DOCUMENT NO: 120146

MAP NO.: PROSPECTUS

MINING DISTRICT: Dawson

115 0/14

CONFIDENTIAL X

TYPE OF WORK: Seismic testing

OPEN FILE

REPORT FILED UNDER: Walter E. Farr

DATE PERFORMED: June 14, 1991

DATE FILED: December 13, 1991

LOCATION: LAT.: 63°58'N

AREA: Hunker Creek - 18 Gulch Area

LONG.: 139°20'W

VALUE \$: 700.00

CLAIM NAME & NO.: Play Gold Disc - Placer Claim #P37003

WORK DONE BY: Ted Sandor

WORK DONE FOR: Walter E. Farr

DATE TO GOOD STANDING:

REMARKS: 115 - B Hunker Creek - 18 Gulch Area

A reconnaissance seismic reflection survey consisting of two test shots was conducted over the claim. The author interpreted the results as showing bedrock occurring at a depth of between 14 and 30 ft.. A stratum change was detected at 11 feet at the first test site.

# ASSESSMENT REPORT

on June 14, 1991

Seismic Survey

on 18 Gulch

Play Gold Disc Placer Claim #P37003

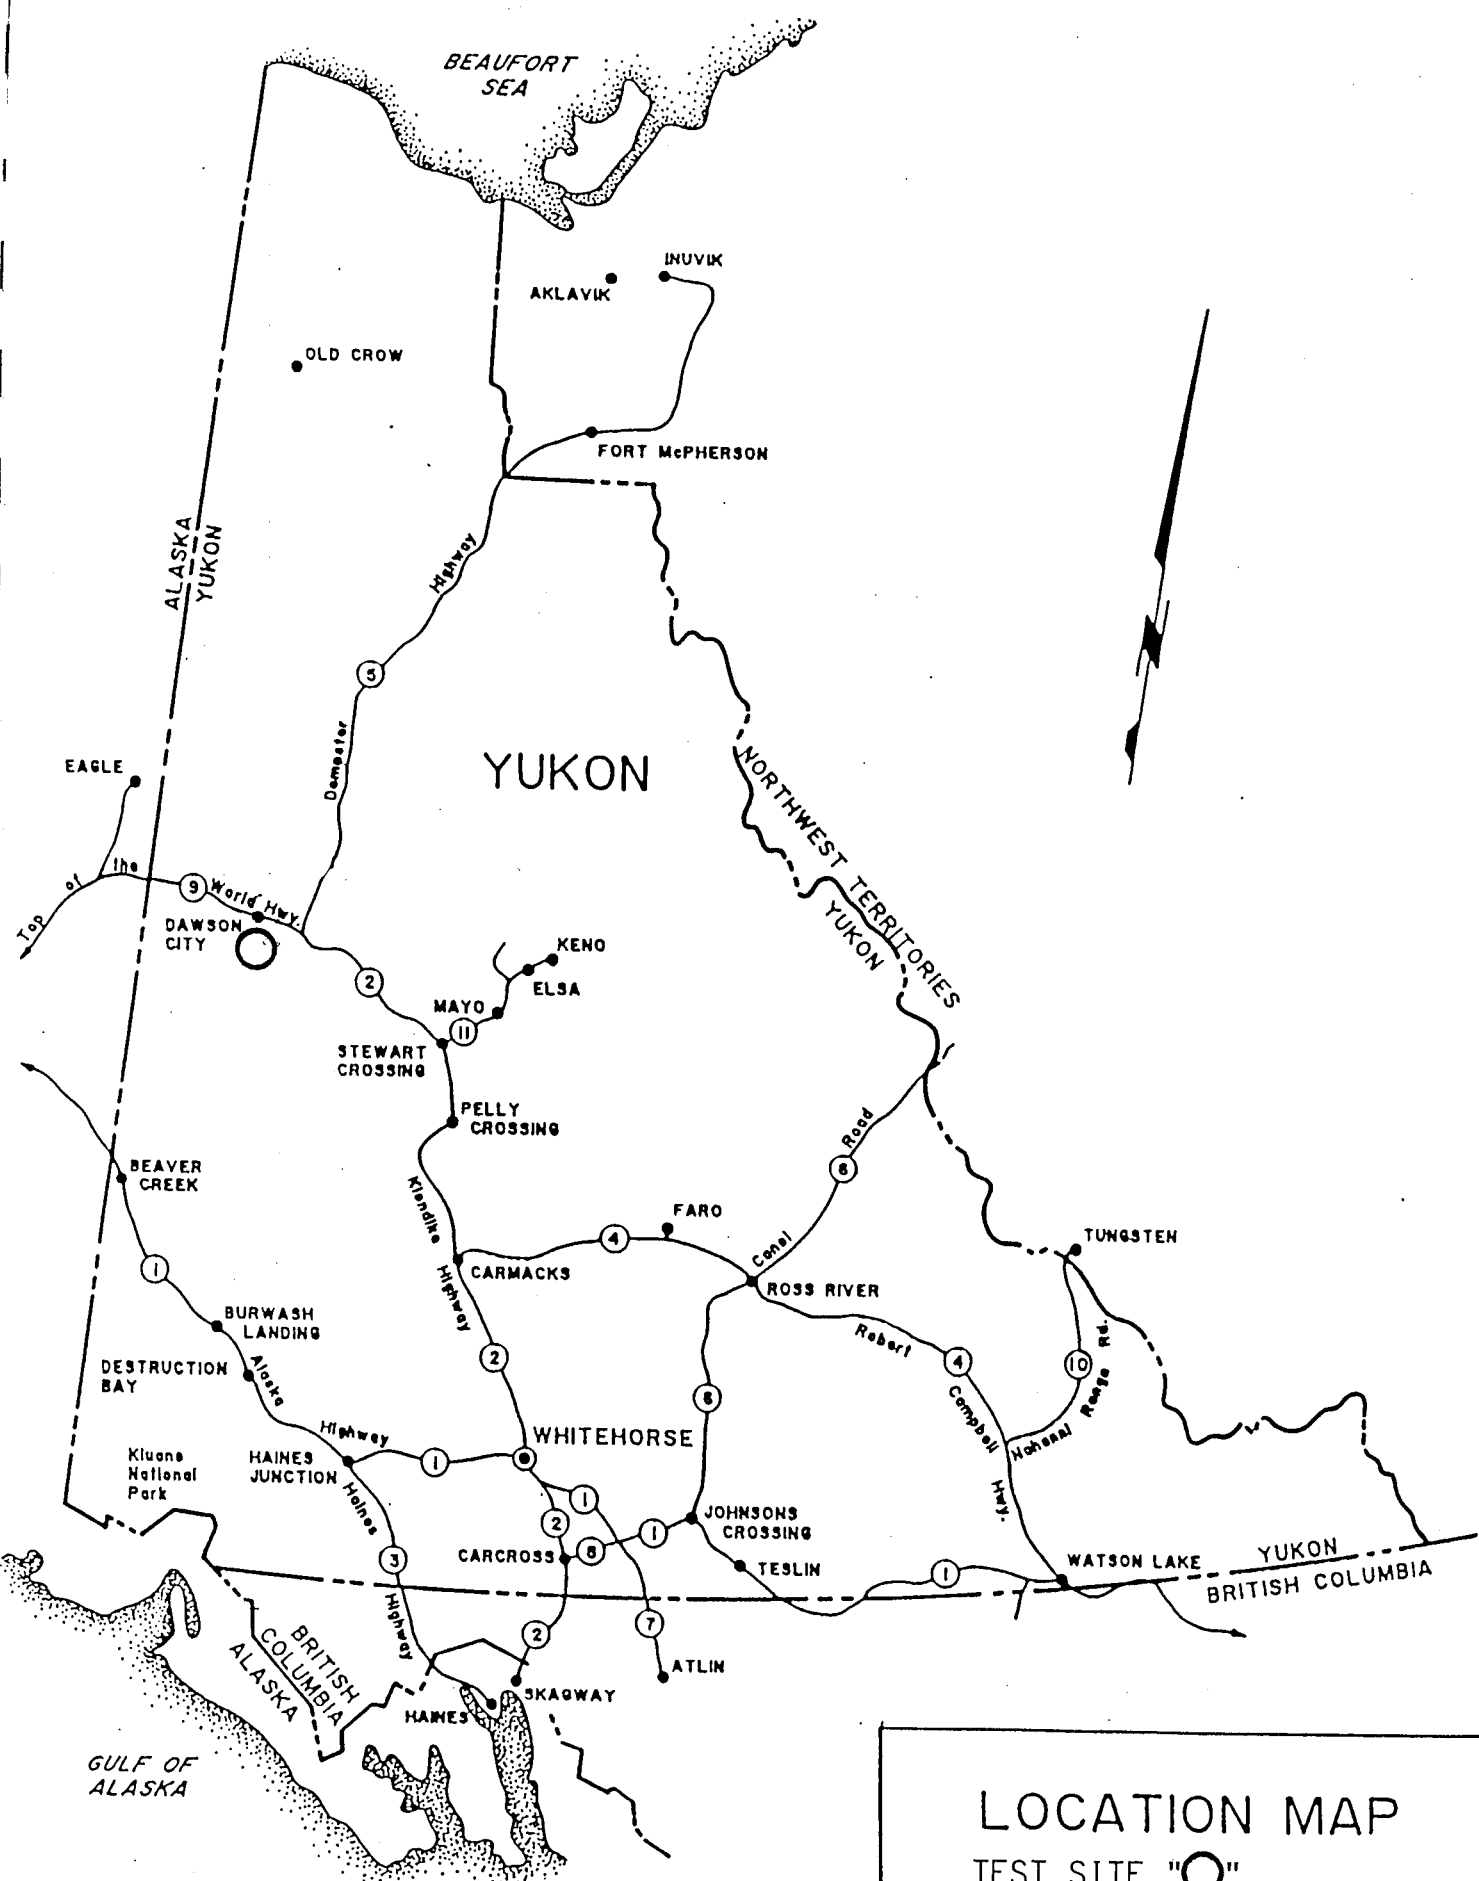

---

## 1. INTRODUCTION

On June 14, 1991 a seismic survey was conducted on Play Gold Disc placer claim #P37003 for the owner Walter Farr by fieldsman Scott Cone.

