Introduction

The HUN South project is located in west-central Yukon, approximately 61 km northwest of the town of Carmacks and 227 km from the city of Whitehorse (Figure 1). The Project lies between two blocks of Category A land held by the Selkirk First Nation to the northeast (SFN R-40B) and Little Salmon/Carmacks First Nation (LSC R-9A) to the southwest. The centre of the main property is at approximately 392265 East and 6929826 North (NAD83 Zone 8, NTS Map sheets 115I 11/7/6).

The HUN South property was staked by 536445 Yukon Inc. in February 2018. An eighteen-day exploration program of soil sampling and prospecting was conducted on the project in late August to early September 2019 with the objective to delineate and define previously known anomalies.

Legal Description

The Hun South claim group consists of 384 contiguous quartz claims (HUN 1-384) covering an area of approximately 8,000 hectares in the Whitehorse Mining District. The property is 100% owned by 536445 Yukon Inc. who paid for work completed between from August 30th to September 16th, 2019. A table summarizing claim data is presented below and full data on each individual claim is available in Appendix I. Claim locations are visible on Figure 2.

Access

The HUN South project is situated 17 km southwest of the Minto Mine. The Minto Mine is located west of the Yukon River, approximately 20 km WNW of Minto Landing, which is on the east side of the river. The Minto Mine is accessible via the Yukon Highway 2 (North Klondike Highway) to Minto Landing. In summer months, a barge connects the landing with an all-weather gravel road, extending 27 km from the west bank to the mine site. In winter, the crossing is accessible by an ice bridge. Access for the 2019 exploration program was by Capital Helicopter's (1995) Inc. helicopter from the Minto Mine's airstrip, which is 17 km northeast from the HUN South property.

Property History

Copper mineralization in the Carmacks area was found by G.M. Dawson in 1887 at the Hoocheekoo bluffs along the Yukon River (MINFILE 155I 013). The Carmacks area map sheet was later mapped by H.S. Bostock from 1931 to 1934 and released in 1936 as Memoir 189, Carmacks District. The discovery of the Casino Cu-Au-Mo porphyry deposit in 1965 spurred exploration in the Carmacks area. In 1970 prospecting led to the discovery of copper carbonates, principally malachite, northwest of the Yukon River, which prompted the staking of the original DEF/Minto claim blocks, now known as the Minto mine. Subsequent reconnaissance prospecting and geochemical sampling in the area and to the south by Archer, Cathro & Associates Ltd. (Abbott, 1971) led to the discovery of the Carmacks Copper deposit in 1971. Exploration for other occurrences continued in the area until the 1980s. The VERLENE mineral occurrence (MINFILE 155I 014) is located within the northwest corner of the HUN property. The current claims of the HUN property are part of the original FIL, HI, and MOON claim groups that covers an area along strike from the DEF/Minto and Carmacks Copper deposit. Portions of these claims had been examined by Hart River Mining Ltd. in the early 1970s and then a large area south of Minto was staked by United Keno Hill Mines Ltd. The HI claims were staked in 1976 shortly after the DEF/MINTO discovery, which prompted a small staking rush in the area after the release of the initial drill hole assay data for DEF. The FIL and Moon claims were staked later in 1980 by United Keno Hill Mines Ltd. In 2010, Canadian Dehua International Mines Group Inc. acquired parts of the original claim outlines of the HI, FIL, and MOON blocks and renamed it as one claim block called Oprah. Canadian Dehua International Mines Ltd. completed two years of assessment work in 2010 and 2011. Most of the Oprah claims were restaked in 2017 as the HUN (South) claims.

United Keno Hill Mines Ltd. 1976-1981

HI Claims

The HI claims were located within the northeast corner of the current HUN claims. The HI claims were staked in 1976 and field work in that year consisted of geological and geochemical surveys. Geological mapping of the area identified a few narrow lenses and horizons of northwest trending biotite-rich gneiss. These rocks were described as malachite stained, strongly foliated quartz-feldspar-biotite gneiss that appeared to be similar to the rocks that occur within the DEF claims.

Soil sampling on the entire claim block revealed two narrow trending anomalous areas with values between 382-510 ppm Cu and some other scattered, isolated anomalies. The highest values were found to indicate mineralized gneissic rocks. Although silver (Ag), lead (Pb), zinc (Zn), and molybdenum (Mo) were also analyzed, no anomalous areas were indicated for any of these metals.

MOON Claims

The Moon claims occupied the southwest corner of the current HUN claims and were staked in 1980. The same year United Keno Mines Ltd. conducted a small geological mapping program on some parts of the claims, which identified a few prominent biotite-quartz-feldspar gneiss outcrops. Only about four percent of the assays from the property-wide soil geochemical survey

returned copper values exceeding 30 ppm. It was concluded that the topography and the deep overburden influenced the quality of the survey. A few isolated anomalies were found with a northwest trend that correlated well with the strongly foliated mafic-rich gneiss.

In 1981, reconnaissance geological and geochemical coverage was completed. Mapping confirmed the presence of quartz-feldspar gneiss in the entire property. The soil survey conducted in 1981 completed a reconnaissance geochemical survey of the property. The samples were only analysed for copper and reflected a generally poor response. It was concluded that these results are most likely due to the thick cover of glaciofluvial cover. An airborne electromagnetic DIGHEM II and magnetometer survey was flown over the Moon claims as part of a large survey which also included the FIL claim block. Data from the survey outlined a sharp contrast between the low resistivity volcanic rocks and the high resistivity granodiorite and gneiss. There was only a small amount of follow-up work carried out over the electromagnetic conductors with no major conclusions.

FIL Claims

The location of the FIL claim block aligns with the current southeast corner of the HUN claims. The FIL claims were staked in June 1980 and were part of the several United Keno Hill properties along the Minto Copper belt. The 1981 field work consisted of property-wide geological mapping, rock sampling, and geochemical sampling

Geological mapping identified a large area of strongly foliated, northwest striking, gneissic rocks with high biotite and magnetite content in the southeast corner of the property. Traces of malachite were locally found in the gneissic fragments. Twenty-seven rock grab samples were collected for assaying. A mix of lithologies were sampled including variably foliated intrusive and undeformed volcanic rocks; however, no favourable assay values were returned. The geochemical sampling involved the collection of a total of 17,046 soil samples at 30 metre intervals along 100 m spaced lines over the entire property. Most copper anomalies determined from the survey were of a low order (50-100 ppm) and showed a northwest trend. Based on these anomalies 5 areas of interest were outlined with copper values 100-187 ppm. The highest copper value obtained in the survey was 192 ppm Cu.

A DIGHEM_{II} survey of 946 line-kilometers was flown with a 200 m line-spacing within the FIL and MOON claim blocks. Numerous areas of interest were outlined on the basis of geophysical anomalies. These anomalies include areas of low resistivity and high conductivity anomalies generally on the eastern side of the FIL claims.

Canadian Dehua International Mines Group Inc. 2010-2011

Oprah Claims

In 2010, a total of 1,168 line kilometers on radiometric and magnetic geophysical survey were flown at 100 m spacings at a 060° heading. The airborne geophysical survey and data processing were carried out by Precision GeoSurveys Inc. and the post geological interpretations and mineral targeting work were done by Mira Geosciences Inc. and Aurora Geosciences Inc. on behalf of

Dehua Mines. Based on the integrated radiometric and magnetic geophysical survey, Mira Geosciences completed targeting for the surveyed areas using a Minto-style mineralization exploration model and criteria. Using sparse regional stream sediment data and regional geology in addition to new geophysical data, they identified several prospective magnetic zones with northwest trends. Some of these zones have an increased potassium anomaly, which was suggested to indicate prospective areas. Numerous targets were created, mainly in the centre of the claim block using proximity to faults, magnetic highs, and radiometric. Ten main targets were identified as primary targets with stream sediment samples ranging from 10 to 15 ppm copper and zones of magnetic highs with 200 m to 300 m strike lengths.

In 2011, Dehua Mines carried out ground exploration on the claims including targeted IP surveys and soil sampling based on the 2010 geophysical survey. The IP ground surveys were conducted on aeromagnetic anomalies along 1 km long lines through the centre of the claim block. Soil sampling was carried out at 50 m spacing along IP lines. Statistical analysis on the soil sampling results showed maximum gold (Au), silver (Ag), and copper (Cu) values of 199 ppb Au, 3.43 ppm Ag, and 699 ppm Cu, respectively. The ground IP survey identified numerous high chargeability zones ($F_s > 2.8$) associated with anomalous copper and magnetically high areas. Despite the promising results of these surveys, these targets have never been followed up.

