WORK DONE BY: C.N. Orssich

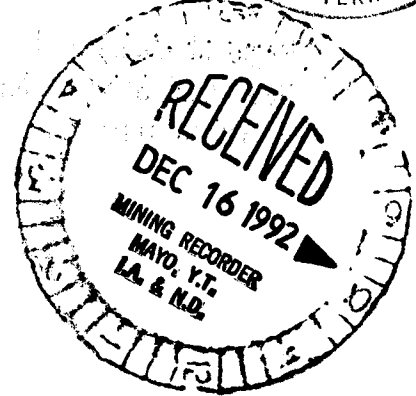

WORK DONE FOR: Amax Gold (B.C.) Ltd.

DATE TO GOOD STANDING:

REMARKS: # 105 M & 106 D - Dublin Gulch Area  
The company collected 501 soil samples over a 4 day period  
in the summer of 1992. Initial results revealed 13 samples  
anomalous in Au +/- As. The results were preliminary thus  
difficult to evaluate without follow up work. Company plans to  
re-assay anomalous samples and if results are confirmed carry  
out more detailed sampling next year. Company is looking for  
intrusive hosted quartz-gold mineralization similar to Fort Knox  
type.

## **SUMMARY AND CONCLUSIONS**

The Dublin Gulch property is located in central Yukon approximately 50 Km north of the town of Mayo. This report covers the geochemical survey conducted on a portion of the property located south of Lynx Creek.

The claims are underlain by Upper Precambrian and/or lower Cambrian Hyland Group (formerly Grit Unit) metasedimentary rocks which have been intruded by stocks, sills and dykes of, Cretaceous granodiorite to quartz monzonite with minor leucocratic granite and aplite.

The geochemical soil survey was conducted to search a generally overburden area for intrusive hosted quartz-gold vein mineralization similar to the Eagle Zone, located 8km northwest of the survey area. A total of 501 soil samples were collected and analyzed by Rossbacher Laboratory in Burnaby B.C. for gold and arsenic.

Thirteen soil anomalies, consisting of one to several samples containing from 20 to 130 ppb gold were identified. One of the anomalies is partially related to a previously explored Pb-Zn-Ag-Au vein hosted in metasedimentary rocks. Two of the soil anomalies are proximal to intrusive exposures.

## **RECOMMENDATIONS**

Additional grid soil sampling is recommended to follow up four gold-in-soil anomalies if reanalyses confirms the anomalous gold values. Geological mapping and rock chip sampling should be carried out in conjunction with the soil sampling.

## **INTRODUCTION**

### **Location and Access**

The Dublin Gulch property is located in central Yukon approximately 68 km by road north of the town of Mayo (Figure 1). Road access is provided by 36 km of all weather gravel road north from Mayo, then left onto the South McQueston River access road for 32 km. The road is well maintained to the South McQueston bridge by the Yukon Territorial Government, beyond that point it is not maintained and has deteriorated since Canada Tungsten Mining Corporation ceased placer mining at Dublin Gulch in 1986.

This report describes a portion of the property located south of Lynx Creek which was most easily accessed by helicopter.

