SUMMARY

The AU property consists of 222 quartz claims located on NTS map sheet 115O/13 and 14 and registered in the Dawson Mining District. A soil geochemical survey was conducted on October 2 and October 4, 2018, with demobilization to Whitehorse on October 6, 2018, for a total of 19 person-days. A total of 227 soil samples were analyzed for gold and multi-element ICP.

The property is located in the heart of the Klondike district, and is drained to the east by Bonanza and Eldorado creeks, which have produced placer gold from the early days of the Klondike to the present. Recent regional mapping shows the property to overlie the Permian Sulphur Creek Orthogneiss at its northeastern contact with the Permian Klondike Schist.

In 2018, 98 claims were added at the northern end of the claims block. A survey was conducted spanning an area where three consecutive samples from the 2013 and 2017 surveys, spaced 50 m apart, returned values of 508, 120 ppb Au, and 25 ppb Au, respectively, and where another sample, 1.5 km to the south, assayed 78 ppb Au. A total of 227 soil samples were analyzed. The 2018 results are displayed in geochemical maps found in Appendix D. The previous anomalous results were not duplicated. However, a new anomaly (64 ppb Au, 116 ppm Pb) was defined at the northeastern edge of the grid.

The author was not involved in the fieldwork. This report documents and interprets the results of the 2018 sampling, based on information supplied by Coureur des Bois Ltée Ltd; it integrates the results of this survey with those of earlier surveys.

CLAIM DATA

The AU property consists of 222 contiguous mineral claims registered in the Dawson Mining District. The claims are held by Coureur des Bois Ltée Ltd. The summary claim data is as follows:

AU 136–186	YF41306 –YF41356
AU 187–284	YF59877 –YF59974

The claims have a renewal date of December 20, 2021, pending acceptance of this filing. The claim map is located in Appendix A; the detailed claim data is found in Appendix B.

Placer claims overlap the eastern portion of the AU property.

LOCATION AND ACCESS

The AU property is located in the heart of the Klondike district, approximately 20 km south of Dawson City, on NTS map sheet 115O/13 and 14 (Figure 1). The claims are located to the west of Bonanza and Eldorado creeks, two historical gold placer producing creeks. The property was accessed by road from Dawson City from the Bonanza Creek road, a well-travelled gravel road that leads into the Klondike goldfields, south of the Klondike Highway. The center of the property lies approximately at Latitude 63° 52' 30" N, Longitude 139° 25' W, or UTM NAD 83 Zone 7: 57500E, 7085500N.

