Certificate of Qualifications

I, Mark Fekete, having my place of residence at 178 Dennison Boulevard in Val d'Or in the Province of Quebec do hereby certify that:

1. I obtained a Bachelor of Science Degree in Geology from the University of British Columbia (1986), I have been engaged as a Geologist continuously since 1986, I am a Member in good standing of the Order of Geologists of Quebec (OGQ #553) and the Association of Professional Engineers and Geoscientists of British Columbia (APEGBC #31440), and I am a "qualified person" as defined in Section 1.2 in and for the purposes of National Instrument 43-101;

2. I inspected the Jaycee property over a ten-day period ending September 24, 2019;

3. I co-wrote this technical report entitled "Memorandum Report of Exploration Work 2019, Jaycee Property, JC1 to JC54 (YF59611 to YF59664), JC55 to JC101 (YD117245 to YD117291), in the Watson Lake Mining District, Yukon, NTS Sheet 105B04, 60.20° N. Lat., 131.70° W. Long.," based on my professional experience, a review of relevant reports and maps made available to me from government and corporate sources and my participation in the work programs described in the report;

4. I am not aware of any material fact or material change with respect to the subject matter of the report that is not disclosed in the report which, by its omission, makes the report misleading;

5. I hold a direct interest in the Jaycee Tin property as a result of my current involvement with the Property; and

7. I have read, and this report has <u>not</u> been prepared for the purposes, nor in full compliance with, National Instrument 43-101 and according to Form 43-101F1.

Respectfully submitted this day 17th of January 2020,

(s) "Mark Fekete"

Certificate of Qualifications

I, Marty Huber, having my place of residence at 16 Flax Mill Drive in Conestogo in the Province of Ontario do hereby certify that:

1. I obtained a Bachelor of Science Degree in Geology from Acadia University (2011) and a Master of Science Degree in Mineral Exploration from Laurentian University (2018), I have been engaged as a Geologist in continuously since May 2011, I am a Member in good standing of the Association of Professional Geoscientists of Nova Scotia (#232), and I am a "qualified person" as defined in Section 1.2 in and for the purposes of National Instrument 43-101;

2. I inspected the Jaycee property over a ten-day period ending September 24, 2019;

3. I co-wrote this technical report entitled "Memorandum Report of Exploration Work 2019, Jaycee Property, JC1 to JC54 (YF59611 to YF59664), JC55 to JC101 (YD117245 to YD117291), in the Watson Lake Mining District, Yukon, NTS Sheet 105B04, 60.20° N. Lat., 131.70° W. Long.," based on my professional experience, a review of relevant reports and maps made available to me from government and corporate sources and my participation in the work programs described in the report;

4. I am not aware of any material fact or material change with respect to the subject matter of the report that is not disclosed in the report which, by its omission, makes the report misleading;

5. I hold a direct interest in the Jaycee Tin property as a result of my current involvement with the Property; and

7. I have read, and this report has not been prepared for the purposes, nor in full compliance with, National Instrument 43-101 and according to Form 43-101F1.

Respectfully submitted this 17th of January 2020,

(s) ***"Marty Huber"***

_____

Marty Huber, P.Geo.

1. Introduction and Terms of Reference

This report describes work done in 2019 on the Jaycee property (the "Property") in the Teslin area of Yukon. It was prepared by Breakaway Exploration Management Inc. ("Breakaway") on behalf of the Jaycee Prospecting Syndicate (the "Syndicate"), an informal entity that includes Mark Fekete and Marty Huber (the "Authors"). The main purpose of the Report is to complete statutory assessment work filings required under the Yukon Quartz Mining Act. It is not intended to and does not fully comply with National Instrument 43-101. The work was done under Class I activity that did not require a Quartz Mining Land Use Permit. The work was partially funded by the Yukon Mineral Exploration Program, Target Evaluation Module (YMEP No. 19-092), for which the Syndicate is extremely grateful.

The work included rock and soil geochemical sampling in the southeastern part of the Property. The goal of the rock sampling was to confirm surface results previously reported in the area of the JC zone. The goal of the soil sampling was to evaluate the westward extension of a linear magnetic feature that corresponds to the JC zone. The JC zone is a skarn that shows polymetallic mineralization.

2. Location, Claim Information and Access

The Jaycee property is located approximately 60 kilometers east of Teslin in southern Yukon (Figure 1). The approximate center of the Property is described by, 60.20° N. Lat., 131.70° W. Long. and appears on NTS Sheet 105B04. The Property covers an approximate area of 2,111 hectares within the Watson Lake Mining Division and includes 101 un-surveyed mineral titles (Figure 2) more fully described in Table 1 below. The claims are recorded 100% to Mark Fekete and held 100% by the Jaycee Prospecting Syndicate.

Table 1: List of Claims

Claim Name No.	Tag No.	Expiry Date	#
JC 1 to 54	YF59611 to YF59664	2020-Feb-16	54
JC 55 to 101	YD117245 TO YD117291	2021-Feb-17	47

The Property lies 30km north of the Alaska Highway. From the highway there is an old Cat trail to the Property, but the trail is in poor condition. For the time being access is by helicopter from Teslin. There is an excellent spot for an exploration camp located between two small lakes in the southwest corner of the Property. The City of Whitehorse, located 190km west-northwest of the Property, provides full services to the mineral exploration industry. Yukon is generally a mining friendly jurisdiction and there are no restrictions on exploration in the Teslin area.

3. Exploration History

3.1. Introduction

Previous work on the Property is well documented on the Yukon Energy Mines and Resources website (Yukon EMR, n.d.). Specific documents are cited where applicable throughout the Report. The Yukon Energy and Resources Library Catalogue contains uniquely numbered assessment reports ("AR"). These reports where cited in this Report are by the individual author rather than the number. Previous work is documented on the Property from 1963 to 2006 centred on three separate occurrences listed in Table 2. Work by the current claim holders started in 2018. The following discussion summarizes previous work done at each occurrence.

