INTRODUCTION

Sunrise Metals Corporation optioned the DK Claims from Terence McCrory, William Preston and Michael Nielsen in July 1986. Work was started immediately. Exploration was financed by means of a tax flow-through share issue.

The property is bounded to the northeast by the JACK CLAIM GROUP, on which a major high grade silver-lead-zinc discovery was made in 1985. Certain similarities of geology exist as on properties in the general area, which properties are known as: the MEISTER, the WOLF, the LENA and SILVER HART, and the ORO all of which are at varying stages of exploration and development.

LOCATION AND ACCESS

The DK Mineral Claims property is located on the north side, and west of Spencer Creek, within the Watson Lake Mining District of southeastern Yukon (Figure 1.). More specifically, the centre of the property is situated at 60°08' North latitude and 130° 27' West longitude. Access to the property can be achieved by means of a gravel bush road, which begins at mile 698 along the Alaska Highway and runs in a general northwesterly direction. The distance to the centre of the property is approximately 7 km (4 miles) distance from the starting point at mile 698. The centre of the property is also approximately 6 km northeast of the settlement of Rancheria, which is at mile 710 on the Alaska Highway (approximately 160 km, or 100 miles, west of Watson Lake).

The town of Watson Lake is serviced, on a regular basis by Canadian Pacific Airlines and has most services and amenities one would find in most large towns.

Rancheria has lodging accommodations and restaurant service available on a 24 hour basis. There is also a service station here, which, besides the routine supplies, offers limited mechanical repair.