Regional Geology

Mesozoic calc-alkaline to alkaline plutons of Stikinia and Quesnellia are known to host prolific porphyry Cu-Au \pm Ag \pm Mo deposits in British Columbia (Nelson et al., 2013; Logan and Mihalyuk, 2014). In Yukon, correlative igneous rocks include the Stikine suite (ca. 218-208 Ma), Minto suite (ca. 204-195 Ma), Long Lake suite (ca. 192-180 Ma), and Bennett-Bryde suite (ca. 178-167 Ma) (Colpron et al., 2015). These Late Triassic to Early Jurassic calc-alkaline batholiths intrude the Stikine and adjacent peri-cratonic Yukon-Tanana terranes. The HUN property is located near the most northern apical junction of the Stikine and Yukon-Tanana terranes, within the Early Jurassic Granite Mountain batholith (GMB) (Figure 3).

The GMB consists of two phases, one each from the Minto and Long Lake suites that are likely in fault contact in the Carmacks Copper area (Colpron et al., 2015) (Figure 4). The Granite Mountain batholith intrudes the contact between mid-Paleozoic rocks of the Yukon-Tanana and Late Triassic rocks of the Stikine terranes. West of the GMB, the Yukon-Tanana terrane is represented mainly by orthogneiss of the Mississippian Simpson Range plutonic suite (Mortensen, 1992). Stikinia in Yukon is composed of volcanic and sedimentary rocks and local subvolcanic intrusions of the Upper Triassic Povoas Formation of the Lewes River Group (Hart, 1997). The Povoas Formation in southern Yukon is characterized by variably deformed and greenschist to amphibolite facies augite porphyritic basalt, volcanoclastic rocks, and hornblende gabbro (Hart and Radloff, 1990). These are juxtaposed against the batholith by the normal, dextral oblique-slip Hoochekoo fault and an unnamed, normal-sense fault. The Minto suite contains inliers of deformed and metamorphosed rocks that host Cu-Au-Ag mineralization at the Minto mine, Carmacks Copper deposit, Stu prospect, and the VERLENE occurrence (MINFILE 115I 014). The occurrences form a 42 km-long, northwest-trending continuous belt referred to as the Minto Copper Belt (Figure 4) (Kovacs, 2018).

Property Geology

The Hun South property is primarily underlain by intrusive rocks of the Minto suite of the Granite Mountain batholith (Figure 5). The property is surrounded to the north, east, and west by the younger, overlying Late Cretaceous Carmacks Group conglomerate. Most recent property-scale geologic mapping in the area was performed in 1981 on the FIL and MOON claim groups in the southeast and southwest of the current HUN South property respectively. Both 1981 mapping and 2019 prospecting reported herein confirm that the Minto suite within the HUN South property comprises phases similar to those seen elsewhere in the Granite Mountain batholith and throughout the Minto Copper Belt (Kovacs, 2018). The main intrusive phase is characterized by K-feldspar megacrystic granodiorite with lesser diorite. Quartz-plagioclase-K-feldspar pegmatite dykes commonly cross-cut the massive granodiorite throughout the area. A strongly deformed, biotite and magnetite rich quartz-feldspar gneiss unit was documented on both the FIL and MOON properties. This gneiss may represent a metamorphosed inlier of the Upper Triassic Povoas Formation, which is interpreted to be the protolith of the mineralized host rocks elsewhere in the Minto Copper Belt (Kovacs, 2018).

Prospecting

Prospecting Overview

A total of 3 man-days — three individual traverses measuring a total 10.2 km — were completed between September 6th and 9th, 2019 on the HUN South property focusing on the southwest property area.

Prospecting Procedure

Field prospecting was performed by trained geological technicians. Prospecting set outs were made by helicopter daily from the Minto Mine airstrip. Traverses focused on ridges due to the known scarcity of outcrop in the field area and wherever possible were planned to intersect target areas and areas of previous work. Outcrops were collected as point data from Garmin brand portable GPS units in NAD 83 / UTM Zone 8. At each outcrop, data on lithology, mineralization time/date, and additional observations were recorded in a field notebook and later digitized. Original point data is available in Appendix II. Traverse lines and outcrops were later drawn from prospecting points data and available ESRI imagery in QGIS 3.2.10 software.

Prospecting Results and Interpretation

Scarcity of outcrop presented difficulties to the prospecting campaign. Prospecting in the area did not find mineralized or otherwise of interest rock samples, thus no samples were collected or submitted to lab for assay. Prospecting confirmed that regional mapping in the area is accurate and that the HUN South property is mainly located within the Minto suite. All traverses and outcrops observed are shown on Figure 6.

Soil Geochemistry

Geochemistry Overview

A total of 1,810 soil samples were collected across the HUN South property from August 30th to September 15th, 2019.

Procedure

Soil samples were collected via hand auger with recovered material collected into waterproof KRAFT bags. Each bag was labelled and a corresponding lab assay tag was inserted into the bag. The program targeted the C soil horizon. When sufficient C horizon could not be obtained, B soil horizon material was taken.

Technicians in the field recorded sample position data using Garmin brand portable GPS units in NAD 83 / UTM Zone 8. Additional field observations were recorded into Apple iPad tablets using Fulcrum App software. For each station information on sample horizon, sample colour, sample depth, sample texture, sample quality, and surrounding vegetation was recorded. Additionally, a photo of sampled material was taken at each station.

All samples were submitted to the ALS prep laboratory in Whitehorse, YT with final analysis performed at the ALS laboratory in North Vancouver, British Columbia using the ME-MS41L analytical package. Samples were dried at < 60° C, sieved to 80 mesh, subjected to an aqua regia digestion, and analysed via ICP-MS for a 53 element suite at super trace levels (Appendix V). CDN Resources Laboratories Ltd. certified, low grade, copper-gold-molybdenum pulp standards and in-house blank pulps using unmineralized granodiorite material were inserted at one per fifty field samples for an overall standard density of four percent.

Results and Interpretations

The 1,810 soil samples were collected across four planned grids on the HUN South property (Figure 7a). Exact sample locations and relevant coordinate and field data are recorded in Appendix III. Assay certificates are available in Appendix IV and assay results for each submitted sample and standards are available in Appendix V. A summary of each grid is provided in Table 1 below.

Target Grid	Sample Spacing (metres)	Total Samples	Grid Area (km²)
Target 1	50 x 50	710	2.19
Target 2	50 x 50	208	1.88
Target 3	50 x 50	640	0.76
Target 4	50 x 50	252	0.71