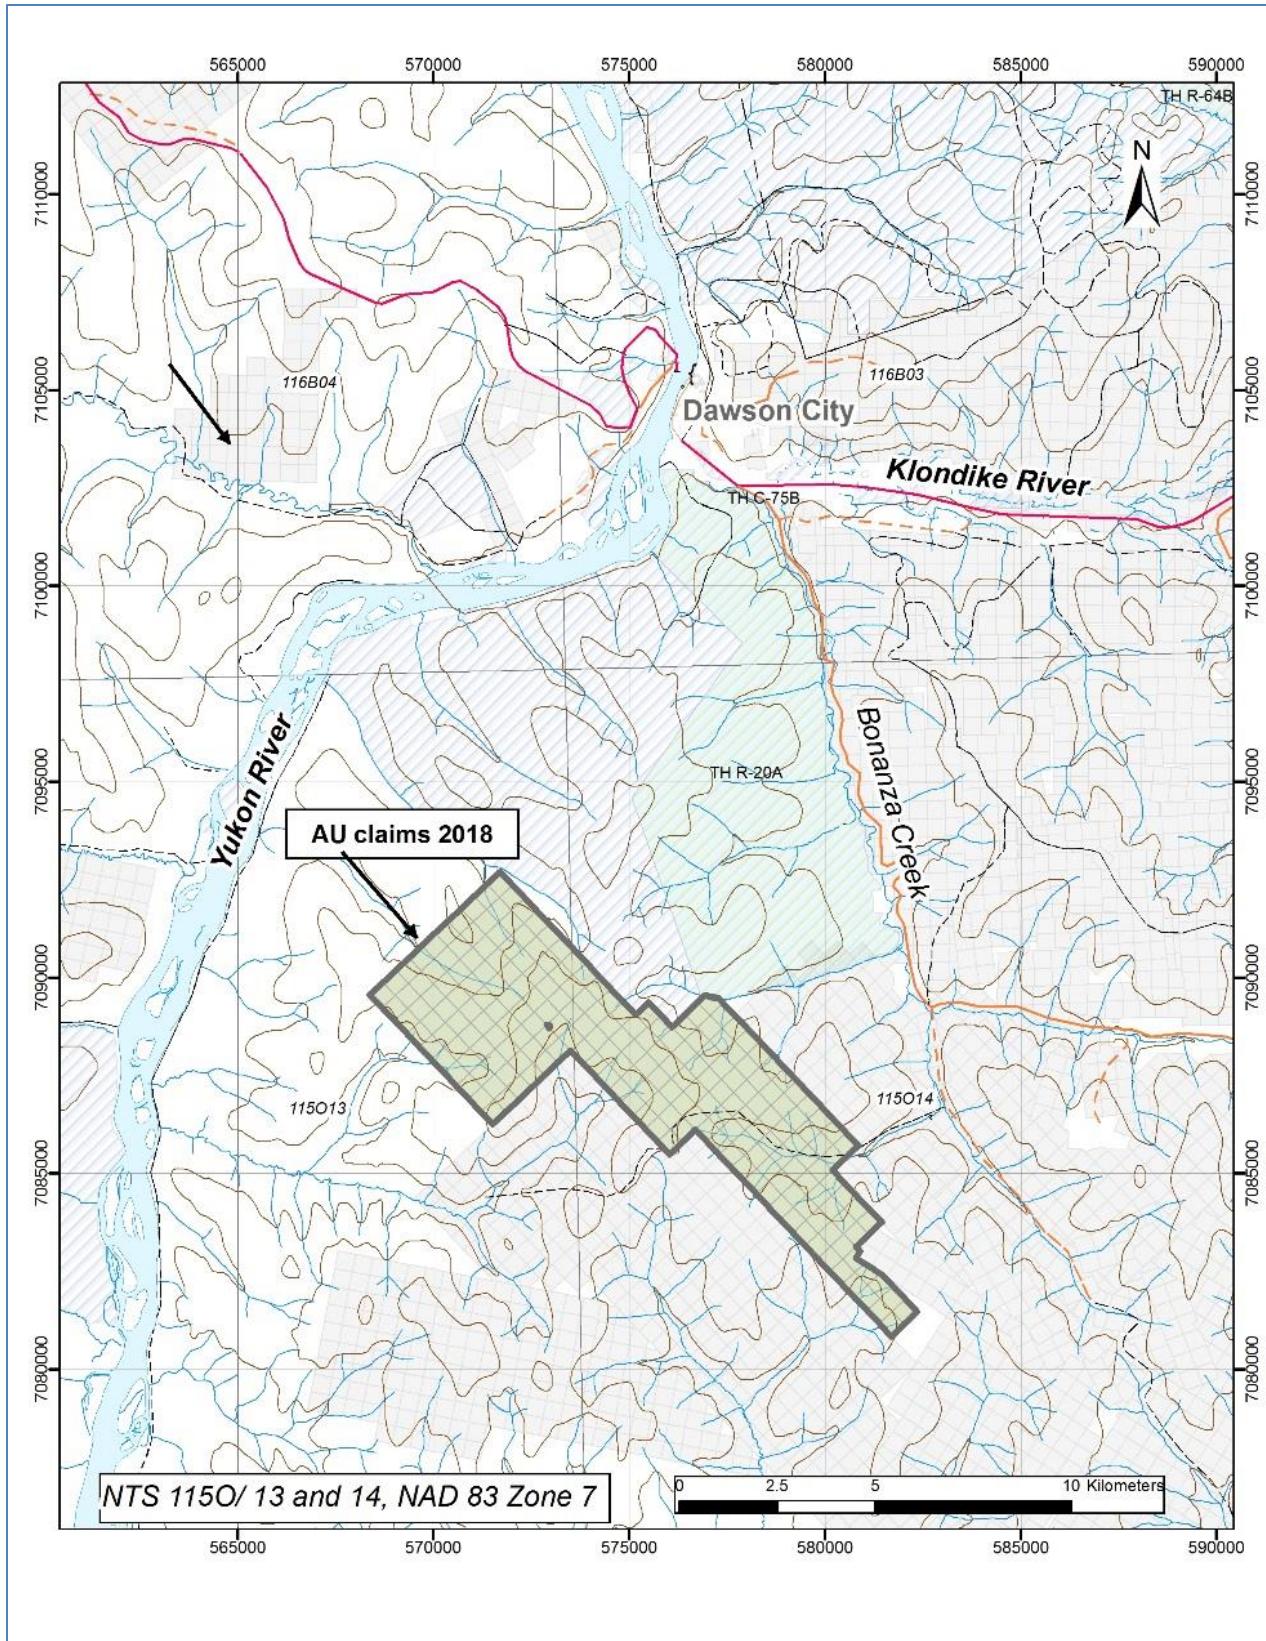

FIGURE 1: GENERAL LOCATION MAP – AU CLAIMS

REGIONAL DATA

The regional data is taken from previous reports on the property.

REGIONAL GEOLOGY

Since this area of central Yukon has not been glaciated, the weathering profile and oxidation level is deeper than in glaciated areas. Metal response in soils may be muted due to prolonged weathering and resulting dilution. Interpretation of soil geochemical results must take this into consideration.

The bedrock geology in the property area is part of the Yukon-Tanana terrane (YTT), a belt of metamorphosed sedimentary, volcanic and plutonic rocks which document a complex magmatic and structural history. Rocks of YTT are interpreted to have started off as a Paleozoic (Devono-Mississippian) magmatic arc built on the margin of the Laurentian craton as a response to subduction of the oceanic lithosphere under the craton. Subsequent rifting created the Slide Mountain Ocean between YTT and Laurentia and lasted until mid-Permian time. In late Permian time, the polarity of the subduction reversed, and the Slide Mountain Ocean began to subduct under YTT, creating a new (Permian) continental arc package. The metavolcanic and metasedimentary rocks of the Klondike Schist and the late Permian Sulphur Creek plutonic suite are part of this Permian arc. In latest Permian time, arc polarity reversed and YTT collided with and overrode the Laurentian margin. Continued convergence led to several other episodes of subduction and their complex magmatic response.

The digital regional geology map published by the Yukon Geological Survey (Figure 2a) shows the claims to be underlain by the Late Permian Sulphur Creek Orthogneiss (unit PqS), described as gneiss/ granite/ granodiorite/ quartz monzonite. The claims overlap the contact with the (earlier) Permian rocks of the Klondike Schist (unit CPK1), described as quartzite/ quartz-muscovite schist/gneiss/amphibolite.

This mapping, originally published in 1996, has now been updated by regional mapping and metallogenetic studies conducted by UBC's Mineral Deposit Research Unit (MDRU) and summarized in their Yukon Gold Project report (Figure 2b). There is no change in the distribution or ages of these two units, but the Jim Creek pluton, located west of the claims and formerly thought to be part of the Jurassic Long Lake Suite, is now known to be Permian and is now correlated with the Sulphur Creek Plutonic suite. This intrusion hosts the IND occurrence (Minfile 115O 095, Gleeson).

No new geological information was collected during Coureur des Bois' programs, the regional geology maps are therefore the most detailed ones available at this time.

YGS MAPMAKER

2B- Regional Geology- MDRU Yukon Gold Project

REGIONAL GEOCHEMISTRY

About ten RGS sample sites are located on creeks that drain the AU claims, while only two are located on the claim block itself (Figure 3). The metal response in these samples is flat for all the elements analyzed. The plot below shows that gold response in silt is muted for most of the Klondike district, with only the King Solomon dome area showing a strongly anomalous gold response.

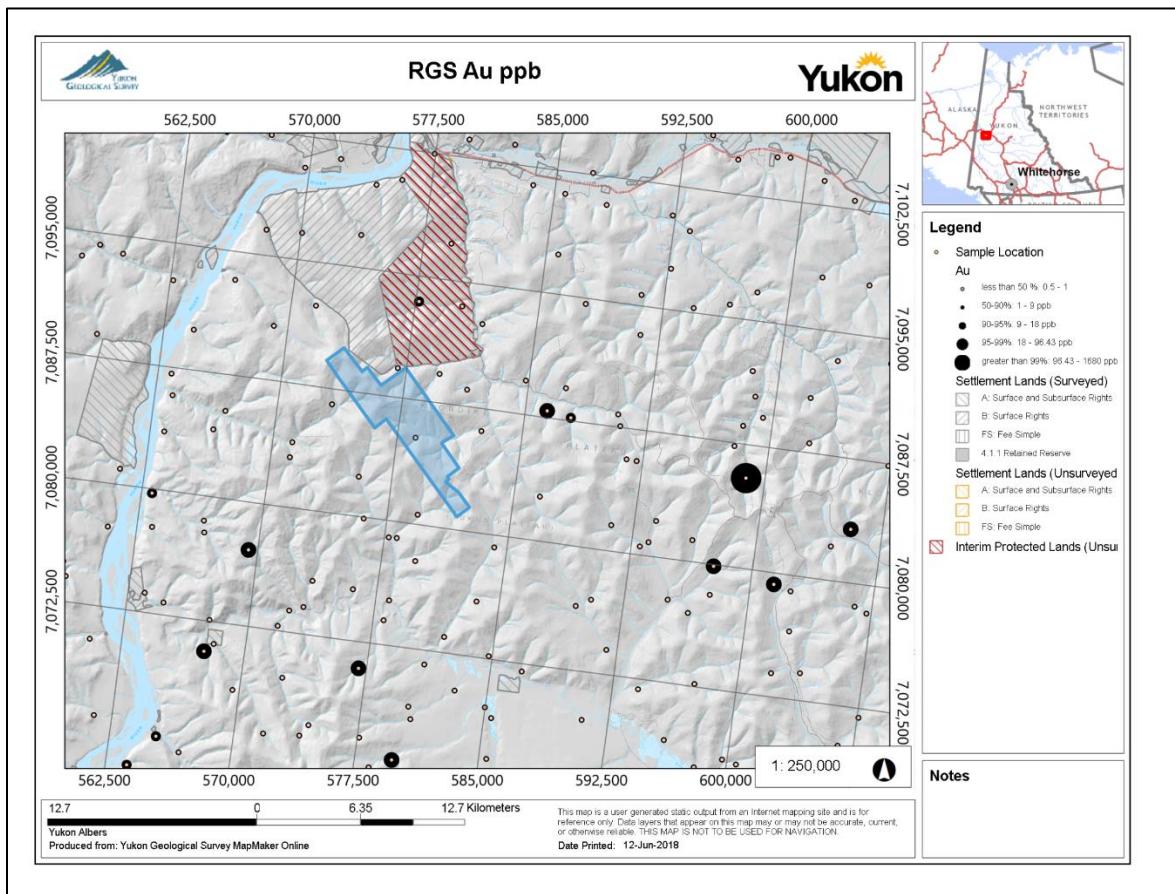

FIGURE 3- RGS DATA FOR AU (PPB)

REGIONAL GEOPHYSICS

Regional magnetic data is available from the YGS website. Figure 4 below shows the first derivative magnetic survey, with the outline of the AU claim block shown in black.