Table 2: Yukon Minfile occurrences

3.2. JC (105B 040)

The JC occurrence is the most developed prospect on the Property. Cypress (1973) indicates that copper mineralization was initially discovered at JC by prospecting in 1963 and subsequently staked as the Viola claims in 1967. In 1968 a bulldozer was walked in from the Alaska Highway and two trenches were excavated. The property was re-staked in 1972 as the FXE claims and vended to Cypress Resources Ltd. In 1973, Cypress carried out surface work and 50.3m of drilling in two shallow holes (Cypress, 1974).

In 1977, the JC 1 to 8 claims were staked by the Dome Cominco or "DC" Syndicate to cover a scheelite (tungsten) and malayaite (tin) skarn showing that returned up to 4.4% WO_3 from a grab sample and 0.96% Sn and 0.40% Cu form a float sample (Chartier and Stephen, 1977). In 1978, the JC claim block was expanded to 82 claims and geological mapping, magnetic and soil geochemical surveys were completed, as well as 18 hand trenches (Stephen, J.C., 1978a). A 900m skarn horizon with significant tin mineralization consisting variously of malayaite, stannite and cassiterite was outlined on surface. Arsenopyrite, chalcopyrite, pyrite, pyrrhotite, scheelite and sphalerite were also noted as "pods and lenses", and silver values up to 1.4opt Ag were reported. From 1979 to 1982, DC drilled 3,972.2m in 35 holes and outlined the "JC Tin" deposit approximately 750m long and varying from 23m to 38m thick (Layne, 1981, Layne and Nagy, 1982, and Nagy, L.J., 1982a). DC also drilled a single 145.5m drill hole (Nagy, 1982b) approximately 2km northwest of the JC zone to test a geochemical target located on claim JC 80 in 1979 (Stephen, 1979a).

In 1981, a tin mineral resource based on the 3247.1m in 30 diamond drill holes drilled from 1979 to 1981 was calculated internally by Cominco at various cut-off grades in Table 4 (Layne, 1981). This historic was not prepared according to National Instrument NI 43-101 standards of reporting and should not be relied upon. Moreover, the drill core found on the Property is in poor condition and cannot be used to verify the resource estimate.

Table 4: JC Tin deposit, 1981 resource estimate

Metric Tonnes	Grade	Cut-off Grade
4,489,000	0.28% Sn	0.10% Sn
2,001,500	0.41% Sn	0.20% Sn
1,250,000	0.54% Sn	0.30% Sn

1,957,500	0.45% Sn	not specified

Table 5 sets out the known drill holes completed on the Jaycee property to date. Most of the drill collars at the JC Zone have been reliably located (Figure 3).

Table 5: Previous drill holes on Jaycee property

Year	Company	# Holes	Metres	Minfile	Claims	Collar located	Source
1974	Cypress Res. Ltd.	2	50.3	JC	JC	No	Cypress, 1974
1979	DC Syndicate	8	804.7	JC	JC	Yes	Layne, 1981

1981	Klinket JV	1	122.0	Cusp	DU	No	Dupont, 1982
		1	122.0				
	Total	49	5,865.6				

The DC Syndicate also completed geological and geochemical surveys on the PLUG property directly west of the JC property in 1978 (Stephen, 1978b). A minor showing of arsenopyrite and sphalerite was located on the PLUG 4 claim and two separate weak tin-in-soil anomalies were found on PLUG 4 and PLUG 10 claims.

In 2006 the area of the JC occurrence was staked as the SMART 1-14 claims by Brett Resources Inc. (Turna, 2006a). Brett located, cleaned out and collected 60 samples from the DC Syndicate trenches. Sample results generally confirmed the historical values. The best tin assay was 4.04% Sn over 0.15m in the "Pass" area. The best copper assay was 6.24% Cu over 0.15m in the "Lake" area. The best zinc assay was 4.13% Zn from a grab sample in the "Camp" area. A ground magnetometer survey outlined two magnetic anomalies trending southeast from the Pass area. Brett also reliably located almost all the previous DC Syndicate drill holes.

3.3. Smith (105B 088)

During the same period as the JC work, Dupont Canada Exploration Ltd. and Duval International Corp. completed work on the extensive "Klinkit" joint venture project. The current Jaycee property covers parts of the DU, JILL, MC, SLIDE, SLIP and SWIFT claim blocks that were part of the Klinket JV. Most of this work was done at the Smith occurrence that includes three separate showings named "MC Ridge", "Cirque Floor" and "MC 66". The Klinket JV relied on tin values determined with an XRF spectrometer. There is some doubt, as discussed below, about the accuracy of the XRF tin values. Therefore, the Klinket JV tin values cited in this Report are qualified as "XRF" or "geochemical".

In 1978 preliminary prospecting, mapping and rock and soil geochemistry sampling was undertaken on the MC claims (Smith, 1978). The area was found to be underlain primarily by Klinkit Group quartzites and marbles with rare Seagull granitic rocks leading to the interpretation that the area was a roof pendant over buried Seagull intrusive rock. In 1979 detailed mapping and soil geochemical surveys were completed over MC Ridge and Cirque Floor, and MC Ridge was trenched extensively (Mato and Smith, 1980). Rock samples up to 8.33% Sn (XRF) were reported at MC Ridge and up to 0.78% Sn (XRF) at Cirque Floor. The "Main" and "Sheeted Veins" zones were located at MC Ridge. The Main Zone was described as a narrow, irregular skarn hosted within a vertical fault. Spotty cassiterite, chalcopyrite and sphalerite mineralization was uncovered in an erratic quartz vein within the skarn. Trench samples returned up to 1.08% Sn (geochemical) from 1.0m chip samples. The Sheeted Vein Zone was described as a 50m wide series of narrow quartz veins variously mineralized with pyrite, chalcopyrite, sphalerite, galena, magnetite

and cassiterite. Trench samples returned up to 0.36% Sn (geochemical) from 1.0m chip samples. The Cirque Floor showing was described as poorly exposed skarns and gossans sometimes mineralized with cassiterite, chalcopyrite and sphalerite. Zinc skarn was reported as the most important mineralization.

