INTRODUCTION

This report was prepared at the request of Mr. M. Nielson, Director, on behalf of Anooraq Resources Corporation. The report compiles a review of public and private information relating to the Evelynn Creek Property (Eve Claims). As a part of this evaluation the property was examined by the author in the company of Mr. Nielson and Mr. T. McCrory, agent for Anooraq Resources Corporation. The author is familiar with the area, having directed various exploration programs in the vicinity from 1974 to 1981.

SUMMARY

The Anooraq Evelyann Creek property covers a geological environment permissive to host copper - silver and silver - lead - gold mineralization. The property warrants additional exploration to evaluate favorable host structures and lithologies. A two-phase development project is therefore recommended by this report at a proposed budget of \$102,500.00 to complete the required program.

YUKON TERRITORY MINING DISTRICTS

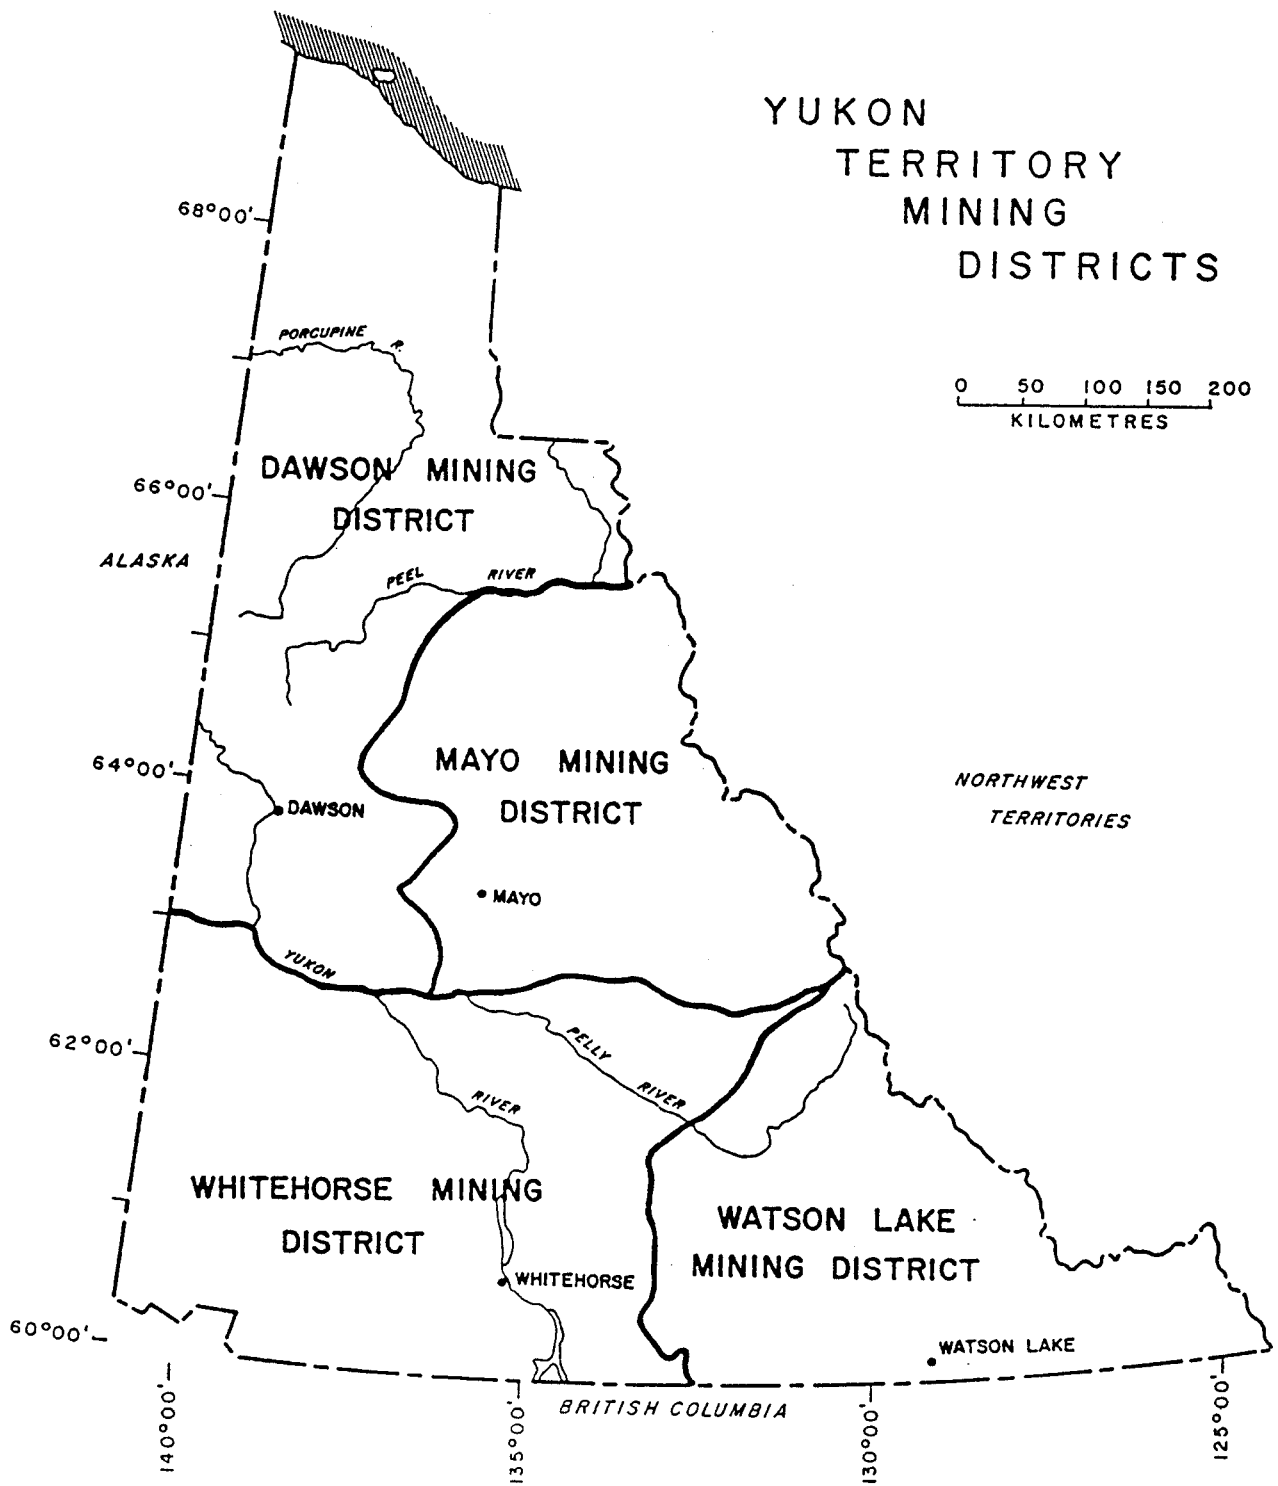

FIGURE 1

PROPERTY

The Evelynn Creek property controlled by Anooraq Resources Corporation is comprised of 79 located Yukon Mineral Claims, as summarized in Table 1. The Eve Claims are administered by the Whitehorse District Mining Recorder located in Whitehorse, Yukon. Located claims, such as these, are held pursuant to the regulations of the Yukon Quartz Mining Act. and require annual assessment work expenditures of \$100.00 per claim to be maintained in good standing.