### **Vegetation and Physiography**

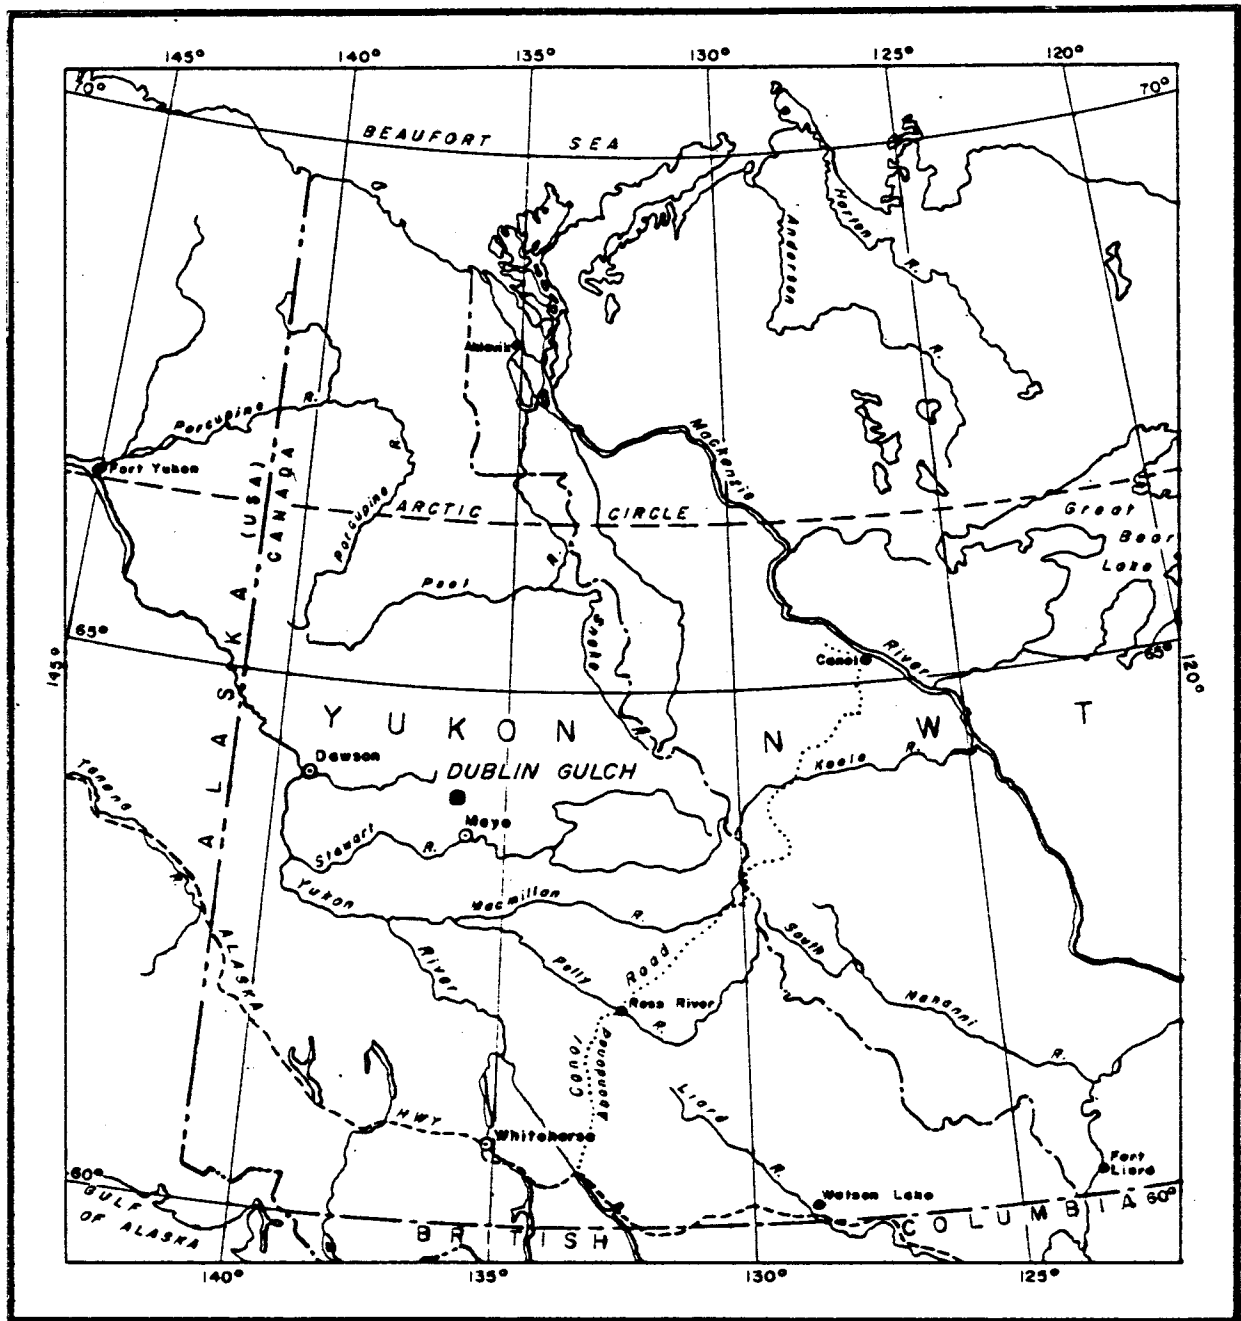

Vegetation is typical for the central Yukon and consists of mixed spruce and aspen on well drained south facing slopes, stunted spruce on frozen north facing slopes and alpine willow and birch at higher elevations. Areas of muskeg occur in the lower portions of the "U" shaped Lynx Creek valley. Elevations in the survey area range between 790 and 1340 metres. Most of the samples were collected on the north facing southern side of Lynx Creek or on the plateau immediately south of Lynx Creek.

### **Claims**

The geochemical soil survey was conducted on those West claims located south of Lynx Creek. Appendix I lists the pertinent claims together with owner and expiry dates.

The West claims were staked by H-6000 Ltd. (now called Ivanhoe Goldfields) in 1991 to expand the size of a claims block optioned from Queenstake Resources and Can Pro Development in September 1991, Fairbanks Gold Inc. entered into an option agreement with H-6000 to earn 50% interest in the property.

The Len claims, owned by Gordon Dickson, are surrounded by the West claims but are not part of the optioned property.

**FIGURE I**

*AMAX GOLD (B.C.) LTD.*

**LOCATION MAP**

SCALE 1" = 120 MILES

## **Geology**

The claims are underlain by Upper Precambrian and/or Lower Cambrian Hyland Group metasedimentary rocks (formerly Grit Unit) and are intruded by Cretaceous granodiorite to quartz monzonite. For a detailed description of geology the reader is referred to:

L.H. Green, 1972, G.S.C. Memoir 364, Geology of Nash Creek, Larsen Creek and Dawson Map-Areas, Yukon Territory.

## **Geochemical Survey**

As a result of poor bedrock exposure in the area a soil geochemical survey was conducted to evaluate the area for intrusive hosted stockwork or disseminated bulk tonnage gold deposit similar to the Eagle Zone, located 5km to the northwest.

