SUMMARY

The Casino porphyry copper-gold-molybdenum deposit is located in west-central Yukon. The property is comprised of 795 mineral claims, 18 placer claims and 38 placer leases owned by Pacific Sentinel Gold Corporation.

The porphyry mineralization at Casino was discovered in 1967 and was explored from 1968 to 1973 with 18,002 m of small diameter diamond and large diameter rotary drilling. The deposit is hosted by a Cretaceous subvolcanic intrusive complex with a well defined soil geochemical signature. It exhibits classic hypogene alteration and mineralization zonation overprinted by deep weathering to produce vertical supergene zonation consisting of a copper-depleted leached cap, a copper-enriched supergene zone and the primary hypogene mineralization.

No work was performed on the property from 1973 to 1983. From 1983 to 1985 soil sampling and bulldozer trenching were done to evaluate the heap leach gold potential of the deeply oxidized leached cap overlying the core of the deposit.

In 1991 Archer, Cathro & Associates (1981) Limited optioned the property from Casino Silver Mines Ltd. and then reoptioned it to Big Creek Resources Ltd. From June to September 1992, 4,792 m of diamond drilling were completed in 21 vertical holes. In November 1992 Big Creek merged with Pacific Sentinel and this was followed by a second merger in February 1993 between Pacific Sentinel and Casino Silver Mines.

The 1993 drill program was intended to delineate the deposit. Drilling began March 12 and ended November 10 using up to six rigs to drill 127 holes totalling 50,316 m. All but one of the 1992 drill holes were deepened in 1993.

Other work done in 1993 included environmental and geotechnical studies plus an extensive placer evaluation program required to maintain the placer leases and claims.

The 1994 field season is scheduled to begin in March. Further diamond drilling is required to fully delineate the deposit and provide geotechnical data for open pit design. Environmental, archeological, socio-economic, geotechnical and metallurgical studies, plus additional placer evaluation, will also be conducted in 1994.

INTRODUCTION

This report describes work done at the Casino property between March 5 and November 12, 1993 and summarizes results from that program. The work was funded by Pacific Sentinel Gold Corp. and included 50,316 m of diamond drilling plus placer evaluation, environmental data collection and geotechnical studies. The initial budget was $9,032,844 for a program including 48,372 m of drilling ($186.74/m including all auxiliary costs). The actual cost was $8,788,017 ($174.66/m). Pacific Sentinel directed the program with on site technical supervision by B. Bower. Archer, Cathro & Associates (1981) Limited was contracted to manage the program with field operations under the direction of author F. Gish and supervision by author D. Eaton. The Authors' Statement of Qualifications are in Appendix I while a Chronology of Significant Events is detailed in Appendix II.

LOCATION, ACCESS AND INFRASTRUCTURE

The Casino property is located in west-central Yukon at latitude 62°44'N and longitude 138°50'W on NTS map sheets 115J/10 and 15 (Figure 1). Ground access is possible by two winter road routes (Figure 2). The more favourable route extends 194 km northwest from Carmacks: 82 km along the Freegold Road (two-wheel drive during summer and fall); 40 km along the Casino Trail (four-wheel drive); and, 72 km along a bulldozer trail. This route could be upgraded to provide year-round access and, in preparation for this, the government has flown airphotos along the route and conducted wildlife studies on the local cariboo herd. The other road extends north 224 km from Km 1762 on the Alaska Highway. This route has not been used since 1970 and would be much more costly to upgrade than the proposed extension of the Casino Trail.

In summer and fall, surface access to the property is possible utilizing a 45 tonne barge from Minto, coupled with a 19 km road from the Yukon River to the camp. During the 1993 field season, fifteen trips were made between June 3 and September 26 to transport additional diamond drills, mud, trucks, propane and construction materials. Each round trip took approximately three days, including loading and unloading.

If a haulage road was built from Casino to Carmacks, the total distance to the year-round deep seaport at Skagway Alaska would be 544 km. The highway from Carmacks to Skagway is paved and was recently handling about twenty 45 tonne truck loads of concentrate per day from the Curragh Resources Inc. lead-zinc mine at Faro, which is approximately the same road distance from Skagway as Casino.

Most services and supplies required for mineral exploration and mine development are available in Whitehorse. The closest electrical transmission lines to the property pass through Carmacks en route to Faro. The Yukon government has given assurances they will pay for transmission lines to Casino. The government is also reviewing its energy policy and has assigned priority to developing lower cost energy alternatives.

CLAIM OWNERSHIP AND STATUS

The Casino property is 100% owned by Pacific Sentinel, a junior mining company trading on the Vancouver Stock Exchange and NASDAQ. The claims are subject to a purchase agreement with Archer Cathro.

