the weather gets warmer.

"About thirty tons of pay rock is on the dump, ready to be taken to the mill."

DUCHESS BRINGS \$900.

Ted Alkman Buys Mayor Macaulay's Handsome Driving Mare.

James Allen Alkman, better known as Ted, yesterday purchased the handsome driving mare Duchess from Mayor Macaulay for the sum of \$900. When such "crack" as Ted, Joe Barrett, Frank Phisepher and Dick Love can be seen making clouds of dust on the Klondike, it is a sight to be remembered.

DISPL	320	Disposal of pulps			VAN
SHP01	320	Per sample shipping charges for branch shipments			VAN

ADDITIONAL COMMENTS

JEFFREY CANNON
Geochemistry Department Supervisor

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
*** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