## **Procedure**

A total of 501 soil samples were collected from depths of 10 - 30 cm below surface with a soil sampling mattock and were placed in 4 x 6 inch, numbered, Kraft sample bags. Samples were partially sun dried and then packed in plastic and canvas sacks for shipment to Rossbacher Laboratory in Burnaby B.C., for analysis.

Samples were collected at 50m spacings on lines parallel to topographic contours at approximately 150m vertical spacing. Survey control was established by altimeter and hip chain and by chaining to recognizable topographic points such as creek intersections and ridge crests.

Soil profiles were poorly developed on north and northeasterly facing slopes and comprised a zone of moss and roots on top of frozen, unsorted but dominantly silty, medium to dark grey soil. On south and westerly facing slopes, soil profiles were better developed with a weak orange-brown silty to sandy, enriched horizon above a grey coloured "C" horizon. Elsewhere on the property, rusty soil profiles up to a metre deep were noted in areas of gold mineralization with 1-2% disseminated sulphides. Solifluction of the active layer has been observed but does not appear to have produced transported anomalies in known mineralized areas.

The soil sample locations, sample numbers and gold values of all samples with > 10ppb gold are plotted on a 1:10,000 scale topographic base map (Figure 3).

### **Analytical Method**

The analytical methods followed by Rossbacher Laboratory are detailed in Appendix II. Quality control was maintained by inserting control pulps of known grade every fifty samples. The lower detection limit of the analysis is 5 ppb for gold and 2 ppm for arsenic.