Scott Cone, using a compass and hip chain, located two (2) sites along the north side of the base line in the middle of the property. Test locations were marked with flagging and labelled. (See Fig. C)

The seismic consultant, Ted Sandor, processed field recordings and interpreted the data received.

## 2. SURVEY

### 2.1 Location and Access

Play Gold Disc Claim #P37003 is located on 18 Gulch that drains into Bonanza Creek from the east. Dawson City is located approximately eight (8) miles north of this claim by road.

Access to the test site was by 4x4 pickup. Testing was done on foot. (See Access Map)

### 2.2 Claim Information

| Name           | Placer Claim Number | Owner       |
|----------------|---------------------|-------------|
| Play Gold Disc | P 37003             | Walter Farr |

Claim Sheet 115-0-14h

### 3. PERSONNEL

Scott Cone surveyed, marked, measured, expedited and carried out the field work.

Ted Sandor supervised the quality, directed the data processing and prepared the report.

#### 4. GEOLOGY

Metamorphic rocks southwest of the Tintina Trench:

"Klondike Schist": mainly buff weathering, light pale green quartz - muscovite - chlorite schist, and schistose, chlorotic quartzite, with all intermediate rock types also present - minor silvery muscovite schist, fine-grained quartz- biotite gneiss, thinly laminated quartz - graphite - sericite schist and quartzite.

## 5. INSTRUMENTATION

Directional Electret Microphone  
800 OHMS 30 - 18,000 Hz Response

Panasonic Magnetic Tape Recorder Model #RQ-L335  
Frequency Range: 180 - 7,000 Hz  
Tape Speed: 4.8 cm/s (1-7/8 I.P.S.)  
Track System: 2-track monaural, recording and playback  
16 ga. shotgun, 1-1/8 oz. shot, #7-1/2 shot

### Software:

Sound Filler St. Visual Sample Editor  
Requires TOS in ROM

### Akai Professional S700 Digital Sampler

12-Bit Sampling

Sampling Frequency: 4KHZ - 40 KHZ

Sampling Time: 8 Sec. - 08 Sec.

Frequency Response: 25 Hz - 16 KHz

Atari 520 St. Computer

Processor: MC6800, 32 Bit Internal,  
16-Bit External Architecture  
8 MHz clock frequency.