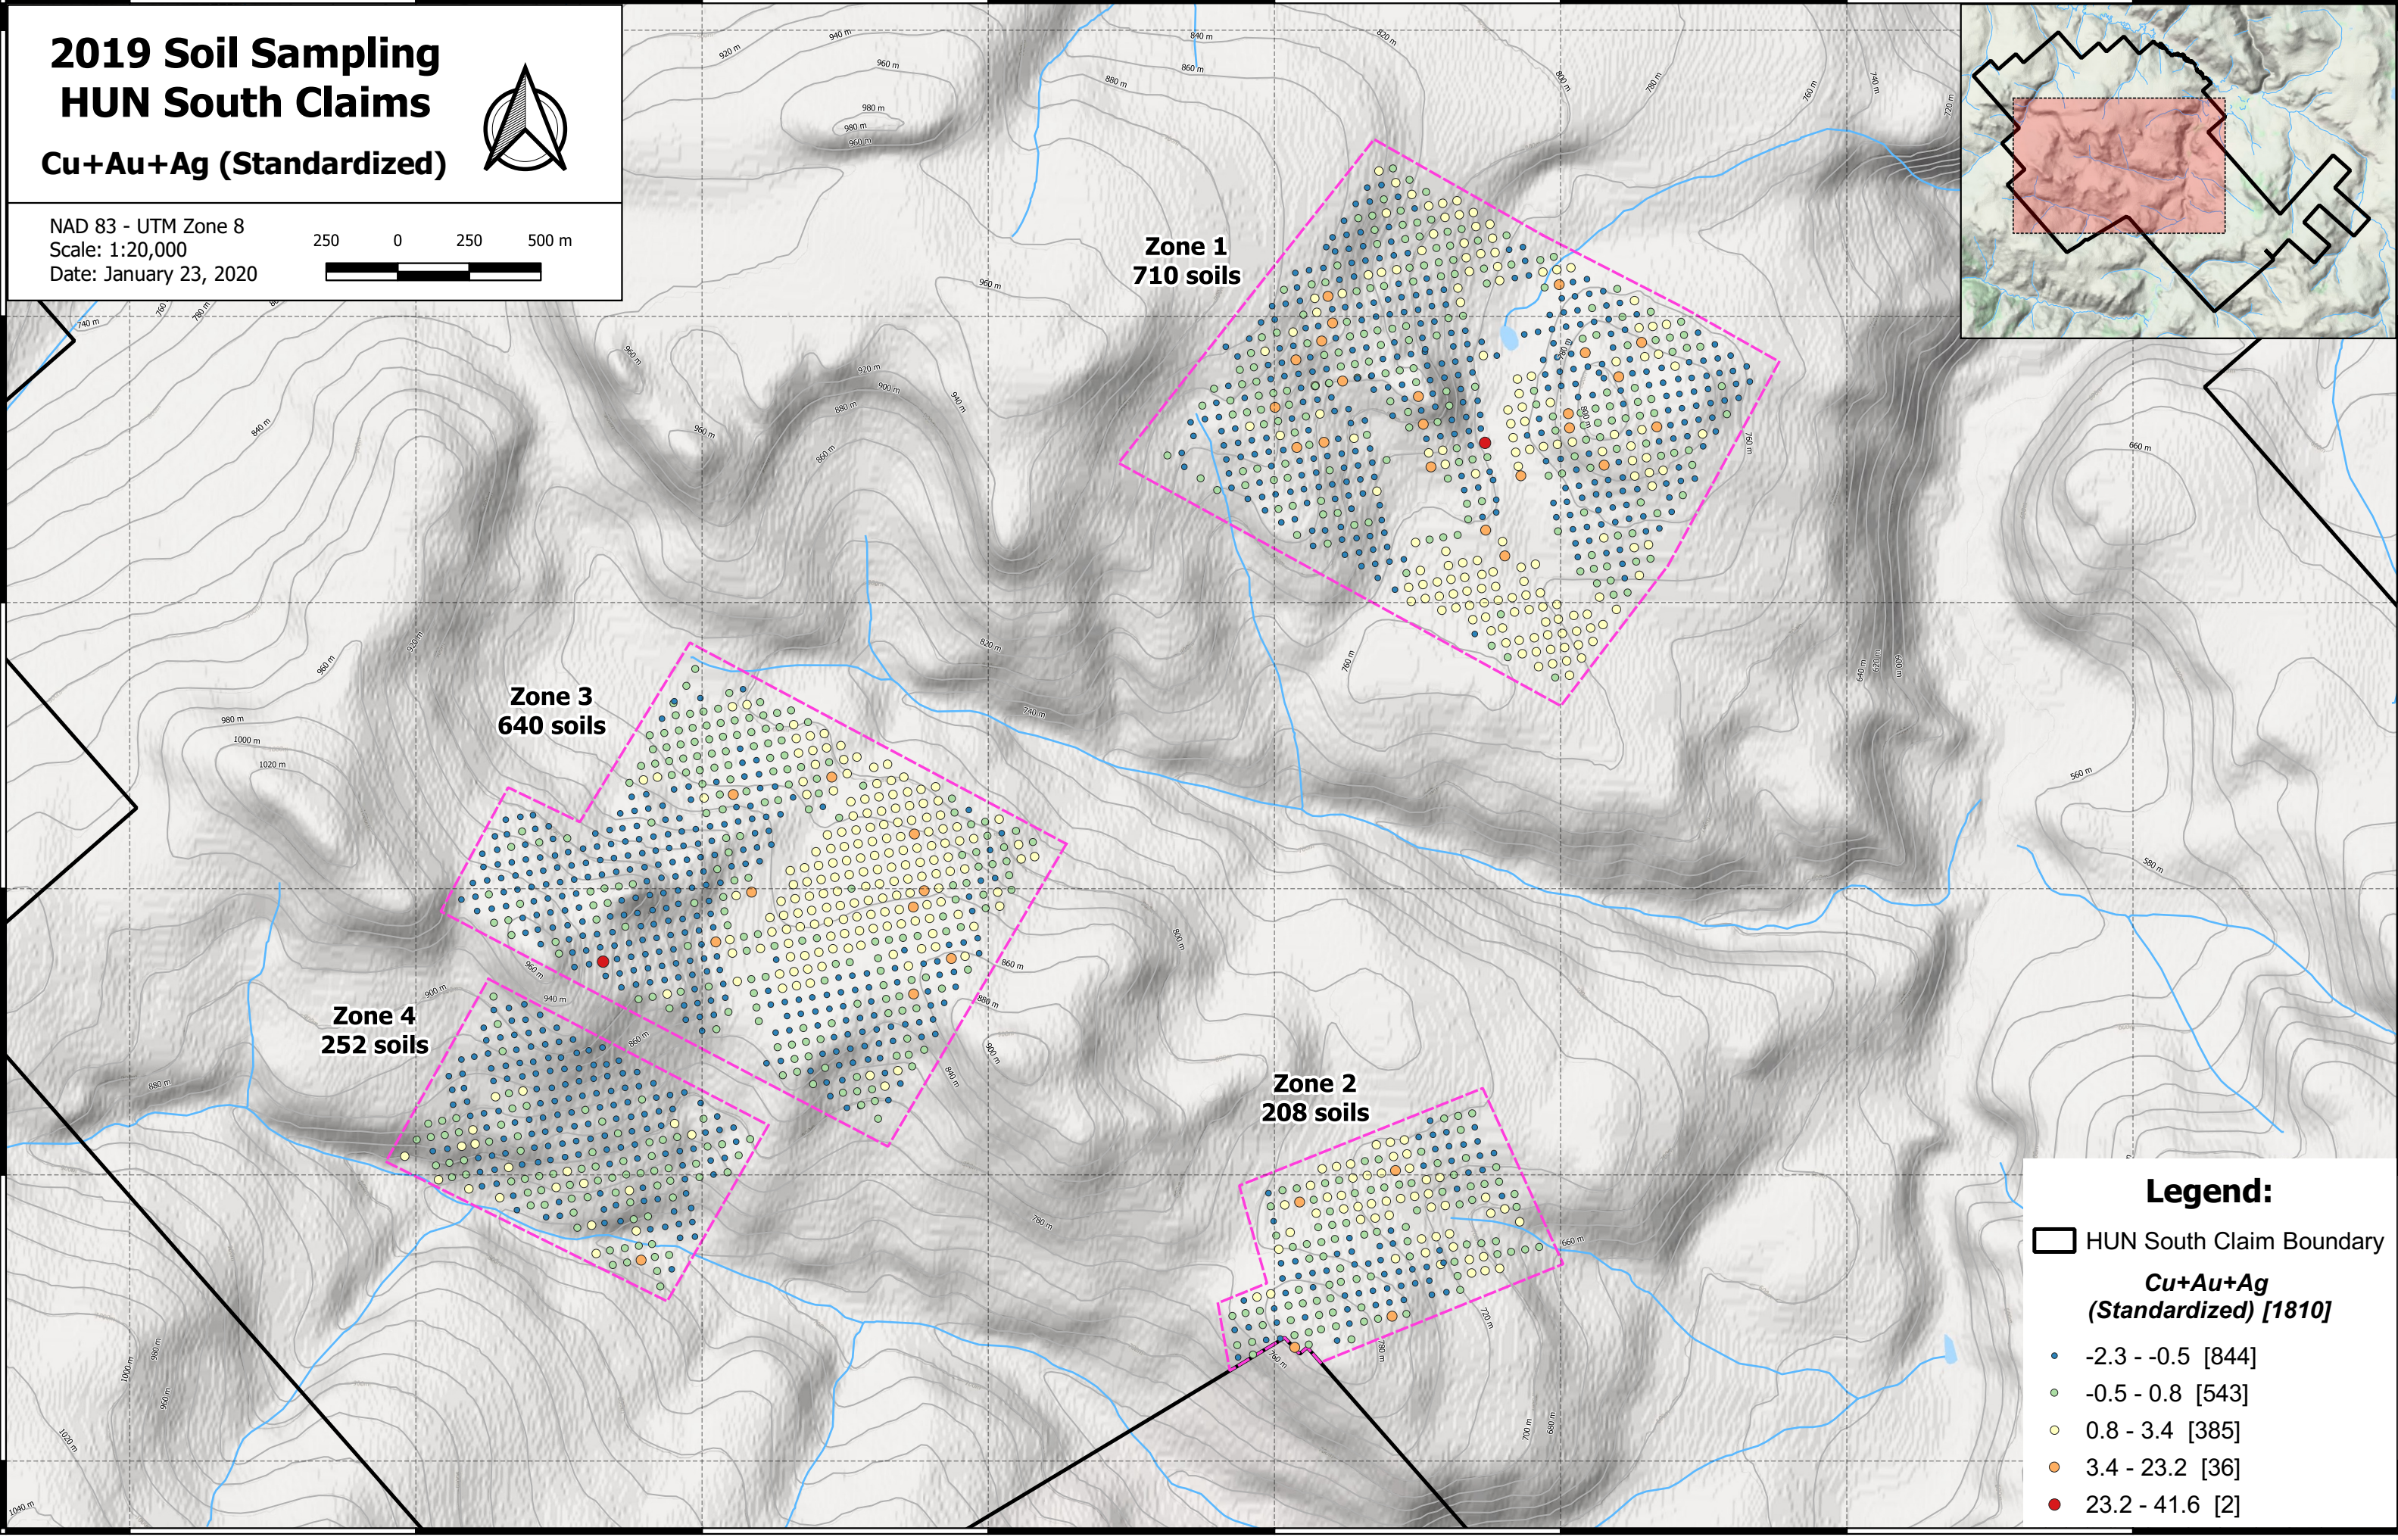

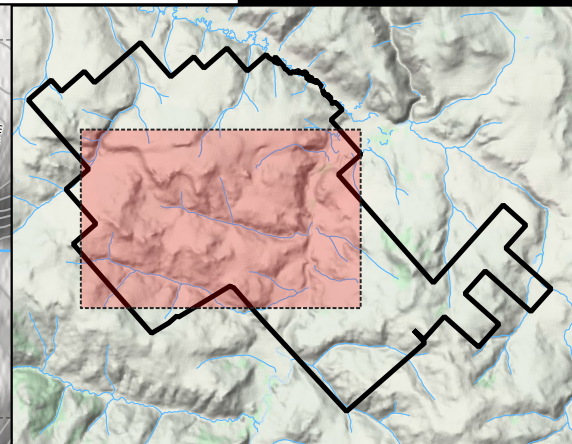

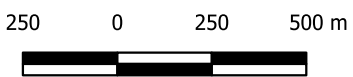

Table 1. Summary of sampling grids.

Soil sample results have been plotted using the Jenks natural breaks classification method for copper (Cu) ppm, gold (Au) ppb, silver (Ag) ppb, and normalised combined Cu + Au + Ag ppb in soil for each zone respectively (Figure 7b). Results and interpretations for each zone are discussed below and indicated a strong correlation between Cu, Au, and Ag across the property.

Zone 1

Zone 1 shows numerous copper-gold anomalous areas (Figure 8a-d). The two most notable anomalous areas lie in the northeast and southeast corners of the target area. The northeast area shows elevated copper in soil values between 25 to 100 ppm (Figure 8a). This area is also correlated with an oval-shaped 250 m-wide and 200 m-long magnetic high anomaly (Figure 8d). Silver shows elevated values sporadically (Figure 8c). Gold is not anomalous and does not seem to be associated with copper or silver (Figure 8b).

