REMARKS: # 113 TOAST The claim block covers the contact between andesite and Cretaceous granodiorite.

In 1987, 3 soil samples, 6 silt samples, and 4 rock samples were collected within 50 m of the grandiorite-andesite contact on the JAM 3 & 4 claims. The samples analysed for 30 elements. One of the silt samples contained 50 ppb Au but no other anomalies were detected.

EXPLORATION REPORT

Jam Quartz Claims 115-1-3

The following is a report of work carried out on the Jam Claims 115-1-3 Quartz.

The Claims are located Northwest of Mt. Nansen between Tritop Peak and Kloza River.

The property was staked by Eugene Curley in June 1987 on a Geo-chem stream sediment gold anomaly.

Prospecting was carried out on the property with the aid of a bomfodier and one assistant.

Initial sampling was carried out on a 300 ft. wide contact zone between Granodiorite and Andesite on Jam 3 and 4. Subsequent Geo-chem analysis and assay failed to locate the anomaly.

The property was revisited in September and further prospecting was done on the outcrops in the area. No mineralized occurrences were noted.

Dynamite was used to blast holes in the permafrost in search of mineralize float and to locate good Geo-chem samples. Atomic absorption and fire assay of the samples failed to locate the anomaly.

Trenching by heavy equipment and a larger scale Geo-chem sampling program may be needed to locate the anomaly.