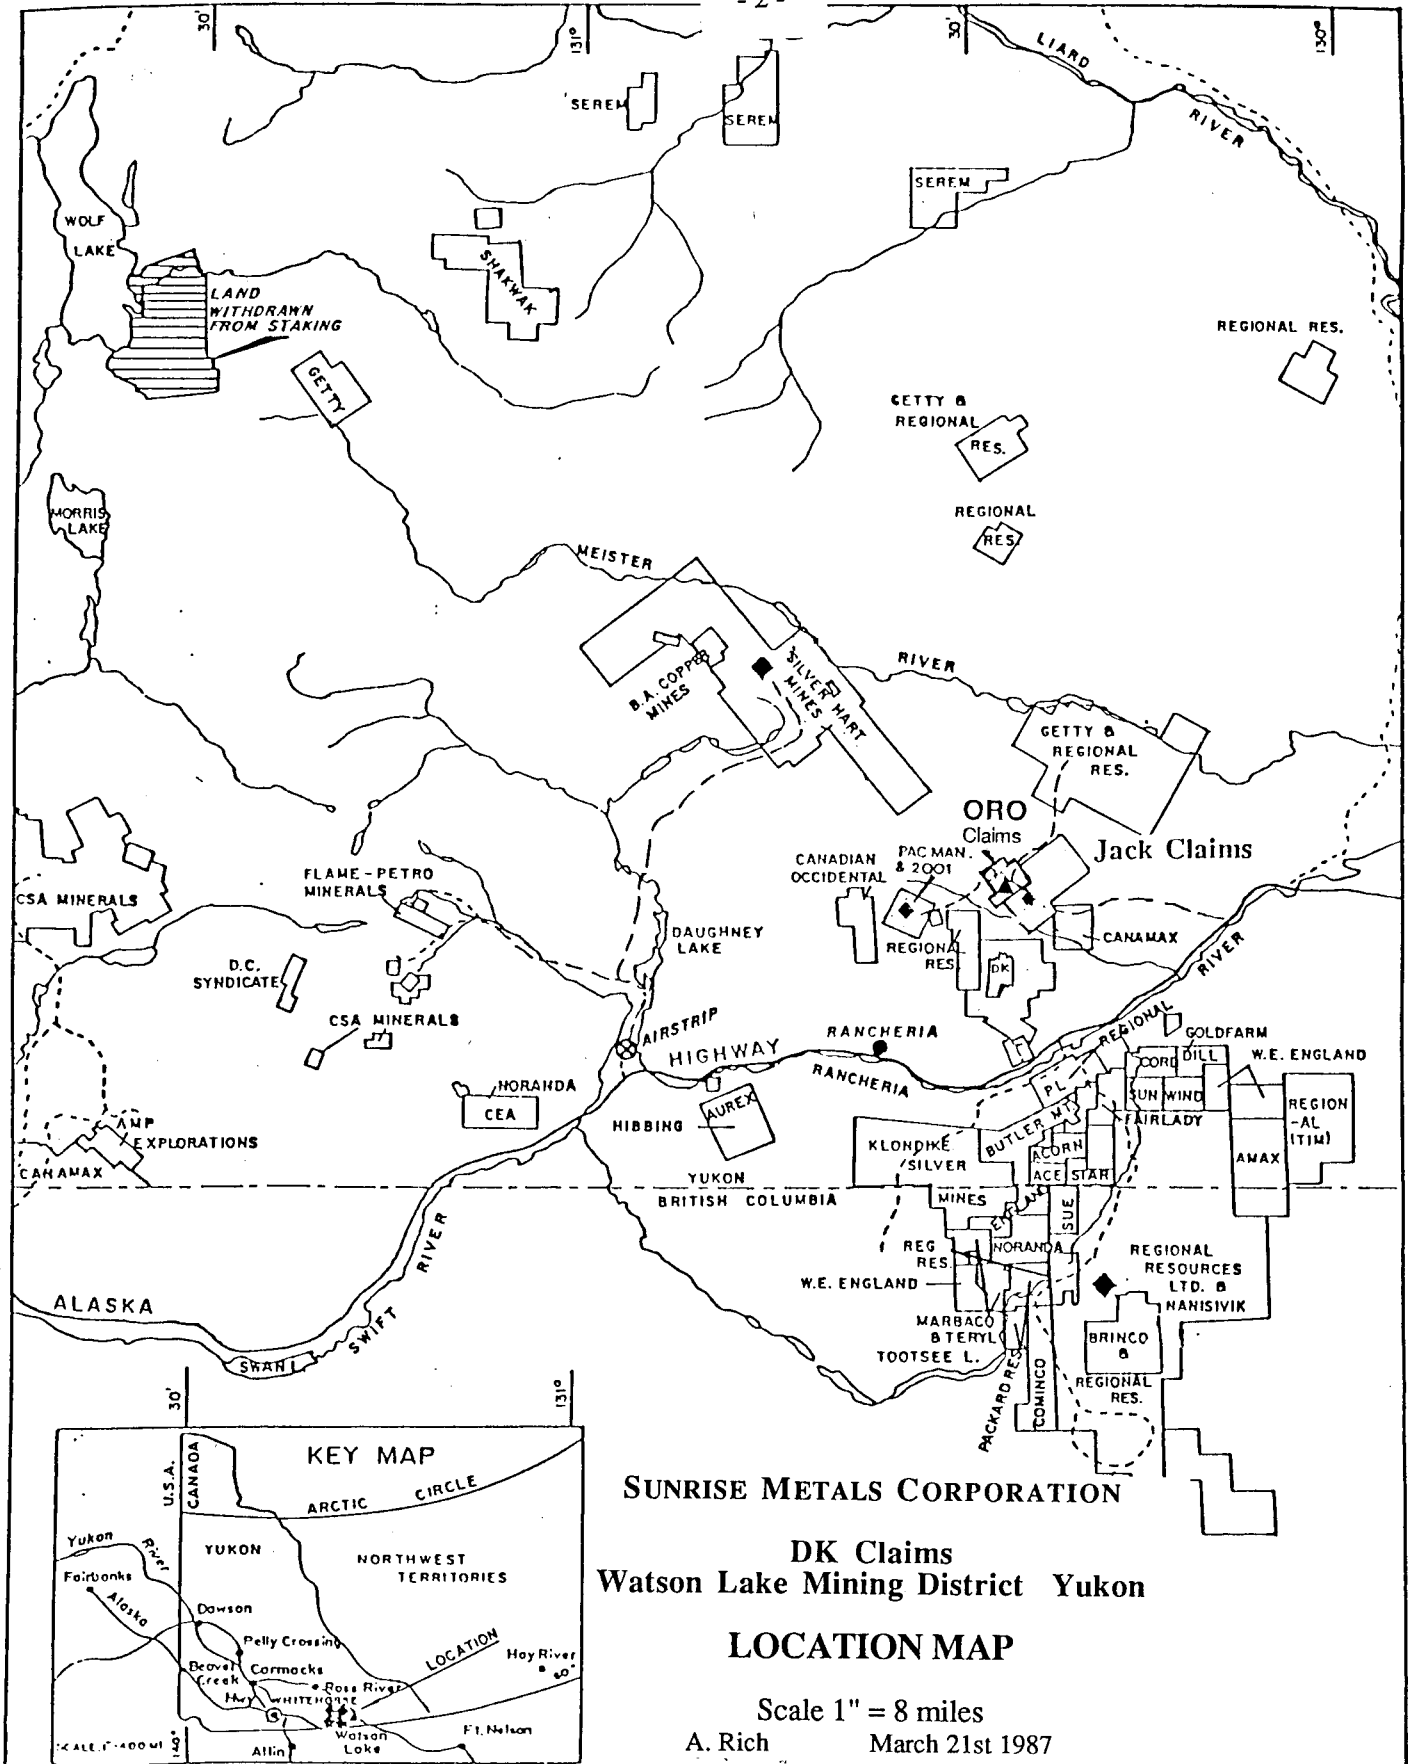

HISTORY

It is not known exactly when silver mineralization was first discovered on the property. The claims adjacent to the south of the DK have for many years been explored and partially developed for the tungsten mineralization. The property was claimed by Goldex Resources Ltd of Toronto until 1986. The claims expired in May of this year and were restaked by T. McCrory, W. Preston and M Nielsen. An old trench, which had obviously been ignored in the course of the tungsten exploration, assayed 30 oz silver per ton over two feet.

In July 1986, Sunrise Metals Corporation optioned the property from McCrory, Preston and Nielsen

PHYSIOGRAPHY AND VEGETATION

The DK Mineral Claims property centres over a high alpine to sub-alpine ridge. The ridge is rounded to subdued, and mostly above tree-line. The lower slopes around, as well as the valley are tree covered. The vegetation consists of varying thicknesses of balsam spruce, scrub conifers, alder and dwarf birch. Above the tree-line the vegetation is predominantly mosses and lichen.

LOCATION MAP

Scale 1" = 8 miles
A. Rich March 21st 1987

PROPERTY

The property is comprised of the DK Mineral Claim Group, which consists of the 33 Yukon Quartz claims, which are a group of contiguous claims known as DK 1-33 inclusive (Figure 2.). All claims are in the Watson Lake Mining District on Mapsheet 105-B-1. Particulars are as follows:

Claim Name:	Grant Number:	Record Date:
DK 1-33	YA 90594 - YA 90626	March 27th 1987

REGIONAL GEOLOGY

The geology of the general area, is dominated by the Cassiar Batholith, which is a north-westerly trending mass of mainly biotite quartz-monzonite and granodiorite of Jurassic/Cretaceous age. It intrudes Lower Cambrian to Devonian sediments and metasediments - *G.S.C. publication, Map 10-1960, Wolf Lake Yukon, Sheet 105B, by Poole, Roddick and Green*. The area appears to form major, nearly isoclinal, folds with numerous shears and tear faults which have a generally northeasterly trending orientation. The rocks underlying the DK Mineral Claim Group belong to a Lower Cambrian age, limestone, dolomite, slate and phyllite sequence. (*Unit 3, map 10-1960*)

PROPERTY GEOLOGY

The DK claims are underlain by Lower Cambrian age, calcareous phyllite, limestone and slate. The sediments have a general northwest- southeast trend. They are tightly folded and are generally cut by numerous faults and minor shears. The silver mineralization was generally observed to occupy the minor fractures. The silver mineralization is in the form of argentiferous galena and pyrite and sphalerite and traces of chalcopyrite were also observed. The mineralization is detected in the overburden by the presence of wad or pyrolusite.

