SUMMARY

This assessment report documents a soil geochemical survey conducted on the Kon 134 to 239 claims inclusive (Slide Lake and Ketza River properties) during the period June 18 to September 10, 1986. The claims are located 42 kilometres south-southeast of Ross River in the Watson Lake Mining District, Yukon Territory.

The Slide Lake property, wholly owned by Canamax, comprises 77 of the above Kon claims. The Ketza River property, with 29 of the above claims, is owned jointly by Canamax and Pacific Trans-Ocean Resources.

A total of 890 soil and stream sediment samples were collected and analyzed geochemically for Cu, Ag, Zn, Pb, Au and As. Samples were collected at 50 metre spacings on reconnaissance lines run parallel to topographic contours to cover the entire property and at 25 and 50 metre spacings on grid lines installed to obtain better definition of a soil anomaly defined by the reconnaissance sampling. Fourteen anomalies were identified and are listed in order of priority. Of these fourteen, ten are gold ± arsenic, silver, lead, one is arsenic without associated gold, and three are lead only.

CONCLUSIONS AND RECOMMENDATIONS

Gold soil anomalies 1 to 4 on the northern half of the Slide Lake property have potential for quartz vein stockwork or limestone replacement gold orebodies. Grid sampling of an approximate 3 kilometre by 3 kilometre area covering anomalies 1 to 4 is warranted to obtain better definition of the anomalies and possibly define additional anomalies. Samples should be collected at 50 metre spacings on 100-metre-spaced lines. Closer sampling should be conducted subsequently within anomalous areas to define trenching targets.

Prospecting and geological mapping is recommended as follow up to soil anomalies 2 to 10.

Bulldozer trenching is recommended within zones of soils highly anomalous in gold, particularly on soil anomaly 1. Hand trenching should be conducted in areas inaccessible by bulldozer.

INTRODUCTION

General Statement

This report presents results of a geochemical survey completed on a block of 106 claims located 42 kilometres south of Ross River in the Watson Lake Mining District, Yukon Territory. Seventy-seven of the claims are 100 percent owned by Canamax Resources Inc. and are referred to as the Slide Lake Property. The remaining 29 claims are owned jointly by Canamax (50%) and Pacific Trans-Ocean Resources Inc. (50%) as part of the Ketza River Property. Work was conducted over the period June 18 to September 10, 1986 by F.R. Harris, D.B. Fleming, C.N. Orssich, L.G. Rowan, M. Burke, D. Pires and R. Versoza. Direct field cost of work claimed for assessment was 25,701.22.

Location, Physiography, Access (Figure 1)

The claim block is located 42 kilometres south-south-east of Ross River in the Saint Cyr Range of the Pelly Mountains. Terrain is rugged, mountainous and predominantly above tree-line. Elevations range between 1,250 and 2,141 metres. The southeast portion of the claims are within walking distance of the Ketza River Base Camp. The remainder of the claims are best accessed by helicopter.

Claims Status

Work described in this report was completed on Kon 134-239 claims inclusive (Record Numbers YA90825 to YA90920 and YA90965 to YA90974 inclusive) as listed below and shown in Figure 2.

CANAMAX RESOURCES INC.