The southeast area within Zone 1 area outlines a large 250 m-wide and 500 m-long soil anomaly with consistent copper values between 25 to 50 ppm (Figure 8a). The magnetic signature of this area is variable (Figure 8d). Silver appears to be associated with copper, showing consistent values between 75- 150 ppb (Figure 8c). Gold is not anomalous in this area (Figure 8b).

The centre area of Zone 1 is located in a previously trenched area that shows numerous 50-100 ppm copper results (Figure 8a). Prospecting in this area identified copper oxide mineralization on surface, and these values likely represent surficial copper mineralization. Elevated silver is apparent in two samples to the south west on the side of the hill with values of 422 ppb and 2590 ppb (Figure 8c). Gold does not show any significant values in this area (Figure 8b).

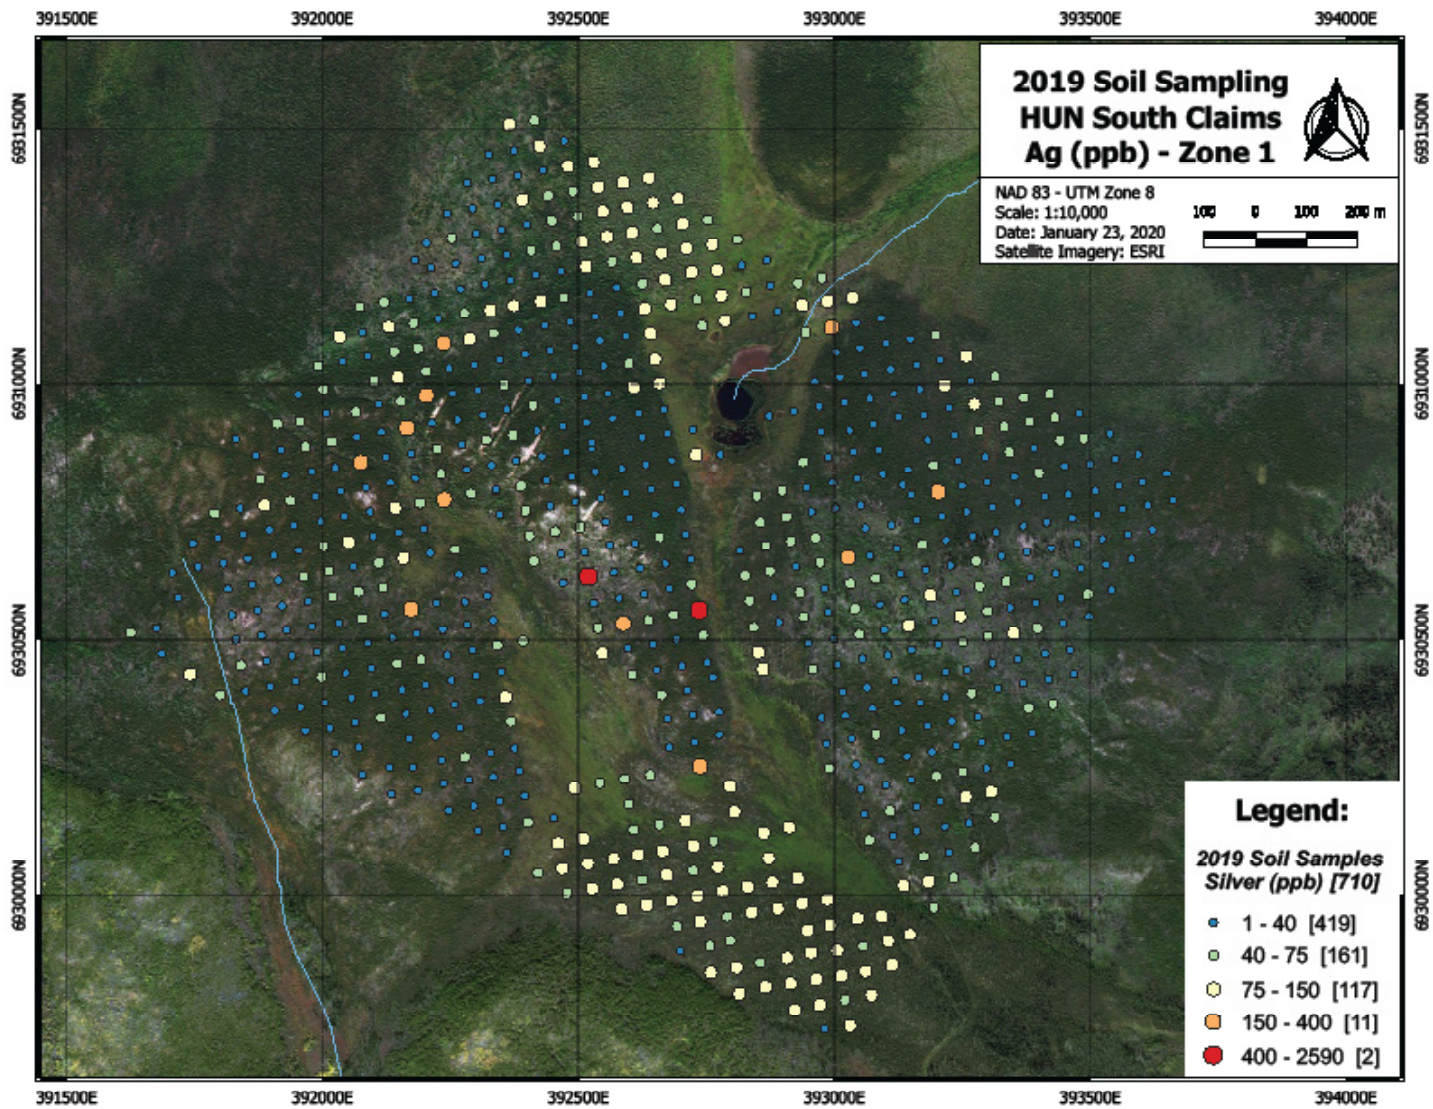

Figure 8c. Map showing silver in soil anomalies in Zone 1, HUN South area.