OBSERVATIONS

The following are the observations of **Allan M Frew**, project geologist who was in charge of the operations on the DK this past summer:

Frew :-

"Unfortunately, no detailed geological mapping could be undertaken due to a budget overrun on the trenching. The program was budgeted for \$40,000 but overran to \$45,000. Far less trenching was carried out than anticipated, but this notwithstanding, there was sufficient encouragement from the results to classify the DK claims as a prospect worthy of further exploration.

PROSPECTING

The DK is located northwest of the extensively explored Fiddle tungsten property. Silver was not the prime target on this property as the emphasis was toward tin and tungsten. Due to the fact that the DK has a higher proportion of slate than the Fiddle, it did not see a great deal of prospecting.

Due to recent discoveries by Silver Hart, Claymore and Yukon Minerals to the north, it had become clear that a new silver belt was developing. This belt is referred to locally as the McCrory Silver Belt. The DK Claims lies just south of the centre of this belt.

Initial prospecting uncovered the criteria prerequisite for the discovery of silver bearing structures. Goethite and manganese oxide (wad) fragments abound. Similar long cross-cutting structures, with a general north-south attitude as well as the general northeast-southwest ones are concentrated on the centre of the property. Examination of the wad showed small remnants of steel argentiferous galena.

Working from the northeast of the property toward the southwest, a series of regularly spaced narrow mineralized northeast cross fractures were discovered. They appear to have 32 metre spacing. It also became evident that structures with a bearing of 130° - 135° appear to be better mineralized. Further hand trenching confirmed this.

TRENCHING

Initially the dozer trenching was concentrated on exposing the east-west cross fractures which contain sporadic wad and galena mineralization - eg. the Lillian and Barry zones. Later trenching was concentrated on the 130° structures.