Memory: 524,288 Bytes of RAM; 196,608 Bytes of ROM

Keyboard: 94-key Intelligent keyboard, using 6301 Microprocessor

Storage Medium: 3-1/2 inch, Microfloppy disk;  
Single-Side, Double Density;  
135 Tracks per inch

Data Transfer

Speed: 250 Kilobits per second

Atari Sc. 1224 RGB Colour Monitor

Seikosha SP-1600 Dot Matrix Printer

Printing Method: Impact Dot Matrix Bidirectional Logic  
Seeking Printing

Print Head: 9 Pins

## 6. THEORY

This report is intended as a guide to the application of seismic refraction and reflection techniques to shallow, subsurface exploration of engineering sites. Many civil engineers and geologists have some acquaintance with this basic geophysical tool, but few apply it frequently. The primary purpose of the report is to provide the reader with a working knowledge of the method, with a convenient reference, and further, with a basis to judge the applicability of the method and the results to his particular exploration problem.

Solid state electronics have improved the portability of engineering-type refraction and reflection instruments, but they operate fundamentally in the same way they did 50 years ago. The basic field practices and methods of interpreting the data have not changed with time, although specialized interpretational techniques have been proposed and developed for some difficult cases.

The conduct of refraction and reflection surveys and the interpretation of the data are well-established and reasonably straight forward, although they are not invariant. The user can change the field layout of his equipment and apply judgement and imagination in his handling of the raw data. In common with other indirect methods of subsurface exploration, there are no rigid inflexible approaches to making sense of the data, nor are there any handbooks that infallibly direct the engineer, geologist or geophysicist to the correct answer. The general case will require thought and care: ambiguities and uncertainties are not uncommon. Some foreknowledge of the site conditions and an understanding of what is geologically plausible will always assist in resolving the raw data into meaningful information.

Figure 1 shows a refraction survey. This method could be quite costly and require complicated data processing should multiple layers of soil and gravels be encountered.

## 6. THEORY CONTINUED

Figure 1. Schematic of Seismic Refraction Survey

There is a definite relation between reflected and refracted energy which could be observed in Figure 2B. Using this principle and Tables A1 and A2 calculation is simplified, for the sound in a reflected survey only has to go down, turn around at point of geophone or microphone without going along the higher velocity layers and then back up. Seismic waves will bounce off of most surface with a lot of amplitude but not necessarily with a wide range of frequencies. The reflected seismic waves returning to the geophone with the strongest amplitude and frequencies should come from the layer with the highest velocity change which, in most cases, should be bedrock (solid rock) or from a gravel layer directly beneath an organic surface cover.

## 6. THEORY CONTINUED

Figure 2. Schematic of Seismic Reflection Survey

The thicker line representing the reflected seismic wave from the bedrock to the microphone should be the wave with the highest amplitudes and the widest range of frequencies in Figure 2. The six foot distance from microphone to charge is to prevent damage to the delicate recording equipment. The error of this footage can usually be made up by averaging the total of the velocities a little higher to simplify interpretation. In this case "1,200 ft/sec." will be close enough.

## 6. THEORY CONTINUED

Fig. 2b. Amplitudes of reflected and refracted compressional waves relative to incident waves as a function of angle of incidence.

Figure 2b Amplitudes of Reflected/  
Refracted Compressional Waves

It may seem anomalous in Figure 2b that the sum of the amplitudes of the reflected and refracted pulses is greater than that of the incident wave (i.e., greater than 1.0). However, the energy of a pulse is proportional to the square of its amplitude, and the sum of the energies of the reflected and refracted waves is equal to the energy of the incident wave.

Table A1. Speed of propagation of seismic waves in subsurface materials.

| MATERIALS                                                | FEET PER SECOND  | MATERIALS                                                                                                                                                                                                                     | FEET PER SECOND  |

## 7. METHOD

After the grid pattern is established on a given claim by the owner or party in charge, we mark each test with flagging. We clean loose debris to allow firm soil contact with the microphone. We then cover the microphone to lessen the surface noise. A small charge is fired (usually a 16 gauge shotgun) to generate a seismic wave six feet from the microphone. The wave going into the ground and the reflected signal coming out is recorded on a magnetic tape recorder. We also do a field test on a nearby area with similar conditions where bedrock depth is known by drilling or excavation to determine the velocity of the gravels.

