1. INTRODUCTION

The No Name (Hawk) prospect is located in the Mayo Mining District, Yukon Territory, south of the Beaver River and approximately 30km north of Victoria Gold Corp.'s Dublin Gulch claim block, NTS map 106D05 (Figure 1).

The Hawk property consists of 833 claims (Appendix I) covering 172km^2 centred approximately 30km north of the Dublin Gulch claim block. The claims were staked by Victoria Gold Corp. in May 2018 and recorded in the name of StrataGold Corporation (Figure 2). The area has no other current or recently lapsed claims nearby and is situated south of the Wernecke Mountains on Crown land, on the traditional Territory of the Na-Cho Nyak Dun First Nation.

StrataGold Corporation, a wholly-owned, directly-held subsidiary of Victoria Gold Corp. is the registered owner and operator for all claims. This assessment report details phase 1 reconnaissance exploration work carried out on the Hawk property between May 1st, 2018 and September 30th, 2018 of which only activities conducted between August 1st, 2018 and August 20th, 2018 were used for qualified expenditures for the renewal of the quartz claims.

1.1 Access

The Hawk prospect is located 30km north of Eagle Gold and accessible via helicopter from Victoria Gold's Bluto Camp on the Dublin Gulch claims. A small pup tent camp was set up on the claims to support the soil program. Access to the ridges in Hawk for mapping and soil sampling was via helicopter or hiking from the pup tent camp.

1.2 Target Rationale

The Hawk area was targeted due to the identification of a large number of gossanous outcrops that lie along a 12 kilometer north westerly trend across the Property. Regional Geochemical Stream Sample (RGS) data indicate elevated gold and base metal responses in the creeks that drain the general area. The current property has seen extremely limited exploration activity lacks detailed geologic mapping/control.

Based on similar nearby mineral occurrences and their geology and structure, there exists the potential for gold-bearing stratabound, structurally-controlled Carbonate Replacement (Tiger Deposit), Manto Style (Ocelot Showing), or structurally hosted vein-fault (McKay Hill) mineralization, as well as high potential of replacement-style sulphide shales or breccias proximal to the gossanous outcrops which could host gold, silver, and/or base metals.

2. PROPERTY HISTORY

The Dace and Steamboat MINFILE occurrences are reported within the vicinity but the target area each of which seen only limited exploration activity.

The Dace occurrence was investigated in the 1960s and covers a transported limonite gossan reportedly anomalous in lead and zinc (MINFILE# 106D035). The occurrence area is located northwest of Steamboat Mountain approximately 25 km northwest of McQuesten Lake. The area was regionally mapped by L. Green of the Geological Survey of Canada in 1961 as part of a helicopter-supported party known as Operation Ogilvie. Although the area has not yet been remapped by the Yukon Geological Survey, C. Roots of the Geological Survey of Canada under contract with the Exploration and Geological Services Division (now part of the Yukon Geological Survey) remapped topographic map sheet 105M located directly to the south in the mid-1990's. In 2003, Gordey and Makepeace released a geological compilation of the Yukon which covered this area.

The Steamboat occurrence is located on the eastern branch of an unnamed creek located on the western side of Steamboat Mountain, approximately 23km northwest of McQuesten Lake. It was last explored in 1965 by United Keno Hill Mines (UKHM) following the release of the regional stream sediment sample data collected by the GSC during Operation Keno in 1964. Field notes recorded by UKHM noted large transported limonite gossans in the vicinity that appear to be derived from metal-rich shales. Grid soil sampling and prospecting by UKHM failed to reproduce the anomaly or uncover mineralization. No drilling or other documented work has been done in the vicinity (MINFILE# 106D034).

StrataGold Corp. staked the Hawk area (formerly referred to as No Name) in May of 2018 in preparation for a large-scale ridge and spur soil sampling program and smaller prospecting program to identify permissible host rocks and structures.

