LOCATION: LAT.: 61° 20'N AREA: Hoole River

LONG.: 131° 00'W VALUE $: 36,450.00

CLAIM NAME & NO.: ANO 1-11 YB 15420-430; CYR 36,38 YA 35461,463;
HOOLE 1-68 YB 15527-594

WORK DONE BY: D.L. Craig

WORK DONE FOR: Cominco Limited

DATE TO GOOD STANDING:

REMARKS: #69 CYR Mapping (1:5000 scale), soil & rock geochemistry were carried out. Rock chip samples of outcrop expression of 1977 drillholes yielded three 1 m intervals of over 97% combined Pb-Zn; 3m of over 7% combined Pb-Zn; and 2m of over 4% combined Pb-Zn in Ordovician quartzite. Four new Pb-Zn numeralized outcrops were discovered along strike.

ASSESSMENT REPORT

HOOLE PROPERTY, YUKON TERRITORY

1. SUMMARY

Cominco Ltd. optioned the CYR claims and the ANO claims in 1988 from S. Barclay and S. Young. The adjoining HOOLE claims were acquired to the east and west by contract staking following the option agreement. In August of 1988 a mapping,soil sampling and lithogeochemistry program was carried out on the property to evaluate the Pb-Zn-Ag potential.

2. LOCATION AND ACCESS

The Hoole property is located south of the Hoole River at 61.33 degrees latitude and 131.33 degrees longitude on NTS map sheet 105G/6. Access is by helicopter 90 km southeast from Ross River. A 50 km long Cat trail connects the northern end of the property to the Robert Cambell Highway.

3. TOPOGRAPHY

The claim group covers a semi mountainous zone on the northern edge of the Pelly Mountains. The elevation ranges from 1300 meters to 2200 meters in moderate to steeply sloping ground. Small scrub coniferous and deciduous vegetation ends at the 1400 meter contour and the ground cover is alpine heather above 1400 m. Glaciation has played the major role in developing the current landform.

4. PROPERTY AND OWNERSHIP

The property consists of the following claims:

LOCATION: On the Hoole River, Watson Lake M.D.
Lat. 61 deg. 22'N; Long. 131 deg. 20'W

PROPERTY: 82 Claims = 81 Units; Total Area + 4,184 Acres

5. PREVIOUS WORK

Regional reconnaissance work by Newmont Exploration discovered mineralized lead-zinc boulders in a stream bed in 1976 during a routine stream geochemistry program. The Cyr claims were subsequently staked and in 1977 a prospecting, mapping and geochemistry program was undertaken. Detailed mapping defined a mineralised quartzite formation containing galena and sphalerite over a strike length of 200 meters. The soil geochemistry confirmed the outcrop exposure and a drill program took place the following year.

The 1978 drill program placed 5 diamond drill holes over the mineralised outcrop with two holes intersecting greater than 23% combined lead-zinc over .4 to .5 meters. Approximately 100 meters along strike to the southeast a third hole intersected 4.25% lead and 8.10% zinc over 3.0 meters.

In 1979 a enlarged soil geochemistry and regional mapping program outlined an anomalous horizon 10 km northwesterly and

southwesterly of the drill site location. Further work was proposed for 1980 but due to the collapse of base metal prices and the remote location of the property, the claims were allowed to lapse.

The Cyr 36 and 38 claims were staked by S. Barclay in September 1988 and were subsequently surrounded by the Ano 1-11 claims staked by S.Young in October 1988. Cominco staked the Hoole claims in November 1988 to cover the on strike trend of the mineralised horizon.

6. REGIONAL GEOLOGY

The Pelly Mountains, between the Tintina and the St. Cyr Faults, consist of the deposition of the northeast flank of the Pelly-Cassiar Platform (Templeman-Kluit et al.,1978) . The rocks consist of carbonaceous and calcareous pelites and carbonates complexly folded and faulted ranging from upper Cambrian to Devonian in age.Transitional facies between shelf and basin occur to the south east near the St.Cyr Fault resulting in the deposition of bioclastic Silurian reef carbonates. Low grade metamorphism is prevalent throughout the region resulting in fissile shales and phyllites in the pelitic units. Locally, the limestones are recrystallised to a low grade fine grained marble with dolomitized sections.

7. PROPERTY GEOLOGY

The Hoole, Ano and Cyr claims are underlain by the rocks of the Selwyn Basin from Cambrian to Devonian-Mississippian as mapped by the Geological Survey of Canada. These Selwyn Basin rocks are fault contacted by the Tintina Trench to the north and the St. Cyr Fault to the south.

The rocks strike 300 degrees and are complexly folded and faulted. Eight basic units are exposed on the claims in order of increasing age: calcareous grey shale, sandy grey siltstone, bioclastic grey limestone, carbonaceous limestone, carbonaceous shale, calcareous and carbonaceous shale, grey quartzite/chert, grey siltstone and orange/brown weathering siltstone. Local repeat sections of stratigraphy suggest that anticlinal, synclinal and fault slice structures exist normal to strike and continue to the Tintina Trench.