In 1980, the Klinkit JV drilled 759.8m in three holes at MC Ridge and 190.8m in one hole at Cirque Floor (Smith, 1981). In 1981, another 418.6m in two drill holes were drilled at MC Ridge (DuPont, 1982). The entire lengths of these holes were scanned for tin with an XRF spectrometer on 2m intervals. Some intervals of the 1981 holes were also analyzed geochemically for tin. The XRF tin values are substantially higher than the geochemical values for corresponding sample intervals. Therefore, the XRF tin values are considered overstated and not valid. Selected intervals were analyzed geochemically for copper, lead, zinc and silver, but the exact sampling intervals are unclear on the existing logs and strip logs and no assay certificates are available. Despite this ambiguity it is worth noting that several narrow lenses of sphalerite and galena were intersected in hole K80-1 generally between 152.0 and 160.0m with values ranging from 0.62 to 2.35% Zn and from 0.62 to 1.86% Pb, and in hole K80-3 generally between 180.0 and 203.0m with values ranging from 0.86 to 6.64% Zn and from 0.12 to 0.72% Pb.

In 1984, CSA Minerals Inc. drilled two holes on claim MC 66 and two holes on claim SWIFT 98 (CSA, 1984) to test a southeast trending geochemical anomaly outlined in 1979 (Mato and Smith, 1980) roughly 1.5km northeast of the MC Ridge and Cirque Floor showings. Hole K84-12 on claim MC 66 intersected 1.35% Zn and 0.14% Sn over 6.0m from 58.7 to 66.7m. The Smith (105B 088) Minfile incorrectly refers to this area as the "Dan" showing which is on NTS Sheet 105B03 rather than 105B04.

In 2006 the area of the MC Ridge and Cirque Floor showings was staked as the Cass 1-10 claims by Brett Resources Inc. (Turna, 2006b). Although limited, an 86-sample soil survey identified anomalous tin at both showings. One of seven grab samples at MC Ridge returned 0.15% Sn and one of three grab samples at Cirque Floor returned 0.35% Sn.

3.4. Cusp (105B 086)

The area of the Cusp occurrence was staked as claims DU 105-108 as part of the 217-claim DU block by the Klinkit JV Joint in 1978. These claims were partially in conflict with DC Syndicate claims Zinc 1-4. The DC Syndicate worked in the area of "Zinc" and "Gem" lakes; the central and easternmost of three small tarn lakes. The Klinkit JV worked primarily on the "Plateau" zone located on the ridge south of Gem Lake.

The DC syndicate staked the ZINC 1-16 claims in 1978 and completed cursory mapping and rock sampling, and a small soil geochemical grid that identified a tin anomaly slightly northeast of Zinc Lake (Stephen, 1978c). Work continued in 1980 with detailed mapping, extended soil geochemistry and a magnetometer survey. The mapping identified numerous narrow, east-trending quartz-tourmaline-fluorite fracture veins with various small amounts of pyrite, sphalerite, galena and arsenopyrite (Stephen, 1980). Several of these veins returned anomalous zinc values up to 3.65% Zn, and some samples returned tin values >1000 ppm Sn. The report however concluded that the area had limited potential for significant tin mineralization.

In 1978, the Klinkit JV completed cursory geological and soil geochemical traverses at the base and ridge crest of the north facing cirque south of Gem Lake (Smith, 1978). This work identified the Cusp area as a roof pendant of south-dipping Klinkit Group quartzites, marbles and meta-volcanics over Seagull Suite granites and related aplite dykes. Contour soil sampling found the cirque to be highly anomalous for tin. In 1979 detailed geological mapping was done over the Plateau zone which includes the Gem Lake cirque face and the plateau south of the ridge crest (Ditson and Mato, 1980). A contour soil geochemical survey was also completed in drainage south of the Plateau zone. The mapping found over a hundred narrow, east-trending quartz-tourmaline-fluorite fracture and sheeted veins with various small amounts of pyrite, sphalerite, galena and arsenopyrite. The best tin values were obtained just south of Gem Lake where up to 5.4% Sn (geochemical) was obtained from a vein 40cm wide. Two veins were uncovered by hand

trenching. The soil sampling survey found the south drainage to be extremely anomalous for tin with some samples returning values > 1.0% Sn (XRF). In 1981 a single 121.9m hole was completed in the area of the 1979 trenches (DuPont, 1982). The hole intersected numerous narrow veins. One vein returned 0.14% Sn (geochemical) and 0.12% Zn.

A beryl showing located roughly 2km south of the Cusp occurrence was evaluated for emerald potential in 2002 (Wengzynowski, 2002).

In 2006 Brett Resources staked the Seagull 1-20 claims and completed a cursory rock and soil sampling survey around Gem Lake (Turna, 2006c). This work confirmed the cirque face south of Gem Lake to be strongly anomalous for tin. It also confirmed the tin anomaly first identified by the DC Syndicate just northeast of Gem Lake. Grab samples from the cirque face returned up to 0.91% Sn.

3.5. Jaycee Prospecting Syndicate

The current Jaycee property was staked in February 2018 and expanded in September 2018. In 2018, three rock samples were collected during a site visit on July 16, 2018 by Yukon Geological Survey geologists Scott Casselman and Lara Lewis, and 475-line kilometres of magnetic and radiometric data was collected over a total area of 42.5 km^2 by Precision GeoSurveys Inc. (Fekete and Huber, 2019). The 2018 rock samples returned very strong results for copper, silver and tin. A sample from the "Camp" showing retuned 17.96% Cu and 633.0gpt Ag. This was a selective grab sample containing >30% chalcopyrite. A second sample from the same site returned 0.33% Cu and 9.9gpt Ag and was deemed more representative. The sample from the "Lake" showing returned 0.29% Cu, 7.3gpt Ag, and 1.13% Sn.