LOCATION AND ACCESS

The Evelynn Creek property is located approximately 25 Km north of Johnsons Crossing (Km 1346, Alaska Highway), in south-central Yukon. The claim group is centered approximately $60^{\circ}42'N$ - $133^{\circ}20'W$ on NTS Claim Map 105C-11. Access is by helicopter available in Whitehorse or Teslin, Yukon. A rough access road suitable for four-wheel drive vehicles extends from mile 19 on the Canol Road to near the property boundary on Evelynn Creek.

TOPOGRAPHY AND CLIMATE

The Evelynn Creek property covers rugged upland country near the common head waters of Evelynn Creek and streams draining to Teslin River. Elevations locally range from 4500 feet to more than 6000 feet above sea level. The region is characterized by steep talus, covered slopes in higher regions and with rounded, glacially modified ridges in lower terrains. Most larger valleys are floored with moraine material. Outcrop exposure is good above 5500 feet above sea level, but generally less than 10% below this altitude.

The area has a characteristic northern interior climate typical of this latitude. Winters are commonly long and cold with moderate snowfalls; summers, by contrast, are warm, but short, with long hours of daylight. Typically, break-up occurs in early May and freeze-up resumes during late October. Minimum winter temperatures may reach -50°C with summer maximums in the $+30^{\circ}\text{C}$ range.