Magnetic signature for the claim area is overall flat and subdued, apart from an isolated weak mag high in the middle of the claim block. The low magnetic response seems to be the signature of the Sulphur Creek Orthogneiss while The Klondike Schist, to the north and east of the claim block, shows a distinct high mag signature.

The southwestern boundary of the claim block lines up with a linear discontinuity in magnetic signature, which, according to the regional geology maps, corresponds to the contact with the Devono-Mississippian Nasina assemblage.

The neighbouring intrusion hosting the IND occurrence, also appears to have a subdued magnetic response.

The isolated higher mag at the center of the claim block has yet to be explained.

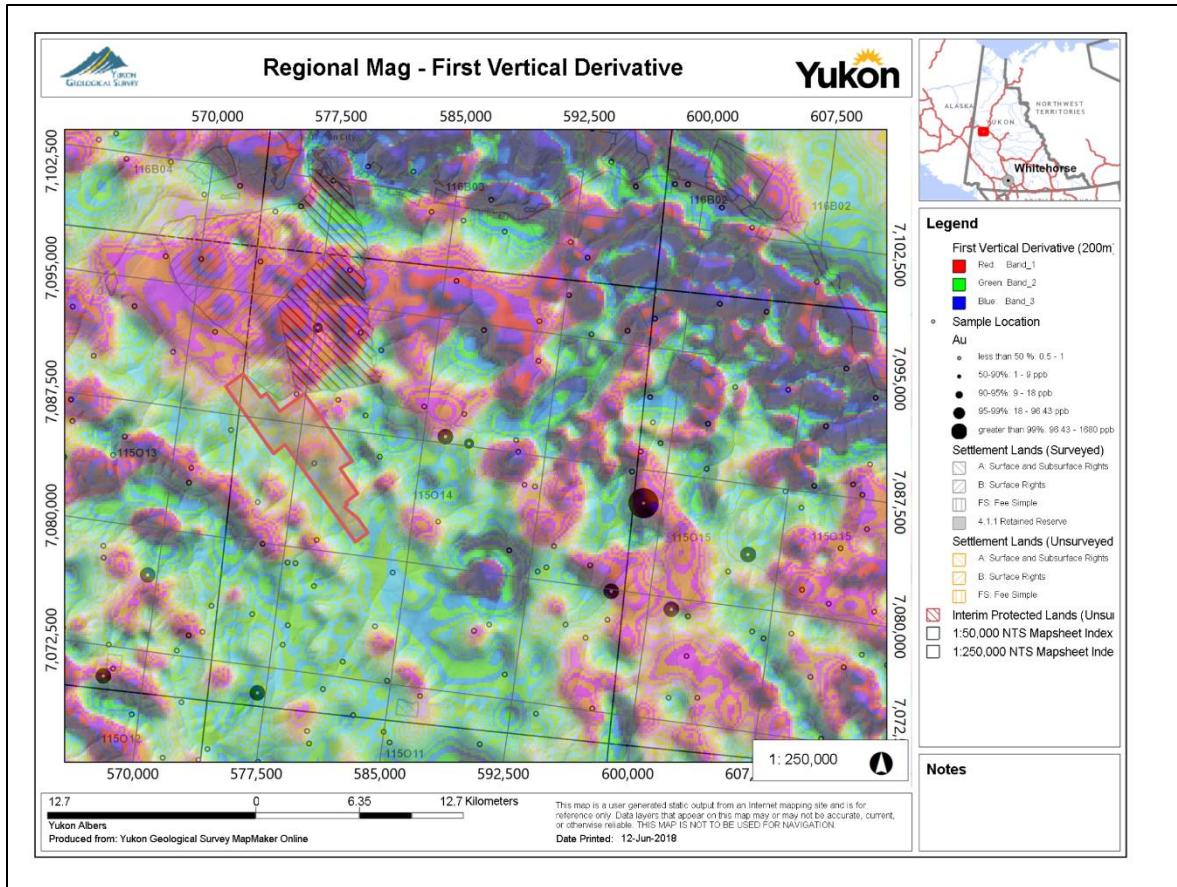

FIGURE 4- REGIONAL FIRST DERIVATIVE MAG

MINERALIZATION

Most of the claim block is underlain by the Permian Sulphur Creek Plutonic Suite. Mineralization in the region is mostly associated with rocks of the Klondike Schist, as is evident from the distribution of Minfile occurrences as seen on Figure 2. The Minfile occurrences that are displayed to be hosted by the Sulphur Creek Orthogneiss are in fact hosted in pendants of Klondike Schist within the orthogneiss.

The neighbouring IND occurrence (Minfile 1150 095, Gleeson) is located 7 km west of the claims block. It is hosted in the Jim Creek pluton, formerly thought to be part of the Jurassic Long Lake Suite. However recent age dating showed the host intrusion to be Permian and that body is now correlated with the Sulphur Creek Plutonic suite (Figure 2). Formerly known as a tungsten skarn, recent work by Aldrin Resources outlined a sheeted sill complex cut by bluish quartz veins. Trench samples yielded up to 12g/t Au (Allan et al, 2012).

Since the AU claims are underlain by the same host rocks as those that host the IND, this same type of mineralization could potentially be found on the AU claims.

PREVIOUS WORK

Claims AU 1 to 130 were staked in September 2012, and a first phase of widely spaced soil sampling (281 samples) proceeded shortly afterwards. A second block of adjoining claims (AU 131 to 186) was staked to the north in October 2012, and widely-spaced soil sampling (231 samples) of these claims took place in September 29th to October 2nd 2013 (Héon 2013).

In 2015, a total of 179 soil samples were collected on five small detailed grids that were established over anomalous sample sites outlined during the 2012-2013 programs (Héon 2016).

In 2017, a total of 21 person-days of fieldwork were conducted on the AU claims. Soil sampling took place on July 18 and 20, September 11, and October 6 to 9. The 2017 work focused on expanding and infilling the eastern portion of the grid, as well as infilling an area surrounding the zone of anomalous soils outlined by previous work. Sampling of an area that had previously returned values of 25 ppb Au and anomalous Ba, Co, La, Mn, and Pb yielded two strongly anomalous values of 508 and 120 ppb Au (Héon 2018).

2018 SOIL SURVEY

DESCRIPTION OF WORK

In 2018, 98 claims were added at the northern end of the claims block. A soil sampling program, conducted on October 2 and 4, 2019, resulted in 19 person-days of work, including one day for demobilization. Other expenses were cost-shared with other projects.

A soil survey was conducted to provide more detailed coverage in the area of anomalous soils, corresponding to the northern end of the 2017 claim block. A grid was established to span two distinct anomalies:

- One area where two consecutive samples from the 2017 survey, spaced 50 m apart, returned values of 508 and 120 ppb Au, adjacent to a 2013 sample that assayed 25 ppb Au.
- Another area, 1.5 km to the south, where a 2013 sample assayed 78 ppb Au.

Four grid lines measured approximately 3 km long, and three other lines measured between 1.5 and 1.9 km long; line spacing was about 150 m and sample spacing was roughly 75 m. This grid provided infill coverage of previous sampling. A total of 227 soil samples were analyzed. The 2018 results are displayed in geochemical maps found in Appendix D; the assay certificate is located in Appendix F.