4. Geological Setting and Mineralization

Roots et al. (2004) indicate that the Jaycee property is located in an area regionally underlain by Lower Carboniferous and older Smart River Greenstone (DBb) intermediate to mafic, chloritic meta-basalts and meta-tuffs, and Swift River Group (PSR) meta-sediments within the Yukon-Tanana Terrane of the Intermontane Tectonic Belt of the Canadian Cordillera (Figure 4). These rocks are overlain by Permian and older Klinkit Group meta-clastics (CPf), carbonates (CPc) and intermediate meta-volcaniclastics (CPv), and minor Lower to Middle Triassic shales, sandstones and conglomerates (TL) of the post terrane accretionary Overlap Assemblages. These stratigraphic groups are intruded by mid-Cretaceous age Seagull Suite (mKqS) granites and monzonites (Figure 5).

Locally at the JC occurrence, a thick sequence of quartzite (CPf) is intruded by a narrow, ridge like lobe of granite (mKqS) that is not exposed at surface. A 30 to 40m thick carbonate horizon (CPc) lies within the quartzite just above and in contact with the granite (Figure 6). The carbonate horizon strikes southeast and dips shallowly to the south. All the rocks are disrupted by northeast striking, sub-vertical faults.

Portions of the carbonate horizon have been altered to skarn and are tin bearing. The skarn zone is traceable intermittently for 900m on surface. In drilling it varies from 20 to 38m thick (Figure 7). It is marked on surface by pale orange to dark red limonite staining. Green malachite staining has also been noted. The skarn shows zoning and has been variously described as pale green diopside to dark green diopside-magnetite-actinolite. Pervasive, fine-grained, garnet is disseminated throughout. Mineralization within the skarn includes lenses containing various amounts of magnetite, arsenopyrite and pyrite, with lesser amounts of pyrrhotite, chalcopyrite and sphalerite. The tin minerals cassiterite and malayaite have been identified in grab samples as well as the tungsten minerals scheelite and wolframite. The tin mineralization occurs mainly as fine-grained cassiterite associated with various sulphides within actinolite-bearing zones of the skarn.

5. Deposit Model

Sinclair (1996) classified the JC deposit as a vein-stockwork tin-tungsten deposit. Vein-stockwork tin-tungsten deposits are related to granitic intrusions and may occur as veins, sheeted veins, breccias and stockworks. The size of this type of deposit varies from very small (i.e. >10,000 tonnes) up to tens of millions of tonnes. Tin grades vary from 0.5 to 2.0% Sn and tungsten grades vary from 0.3 to 1.5% tungsten oxide. They may be tin only, tungsten only or contain both metals. Canadian tin-bearing examples of this type include East Kemptville, Nova Scotia (83.0Mt of 0.17% Sn plus copper and zinc), and Mount Pleasant, New Brunswick (5.1Mt of 0.79% Sn). Foreign deposits include Aberfoyle (1.6Mt of 0.84% Sn plus WO_3) and Ardlethan (9.0Mt of 0.50% Sn) in Australia, and Wheal Jane (5.0Mt of 1.2% Sn), South Crofty (3.9Mt of 1.6% Sn) and Geevor (5.0Mt of 0.65% Sn) in Cornwall, United Kingdom.

Layne and Spooner (1988a) suggested that the JC deposit is instead a tin-rich skarn deposit since it is hosted in skarn-altered carbonate immediately adjacent to a granite intrusion. Tungsten skarns are very common in Yukon with several significant deposits including Mactung (32.0Mt at 0.92% WO_3) and Cantung (9.0Mt of 1.42% WO_3). Cantung, located 275km northeast of the Property, was mined as recently as 2015. Abbott (1981) noted that tungsten-bearing skarns in Yukon are associated with deeper level Cassiar Suite quartz monzonites whereas tin-bearing skarns are related to high level Seagull suite granites. Relative to vein-stockwork deposits, skarns are much larger and more amenable to bulk mining methods and present a better exploration target.

Considering the highly anomalous arsenic, copper, silver zinc results values obtained from the rock and soil samples collected in 2019, the Authors suggest that the potential skarn deposits on the Property are polymetallic rather than tin only.

6. 2019 Work

6.1. Introduction

The work done in 2019 consisted of prospecting and rock sampling in the area of the JC zone, and soil sampling westward from the "Pass" showing along the linear magnetic anomaly that coincides with the JC zone. The field work was done by the Authors from a tent camp set up on the Property over a ten-day period ending September 24, 2019. Mobilization and demobilization were done by helicopter from and to a point on the Alaska Highway where the Smart River crosses. Core available at the H.S. Bostock Drill Core Library was also examined and three core samples were selected for analysis. One of these samples was submitted for polished thin section analysis and petrographic description.

A complete YMEP "Final Submission Form" is included herein as Appendix C and a detailed "Statement of Work" is included herein as Appendix D.

6.2. Rock Geochemistry

A total of 19 rock samples were collected mainly from old trenches excavated along the strike of the JC zone. Two samples were collected approximately 2km west along the linear magnetic feature that corresponds to the JC zone. Rock sample locations (Figure 8) and descriptions are included herein as Appendix A. Analytical results are included herein as Appendix B. The goal of the rock sampling was to confirm surface results previously reported in the area of the JC zone.

6.3. Soil Geochemistry

A total of 230 soil samples were collected at 50 metre sample intervals on predetermined lines spaced 100 metres apart. Soil sample locations (Figure 9) and descriptions are included herein as Appendix A. Analytical results are included herein as Appendix B. The goal of the soil sampling was to evaluate westward extension of a linear magnetic feature that corresponds to the JC zone.

6.4. Core Samples

Three drill core samples were selected for analysis from the DC Syndicate core available at the H.S. Bostock Drill Core Library. The samples were collected from holes JC81-07 and JC81-08. A section of one sample was submitted to Vancouver Petrographics Ltd. for polished thin section and petrographic description. Core sample intervals and descriptions are included herein as Appendix A. Analytical results are included herein as Appendix B. The polished thin section description is included herein as Appendix A. The goal of the core sampling was to compare the historical results, determined by uncertain analytical methods, to modern analytical methods.

6.5. Sampling and Analytical Procedures

All sample locations were recorded with HP iPAQ 200 series field computers running GeoInfoMobile™ and TierraMapper™ software paired with Holux GPS receivers in map datum UTM WGS84 Zone 9N.