The property consists of 795 mineral claims (approximately 133 sq km) plus 18 placer claims (approximately 2 sq km) and 38 placer leases (approximately 50 sq km) that overlie parts of the mineral claims and protect proposed tailings pond, waste dump, mill and mine sites. Figure 3 outlines the general area of mineral and placer holdings while Figures 4 to 7 show the location of specific claims and leases.

The only changes in property holdings during 1993 were the addition of the placer claims (purchased in November) and five placer leases staked in September. An additional sixty mineral claims were staked in January 1994. All of the claims and leases are filed with the Whitehorse Mining Recorder as shown in Table 1 on the following page.

An extensive claim tagging program was conducted during the 1993 field season. A total of 1050 claim posts from the claims staked in 1992 were relocated and tagged. Only twelve posts were not found (see Table 2 following Table 1) and these should be repositioned in 1994 using replacement posts approved by the mining recorder.

WORK HISTORY

Initial exploration in the Casino area was directed toward placer gold and silver-lead veins on the periphery of the porphyry deposit. The first record of work was placer claims staked on Canadian Creek in April 1911 by J. Britton and C. Brown. D.D. Cairnes, a Geological Survey of Canada geologist, examined the placer working in 1917 and recognized huebnerite in the heavy mineral concentrates. He suggested that the gold and tungsten mineralization was derived from an intrusive complex on Patton Hill which is now recognized as the core of the porphyry deposit. The first mineral claim in the area was staked in 1917 by N. Hansen. A number of other claims were staked over parts of the deposit between 1920 and 1950 but no significant work was done and no lode mineralization was reported. Early gold production from the Canadian Creek placer operation is not known but the most recent work (1980-85) yielded about 50 kg (1615 troy ounces). During the Second World War a small amount of tungsten was also recovered.

Silver-lead veins were discovered about 3 km south of the Canadian Creek placer workings in the early 1940's by J. Meloy and A. Brown. They optioned the claims in 1948 to Noranda Mines Limited, which performed hand trenching, and again in 1963 to a joint venture between Rio Tinto Canada Exploration Limited and Yukon Consolidated Gold Corporation Limited, which did bulldozer trenching. L. Proctor purchased the claims in 1965 and formed a junior mining company, Casino Silver Mines Limited, to develop the property. Casino Silver Mines completed bulldozer trenching on the veins later that year and shipped 44 tonnes of hand cobbed argentiferous galena to the Cominco smelter at Trail. In the next two years Casino Silver Mines tested the Bomber vein with a 366 m adit and explored for other veins by soil geochemical, magnetic and electromagnetic surveys, bulldozer trenches and 13 diamond drill holes totalling 1441 m (later

work on the porphyry deposit showed that these holes tested a transported limonite gossan precipitated from acidic water draining the porphyry). The Bomber vein was leased in 1976 to E. Jacobs who explored with 49 m of drifting, 55 m of raising and extensive surface trenching between 1978 and 1980. During this period a total of 328.5 tonnes of ore were hand cobbed and shipped to Trail. The average grade of the 372.5 tonnes smelted between 1965 and 1980 was 3689 g/t Ag, 17.1 g/t Au and 48.3% Pb plus about 5% Zn, 1.5% Cu and 0.02% Bi.

Porphyry exploration at Casino began in late 1967 when the Brynelson Group acquired control of Casino Silver Mines. A. Archer of Archer Cathro had visited the claims earlier that year and recognized the silver-lead veins occurred peripheral to a large alteration zone that could represent a deeply weathered porphyry copper deposit. In 1968 he persuaded the new owners to perform grid soil sampling and mapping over the altered rocks on Patton Hill. This work outlined a large area of strongly anomalous copper and molybdenum response. Brameda Resources Limited optioned the claims in May 1969 and drilled the discovery hole (P1) shortly afterward. With the positive results, Quintana Minerals Corp. became involved (purchasing Brameda Resources shares) and the program quickly expanded. By August 1970 detailed mapping, IP and magnetic surveys, 49 BQ and NQ diamond drill holes (11,254 m), 35 twelve cm diameter rotary drill holes (5328 m) and preliminary metallurgical studies had been completed. Although results were encouraging and a 50 tonne/day test mill was en route to the property, all work was terminated abruptly when terms for development financing could not be negotiated and Quintana Minerals withdrew its support.

In 1973 Brameda Resources exchanged its option on the property for a 38.4% equity interest in Casino Silver Mines and subsequently sold this interest to Teck Corp. Casino Silver Mines conducted EM surveys, reanalyzed soil sample splits for gold and drilled 7 NQ diamond drill holes (1420 m) later that year.