HISTORY AND PREVIOUS WORK

Parts of the Teslin Map Area have been investigated by Geological Survey of Canada personnel on several occasions. R.G. McConnell (1998), J.C. Gwillim (1901) and E.J. Lees (1936) mapped portions of Teslin area in conjunction with other reconnaissance work. C.S. Lord (1944) and E.D. Kindle (1946) carried out geological investigations along the Alaska Highway and Canol Road, respectively. The Teslin Map Sheet was mapped and compiled by R. Mulligan during 1950 - 1953, who published the results as Map 1125A in 1963.

The streams draining Big Salmon Range into Teslin River were prospected for placer deposits by miners from the Dease Lake area previous to discovery of gold in the Klondike region in 1896. Workable placer gold deposits were located in the Livingston Creek area immediately north-west of Teslin Map Sheet in the Big Salmon Range by 1899 and a surge of exploration to the surrounding area ensued. In the following two decades, the Livingston placer camp produced more than 50,000 ounces of gold, but mining had virtually ceased by 1920. By the early 1930's, the level of exploration activity again increased in the Big Salmon region with miners working on creeks in the Livingston Creek camp and on Iron Creek and Cottonwood Creek between Big Salmon Range and Nisutlin River. However, the region again became dormant with the outbreak of World War 2 and next underwent exploration activity surges as a result of opening the Canol Pipeline Road to civilian travel and improved road access along the Alaska Highway. The advent of helicopter supported prospecting programs in the late 1950's resulted in additional exploration of the Teslin region.

The area encompassed by the Anooraq Evelynn Creek property has been staked, or partially staked, by several operators. The first recorded claims in this location were apparently located in 1955 to 1956 by individuals staking the manganese (rhodonite) and rhodocrosite) and chalcopyrite - bornite mineralization. Mt. Grant Mines Ltd. acquired the prospects

in 1968 and constructed a 14 mile access road to facilitate exploration at the manganese occurrence. A percussion drilling program totaling 2901 feet was completed to test the deposit.

The property was again acquired by staking by Cortex Silver Mines Ltd. in 1968 and Providence Mining Ltd. in 1974, but no additional exploration was conducted by these owners.

GENERAL GEOLOGY

The Evelynn Creek Property is underlain by stratified metamorphic rocks of the Paleozoic Big Salmon Complex. The unit here consists of quartz-biotite schist, argillaceous slate, quartzites and limestone member. Lower Paleozoic (?) quartz-hornblende gneiss outcrops north and south of the Eve Claims. Cretaceous granitic rocks intrude the metamorphic complex on the eastern portion of the claim area. The stratified rocks are highly regionally metamorphosed and typically are intensely deformed with tight isoclinal folding and slip-faulting.

Regionally, the bedded rocks are folded, with fold axes generally parallel to the trend of the formation. This main orientation is usually a north west strike. The more competent rock lithologies (eg: limestone) show brecciation, tectonic fracturing and straining (boudinage), associated with the folding event.

Faulting is a common feature, in this area, with many normal faults observable as topographic lineaments. No preferred orientation has been recognized for these fault systems to date.

Low angle thrust faults may be implied in some localities, but recognition of such elements is quite difficult on a regional scale.

A summary of geology is provided in Table 2:

TABLE 2 TABLE OF FORMATION

Quaternary	Q	Glacial drift; till.
Cretaceous	Kg	Granite; Granodiorite; Medium grained, equigranular greyish colored fresh rocks.
Mississippian (?)	Msq	Biotite-quartz schist; quartzite; Limestone. Includes quartz-sericite alteration lithologies.
Cambrian (?)	Cg	Quartz hornblende gneissic rocks.

ECONOMIC GEOLOGY

The Anooraq Evelynn Creek property contains occurrences of vein-type silver - lead - gold and replacement - type copper - silver mineralization.

The vein zone is exposed in two trenches approximately 30 meters apart in a steep talus covered slope on Evelynn Creek. The vein system is apparently a fissure - filling in gneissic rocks and consists of galena and pyrite in a ribbon quartz matrix. The zone is up to 0.5m wide and contains up to 15% galena over 10cm increments. A grab sample of well mineralized vein material (No. 8107) contained 25.4% lead and 8.46 OPT silver. The host gneissic rock is typically fresh and unaltered except for narrow (1-10cm) alteration "envelopes" peripheral to the veining. Extensions of this vein structure are obscured by the talus slope.