Figure 5 shows the distribution of the various grids throughout the sampling history of the property; the 2018 samples are displayed in yellow. Figure 6 show the 2018 samples with respect to the historical grid; the two anomalous zones are highlighted for reference.

METHODOLOGY

Sample sites were pre-determined and stored in the sampler's GPS unit. The samplers navigated to the planned waypoints using their GPS, and sampled the B or C horizon at the sample site using a mattock or soil auger. The soil sample was put in a Kraft bag which was labeled with the waypoint number.

Samples were bagged, brought to Whitehorse and shipped directly to ALS Minerals sample prep facility in Whitehorse.

Samples were prepped according to prep code 41, where the samples were dried at <60°C/140F, sieved to -180 micron (80 mesh) and both fractions retained. The samples were then assayed using the Au-ICP21 package, a 30g fire assay with AES finish, and the ME-MS41L for the multi-element analyses.

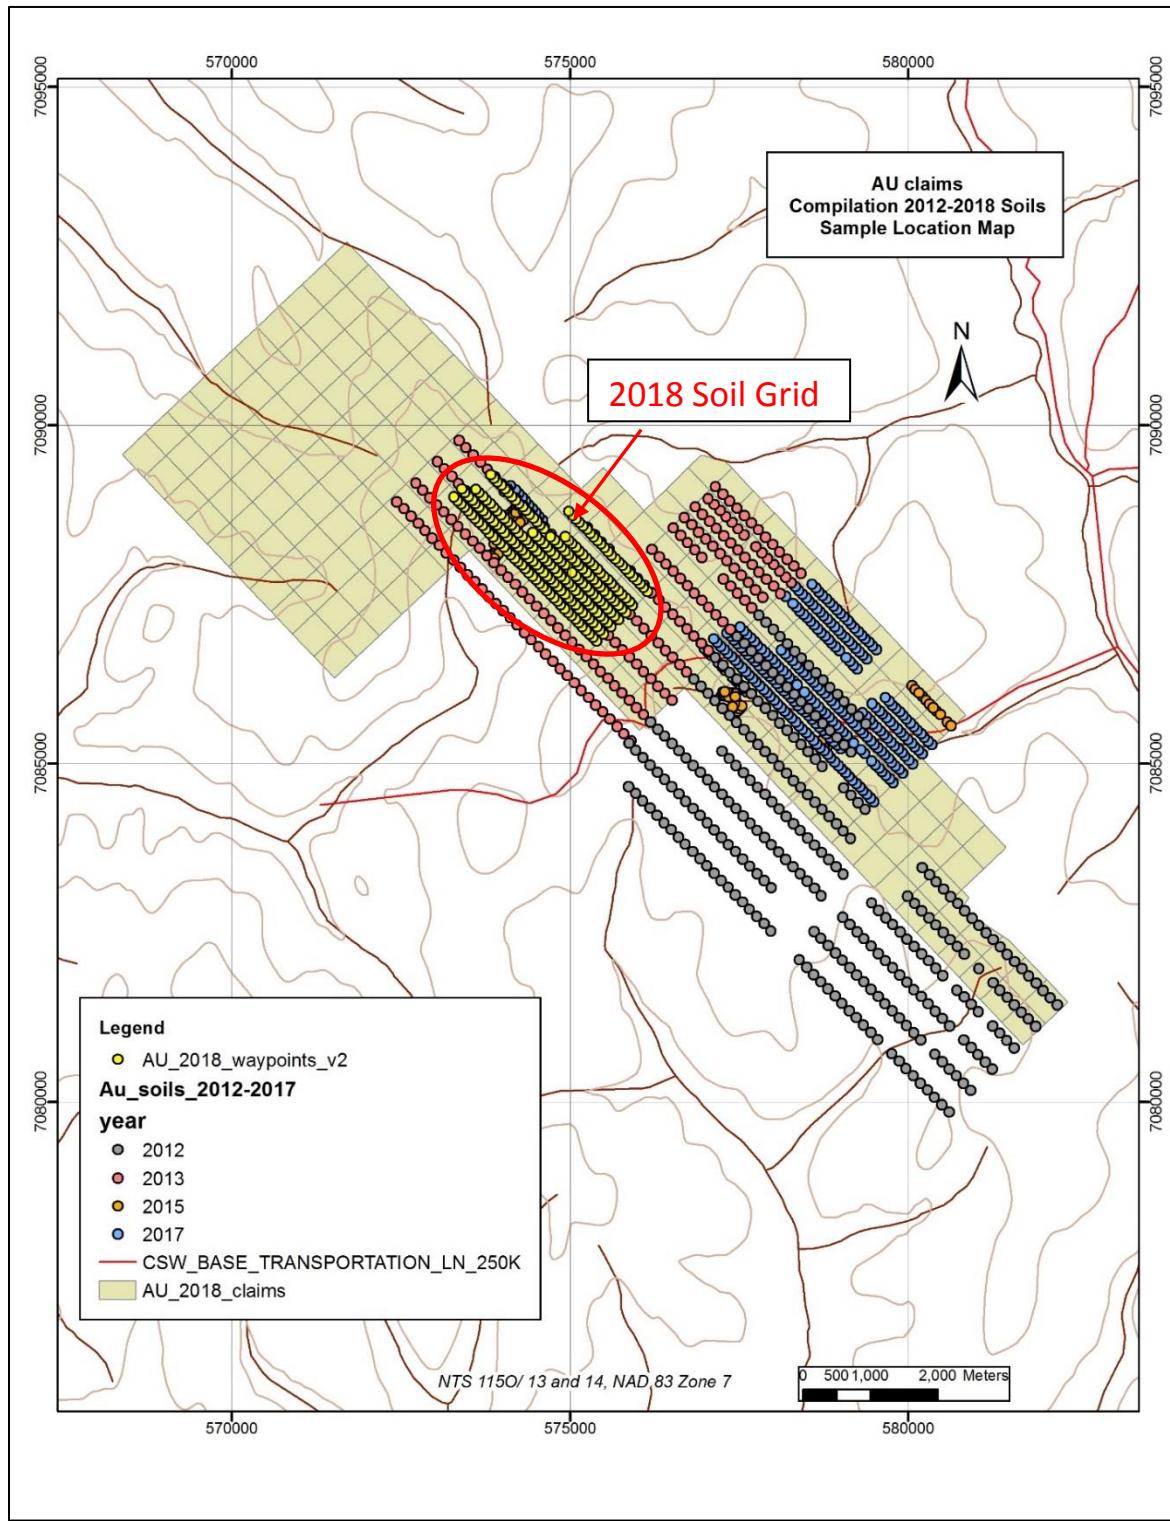

FIGURE 5: LOCATION MAP OF THE DIFFERENT SOIL GRIDS BY YEAR

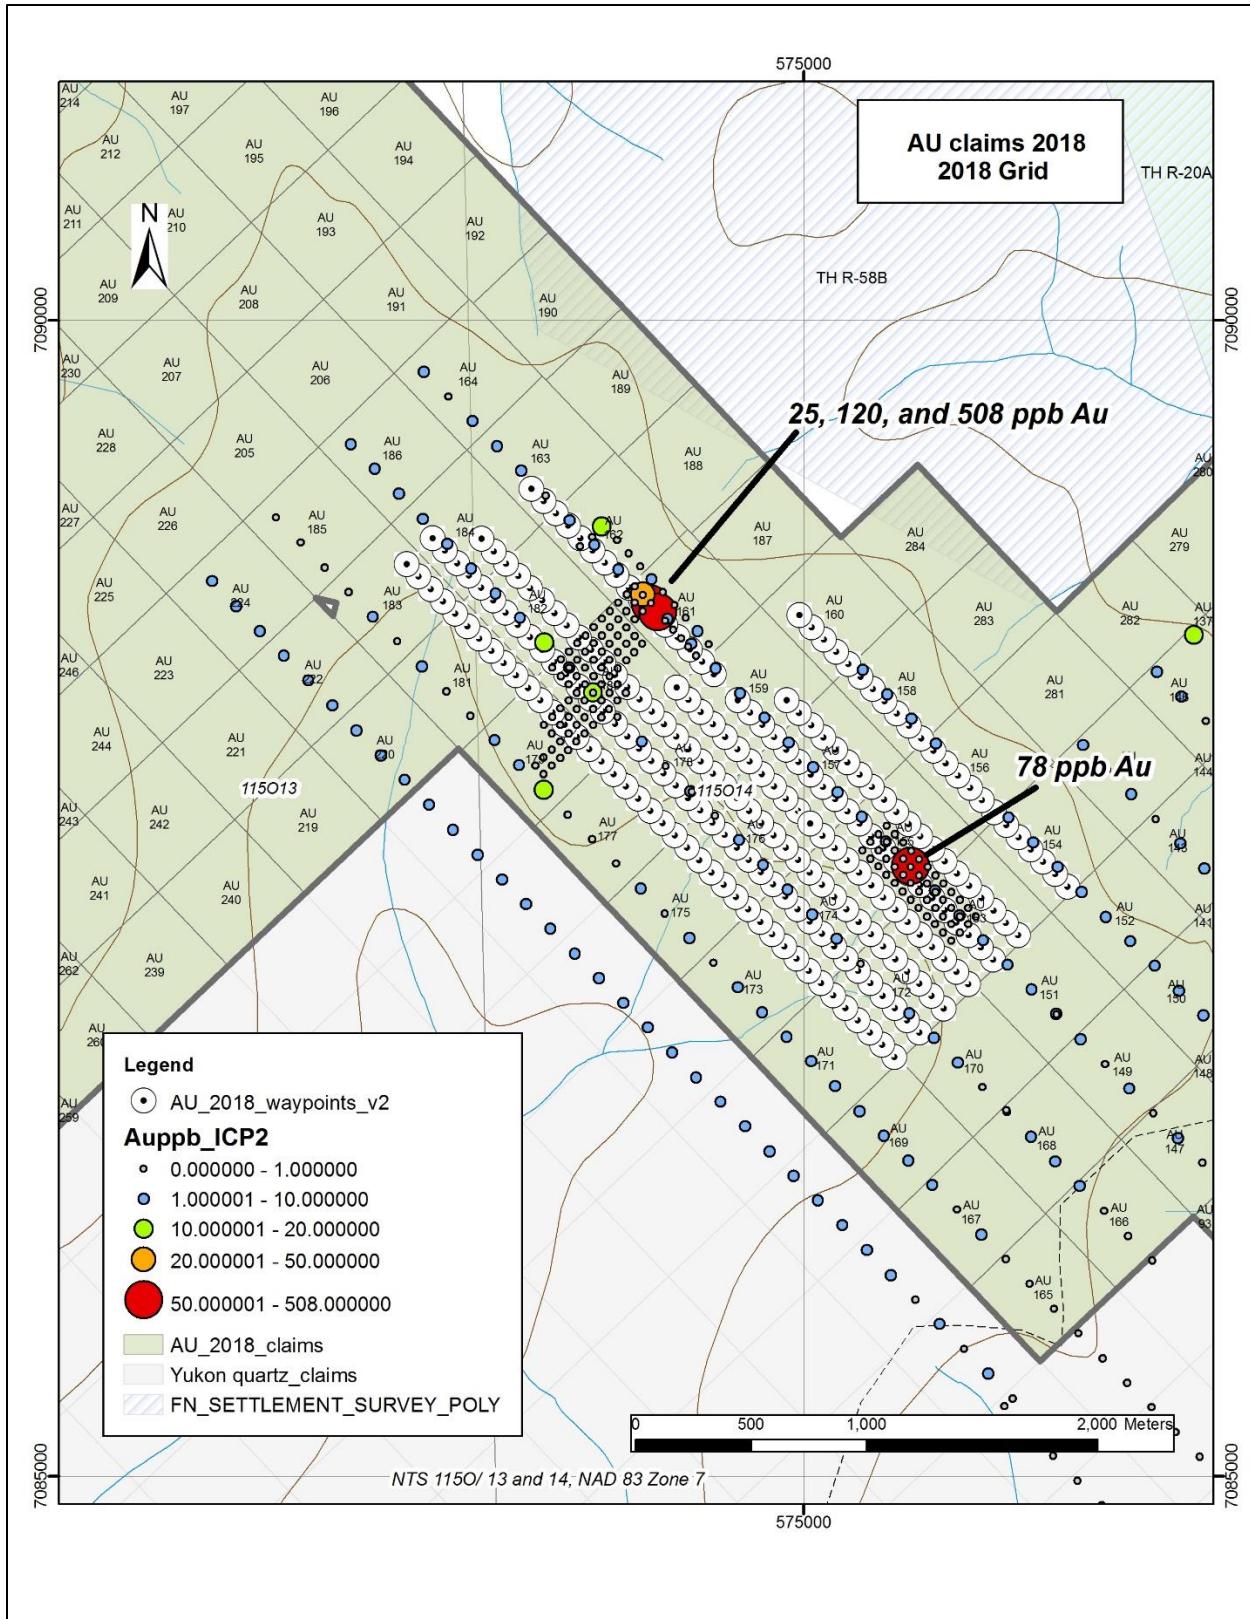

FIGURE 6: LOCATION OF 2018 SOIL GRID WITH RESPECT TO 2017 GOLD ANOMALIES AND HISTORICAL GRID

2018 RESULTS

Soil geochemical maps for Au, As, Ba, Bi, Ce, Pb and U are shown in Appendix D. The 2018 assay results are listed in the assay certificates compiled in Appendix F. Gold values below detection limit (1 ppb) were converted in the digital database to half of that detection limit.

The geochemical maps display the range of values for selected elements. The ranges of values were chosen in order to best represent the distribution of ranges of values for each element. Metal values are generally low. Muted metal response is expected in non-glaciated terrain as the prolonged weathering and oxidation of sample material may cause leaching and therefore dilution of metals. The metal signature and anomaly thresholds may therefore be at lower grade than in glaciated areas.