3. GEOLOGICAL SETTING

3.1 Regional Geology

The Hawk area resides within Mississippian Keno Hill Quartzite, Devonian Earn Group, and upper Proterozoic Hyland Group rocks, which are part of the western Selwyn Basin, an epicratonic basin developed in a divergent margin setting established as the result of neo-Proterozoic rifting along the North American margin (Ross, 1991; Colpron et al., 2002). Jurassic convergence between the North American and Farallon plates led to the collision of outboard terranes with the continental margin, which resulted in northward thrusting and low-grade metamorphism of Selwyn Basin strata (Monger, 1993). In the Mayo region, the Jurassic-Cretaceous Dawson, Tombstone and Robert Service thrusts (Murphy and Héon, 1995), juxtapose Hyland Group rocks against Mississippian shelf units and Devonian to Jurassic clastic units. With waning deformation across the orogen by the mid-Cretaceous, emplacement of a series of northwardly-younging, orogen-parallel, felsic to intermediate plutonic suites occurred between 112 and 90 Ma (Mortensen, 2000). The Tombstone Plutonic Suite (TPS) is the most craton-ward and youngest of the mid-Cretaceous plutonic belts emplaced into deformed Selwyn Basin strata. It extends in excess of 500 kilometers in an east-west direction, from the Yukon-Northwest Territory border to Dawson City, where it is truncated by the Tintina Fault Zone, a Cretaceous-Tertiary strike-slip fault with an estimated 450 kilometers of displacement. The TPS intrusions are typically <5 km in diameter and occur as composite plutons or as isolated pluton and dyke clusters. Compositionally they are predominantly monzogranite to quartz monzonite, with smaller volumes of later monzonite to quartz monzodiorite (Mortensen et al., 2000; Hart et al., 2004). They are weakly reduced to weakly oxidized and metaluminous to weakly peraluminous. Minor porphyritic, aplitic and calc-alkaline lamprophyre dykes (Mair et al., 2003) cross-cut and intrude the main stocks.

3.2 Property Geology

The Hawk area is located North West of Steamboat Mountain in the Ogilvie Range. The area is mapped as underlain by Mississippian Keno Hill Quartzite, Devonian Earn Group, and Proterozoic to Middle Cambrian Hyland Group siliciclastic units of the Yusezyu Formation (Figure 3). The Keno Hill Quartzite unit has been thrust to the northeast by the Robert Service Thrust Fault, onto the younger (Upper Proterozoic to Lower Cambrian) Hyland Group clastic rocks. The Tombstone Thrust Fault occurs to the North of the No Name area. A number of carbonate-like outcrops are not included in the regional mapping and it is likely some of what is mapped as quartzite is Earn group carbonate. The Keno Hill Quartzite and the Earn Group units are intruded by a North West trending package of Triassic Galena Suite greenstone bodies.

The 2018 mapping program focused on prospecting around several of the gossanous areas, and was subsequently followed by prospecting any outcrops upstream. Ridge mapping was limited by poor weather and low cloud ceilings on many days. In general mapping found an abundance of quartz veined (stockwork-style) quartzite, oxidized breccias, coarse grained gabbros, and pyritic shales (Figure 4). Rock-chip samples were assayed with no significant values of gold or silver were uncovered.

3.3 Deposit Type and Mineralization

A number of gossanous outcrops occur in the target area along a 12km trend with a north westerly orientation. The gossans are anomalous in lead and zinc. RGS data indicates anomalous gold draining from the streams in the target area. The gossans could be similar to ATAC's Ocelot showing located to the east in a similar NW trending thrust fault package. This area is marked by much smaller spring gossan formed by the precipitation of iron oxides containing silver, lead and zinc from solutions traveling along fractures. The gossan is predominately dolomite rubble cemented by iron oxides and is surrounded by buff to orange weathering dolomite and limestone. The 2010 drill program intersected 4.23m of 552 g/t silver, 14.5% lead, and 34.3% zinc. Best results of the 2011 drill program include 15m of 400 g/t silver, 20% lead, and 9% zinc.

In the Yukon-wide airborne magnetic data (200m spaced grid) the Hawk area is located in a magnetic low with no discernible structures at this scale (Figures 5 and 6).