SLIDE LAKE PROPERTY

WATSON LAKE MINING DISTRICT — YUKON TERRITORY

LOCATION MAP

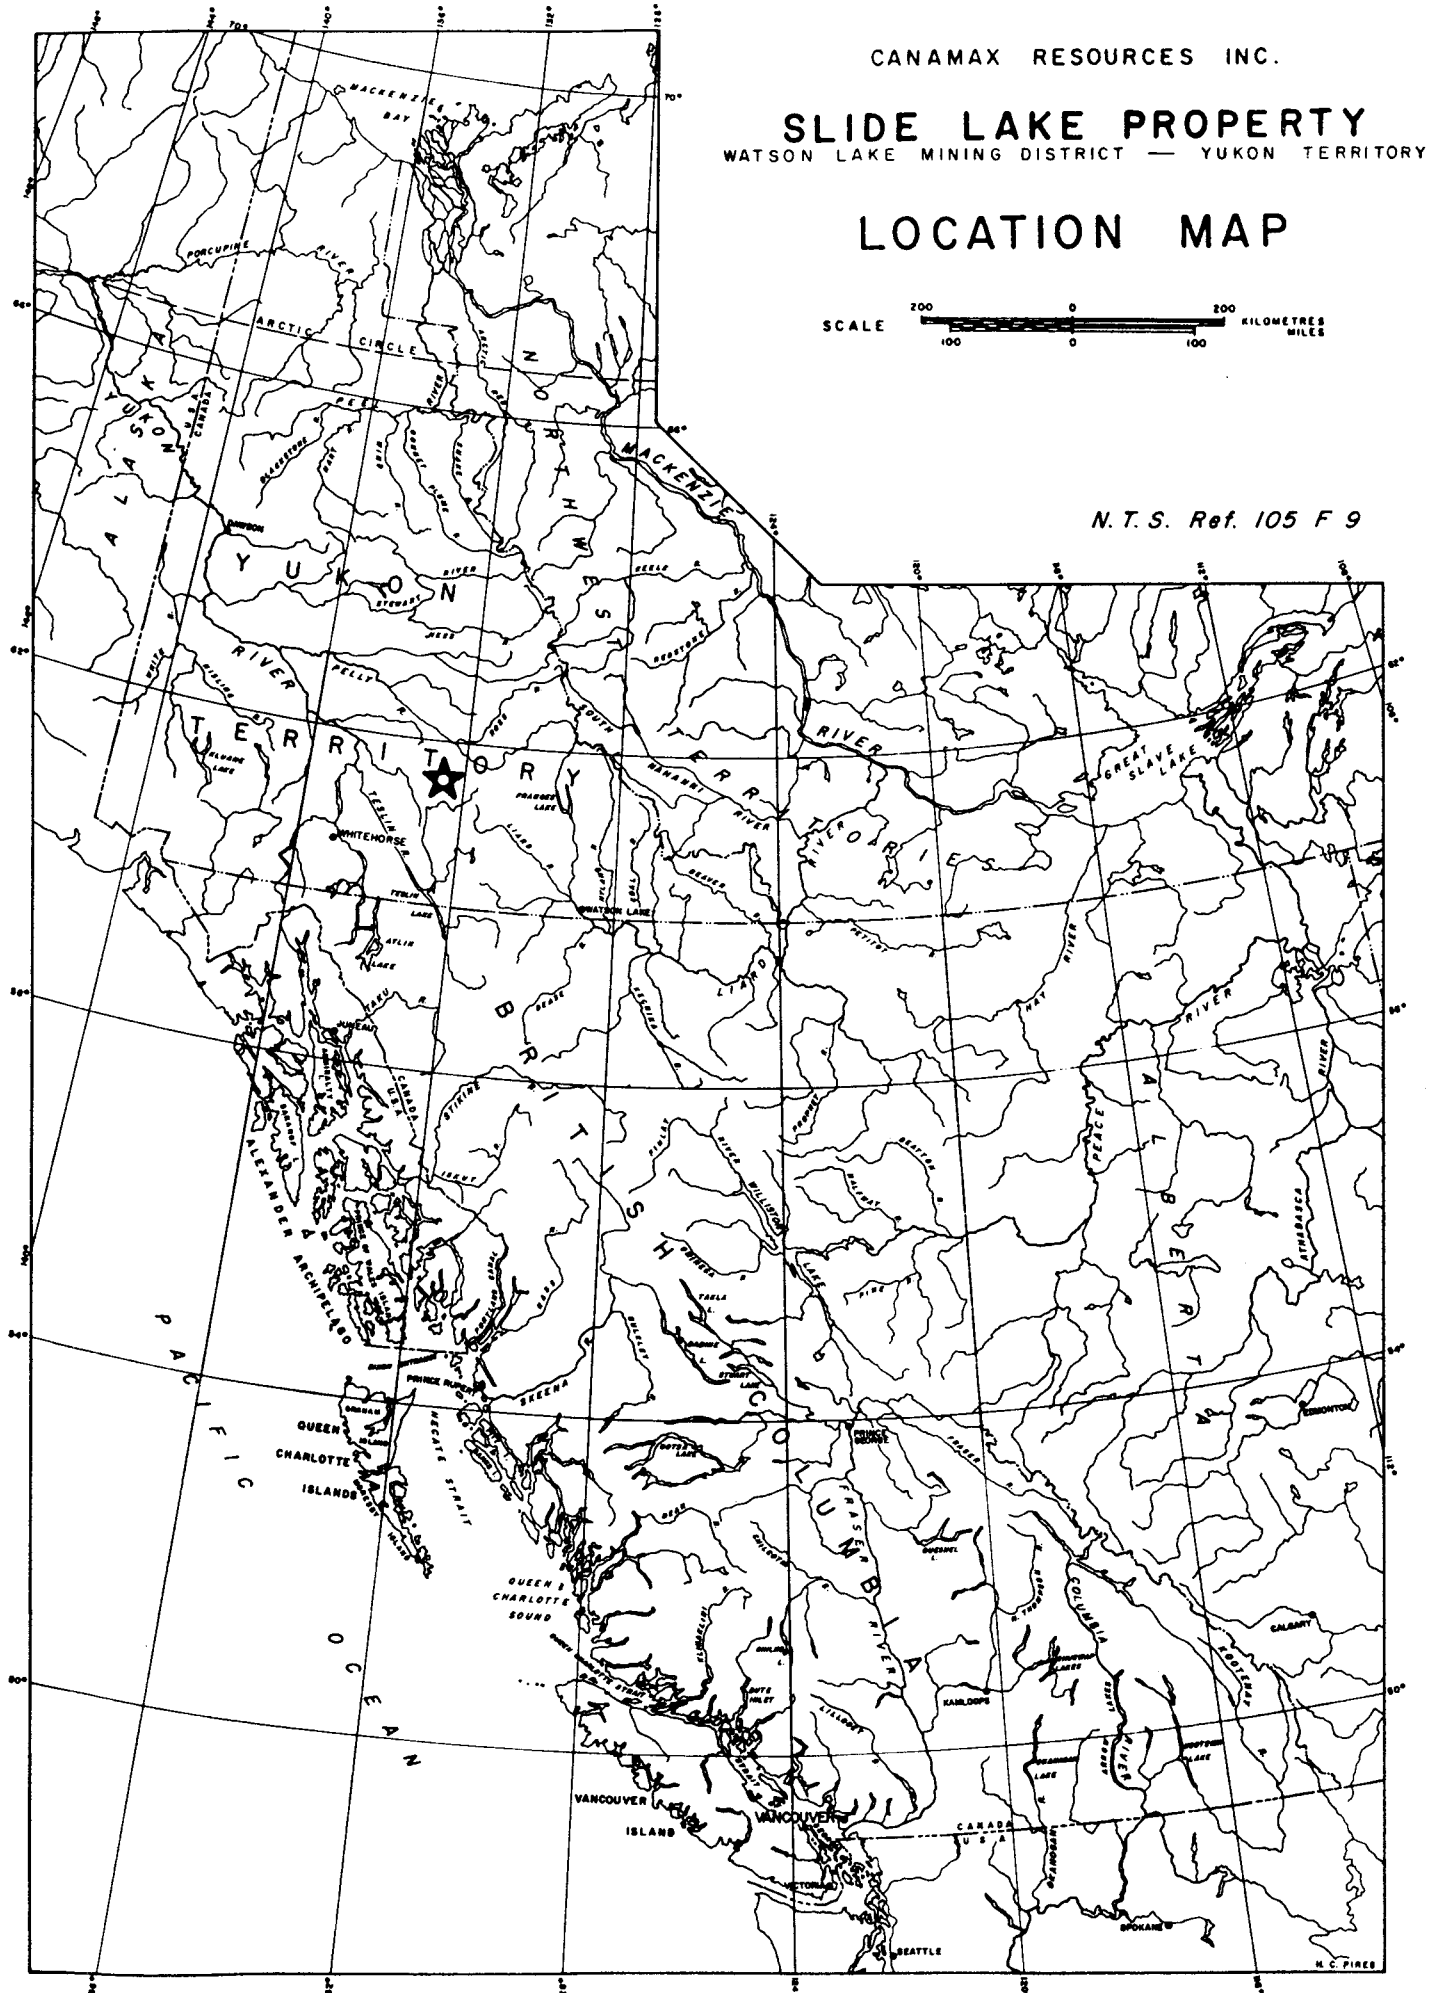

FIG. 1

Ketza River Property (Canamax Resources Inc./Pacific Trans-Ocean Resources Ltd.): Kon 134-147, 154-165, 174, 176, 178.

Slide Lake Property (Canamax Resources Inc.): Kon 148-153, 166-173, 175, 177, 179-239, 246-261.

The claims were staked in March and May, 1986 and recorded in April and May, 1986. All are located in the Watson Lake Mining District.

Kon 246 to 261 claims were recorded on September 22, 1986, subsequent to the work described in this report and are therefore ineligible for assessment credits from this work.

Previous Work

The Fury Showing was discovered, mapped and hand trenched in 1955 on ground now covered by Kon 200 and 202 claims. It is described as a zone of quartz veins with minor chalcopyrite and tetrahedrite ranging from 0.5 to 4.5 feet wide and traceable along strike for 300 feet. A selected sample analyzed 7.8% Cu, 45.5 oz/t Ag and 0.44 oz/t Au (Archer, Cathro; 1972).

GEOLOGY

Regional Setting

The claims lie within the Pelly-Cassiar Platform, a structural province located southwest of the Tintina Fault. The rocks of the Pelly-Cassiar Platform consist of sedimentary and volcanic rocks ranging in age from Upper Proterozoic to Mississippian and are intruded by stocks of