A chalcopyrite - bornite replacement zone occurs in schist and gneiss lithologies on claim Eve 78. Mineralization, consisting of bornite and chalcopyrite, is present in a strata-bound quartz-carbonate lense up to 30cm in width and exposed by trenching for a 10m length. Small (1cm) chalcopyrite veinlets are occasionally present cross-cutting the host lithologies below the main lense. Sulphides are present up to 30% and three grab samples were assayed to test precious metal content of bornite-rich main zone mineralization (No. 8102), chalcopyrite-rich main zone mineralization (No. 8101) and material from chalcopyrite-rich cross fractures (No. 8103). Results are presented in Table 3.

Extensions of the main zone are obscured by overburden. but similar-appearing mineralization occurs sporadically as float along the strike projection as much as 400 meters south-west of the Eve 78 trenches. The zone dips moderately south-east.

A section of brown-weathering weakly altered quartz-sericite schist with

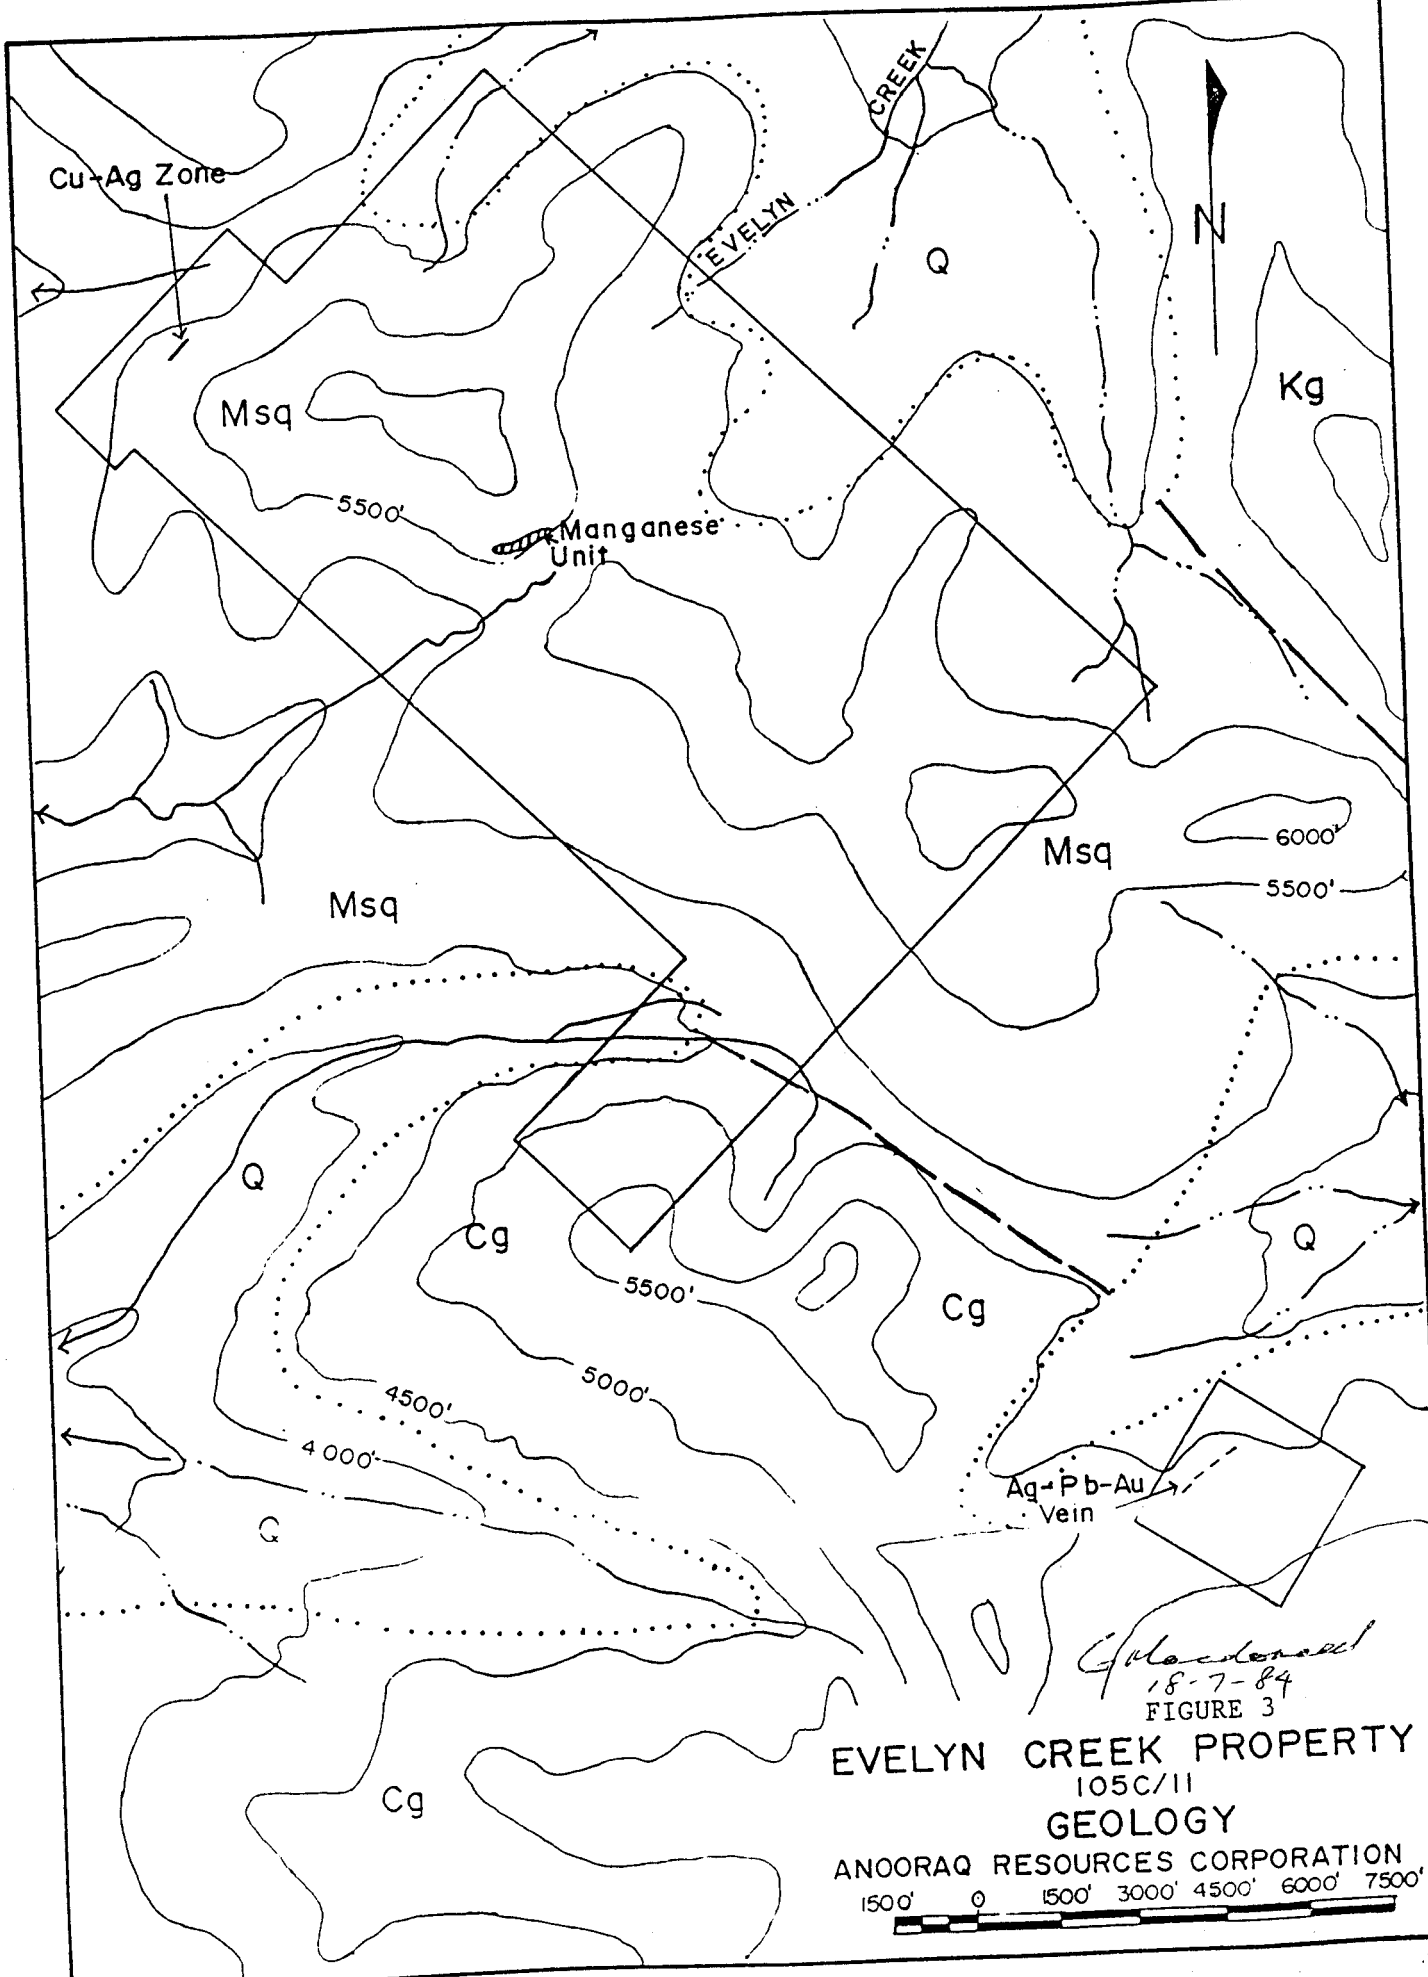

up to 5% finely disseminated pyrite was tested as sample No. 8108. Garnet-diopside-magnetite skarn is present in this vicinity as float, suggesting that the alteration of the schist unit may be a local metamorphic (hydrothermal) event. This zone is present on claims Eve 12-13 near a rhodocrosite lithologic (?) unit.