Thrust faulting occurs on the south western section of the claim group with Devonian-Mississipian siltstones over thrusting Silurian-Ordovician pelitic and bioclastic rocks to the northeast. To the northeast of the thrust fault, a synclinal structure exists with Silurian carbonates in the core of the fold followed by graptolitic Ordovician shale and quartzite

underneath.

Within the Ordovician quartzite, lead-zinc-silver mineralization occurs as blebs and clots with disseminated and blebby pyrite. This previously drilled outcrop exposure yielded 13.75% Pb, 10.04 Zn and 2.14 oz/ton Ag over .4m and widens down dip to 4.55% Pb, 9.22% Zn and 1.20 oz/ton Ag over 2.3 meters.

8. 1989 RESULTS

In 1989 Cominco took surface rock chip samples of the outcrop expression of the drill holes. Chip samples D9HO60 1-9 and A-O (see Appendix D) yielded
three one meter intervals of greater than 9% combined Pb+Zn in quartzite. Chip samples D9HO61 0-4 yielded 3 meters of greater than 7% combined Pb+Zn in quartzite. Chip samples D9HO59 1-9 yielded 2 meters of greater than approximately 4% combined Pb+Zn in quartzite.

Prospecting on the claims in 1989 discovered four new mineralized outcrops of galena and sphalerite with minor pyrite in a grey siltstone host northeast and parallel to the strike of the known quartzite zone. Rock chip samples D9HO60, 61, 59 and 66 are displayed in Appendix D and Plate 1.

Soil grid geochemistry confirmed both the quartzite mineralization and the trend of the mineralization in the grey siltstone.

Soil contour geochemistry indicated further mineralization to the east of the grid installed in 1989 and provided a target for further work in 1990.

Property mapping on a 1:5000 scale provided stratigraphic control through rock correlation and fossil age dating. Mineralization appears to be Ordovician in age and correlation between the mineralized quartzite and the mineralized grey shale/siltstone is an untested possibility.

9. CONCLUSIONS

Mapping and geochemistry has revealed that a mineralized horizon exists on the Hoole Property that is Ordivician in age. Four new outcrops were discovered that exibited mineralization in a host grey siltstone that is currently untested.

APPENDIX B

AFFIDAVIT

I, Dunham L. Craig of the city of Victoria, B.C. in the province of British Columbia make oath and say:

1. That I am employed as a Geologist by Cominco Ltd. and as such have a personal knowledge of the facts to which I hereinafter dispose;

2. That annexed hereto and marked as Appendix A, to this my affidavit is a true copy of expenditures incurred in connection with a geological and geochemical program carried out on the Hoole, Ano and Cyr mineral claims;

3. That said expenditures were incurred between the 1st day of August and the 30th day of August, 1989 for the purpose of mineral exploration on the above noted claims.

Dunham L. Craig
Geologist

Dated this 16 day of OCTOBER, 1989
at Vancouver, British Columbia.

APPENDIX C

STATEMENT OF QUALIFICATIONS

I, Dunham L. Craig of the City of Victoria in the Province of British Columbia, hereby certify:

1. That I am a geologist residing at 1325 Kings Road, Victoria, British Columbia with a business address at #700- 409 Granville St, Vancouver, British Columbia.

2. That I graduated with a B.Sc in Geology from the University of British Columbia in 1988.

3. That I am a member in good standing with the Association of Exploration Geochemists

4. That I have practiced geology with Cominco from June 1988 to the present.

Dunham L. Craig
Geologist

Dated this 6 day of OCTOBER, 1989
at Vancouver, B.C.

LEGEND

DEVONIAN-MISSISSIPPIAN

1	SILTSTONE-	Light grey; fissile; strongly cleaved and foliated locally; calcareous mudstone bands interbedded in fissile shale host.

SILURIAN

2	SILTSTONE-	Grey to brown weathering; medium to coarse grained, uniform sandy to silty texture; non-calcareous.
3a	LIMESTONE-	a).Crinoidal reef limestone, cream to light tan coloured; numerous crinoid stems and Coenites, Favosites
3b		b).Black to grey; carbonaceous; ocassionally thin bedded; granular massive texture.

ORDOVICIAN

4	SHALE-	Black, carbonaceous; locally graphitic, folded and sheared.
5	SHALE-	Black, calcareous and carbonaceous, medium-fine grained; locally silicified.

LOWER ORDOVICIAN/ UPPER CAMBRIAN

6	QUARTZITE-	Dark grey to tan, sugary to fine grained cherty texture, disseminated pyrite with blebs and clots of pyrite sphalerite and galena

CAMBRIAN

7	SILTSTONE-	Grey, noncalcareous, slightly phyllitic, fissile with rusted pyrite phantoms scattered across cleavage surface.
8	SILTSTONE-	Orange\brown weathering, generally non-calcareous with calcareous mudstone lenses 1 to 10cm scattered through unit.