The 2018 results are shown in isolation of the rest of the grid for clarity but the location of earlier gold anomalies is shown for context. The anomaly thresholds for gold and lead are the same as those displayed in the 2012 to 2017 compilation (Héon 2018); thresholds for the other elements were tailored to the 2018 distribution of elements.

From this 2018 soil survey, the following observations can be made:

- Metal response in this survey is low but locally statistically anomalous for some elements.
- The median gold value was below detection limit (1 ppb, Table 1). Out of 227 samples, only three assayed > 10 ppb Au.
- **A highly anomalous value of 64 ppb Au was sampled on the eastern edge of the grid; this is coincident with a Pb value of 116 ppm, also highly anomalous.** The grid line is an extension of an existing line, the anomalous sample is the second to last sample of the line, with no samples to the SW or NE and only one sample following it to the NW. This anomaly is therefore considered open in three directions.
- Samples taken near those 2017 samples that assayed 508 ppb and 120 ppb gold (analyzed by fire assay) did not duplicate the anomaly.
- Although a good portion of the grid is at 150 m spacing, the location of the 508 and 120 ppb Au anomaly has no samples to the east of it, and to the west is constrained by a tightly spaced but narrow grid. That anomaly is therefore still considered open.
- The location of the 2013 78 ppb Au anomaly has adequate coverage around it; the 2018 survey did not duplicate the 2013 results.
- A small cluster of highly anomalous lead occurs at the western edge of the 2018 grid: 70.2, 1228, and 112.5 ppm Pb.
- Arsenic values are quite low, with a maximum of 28 ppm.
- Bismuth values are very low but shows a map pattern that suggests formation controls.