Rock samples were placed in plastic sample bags with plastic sample tags and the corresponding sample number was marked on the outside of the bag with indelible ink. The samples were sealed in rice bags with security tags and submitted in person by the Authors to the Bureau Veritas Commodities Canada Ltd. ("BV") facility in Whitehorse, Yukon where they were dried and crushed to ≥70% < 2mm., and a 250g split was pulverized to ≥85% < 75µm (BV Code PRP70-250). The sample pulps were then sent to BV's Vancouver facility where they were analyzed for 45 elements by 0.20g lithium borate fusion for refractory and Rare Earth Elements, ICP-MS finish (BV Code LF100-EXT). Numerous samples were variously over limit for certain metals. Therefore, all samples were re-analyzed for 23 elements by 0.5g multi-acid digestion for sulphide and silicate ores, ICP-ES finish (BV Code MA370), and 0.25g sodium peroxide fusion for refractory tin ore, ICP-ES finish (BV Code PF370-Sn).

Soil samples were placed in Kraft-type paper bags affixed with numbered water resistant barcode stickers. Appropriate numbers were also written on the bags with indelible ink. The samples were sealed in rice bags with security tags and submitted in person by the Authors to BV Whitehorse where they were dried and sieved to 100g of -80 mesh size (BV Code SS80). The sample pulps were then sent to BV's Vancouver facility where they were analyzed for 35 elements by 0.25g multi-acid digest ICP-ES (BV Code MA300).

The three core samples were delivered to BV in Whitehorse, Yukon where they were dried and crushed to ≥70% < 2mm., and a 250g split was pulverized to ≥85% < 75µm (BV Code PRP70-250). The sample pulps were then sent to BV's Vancouver facility where they were analyzed for 45 elements by 0.20g lithium borate fusion for refractory and Rare Earth Elements, ICP-MS finish (BV Code LF100-EXT). One sample consisting of massive sulphide was over limit for arsenic. This sample was re-analyzed for arsenic by 1g aqua-regia digest, ICP-ES-finish (BV Code AQ370-As). A portion of this sample was also sent to Vancouver Petrographics for petrographic analysis by polished thin section.

All BV facilities are accredited under BV's ISO 9001:2015 registration.

It is the Authors' opinion that the sampling procedures, security measures, sample preparations and analytical methods applied to the soil, rock and core samples were diligently followed and are adequate to meet industry standards commonly accepted or this level of exploration. The field data was reconciled with the analytical results. Three soil samples were recorded in field but not received by BV. These samples were subsequently removed from the database.

7. Discussion of Results

The rock samples returned numerous strong results for various metals including silver, arsenic, copper, tin and zinc. Values greater than 1.0% were obtained in five samples for copper, four samples for arsenic, four samples for zinc and in one sample for tin. Weak to moderate values were obtained for gold, barite, bismuth, cadmium, cobalt, antimony, strontium and tungsten. Many of the rock samples also showed high calcium and iron content. Silver values are uniformly high with 14 of the 19 samples returning strong values ranging from 7.0 to 147.0gpt Ag. The rock results are summarized in Table 6 and presented in point range maps for silver, arsenic, copper, tin and zinc (Figures 11, 12, 13, 14 and 15 respectively).

Five surface showing are recognized (Figure 16). The Lenz showing consists of a rusty lens within marbleized carbonate. Zinc values range from 2.95 to 5.80% Zn and silver values range from 27 to 41gpt Ag. Copper, tin and zinc values are all low at this site. The Camp showing (Figure 17) is marked by malachite and consists of 2-3% chalcopyrite as stringers and disseminations within dark green actinolite skarn. Copper values range from 0.63 to 3.02% Cu. Silver values range from 11 to 53gpt Ag. Arsenic, tin and zinc values at this site are all low. The Lake showing (Figure 18) consists of massive magnetite with 5-10% pods and stringers of pyrrhotite and arsenopyrite within dark green actinolite skarn. Copper values range from 0.27 to 3.07% Cu. Silver values range from 12 to 147gpt Ag; the highest silver values from the 2019 rocks. Arsenic is also significant ranging from 0.55 to 3.47% As as is tin ranging from 0.01 to 0.47% Sn. Zinc values are low at this site. The Zinc showing (Figure 19) consists of 5-10% stringer to massive sulphides within a tremolite skarn. The sulphides are not distinct but appear to include pyrrhotite, arsenopyrite and sphalerite. Copper values range from 0.23 to 3.78% Cu. Silver values range from 7 to 82gpt Ag. Arsenic is also significant ranging from 2.29 to 2.67% As. Zinc values are the highest from the 2019 rocks ranging from 9.12 to 12.93% Zn. Tin values are low at this site. The Pass showing (Figure 20) retuned the best tin values ranging from 0.17 to 5.47% Sn. Copper is also significant ranging from 0.01 to 0.84% Cu as is silver ranging from 2 to 20gpt Ag. Arsenic and zinc are low at this site. This showing is within tremolite skarn but not much mineralization is visible except for minor malachite patches.

The soil samples also showed strong results for silver, arsenic, copper, tin and zinc. Strong barite and strontium values were also obtained but showed no correlation to the metals of interest including silver, arsenic, copper, tin and zinc. Although only weak values were obtained for bismuth, antimony and tungsten, these metals do show some correlations with the metals of interest.

Of the metals of interest, copper showed the highest concentrations in soil and correlated strongly with arsenic and bismuth, and moderately with silver and iron. Arsenic showed the next highest concentrations in soil and correlated strongly with bismuth and copper, and moderately with silver and iron. Tin was the third most prevalent metal in the soils and correlated moderately with antimony, iron and tungsten. Zinc showed the fourth highest concentrations in soil and correlated moderately with silver. Antimony correlates moderately with tin and iron. These various correlations suggest there are several phases of mineralization within the JC zone including a copper-arsenic-silver-bismuth phase, a tin-tungsten-antimony phase and a zinc-silver phase.