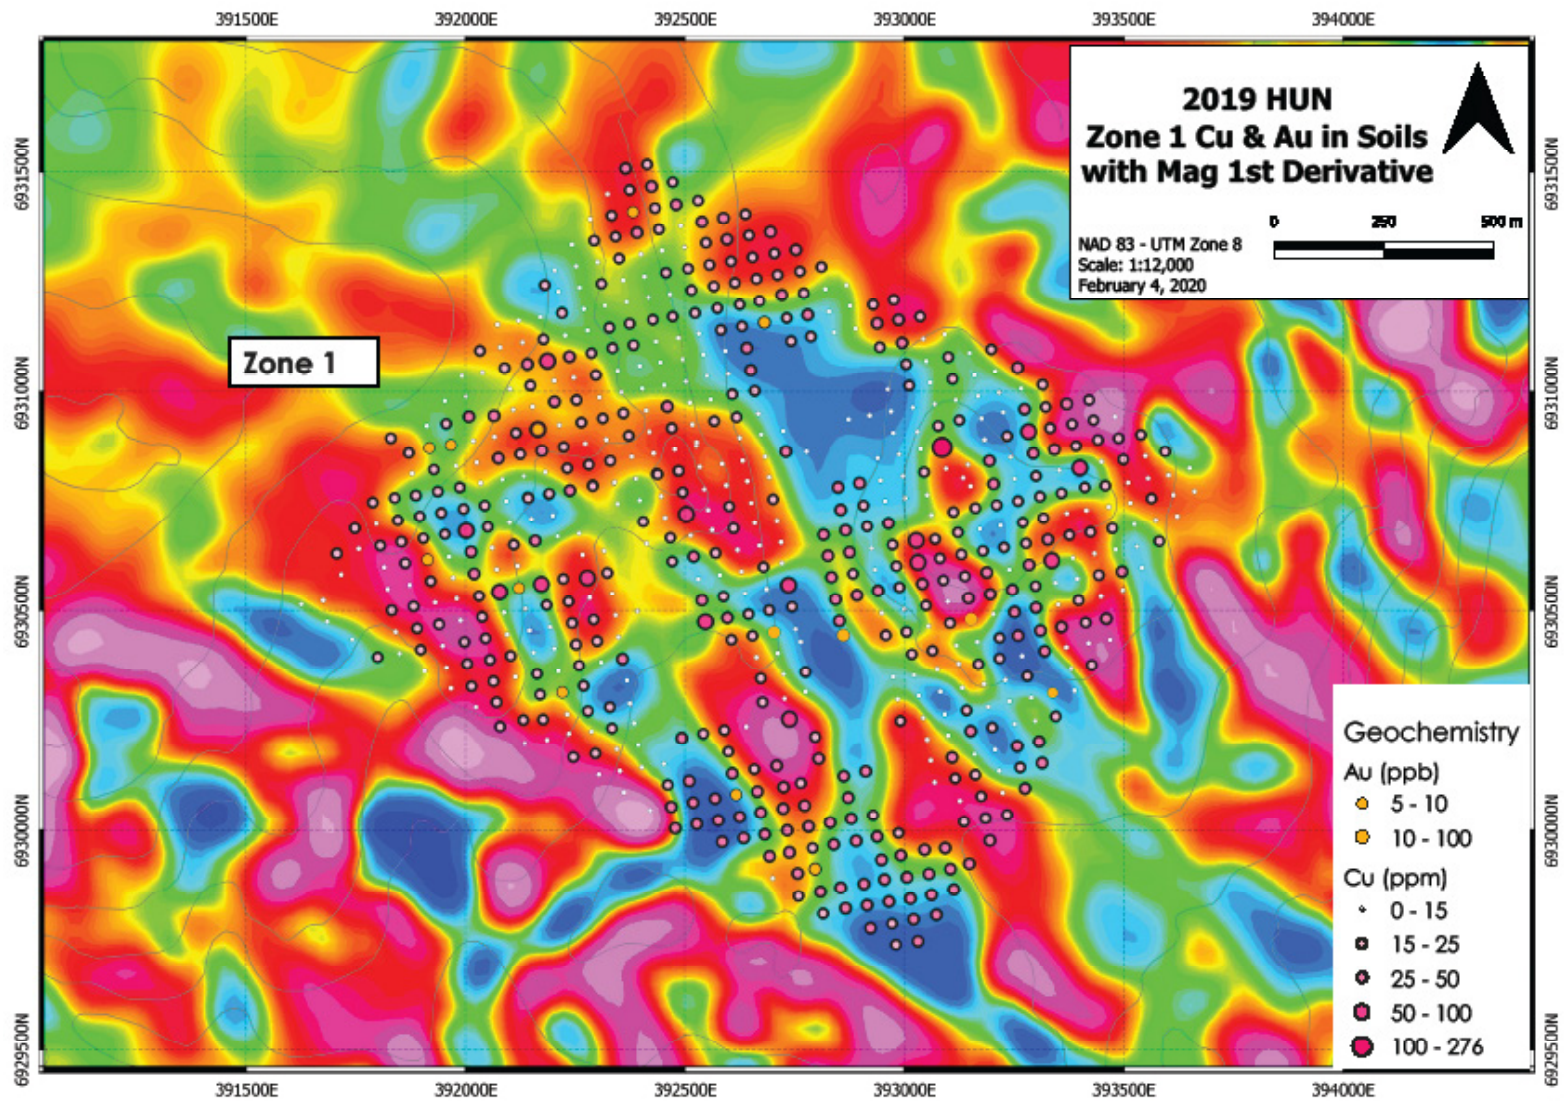

Figure 8d. Map showing copper and gold in soil anomalies in Zone 1 in correlation with magnetic first derivative in HUN South area.

Zone 2

Zone 2 was centered on two distinct magnetic high anomalies located on the southwest and northeast sides of a hill (Figure 9d). Both of these targets show anomalous copper values from 25 to 50 ppm (Figure 9a). The smaller magnetic anomaly in the southwest corner of the target area is located on a topographic high with the largest copper value on the side of the ridge. The larger magnetic anomaly is distinctively marked by less vegetation than the surrounding area. The elevated copper values associated with this anomaly to the north are likely the result of downhill dispersion.

Silver and gold correlations are more prominently associated with the larger magnetic anomaly to the northeast (Figures 9b-c).