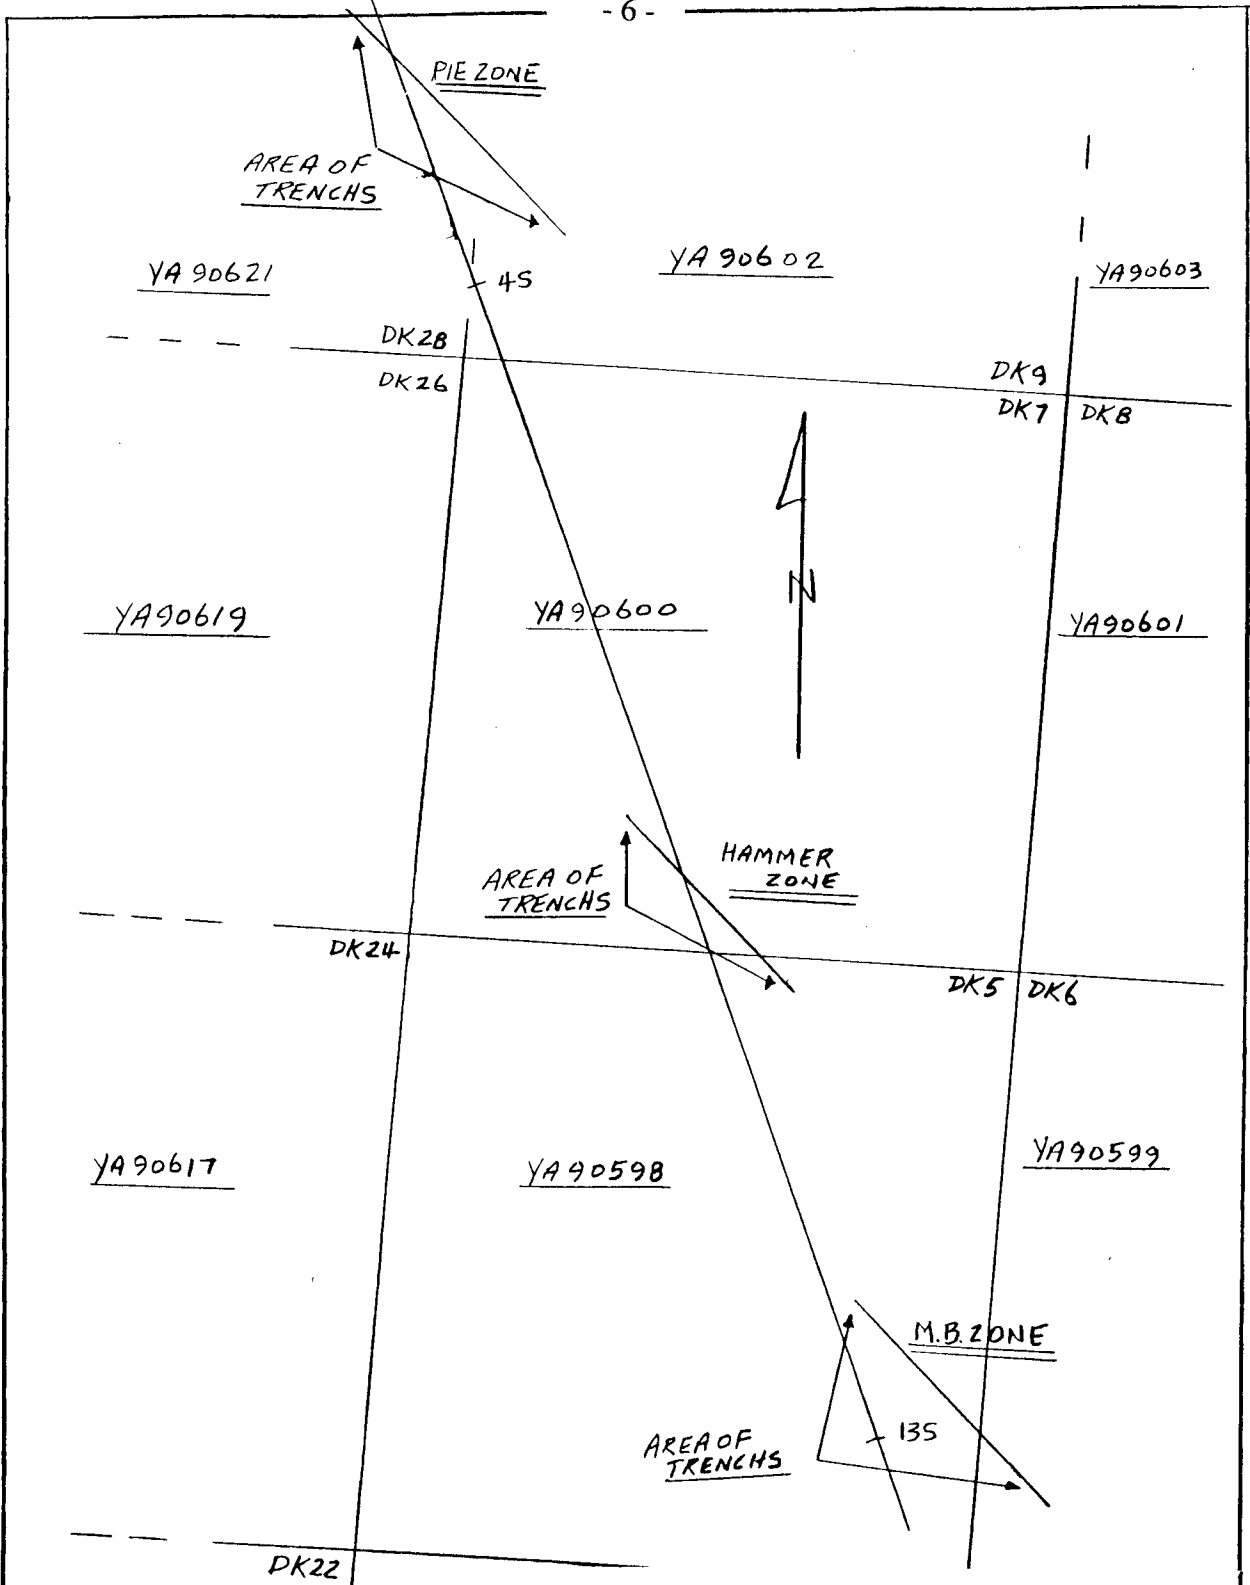

To date three relatively long strong shears have been revealed. From north to south they are named PIE, HAMMER and MB. All pits along these zones have been blasted and dozed.

The **PIE ZONE** has been exposed for a length of 100 metres and is open to the north. The shear zone has widths up to 1.4 m. comprised of yellow puggy fault gouge, vuggy white quartz vein containing limonitic fragments and large masses of coarsely crystalline argentiferous galena (some of which measures 7cm across). These coarse galena fragments gave the following values: 54.16 oz/ton Ag ; 79.51% Pb and 0.13% Zn. A sample of steel galena collected by A. Rich from a site halfway between Pits 1 and 2 yielded 270 oz/ton Ag. It should be pointed out that there is an increase in the mineralization at the intersection of fractures and shears.

The **HAMMER ZONE** has been exposed for a distance of approximately 120 metres. It is open to the north. Along its length have been blasted and dozed twelve equidimensional pits which are deep enough to give some indication of the changes of mineralization with depth. The west wall of the shear zone ranges in attitude from 80°E to vertical while the east wall has dips from 77° to 42° E . This may be a pinch and swell effect or indicate a widening at depth.

Several encouraging assay results were obtained from the Hammer zone test pits. In Pit No 9, there was 43.3 oz/ton Ag and 80.9% Pb over 10cm width of oxidized zone containing galena nodules. In test pit 6, a 6cm grab sample of galena gave 46.46 oz/ton Ag and 83.97% Pb. Worthy of note are the results from Pit 8 where 20cm width of limonite nodules with galena cores gave 22.24 oz/ton Ag and 43.37 % Pb and 0.5metres of gouge with a 9 cm galena bearing vein gave a combined assay of 11.7 oz/ton Ag and 31.37% Pb.