Mississippian syenite and Cretaceous quartz monzonite. The Pelly-Cassiar Platform is bounded by the Selwyn Basin to the northeast and the Omineca Crystalline Belt to the southwest. The region is imbricated by northeasterly directed thrust faults and is segmented by normal faults.

Property Geology

The claims are underlain by sedimentary rocks ranging from Upper Proterozoic to Upper Cambrian age. Upper Proterozoic green-grey phyllite and Lower Cambrian black limestone are exposed in the valley on the southwest portion of the claims. These rocks are successively overlain by Lower Cambrian mudstone or phyllite, and bedded to massive light grey limestone or its orange-brown dolomitized equivalent; these strate are common over most of the property. Upper Cambrian shale and overlying variably calcareous phyllite occur predominantly in the northern portions of the property.

The rocks are cut by a series of subparallel north-to-northwest-trending faults which are thought to be responsible for the localization of mineralization.

GEOCHEMISTRY

Survey Description

A total of 890 soil and stream sediment samples were collected and analyzed by atomic absorption for Cu, Ag, Zn, Pb, Au and As at Rossbacher Laboratory, Burnaby, B.C. Five hundred and sixty soil samples were collected at 50 metre intervals along reconnaissance lines run parallel to topographic contour and cover the entire claim block. One hundred and ninety-six soil samples were collected from a small 600 by 450 metre grid on the northern portion of the claims to obtain better definition of a soil anomaly located by Canamax in 1984. Samples were collected at 25 metre spacings on 50 metre-spaced lines. The reconnaissance and grid sampling indicated a large linear anomaly (Anomaly 1) covering the grid area and extending 2.2 kilometres to the southeast. One hundred and twenty-one soil samples were collected at 50 metre spacings on 500 metre-spaced lines to obtain better definition of this anomaly. Thirteen stream sediment samples were collected along traverse lines, or randomly.

Results

Analytical results are listed in Appendix III and are plotted on Figures 3 to 6. The results for gold and arsenic are plotted on one set of maps with lead and silver plotted on another set. Results for zinc and copper were not plotted as they provide little additional information. Zinc values closely follow lead while copper values generally follow arsenic. Anomalous thresholds were determined by inspection as follows:

Au	- 15 ppb	Pb	- 100 ppm
As	- 200 ppm	Ag	- 2.0 ppm

Anomalous thresholds are contoured for gold and lead. Highly anomalous thresholds have also been contoured at 150 ppb gold and 1,000 ppm lead.