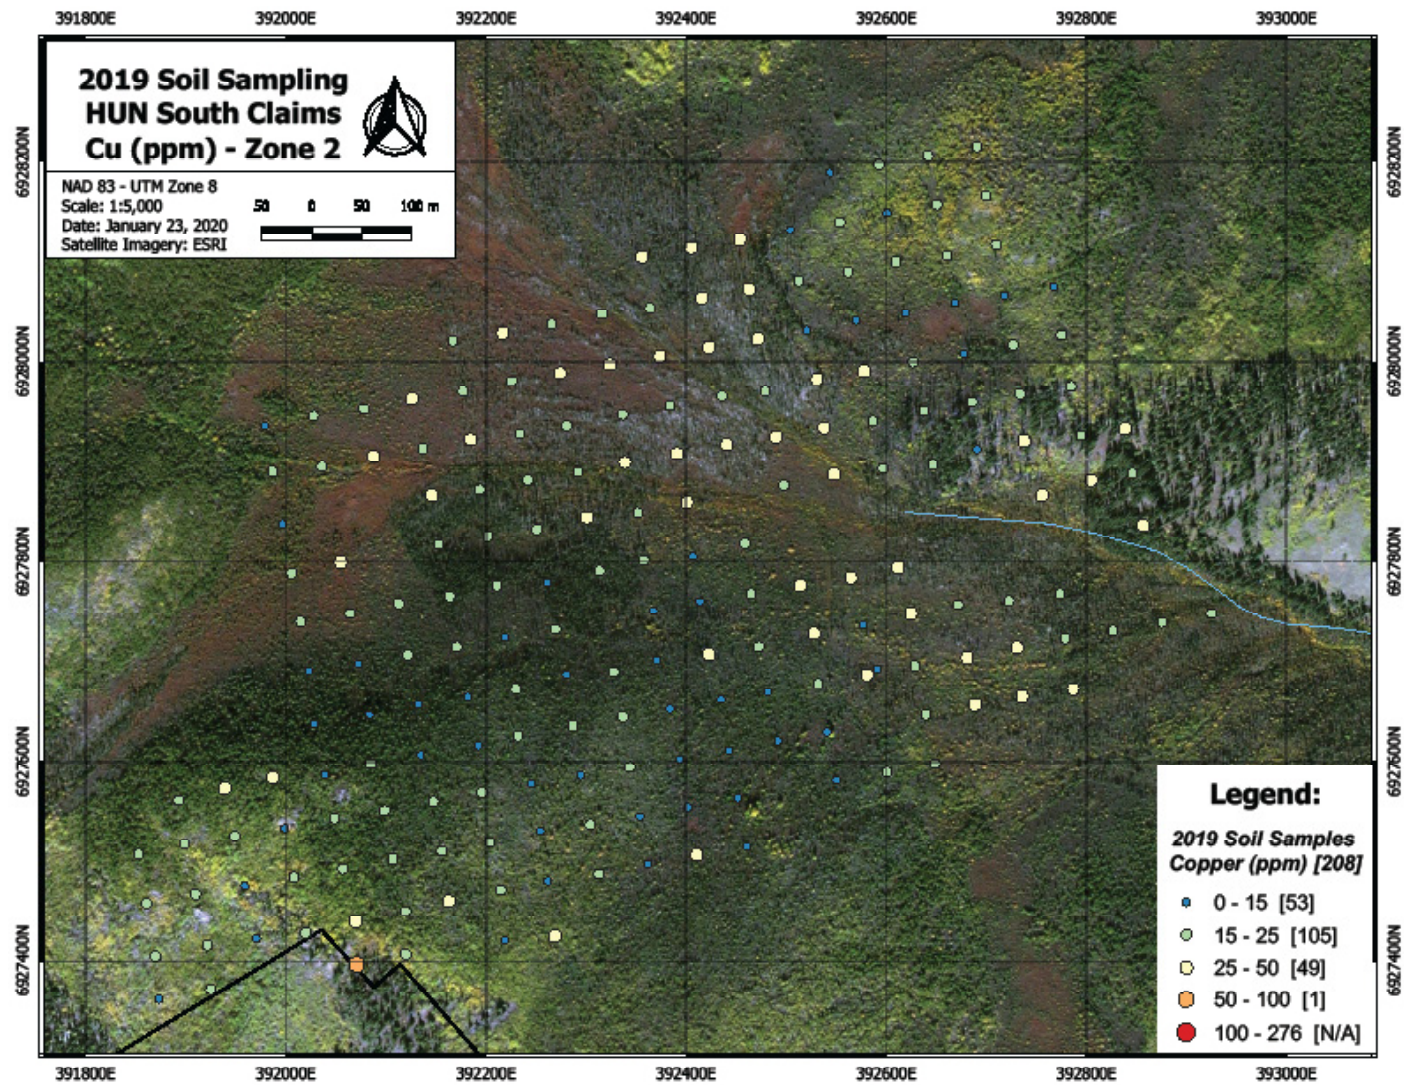

Figure 9a. Map showing copper in soil anomalies in Zone 2, HUN South area.

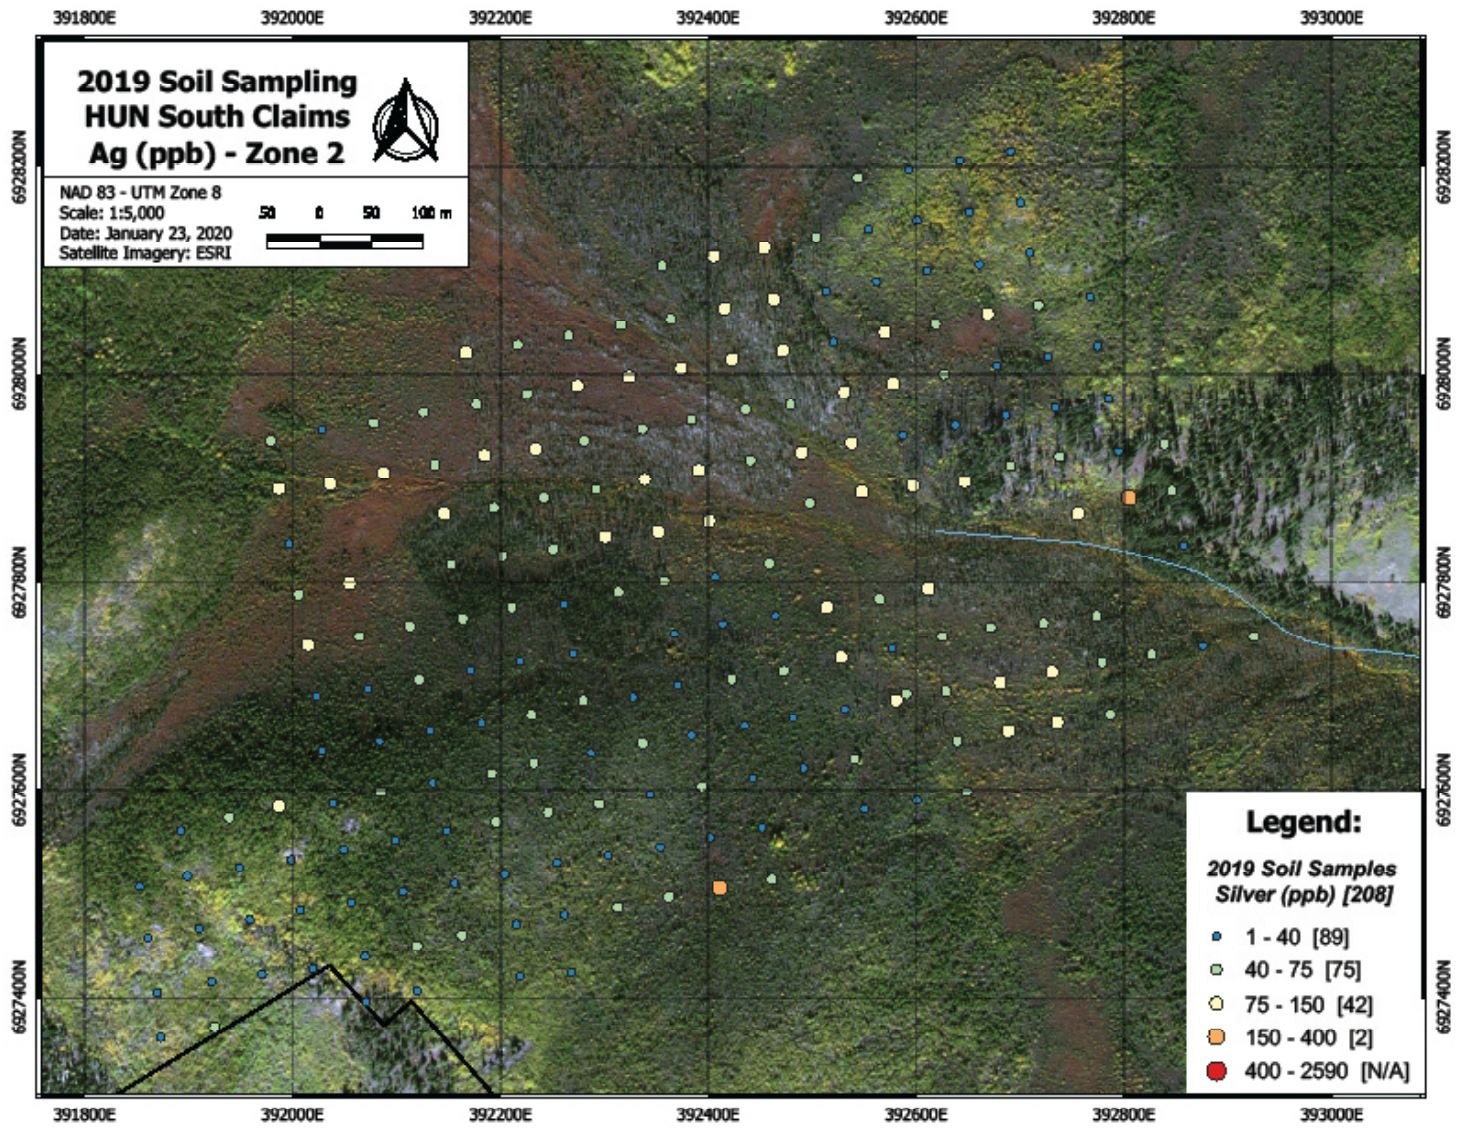

Figure 9c. Map showing silver in soil anomalies in Zone 2, HUN South area.