### **Results**

From results of soil surveys conducted over mineralized zones elsewhere on the Dublin Gulch property, gold values of 20 to 49 ppb are considered weakly anomalies, 50 to 99 ppb anomalous and +100 ppb strongly anomalous. All samples of > 20 ppb on Figure 3 are identified by a number from 1 to 13 and are discussed below. Analytical results for all samples are attached as Appendix II.

Anomalies 1, 2, 3, 4, 5, 6, 10, 11 and 13 are single sample anomalies containing from 30 to 80 ppb gold and are located in areas of poor exposure. Only anomaly 13 occurs within 500m of known intrusive exposures.

Anomaly 7 (samples R92581 to R92586B), is a multi-sample anomaly with samples ranging from detectable gold (10 ppb, 15 ppb Au) to anomalous (20 ppb, 30 ppb, 50 ppb Au) over a 250m width along the line. Anomaly is unexplained but is thought to be underlain by schist and phyllite.

Anomaly 8 (samples R91997 - R91999, R93501) is a single strongly anomalous sample (100 ppb Au, 620 ppm As) followed by three samples with detectable to weakly anomalous gold (10 ppb, 20 ppb Au) for a width of 200m along the line. The samples were collected over a protruding knob of phyllically altered leucocratic granite with some quartz veins. A rock chip sample of this material had no detectable gold.

Anomaly 9 (samples R99035, R99037, R99038) is a weak two sample anomaly of 20 and 30 ppb Au and an adjacent sample with detectable gold (10 ppb Au). This anomaly is part of a larger anomaly which trends easterly onto the adjacent Len claims. Mineralization on the Len claims consists of a siderite-galena-sphalerite-pyrite vein cutting quartz - mica schist and marble and

analyzed 1.091 ppm Au. Similar mineralization could be responsible for the anomaly on the West claims.

Anomaly 12 is a single strongly anomalous sample of 130 ppb Au. The sample was collected proximal to a protruding knob of biotite quartz monzonite to granodiorite with rare quartz veins. Rock chip samples did not contain detectable gold.

### **Discussion and Interpretation**

Rock exposure is particularly poor in the area and many of the anomalies are unexplained. The only known mineralization is vein type mineralization on the Len claims, which occur within the West claim block. Anomaly #9 trends easterly onto adjacent Len claims and although it could be related vein type mineralization an intrusive source cannot be ruled out. The proximity of anomalies 8 and 12 to intrusive outcrop suggests an intrusive source for these anomalies. Anomalies 5, 6 and 7 are clustered within a 600 metre length along one line. Outcrops of quartzite occur on the crest of the hill to the south but the immediate area of the anomalies has not been mapped.

None of the anomalies outlined during this survey compare in size or intensity to those associated with gold mineralization in the Dublin Gulch area. However, with the extensive overburden and widely spaced sample lines even subtle anomalies could be favourable. Anomalies 8, 9, 12 and 13 warrant additional soil sampling and prospecting if the anomalies remain after re-analyses of the original pulps.

## GEOCHEMICAL ANALYTICAL METHODS CURRENTLY IN USE AT ROSSBACHER LABORATORY LTD.

### A. SAMPLE PREPARATION

#### 1. Geochem. Soil and Silt:

Samples are dried and sifted to minus 80 Mesh, through stainless steel or nylon screens.

#### 2. Geochem. Rock:

Samples are dried, crushed to minus  $\frac{1}{4}$  inch, split, and pulverized to minus 100 mesh.

### B. METHODS OF ANALYSIS

#### 1. Multi element: (Mo, Cu, Ni, Co, Mn, Fe, Ag, Zn, Pb, Cd, As):

0.50 Gram sample is digested for four hours with a 15:85 mixture of Nitric-Perchloric acid. The resulting extract is analyzed by Atomic Absorption spectroscopy, using Background Correction where appropriate.