The following table lists the basic statistics for the main elements.

TABLE 1: BASIC STATISTICS FOR 2018 SOILS

	Au ppb	Ag	Al	As	Ba	Bi	Cd	Ce	Co	Cr	Cs	Cu

CONCLUSIONS AND RECOMMENDATIONS

The initial 2012-2013 soil surveys were conducted on widely-spaced lines (450m apart). The 2015 work consisted of small focused grids infilling near the 2012-2013 anomalies. The 2017 work infilled an area to the north following up on anomalous results and yielded significant gold anomalies. The 2017 work also expanded and infilled the eastern portion of the grid. The 2018 work infilled a section of the northern portion of the grid at a good sampling density. This coverage could be extended.

The 2018 survey was not successful in duplicating the previous anomalous results. The fact that previous anomalous results were not reproduced opens up the possibility that the soil sampling methodology, such as depth of samples, needs to be evaluated to make sure the sampling method is adequate throughout all surveys.

No prospecting took place during this work program.

Metal response was generally low and no element correlation could be determined, except for a coincident gold (64 ppb) and lead (116 ppm) at the northeastern edge of the soil grid.

The portion of the property underlain by the Klondike Schist, according to the regional geology map, remains largely untested.

In light of these results, the following work is proposed:

-Continued infill sampling around the 506 and 120 ppb Au anomaly, as well as around the new 64 ppb Au anomaly.

-Air photo interpretation, looking for evidence for structures as controls to orogenic gold mineralization.

-Soil coverage of the northern portion of the claim block, including the new claims, and of area possibly underlain by the Klondike Schist.

-More complete infill sampling of soil grid near anomalies outlined, and with soil augers instead of mattocks, to increase the sampling depth.

-Geological mapping and prospecting of the property, with focus on the contacts, potential outcrops of Klondike Schist, characterization of Sulphur Creek body, magnetic high area, high As and Au values in soil, and the three known gold anomalies.

-Trenching of those same areas to determine the source of the anomalies.

Additional work would be dependent on the results of this proposed phase of work.