Fourteen anomalies have been identified and are discussed in order of priority in Table 2.

C.N. Orssich

C.J. Hodgson, P.Eng (B.C.)

TABLE 2

GEOCHEMICAL ANOMALIES

Anomaly Number	Anomaly Description	Geological Setting	Related Mineralization	Recommendations
1	A coincident Au, As, Pb, Ag anomaly 2.7 km long and up to 600 m wide. Results range up to 4000 ppb Au, 8800 ppm As, 3740 ppm Pb, 14.6 ppm Ag.	Occurs predominantly over Lower Cambrian limestone and minor Upper Cambrian shale.	Many zones of quartz vein stockwork with minor pyrite, arsenopyrite, galena, chalcopyrite up to 100 by 200 m. Smaller zones of oxide mineralization.	Grid soil sampling, bulldozer trenching on highly anomalous soil anomalies.
2	Several samples anomalous in Au, As, Pb, Ag over 600 m. Results range up to 300 ppb Au, 1660 ppm As, 1440 ppm Pb, 6.4 ppm Ag.	Occurs predominantly over Lower Cambrian limestone talus.	Zones of quartz and oxide up to 200 by 150 m. Occurs adjacent to Fury Showing.	Grid soil sampling, prospecting, trenching.
3	One soil and one steam sediment sample anomalous in gold, and one selected sample from a 3 by 15 m soil gossan, highly anomalous in gold (600 ppb) and As (3100 ppm), all within a 100 by 350 m area.	Occurs over Lower Cambrian limestone.	Quartz calcite siderite veins, up to 2 m wide with minor chalcopyrite, tetrahedrite and oxides. Occurs 250 m northeast of Fury Showing.	Grid soil sampling, prospecting and hand trenching on highly anomalous soil gossan.
4	Several samples anomalous in Pb with one sample anomalous in Ag and one anomalous in Au, As over 400 m. Peak values are 120 ppb Au, 1300 ppm As, 540 ppm Pb, 6.0 ppm Ag.	Occurs over Lower Cambrian limestone separated from Upper Cambrian shale by a northwest trending fault.	A one-square-metre area of scorodite occurs in Lower Cambrian limestone and oxides occur in talus.	Grid soil sampling, prospecting and hand trenching. In particular, prospect along northwest-trending fault.

TABLE 2

GEOCHEMICAL ANOMALIES

Anomaly Number	Anomaly Description	Geological Setting	Related Mineralization	Recommendations
5	Two stream sediment samples analyzing up to 210 ppb Au, 352 ppm As.	1 km and 2 km downstream of soil Anomaly 2.	Probably related to Anomaly 2.	Prospecting up stream from anomaly.
6	A single soil sample analyzing 150 ppb Au, 490 ppm As.	Over Upper Proterozoic green-grey phyllite.	No known mineralization.	Prospecting.
7	Two soil samples within 150 m anomalous in gold (both 20 ppb).	Over Lower Cambrian limestone or dolomite.	No known mineralization.	Prospecting.
8	One sample anomalous in gold (20 ppb) and arsenic (224 ppm).	Occurs over Lower Cambrian limestone.	Quartz vein stockwork and gossanous zones occur in cliffs upslope.	Prospecting.
9	One sample anomalous in gold (20 ppb) and the adjacent sample anomalous in arsenic (210 ppm).	Over Lower Cambrian black limestone.	No known mineralization.	Prospecting.
10	One sample anomalous in gold (20 ppb).	Geology unknown.	No known mineralization.	Prospecting.
11	One sample anomalous in arsenic (256 ppm).	Over Lower Cambrian limestone.	No known mineralization.	No further work.
12	Two samples anomalous in lead (212 ppm, 312 ppm).	Over Lower Cambrian limestone.	No known mineralization.	No further work.