The silver, arsenic, copper, tin and zinc results show an anomalous geochemical trend that corresponds to the north edge of the linear airborne magnetic high identified in 2018 (Fekete and Huber, 2019). The short magnetic trend in the northwest part of the sampling area is also geochemically anomalous.

The soil results are summarized in Table 7 and Table 8 shows the soil correlation matrix. The soil results are presented in point range maps for silver, arsenic, copper, tin and zinc (Figures 21, 22, 23, 24 and 25 respectively).

The main objective of the core sampling was to verify the reliability of the DC Syndicate analytical results stated in the drill logs. The drill reports do not contain analytical certificates for the results recorded in the drill logs therefore it is uncertain what analytical methods were used. It was assumed results were determined by Aqua regia digestion, atomic absorption finish; a commonly used analytical method at the time of the drilling. Tin oxide and silicate minerals are known to be refractory and generally not fully dissolved in aqua regia so it was further assumed that the 2019 results, determined by a more aggressive sodium peroxide fusion, ICP-ES finish analytical method would produce better tin results. This was not the case. Essentially the tin 2019 values reasonably match the 1981 results as shown in Table 9. This is also true of the copper values. The 2019 silver values however are much lower than the 1981 values.

Table 9: Core analysis 1981 versus 2019

Variance									
JC81-07	240	243	3	Var.	-229%	n/a	2%	-16%	n/a
JC81-07	243	246	3	Var.	-44%	n/a	-15%	13%	n/a
JC81-08	223	226	3	Var.	-29%	n/a	28%	54%	n/a

The two samples from hole JC81-07 (141923 and 141924) show less arsenic and copper and more tin than the single sample from hole JC81-08 (141881). This is to be to be expected since the former two samples consist of skarn with no visible sulphides whereas the latter sample consists of massive sulphide. The polished thin section petrographic analysis shows that massive sulphide makes up about 70% of the sample (Figure 26). The sulphides are mainly pyrrhotite (68%) with much less chalcopyrite (2%) and arsenopyrite (trace). Tremolite (15%) and fluorite (10%) are the main silicates interstitial to the sulphides with locally abundant quartz and lesser muscovite, plagioclase and chlorite (aggregate 5%). The chalcopyrite is concentrated along margins of pyrrhotite and other minerals (Figure 27).

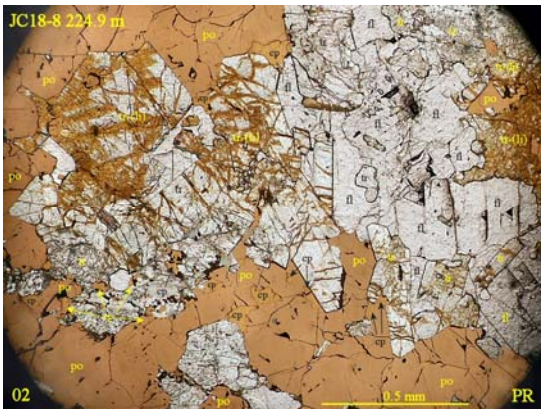

Figure 26: Pyrrhotite with interstitial tremolite and fluorite

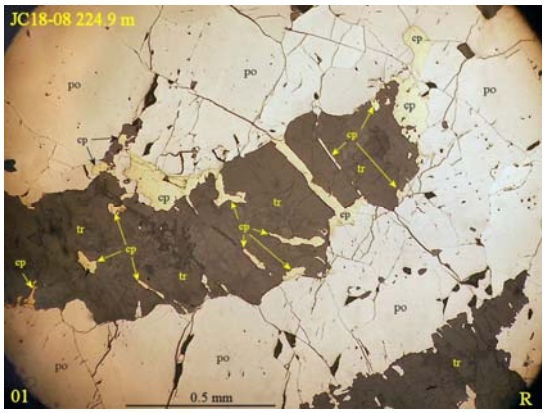

Figure 27: Chalcopyrite on margins of pyrrhotite and tremolite

8. Conclusions and Recommendations

The 2019 work on the Jaycee property successfully met its objectives. The rock geochemistry returned excellent values from the JC zone for silver, arsenic, copper, tin and zinc from five surface showings over 850 metres of strike length. Weak to moderate values were also obtained for antimony, cadmium, bismuth and gold. Different minerals observed at and contrasting analytical results from each showing indicate that the JC zone contains several types of mineralization. These types can be roughly characterized as:

a) actinolite skarn with massive magnetite replaced by pyrrhotite, ±chalcopyrite, ±arsenopyrite, ±tin (Camp and Lake showings);
b) tremolite skarn with sphalerite, ±pyrrhotite, ±chalcopyrite, ±arsenopyrite (Zinc showing);
c) marble with sphalerite-rich lenses in marble (Lenz showing); and
d) tremolite skarn with tin (Pass showing).

All the above types of mineralization show elevated silver values ranging from 2 to 147gpt Ag. No tin minerals were recognized in the 2019 field work but both cassiterite and malayaite were identified by Layne and Spooner (1988a). Although not always the case, it appears that the better tin values are from zones without visible sulphides. This is demonstrated by the assay results returned from the three core samples as discussed above. It suggests a division between sulphide-rich silver, arsenic, copper and zinc mineralization and sulphide-poor tin mineralization.

In the past the JC zone has been considered as a tin only skarn. It is clear form the 2019 rock geochemistry however that the JC zone is a complex polymetallic skarn that has potential for copper, silver and zinc in addition to tin mineralization

The 2019 soil sampling demonstrates that the JC zone can be geochemically traced by elevated silver, silver, arsenic, copper, tin and zinc values. The soil sampling also confirmed that the north edge of the linear airborne magnetic high identified in 2018 (Fekete and Huber, 2019) marks the JC zone. The magnetic trend is likely due to magnetic and pyrrhotite mineralization with the JC zone.

This provides a working model for focused regional exploration of the Jaycee property. Soil geochemistry, and prospecting and rock sampling along the linear magnetic highs should be an effective strategy to locate new mineralized targets on the Property.