Metamorphic lithologies on the Anooraq property are structurally quite complex with intense local deformation (contortion of schist units etc.). Some of the stratified units are apparently in a fault relationship (thrust fault, or low angle fault). Steeply dipping normal faults trending generally north-easterly complicate geological interpretation in the centre of the property.

CONCLUSIONS AND RECOMMENDATIONS

The Anooraq Evelynn Creek property covers occurrences of bornite-chalcopyrite replacement mineralization and silver-gold-lead vein mineralization in a geological environment permissive to host significant metal deposits. Environments present on the property worthy of exploration are as follows:

1. Extensions to and additional zones of copper-silver mineralization on Eve 78.
2. Skarn zones in the limestone units near the centre of the claim block.
3. The fault/limestone contact region north-east of the silver-lead veining on Eve 73 - 76.

A two-phase program of exploration is recommended to evaluate the economic potential of the Evelyn Creek Property as follows:

<u>PHASE 1</u>	
Geological Mapping and Prospecting	\$ 10,000.00
Stream (concentrate) Sampling	5,000.00
Soil Geochemical Survey	7,500.00
IP Geophysical Survey	7,000.00
VLF-EM Geophysical Survey	3,000.00
Bulldozer Trenching	7,500.00
Road Rehabilitation	5,000.00
Grid	<u>7,500.00</u>
<u>Total Phase 1</u>	<u>\$ 52,500.00</u>
<u>PHASE 2</u>	
Diamond drilling 1000 feet @ \$40.00/ft.	\$ 40,000.00
Contingency	<u>10,000.00</u>
<u>TOTAL BUDGET</u>	<u>\$102,500.00</u>

Respectfully submitted

CERTIFICATE OF QUALIFICATIONS

I, Glen C. Macdonald, with business and residential address in Whitehorse, Yukon, do hereby certify that:

1. I am a consulting professional geologist.
2. I am a graduate of the University of British Columbia (B.Sc. Geology, 1973 and B.A. Economics 1971).
3. I am registered as a Professional Geologist by the Association of Professional Engineers, Geologists and Geophysicists of Alberta (No. 36214).
4. I am registered as a Professional Geologist by the Association of Professional Engineers, Geologists and Geophysicists of the Northwest Territories (No. L166).
5. I am a member in good standing of the Canadian Institute of Mining and Metallurgy.
6. I have practiced Mining and Exploration geology in Yukon, northern British Columbia and Northwest Territories since 1973. I began private practice in 1982 after leaving the position of Regional Geologist for Noranda Exploration Company, Limited, Whitehorse, Yukon.
7. I have examined the showings and area of the Evelynn Creek property of Anooraq Resources, Corporation and have reviewed all available private and public information on the property to compile this report.
8. I have not received, nor do I expect to receive, any interest in properties or securities of Anooraq Resources, Corporation.
9. I hereby grant my permission for Anooraq Resources Corporation to use this report for filing with the Vancouver Stock Exchange as partial requirement of a Statement of Material Facts or for any legal purposes normal to the business of Anooraq Resources Corporation.

DATED at Whitehorse, Yukon this 30th day of September. 1984.

Glen C. Macdonald, P. Geol.