#### 2. Antimony:

0.50 Gram sample is fused with Ammonium Iodide and dissolved. The resulting solution is extracted into TOPO/MIBK and analyzed by Atomic Absorption spectroscopy.

#### 3. Arsenic: (Generation Method)

0.25 Gram sample is digested with Nitric-Perchloric acid. Arsenic from the solution is converted to arsine, which in turn reacts with silver D.D.C. The resulting solution is analyzed by colorimetry.

#### 4. Barium:

0.20 Gram sample is repeatedly digested with  $\text{HClO}_4$ - $\text{HNO}_3$  and HF. The solution is analyzed by atomic absorption spectroscopy.

#### 5. Biogeochemical:

Samples are dried and ashed at 550°C. The resulting ash analyzed as in #1, Multielement Analysis.

#### 6. Bismuth:

0.50 Gram sample is digested with Nitric acid. The solution is analysed by Atomic absorption spectroscopy.

## METHODS OF ANALYSIS (CONT'D)

7. **Chromium:**  
0.25 Gram sample is fused with Sodium Peroxide. The solution is analyzed by atomic absorption spectroscopy.
8. **Fluorine:**  
0.50 Gram sample is fused with Carbonate Flux, and dissolved. The solution is analysed for Fluorine by use of an Ion Selective Electrode.
9. **Gold:**  
10.0 Gram sample is roasted at 550°C and dissolved in Aqua Regia. The resulting solution is subjected to a MIBK extraction, and the extract is analyzed for Gold using Atomic Absorption spectroscopy.
10. **Mercury:**  
1.00 Gram sample is digested with Nitric and Sulfuric acids. The solution is analyzed by Atomic Absorption spectroscopy, using a cold vapor generation technique.
11. **Partial Extraction and Fe/Mn oxides:**  
0.50 Gram sample is extracted using one of the following: hot or cold 0.5 N. HCl, 2.5% E.D.T.A., Ammonium citrate, or other selected organic acids. The solution is analyzed by use of Atomic Absorption spectroscopy.
12. **pH:**  
An aqueous suspension of soil, or silt is prepared, and its pH is measured by use of a pH meter.
13. **Rapid Silicate Analysis:**  
0.10 Gram sample is fused with Lithium Metaborate, and dissolved in HNO<sub>3</sub>. The solution is analyzed by Atomic Absorption for SiO<sub>2</sub>, Al<sub>2</sub>O<sub>3</sub>, Fe<sub>2</sub>O<sub>3</sub>, MgO, CaO, Na<sub>2</sub>O, K<sub>2</sub>O, TiO<sub>2</sub>, P<sub>2</sub>O<sub>5</sub>, and MnO.
14. **Tin:**  
0.50 Gram sample is sublimated by fusion with Ammonium Iodide, and dissolved. The resulting solution is extracted into TOPO/MIBK and analysed by atomic absorption spectroscopy.
15. **Tungsten:**  
1.00 Gram sample is sintered with a carbonate flux, and dissolved. The resulting extract is analyzed colorimetrically, after reduction with Stannous Chloride, by use of Potassium Thiocyanate.

GENERAL NOTICE

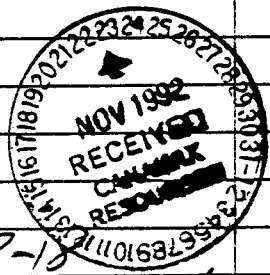

Items sold by VANCAL REPRODUCTIONS GROUP are subject to discontinuance and price change without notice. Title passes to buyer upon delivery of goods to carrier. Claims against the carrier must be made by the consignee within time limits specified by the Carrier.

CLAIMS CLAUSE

Claims must be made within TEN DAYS after receipt of the goods and be accompanied by our packing ticket. No goods may be returned for credit without first securing permission. Goods so returned will be subject to a charge of 10% for rehandling. Transportation to be paid by shipper.