APPENDIX D- SOIL GEOCHEMISTRY

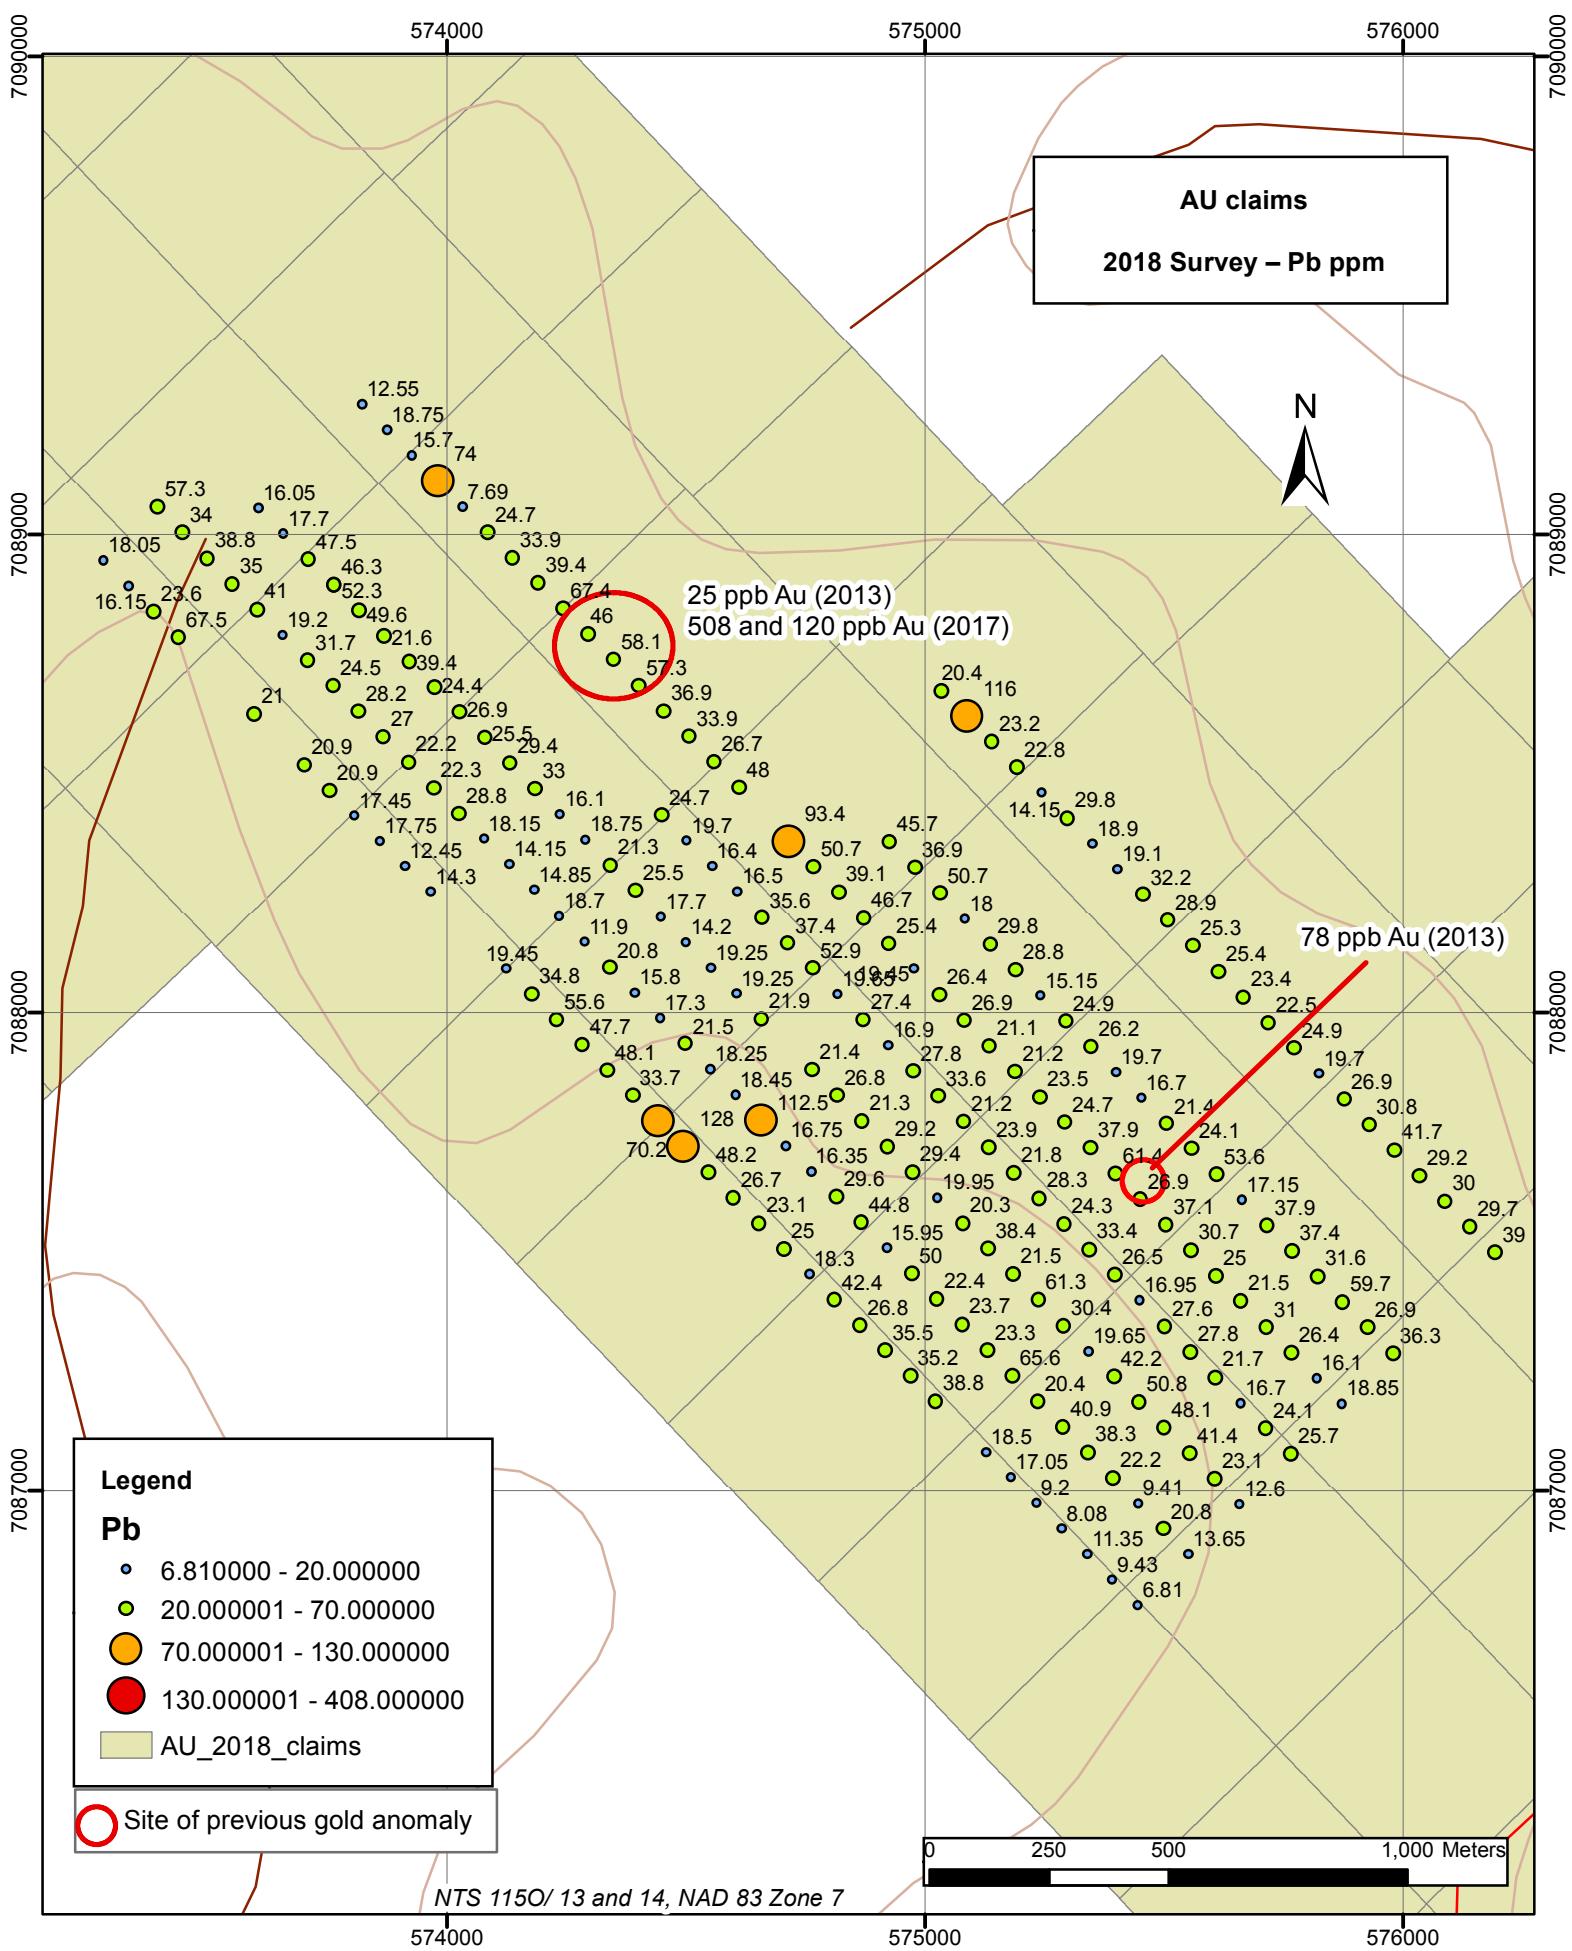

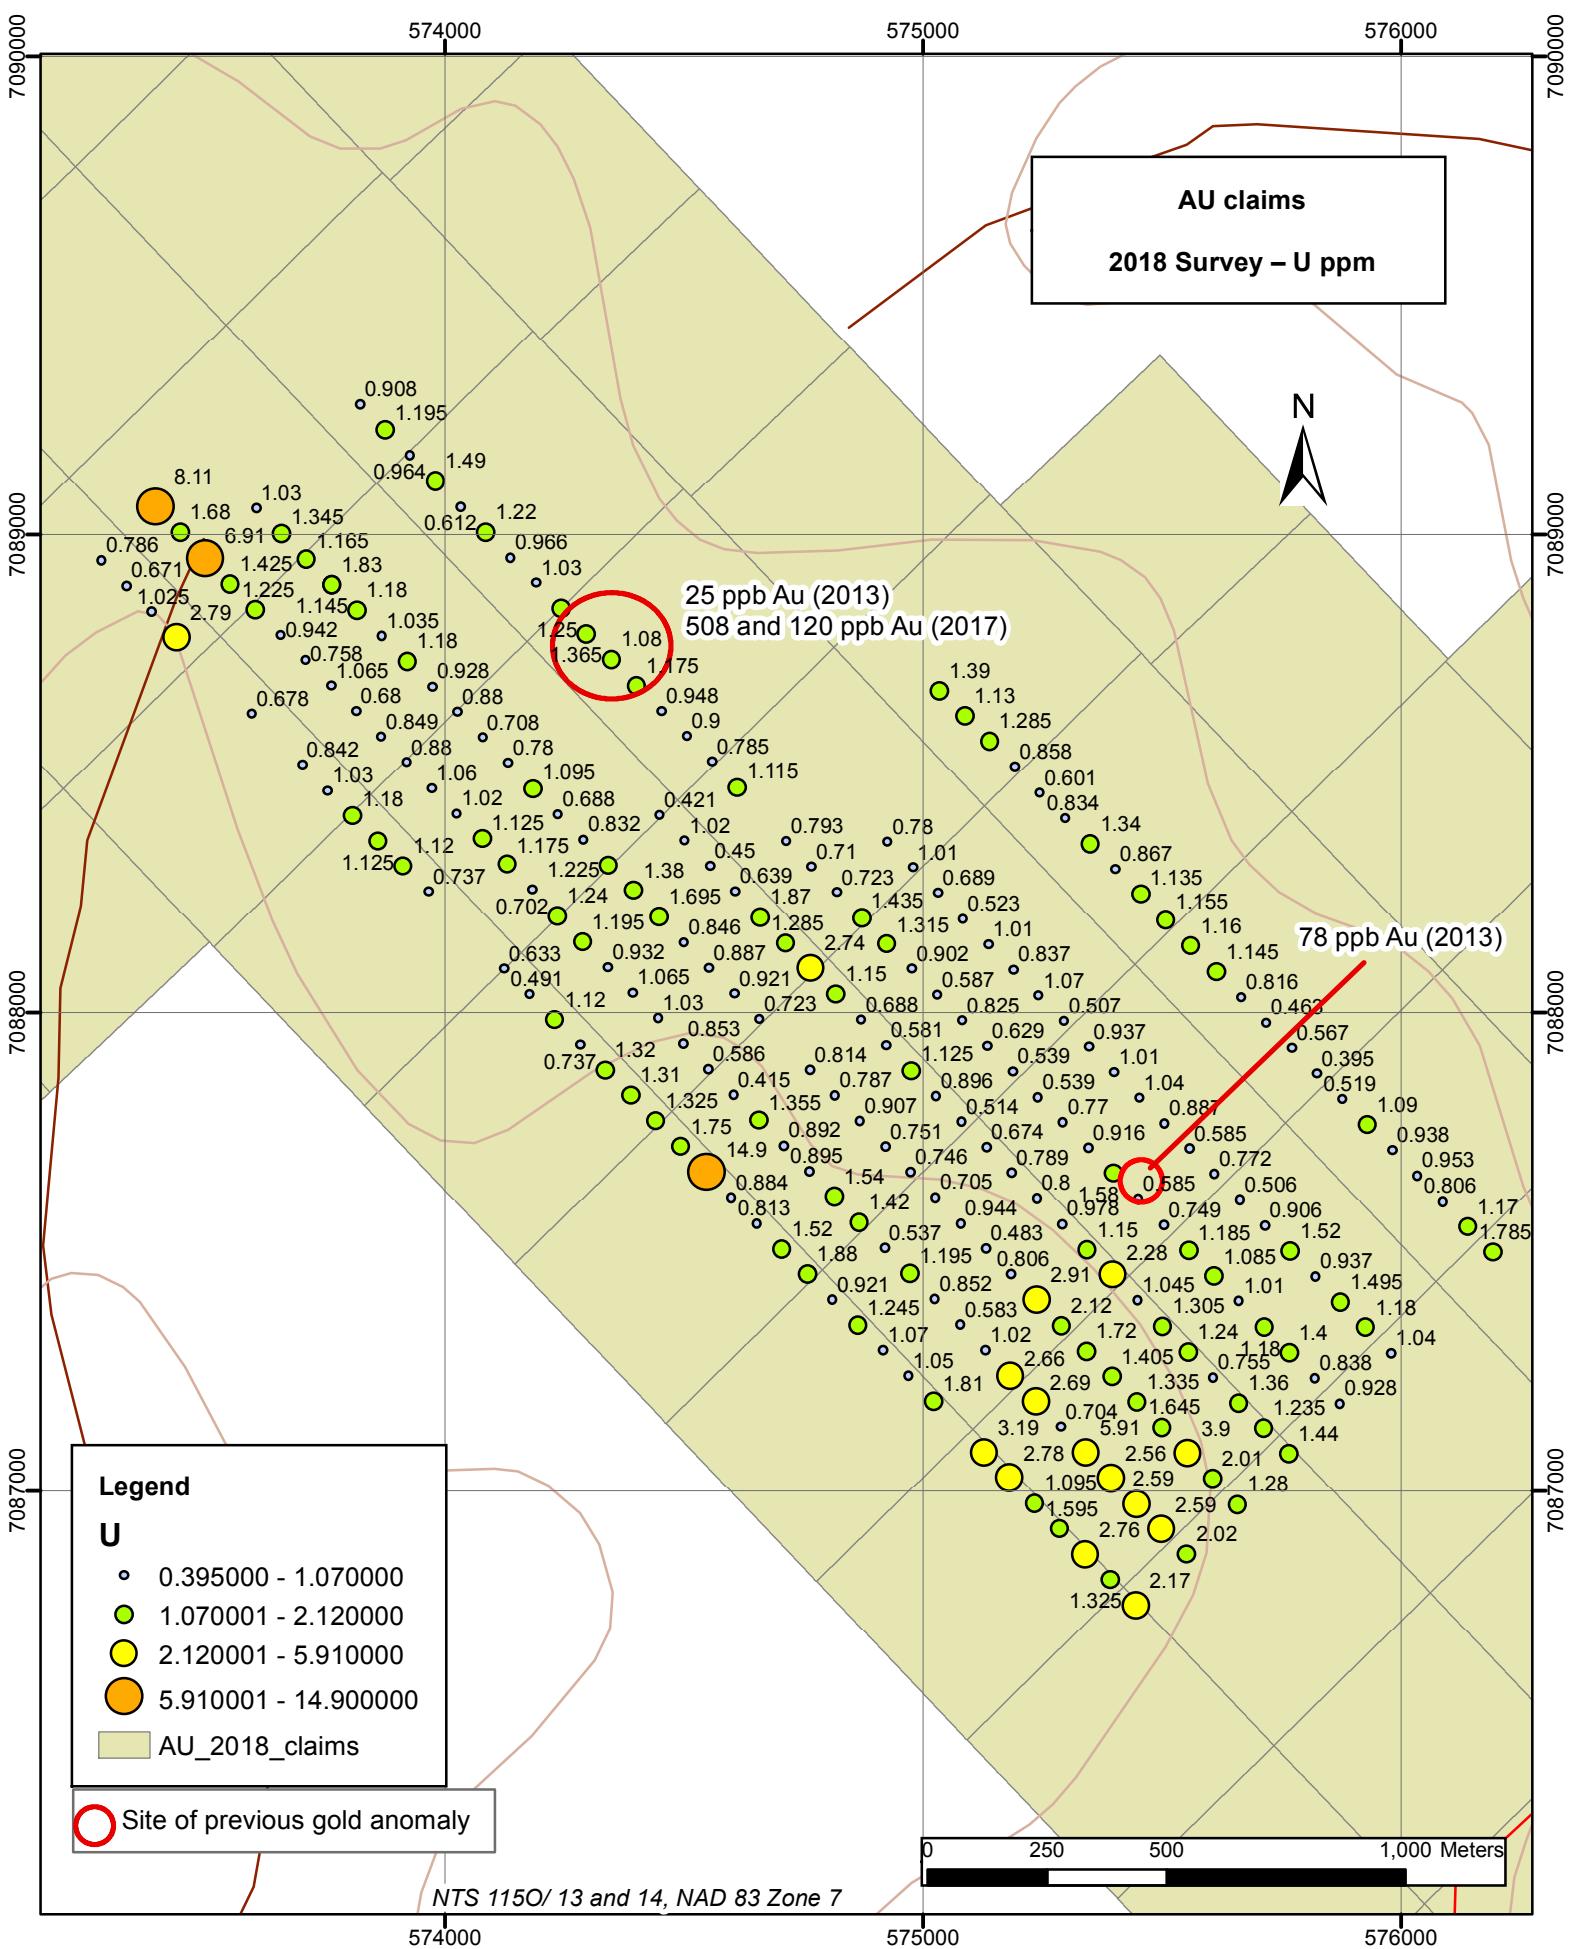

APPENDIX E- STATEMENT OF EXPENDITURES

AU claims - Statement of Expenditures October 2018

Dawson Mining District, 115O/ 13 and 14

Fieldwork: October 2 and 4, demob October 5, 2018.

Sample management and shipping: October 6, 2018

Total: 19 pers-days

including demob 1 day (mob cost assigned to other project)

Wages: 19 pers-days	\$5,700.00
Room and board and extra food:	\$3,258.35
Truck (5.5 x \$100/day):	\$550.00
Fuel:	\$710.47
Assays (234 samples):	\$15,086.83
Data management, geology, report:	\$1,890.00
	TOTAL: \$27,195.65

Based on information supplied by Coureur des Bois

See attached for detailed breakdown of field expenses and receipts