The 2018 airborne survey (Fekete and Huber, 2019) detected numerous linear magnetic anomalies (Figure 28) which may outline skarns prospective for polymetallic mineralization like the JC zone. Indeed, some of these magnetic anomalies correspond to units mapped as marbleized carbonate horizons (Roots et al., 2004). Previous work by the DC Syndicate and the Klinket JV in the late 1970s and early 1980s indicate numerous tin-in-soil anomalies adjacent to these magnetic anomalies (Figure 3). More recently in 2006 some of these historical geochemical anomalies were confirmed by Brett Resources Inc. in the area of the MC and Cusp occurrences (Turna, 2006b and Turna, 2006c).

At this point there is little meaningful surface exploration that can be done along the JC zone. Drilling is required to further evaluate the deposit. Prior to any drilling however it would be useful to enter all the available drill data into a database and do some three-dimensional modelling. All the drill logs are available and Turna (2006a) reliably located all the drill collars. As discussed earlier in this report, the assay data in the previous drill logs cannot be validated due to uncertainly about analytical methods, lack of analyses for arsenic and zinc, large variances between historical and current silver values and verification difficulties related to missing core intervals, boxes or entire drill holes. Not withstanding these problems, the lithological and assay data from the previous drilling can be used to generate a reasonably reliable model for picking drill targets.

It is recommended that exploration of the Jaycee property be conducted in two phases to focus on generating new targets outside of the JC zone with soil geochemistry, and prospecting and rock sampling as a first phase, and further target evaluation of the JC zone with drilling as the second phase.

Specifically, it is recommended that fifteen days of surface work be done with two fly camps at the MC and Cusp areas as the first phase. This will involve mobilization, one move at the midway point and demobilization by helicopter. The recommended second phase of drilling is limited to a three-hole, 450-metre initial program to twin the drill holes with the best results reported by the DC Syndicate.

The cost estimate of the recommended work is outlined in Table 4 below:

Table 10: Cost Estimate

Item	No.		Rate		Costs	Totals
Phase 1: Prospecting, Soil/Rock sampling						
Senior Geologist (GIS Setup)	2	mandays @	$750	per manday	$1,500.00	
Senior Geologist (Field)	15	mandays @	$750	per manday	$11,250.00	
Prospector (Field)	15	mandays @	$500	per manday	$7,500.00

Val d'or, Quebec, J9P 7H1 **December 2019**
tel: 819-354-5244

Sample: JC81-8 224.9 m

Summary:

Sample JC18-8 224.9 m is of massive sulphide that is dominated by pyrrhotite with much less chalcopyrite, with interstitial patches dominated by tremolite (locally stained orange by limonite) and fluorite, with locally abundant quartz and lesser muscovite, plagioclase, and chlorite. Chalcopyrite is concentrated along margins of pyrrhotite and other minerals.

Photographic Notes:

The scanned section shows the gross textural features of the sections; these features are seen much better on the digital image than on the printed image. For the photographs, sample numbers are shown in the upper left corner, photo numbers are shown in the lower left corner, and the letter in the lower right corner indicates the lighting conditions: plane polarized incident light (= P); incident light in crossed nicols (= X); reflected light (= R); reflected light in nearly crossed nicols and incident light in crossed nicols (= ~RX). Locations of photographs are shown on the scanned section. Descriptions of the photographs are at the end of the report.

Sample JC18-8 224.9 m Massive Sulphide
Pyrrhotite-Tremolite-Fluorite-Quartz-Chalcopyrite

The sample is of massive sulphide that is dominated by pyrrhotite with much less chalcopyrite, with interstitial patches dominated by tremolite (locally stained orange by limonite) and fluorite, with locally abundant quartz and lesser muscovite, plagioclase, and chlorite. Chalcopyrite is concentrated along margins of pyrrhotite and other minerals.

mineral	percentage	main grain size range (mm)
pyrrhotite	65-70%	0.2-0.7
tremolite	15-17	0.2-0.7 (a few up to 1.2 mm long)
fluorite	10-12	0.2-1.5
quartz	3- 4	0.1-0.5 (a few 1.0-1.5 mm)
chalcopyrite	1-1.5	0.02-0.05
chlorite	0.5	0.05-0.3; 0.003-0.005
plagioclase	0.5	0.2-0.7
muscovite	0.4	0.1-0.15 (one flake 0.7 mm across)
epidote	minor	0.1-0.15
arsenopyrite	trace	0.15
pentlandite	trace	0.03-0.1

Pyrrhotite forms aggregates of anhedral grains intergrown coarsely with patches of silicates.

Tremolite forms anhedral to subhedral prismatic grains with a colourless to very pale green colour; some patches are stained light to medium orange by limonite.

Fluorite forms anhedral grains, locally with a light purple colour.

Quartz forms patches of anhedral grains.

Chalcopyrite forms anhedral grains along or near the borders of pyrrhotite patches against silicates, and forms patches and minor veinlets in adjacent silicate patches.

Chlorite forms clusters of a few flakes (0.05-0.1 mm) and a few patches of cryptocrystalline aggregates of equant grains, most with a pale green colour, and the coarsest few grains showing pleochroism from pale to light green.

Plagioclase is concentrated at one end of the section as anhedral grains altered slightly to moderately to sericite.

Muscovite forms clusters of slightly elongate flakes intergrown with each of tremolite, fluorite, and quartz, and one much larger grain intergrown with tremolite.

Epidote forms a cluster 0.5 mm long of subparallel, elongate grains in a patch of quartz.

Arsenopyrite forms one euhedral equant grain enclosed in pyrrhotite.

Pentlandite forms one equant grain 0.1 mm across and a few nearby elongate grains (up to 0.03 mm long).

List of Photographs

Photo	Section	Description
01	JC18-8 224.9 m	massive pyrrhotite with interstitial patches of tremolite; chalcopyrite occurs along the borders of one tremolite patch and as a few grains and veinlets within the tremolite patch.
02	JC18-8 224.9 m	pyrrhotite with scattered patches of chalcopyrite with interstitial patches of tremolite (partly stained by limonite) and fluorite, with minor chalcopyrite in one tremolite-rich zone.
03	JC18-8 224.9 m	interstitial patch of tremolite-quartz containing patches of chalcopyrite and pyrrhotite; partly surrounded by pyrrhotite with locally abundant chalcopyrite.