TABLE 2

GEOCHEMICAL ANOMALIES

Anomaly Number	Anomaly Description	Geological Setting	Related Mineralization	Recommendations
13	One sample weakly anomalous in lead (110 ppm).	Over Lower Cambrian limestone.	No known mineralization.	No further work.
14	One sample weakly anomalous in lead (102 ppm).	Over Lower Cambrian limestone.	No known mineralization.	No further work.

AREA CODE: 604

METHOD OF ANALYSIS (CONT.)

8. Fluorine:	0.50 Gram sample is fused with a Carbonate Flux, and dissolved. The resulting solution is analyzed for Fluorine by use of an Ion Selective Electrode.
9. Gold:	10.0 Gram sample is roasted at 550°C. and dissolved in Aqua Regia. The resulting solution is subjected to a Methylisobutyl Ketone extraction, which extract is analyzed for Gold using Atomic Absorption spectroscopy.
10. Mercury:	1.00 Gram sample is digested with Nitric and Sulfuric acids. The solution is analyzed by Atomic Absorption spectroscopy, using a cold vapor generation technique.
11. Partial Extraction and Fe/Mn oxides:	0.50 Gram sample is extracted using one of the following: Hot or cold 0.5 N. HCL, 2.5% E.D.T.A., Ammonium Citrate, or other selected organic acids. The solution is analyzed by use of Atomic Absorption spectroscopy.
12. pH:	An aqueous suspension of soil, or silt is prepared, and its pH is measured by use of a pH meter.
13. Rapid Silicate Analysis:	0.10 Gram sample is fused with Lithium Metaborate, and dissolved in HNO_3. The solution is analyzed by Atomic Absorption for SiO_2, Al_2O_3, Fe_2O_3, MgO, CaO, Na_2O, K_2O, TiO_2, P_2O_5, and MnO.
14. Tin:	0.50 Gram sample is sublimated by fusion with Ammonium Iodide, and dissolved. The resulting solution is extracted into TOPO/MIBK and analyzed by Atomic Absorption spectroscopy.
15. Tungsten:	1.00 Gram sample is sintered with a carbonate flux, and dissolved. The resulting extract is analyzed colorimetrically, after reduction with Stannous Chloride, by use of Potassium Thiocyanate.

GEOCHEMICAL ANALYTICAL METHODS CURRENTLY IN USE AT ROSSBACHER LABORATORY LTD.

A. SAMPLE PREPARATION

1. Geochem. Soil and Silt: Samples are dried, and sifted to minus 80 Mesh, through stainless steel, or nylon screens.

2. Geochem. Rock: Samples are dried, crushed to minus ¼ inch, split, and pulverized to minus 100 mesh.

B. METHODS OF ANALYSIS

1. Multi element: (Mo, Cu, Ni, Co, Mn, Fe, Ag, Zn, Pb, Cd):
0.5 Gram sample is digested for four hours with a 15:85 mixture of Nitric-Perchloric acid.
The resulting extract is analyzed by Atomic Absorption spectroscopy, using Background Correction where appropriate.

2. Antimony: 0.50 Gram sample is fused with Ammonium Iodide and dissolved.
The resulting solution is extracted into TOPO/MIBK and analyzed by Atomic Absorption spectroscopy.

3. Arsenic: 0.25 Gram sample is digested with Nitric-Perchloric acid.
Arsenic from the solution is converted to arsine, which in turn reacts with silver D.D.C. The resulting solution is analyzed by colorimetry.

4. Barium: 0.50 Gram sample is repeatedly digested with $HClO_4$-HNO_3 and HF.
The solution is analyzed by Atomic Absorption spectroscopy.

5. Biogeochemical: Samples are dried, and ashed at 550°C. and the resulting ash analyzed as in #1, multielement analysis.

6. Bismuth: 0.50 Gram sample is digested with Nitric acid. The solution is analyzed by Atomic Absorption spectroscopy.

7. Chromium: 0.25 Gram sample is fused with Sodium Peroxide. The solution is analyzed by Atomic Absorption spectroscopy.