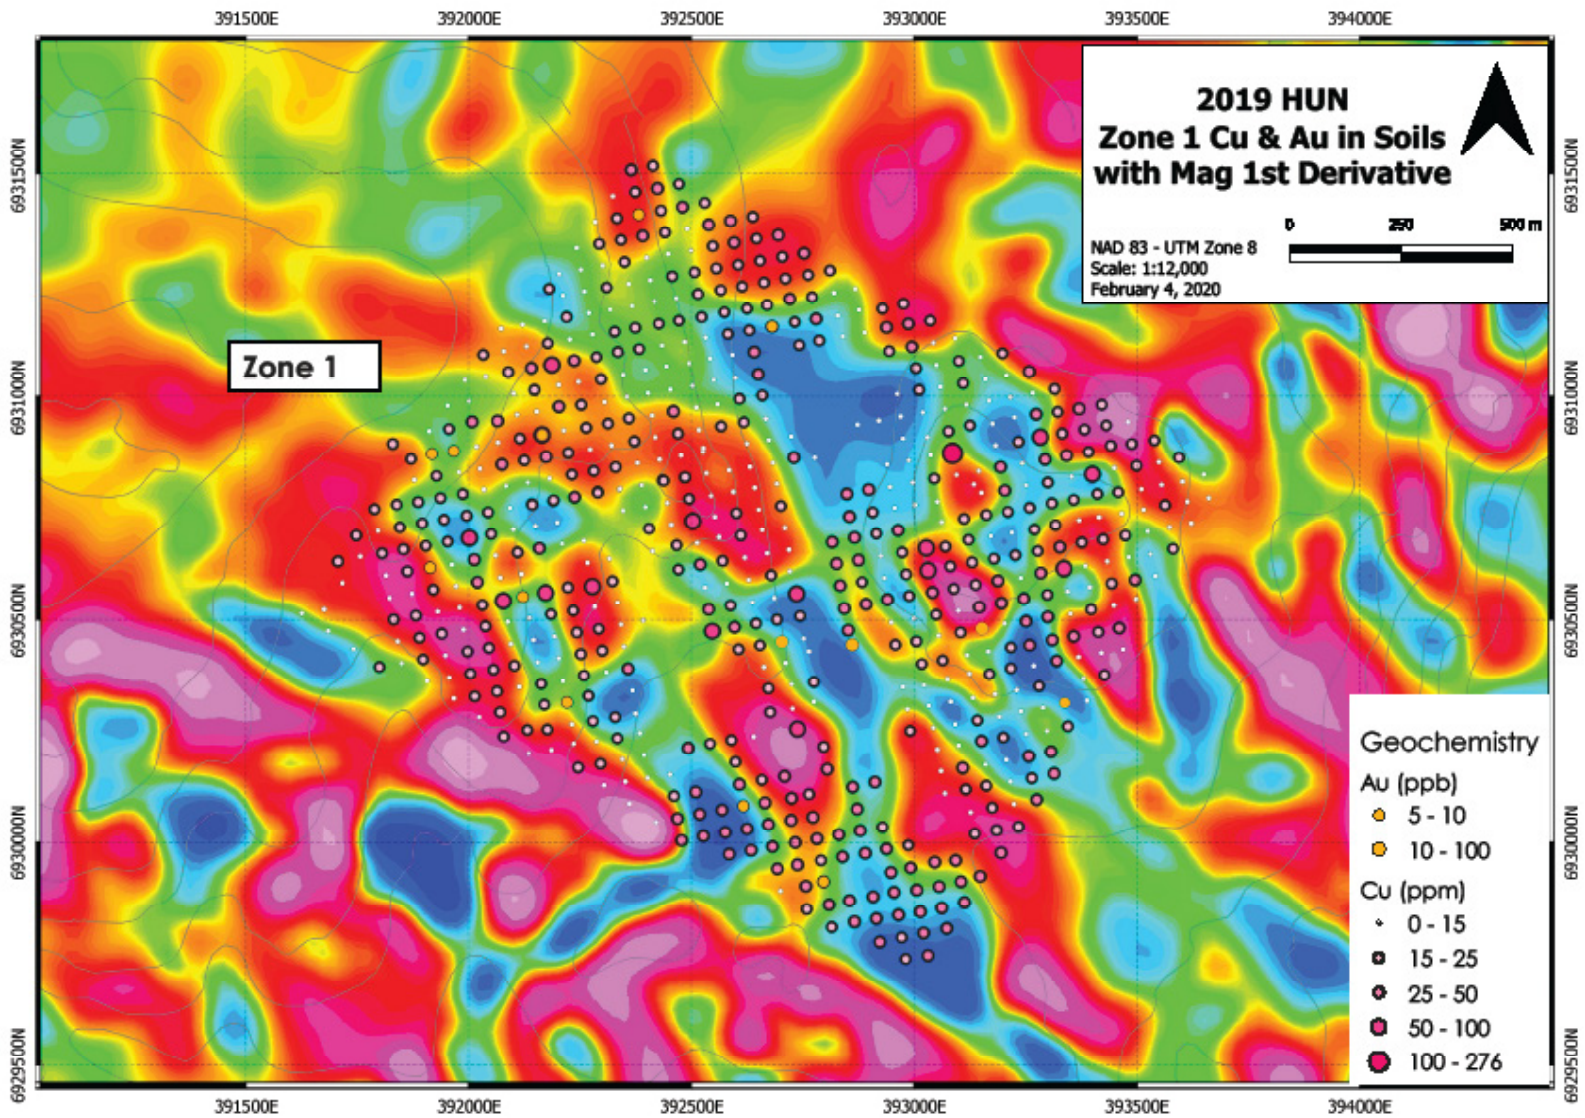

Figure 9d. Map showing copper and gold in soil anomalies in Zone 2 in correlation with magnetic first derivative in HUN South area.

Zone 3

Zone 3 shows the best potential for future exploration (Figure 10). The most notable zone in this area is located in the northeast corner of the target area. An anomalous zone is located in the northeast corner of the target area and lies on a gentle northeast-facing slope with less vegetation than the surrounding area. The anomaly occupies a 1000 m-long and 500 m-wide oval shaped area with anomalous and consistent copper values ranging between 25 to 50 ppm (Figure 10a). Silver appears to be strongly associated with copper showing consistent values between 75 ppb to 150 ppb (Figure 10c). The first derivative magnetic signature of this area shows a magnetic low (Figure 1d).