It is also worthy of note that of all of the samples taken from the Hammer zone, the values of zinc are low (2.71% - 0.85%).

SUNRISE METALS CORPORATION
DK CLAIMS

LOCATION MAP
 showing Trench Areas
 relative to Claim Locations

Watson Lake Mining District
 YUKON

prepared by Allan M Frew, February 1987

The MB ZONE is most intriguing by virtue of the degree of mineralization. It has a strike length of 200 metres and is open on both ends. The centre exposure reveals an oxidized feeder vein containing goethite, hematite, pyrolusite and galena with lesser sphalerite. Alteration and stringer mineralization penetrate the east wall rock for 4 metres. At a pit 40 metres along strike, this feeder is seen to increase 0.9 metres in width. Random grab samples from this zone assayed 33 oz/ton Ag.

It should be noted that most work on this property was carried out under heavy rain and strong winds. Mapping had to be carried out in water-filled pits. Furthermore, transportation was dictated by the availability of a helicopter so work was fragmented.

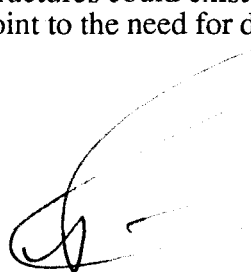

CONCLUSIONS

The zones so far revealed may not fully represent the potential of this property. It is quite possible that the structures so far explored are synthetic shears. Further work should be carried out on the DK to test for larger mineralized structures associated with those discovered in 1986."

--- Frew

Rich-

At the time of writing this report it is uncertain whether Sunrise Metals Corporation will undertake further work on the DK claims. The writer agrees that larger mineralized structures could exist on the claims and results from work on other properties in the area point to the need for deep drilling of the silver-bearing structures.