## 8. DATA PROCESSING AND PRESENTATION

The recording is sent back to base camp and is transferred into the Akai S700 Digital Sampler by means of a coaxial cable with 6.3 mm phone plug jack. The Akai is coupled with the Atari 520 St. computer with Midi Interface. Other peripherals are connected with various other interface connections.

The seismic recording is now analyzed in various formats and then the best choice is printed out on a Seikosha SP-1600 Dot Matrix Printer. A report on the testing and the interpretation of the data is made out to finalize the survey, along with copies of the original Fourier Transform for 3-D wave form analysis.

## 9. INTERPRETATION

In tests conducted in the past on Hunker Creek and the Klondike River, we determined that those frozen gravels had a velocity of 1500 ft/sec. (1.5 ft./ms.). Based on this calculation the following formula is used:

Reflected milliseconds x 1.5 divided by 2 = feet to bedrock or the layer to be of interest.

### TEST 1

Fourteen (14) milliseconds indicate a strong stratum change at 11 feet. On the 3D format the broader frequency range comes at 40 milliseconds showing bedrock to be 30 feet deep.

### TEST 2

Nineteen (19) milliseconds show bedrock at 14 feet.

## 10. CONCLUSION

For the many varying soil conditions in different geographical locations could alter the final results. For this fact, an actual excavation on one of the test sites is strongly recommended. The most shallow reading test site is the best suited for this purpose. More accurate results can be achieved in this manner.

## 11. RECOMMENDATION

This type of reflected seismic testing is ideal in shallow placer ground. Without drilling or excavating near the test sites to establish velocity, the contour of the subsurface profile could still be charted in a cross test of a given valley. Old stream beds are possible to locate this way, giving a target area for a drill. A re-analysis of the seismic data after a drill log can make these tests surprisingly accurate. A tighter grid pattern in the future may be of great value in a drilling or mining strategy program.

## 12. STATEMENT OF ASSESSMENT COSTS

For seismic survey conducted on Queen Gulch on Placer Lease #PL8563.

### Seismic Test

\$250 per test x 2 shots = \$500

Includes:

Seismic consultant  
Assistant for field and expediting  
Computer and printer time  
Computer and program time  
Computer down-loading (off-loading/data dumping)  
Seismic interpretation  
Equipment - ATV, axe, hip chain with thread,  
flagging tape, marker etc.  
Transportation  
Food and camping supplies  
Accommodations (hotel, tent or camper)  
Test shots where applicable (for calibration)

### Report Preparation

Report writing, drafting,  
map and figure preparation,  
photocopying and binding = \$200

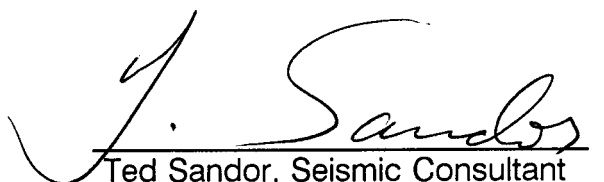

Total Cost = \$700

## CERTIFICATION

I, Ted Sandor, of Whitehorse, Yukon Territory certify that:

1. I hold a Gas and Arc Welding diploma from Northern Alberta Institute of Technology, Edmonton, Alberta, and have been practising continuously since mid seventies in Ardco Industries on oil field and seismic related equipment.
2. I am a journeyman welder, licensed to practise in Alberta. The geophysical technology came from extensive field work in the oil patch, and the very need to satisfy my own mining strategy since 1978.
3. The geophysical field work was conducted with assistance that may change from test to test. The report preparation and interpretation is done by me personally to keep up the highest quality of this report.
4. I have based conclusions and recommendations contained in this report on my knowledge of geophysics, my previous experience and the results of the field work conducted on the property.
5. Directly or indirectly I hold no interest in this property other than professional fees, nor do I expect any interest in the property or any other of the owner's holdings.
6. The accuracy of the final results depends more on the calibration of the recording device and the computers than on the qualification of the operator.

*Whitehorse, Yukon Territory*  
*June 14, 1991*

  
Ted Sandor, Seismic Consultant