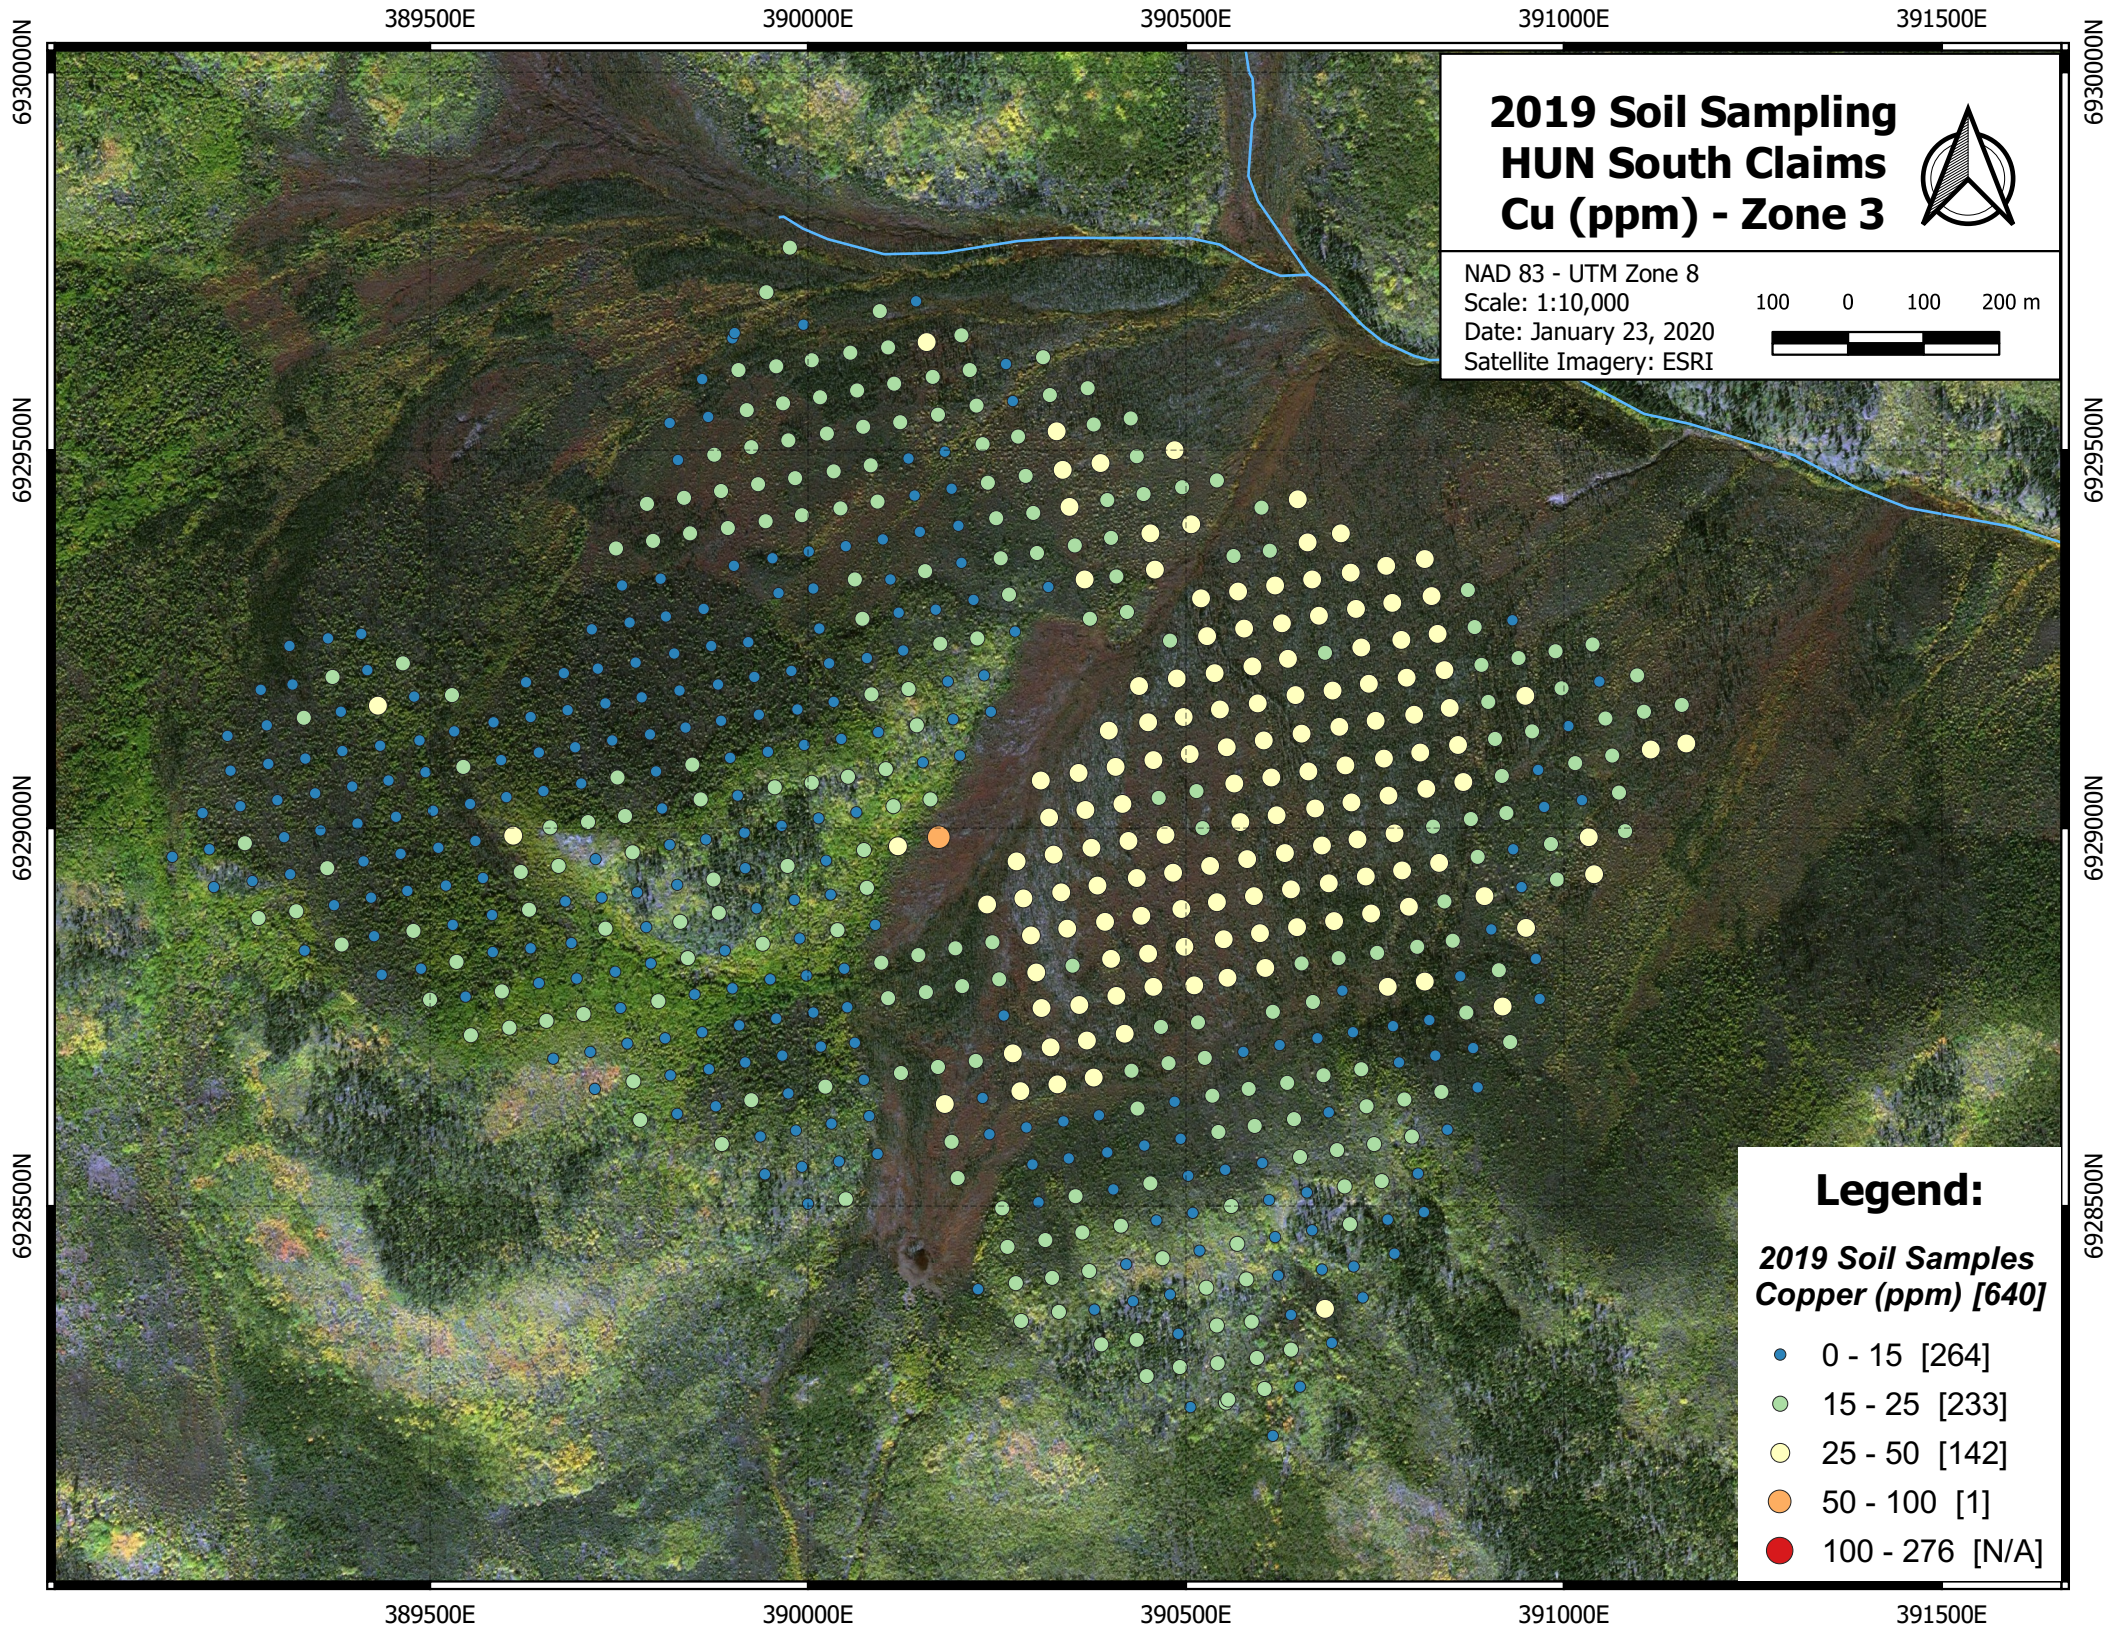

Another area on the northwest tip of the creek also shows local anomalous copper values ranging between 25-50 ppm with elevated silver (75-150 ppb)(Figures 10a and 10c). This area is also centered on a 250 m-wide and 200 m-long magnetic high anomaly (Figure 10d).

Elevated gold appears to be sporadic and locally anomalous with values of 10 to 100 ppb. Two samples southwest of the target area indicate high gold values of 104 and 233 ppb gold (Figure 10b).

Zone 4

Zone 4 was centered on a small 150 m-long, 50 m-wide magnetic high anomaly located in the creek valley (Figure 11). The north side of the creek valley shows local values of elevated copper (25-100 ppm); however, it seems inconsistent (Figure 11a).

Gold and silver does not seem to show significant values in this area, except two soil samples on both sides of the creek that returned 33.9 ppb and 20.1 ppb gold values (Figure 11b).

Future Recommendations

The 2019 field program successfully further delineated previously identified targets. Four target areas (Zones 1, 2, 3, and 4) were identified prior to geochemical sampling. Out of these 4 zones, Zone 3 shows the most promising geochemical results. An RC drilling program would be beneficial on this area to test the nature of mineralization. The other targets that are lesser priority such as Zones 1, 2, and 3 will probably require trenching prior to drilling.