Suite 1100
Val d'Or Québec J9P 7H1 Canada

Submitted By: Mark Fekete
Receiving Lab: Canada-Whitehorse
Received: September 24, 2019
Report Date: October 28, 2019
Page: 1 of 9

CERTIFICATE OF ANALYSIS WHI19000592.1

CLIENT JOB INFORMATION

Project: Jaycee
Shipment ID:
P.O. Number
Number of Samples: 232

SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage
STOR-RJT-SOIL Store Soil Reject - RJSV Charges Apply

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
DY060	230	Dry at 60C			WHI
SS80	230	Dry at 60C sieve 100g to -80 mesh			WHI
MA300	230	4 Acid digestion ICP-ES analysis	0.25	Completed	VAN
EN001-MA	230	Environmental disposal fee - Multi-acid neutralization			VAN
SVRJT	230	Save all or part of Soil Reject			WHI
SHP01	230	Per sample shipping charges for branch shipments			VAN

ADDITIONAL COMMENTS

Invoice To: Breakaway Expl. Mgmt. Inc.
3081 Third Ave.

CLIENT JOB INFORMATION

Project: Jaycee
Shipment ID:
P.O. Number
Number of Samples: 19

SAMPLE DISPOSAL

STOR-PLP Store After 90 days Invoice for Storage
STOR-RJT Store After 60 days Invoice for Storage

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	19	Crush, split and pulverize 250 g rock to 200 mesh			WHI
LF100-EXT	19	LiBO2/Li2B4O7 fusion ICP-MS analysis	0.2	Completed	VAN
SHP01	19	Per sample shipping charges for branch shipments			VAN
SLBHP	0	Sort, label and box pulps			WHI
MA370	19	4-Acid Digestion ICP-ES Finish	0.5	Completed	VAN
EN001-MA	19	Environmental disposal fee - Multi-acid neutralization			VAN
PF370-X	19	Na2O2 fusion, analysis by ICP-ES	0.25	Completed	VAN

ADDITIONAL COMMENTS

Version 2 : MA370 & PF370_Sn included.

Comment:

PROJECT SUMMARY

Total project expenditures: 36,609.69

Number of new claims since March 31st: None

Has an option resulted since March 31? ☐ yes ☑ no ☐ in negotiation

Number of calendar field days: 10

Number of person-days of employment: n/a paid 27 days of unpaid work

Total no. of samples: 19 rocks n/a silts 230 soils 3 other

Total length/volume of trenching/ shafting: n/a

Total number of line-km of geophysics n/a

Total meters drilled n/a diamond drill n/a RC drill n/a auger/percussion drill

Other products (provide details):

This is not an expense claim form. To request reimbursement of expenses, please submit a separate detailed expense claim form.

FINANCIAL SUMMARY

Total daily field allowance	2,000.00	Total contractor costs	0.00
Total field air transportation costs (helicopter/plane)	6,499.37	Total excavating/ heavy equipment costs	0.00
Total truck/ mileage costs	436.20	Total assay/analyses costs	7,175.93
Total wages paid	10,500.00	Total reclamation costs	0.00
Total light equipment rental costs	80.00	Total report writing cost	3,660.97
Other (please specify) 0.00		Total staking costs	0.00
Other (please specify) 0.00			

(see reverse)

YMEP FINAL SUBMISSION FORM

Your feedback on any aspect of the program:

YMEP is excellent program. We could not have done this work without YMEP support. We appreciate the funding very much.

The Department of Energy, Mines and Resources may verify all statements related to and made on this form, in any previously submitted reports, interim claims and in the Summary or Technical Report which accompanies it.

I certify that;

1. I am the person, or the representative of the company or partnership, named in the Application for Funding and in the Contribution Agreement under the Yukon Mining Incentives Program.

2. I am a person who is nineteen years of age or older, and I have complied with all the requirements of the said program.

3. I hereby apply for the final payment of a contribution under the Yukon Mineral Exploration Program (YMEP) and declare the information contained within the Summary or Technical Report and this form to be true and accurate.

Date January 20, 2020

Signature of Applicant

Name (print) Marty Huber

(see reverse)

Appendix D: “Certificate of Work”

Yukon
Energy, Mines and Resources

QUARTZ MINING ACT FORM 4 SECTION 56

APPLICATION FOR A CERTIFICATE OF WORK

Office Date Stamp

I, _____ ,

(Agent for Mark Fekete)

of 178 Dennison, Val-d'Or, Quebec J9P 2K6

Phone 819 354-5244

Client I.D. Number: _____

make oath and say that:

1. I am the owner, or agent of the owner, of the mineral claim(s) to which reference is made herein.

2. I have done, or caused to be done, work, on the following mineral claim(s): (Here list claims on which work was actually done by number and name)

See attached Schedule of Claims

situated at South of slope of Cabin Peak Claim sheet No. 105B04

in the Watson Lake Mining District, to the value of at least $ 36,609.69 dollars,

since the 1st day of September 20 19 ,

to represent the following mineral claims under the authority of Grouping Certificate No. HL - 12560 .
(Here list claims to be renewed in numerical order, by grant number and claim name, showing renewal period requested).

See attached Schedule of Claims

3. The following is a detailed statement of such work: (Set out full particulars of the work done indicating dates work commenced and ended in the twelve months in which such work is required to be done as shown by Section 56).

Work included rock & soil geochemical sampling on property from September 15 to 23, 2019; core sampling at Bostock Core Library, September 26, 2019; and report, maps and figures January 15 to 17. Total cost of work is $ 36,609.69. Number of samples: soil 230, rock 19, core 3, thin section 1.

Sworn before me at Whitehorse this _____ day of January 20 20 .

_____ Notary Public

_____ Owner or Authorized Agent