4. 2018 EXPLORATION PROGRAM

A 172 square kilometer claim block consisting of 833 quartz claims was staked in the target area in May 2018 by a contracted crew from Pika Exploration (Figure 2). Subsequently an 11-day soil and prospecting program was conducted in mid to late August. Pika Exploration provided five (5) soil samplers with geologists from Victoria Gold imbedded with the soils crew. Fireweed Helicopters was used to set up the soil camp and move samplers and geologists. Hi-resolution orthophotography was flown over the entire property in September by Eagle Mapping.

2,033 soil samples were collected from ridges and spurs covering the entire property (Figure 7), as well as 20 select rock-chip samples (Figure 8). Appendices II, III and IV present soils and rock assays certificates as well as compiled collection data and results, respectively.

4.1 Sample Method

For the 2018 field program, soil geochemical samples were collected from the B horizon wherever possible. Soil data and location information was recorded using handheld GPS units. Samples were collected into Kraft paper soil bags with sample number tags inserted and associated sample numbers written on the bags. Soil samples were sent to the Bureau Veritas prep facility in Whitehorse and dried at 60 degrees C, 100g soil sieved to 80 mesh. They were then shipped to Bureau Veritas' Vancouver Laboratories where they were analyzed using a 15g – 36 element ICP MS, detection limits are shown in Table 1.

Rock-chip samples were collected from subcrop, outcrop and float. They were sent to the Bureau Veritas prep facility in Whitehorse, crushed, split and pulverized 250g rock to 200 mesh. The samples were then sent to the Vancouver assay lab and analyzed with 50g lead collection fire assay fusion – AAS Finish, and a 1:1:1 Aqua Regia digestion ICP-MS analysis for 36 elements. ICP detection limits are the same as for the soil samples. Detailed soil and rock assay tables can be found in Appendix IV along with multi-element soil maps presented in Figures 9 -20 below.

4.2 Geochemical Results

In rock-chip sampling, anomalous copper values occurred in two gabbro samples (141ppm Cu and 144 ppm Cu), and in two dark green massive greenstone units (230ppm Cu and 348ppm Cu), as well as in an oxidised fault breccia (135ppm Cu). No significant values of gold or silver were found.

The soil program at Hawk focused on 50m spaced ridge and spurs throughout the property as well as a small grid 100m x 50m spaced on the western portion of claims. Low level values of gold occur with highly anomalous results between 25-71ppb Au. A slight trend can be seen in gold values in a roughly WNW striking orientation over multiple ridges in the Earn Group limey sediment unit. Although elevated gold values also occur in the Keno Hill Quartzite and Hyland Group Metasediments to the south and north, they are not highly anomalous. Copper, antimony, arsenic tellurium, mercury, molybdenum, and thallium (zinc to a lesser extent) all follow the same WNW striking orientation but are quite well confined to the Earn Group sediments. Table 2 shows a statistical overview of the significant elements, and Table 3 presents a correlation matrix between these elements. These results are shown in Figures 9 through 20.

5. INTERPRETATION AND CONCLUSIONS

The Hawk target north of Dublin Gulch was staked by StrataGold Corp. in May of 2018 to follow up on targets identified in newly publicly available satellite imagery. A number of oxidized spring gossans occur on the property draining off of coarsely mapped Earn Group limey sediments. The 2018 exploration program consisted of 2,033 soil samples covering most of the ridges on the property as well as a smaller 20 sample rock-chip/prospecting program. Subsequently, orthophotos were flown over the entirety of property in September, 2018.

Gold mineralization associated with silver, arsenic, thallium, and mercury (lesser extent antimony) in the limey sediments suggest Carlin gold type signatures potentially similar to deposits at the nearby Rackla belt. Additional on the ground work is needed to better map the structure and lithology in the area of the soil anomaly and follow up on highly anomalous soils samples.

5.1 Recommendations

Further work is recommended in the Hawk claim block, including:

- Detailed lithologic and structural mapping in the Earn Group Sediments, focused on the central portion of the ridge over the WNW trending soil anomaly.
- Prospecting and following up on soil sampling in the Hyland Group sediments to the north.
- Additional soil sampling in the form of 50m spaced grid and contour sampling in the central portions of the claim block.
- Detailed air photo interpretation using the recently 2018 hi-resolution airphotos.