Although Casino was recognized as a major resource, the property was inactive throughout most of the 1970's and early 1980's because of low copper prices. Casino Silver Mines soil sampled much of the property again and analyzed for gold in 1983 and optioned the oxidized leach cap portion of the porphyry deposit to a joint venture consisting of Permian Resources Limited and Nordac Mining Corp. in 1985. Work done that year consisted of additional soil geochemical surveys, cyanide leach tests and bulldozer trenching to test heap leach gold potential. Results showed that the weathered rocks typically contains between 0.27 and 1.0 g/t gold over most of the deposit but it was concluded that these grades were too low to justify a stand-alone heap leach operation.

In November 1991 Archer Cathro optioned the property from Casino Silver Mines and later assigned the option to Big Creek Resources Ltd. Drilling began in June 1992 and, after encouraging results were obtained from initial holes, Pacific Sentinel proposed a merger between themselves and Big Creek. By the end of the field season, a total of 4729 m of drilling had been completed in 21 vertical holes. The Pacific Sentinel-Big Creek merger was completed in November 1992 and shortly thereafter a second merger took place between Pacific Sentinel and Casino Silver Mines. During the 1992 field season, the property was substantially expanded with the staking of 583 mineral claims and 33 placer leases.

CAMP, LOGISTICS AND PERSONNEL

The Casino camp is located in the south-central part of the property, 300 m west of the airstrip and approximately 2.5 km by road from the main drill area. It has accommodation and dining facilities for up to 70 people and consists of main dining and dry complex, six bunkhouse trailers, office tent, womens' dry tent, drillers' dry tent, first aid tent, common room tent and twelve sleeping tents. Of the six bunkhouse trailers, two were part of the original Casino camp while the other four were salvaged from the abandoned Canadian Creek camp in 1993. Power for the camp is supplied by 17 kw and 11 kw diesel generators with a 7 kw diesel generator for emergency backup.

Core facilities are situated at the airstrip. The main building is a core logging, geotechnical and core splitting complex set up to handle six drills. There is also a separate trailer equipped with a fume hood and rock saw for cutting and staining drill core. A nearby tent houses a small lab for geotechnical soil studies. Power for the core facilities is supplied by an 11 kw diesel generator.

Core storage was consolidated in 1993 and is now located at the airstrip adjacent to the core logging complex. Thirty-four core racks house approximately 56,500 m of core drilled in 1969, 1973, 1992 and 1993. Appendix III shows which holes are stored in each rack. Six extra core racks were built in 1993 to hold the initial 9,000 m of core that will be drilled in 1994.

The camp opened March 5 and closed November 12 with a peak work force of 64 and an average of 55. A total of 47 individuals worked for Archer Cathro at Casino in 1993, of those 28 (60%) were hired in Yukon, 15 (31%) were female and 8 (17%) were First Nation. The winter watchman, Larry Smith, started November 10. His duties include keeping regular meteorological and wildlife records.

Transportation

Year-round access to the property is provided by an 800 m gravel airstrip suitable for aircraft up to DC-3 in size. The airstrip slopes to the south at about 10° allowing approach only from the downhill (south) end. A variety of aircraft are available for charter in Whitehorse, 305 km to the south (Table 3). Groceries, propane, regular gas, crew and miscellaneous supplies were flown in on regularly scheduled DC-3 flights from Whitehorse (every Tuesday and Friday). Departing personnel, core samples and empty propane bottles were back-hauled on these flights. Approximately 48 additional flights were made from Whitehorse (usually with smaller aircraft) to transport urgently needed items, excess freight, or personnel with awkward travel schedules.

Most of the heavier and bulkier freight that was not transported by barge was flown in from the road-accessible Minto airstrip, located 103 km east of the property and 260 km by road north of Whitehorse. To avoid the risk of a diesel spill on the Yukon River, all of the diesel was flown to the property by DC-3 from Minto at a cost of $0.38 per litre. Aviation gas and diesel were stored at Minto in two tankers which were removed at the end of the field season. At Casino, the diesel was stored in five tanks adjacent to the airstrip. The tanks have a total capacity of 77,000 litres (17,000 gallons) and are surrounded by a deep trench and a berm to contain the fuel in case of a spill.

TABLE 3
AIRCRAFT UTILIZATION MARCH TO NOVEMBER 1993

Aircraft	Return Trips	Number of Trips	Freight cost/lb	Freight cost/kg
DC-3	Whitehorse to Casino	115	$0.44	$0.98
	Minto to Casino	214	$0.17	$0.39
Cessna 206	Whitehorse to Casino	21	$0.67	$1.50
Islander	Whitehorse to Casino	19	$0.65	$1.43

On site transportation utilized an extensive road system and is provided by the following vehicles.

Vehicles owned by Pacific Sentinel

1 4x4 Suburban (emergency transport vehicle)
2 4x4 3/4 ton pickups
1 4x4 Bronco
3 4x4 Honda all terrain vehicles.

Vehicles owned by E. Caron Diamond Drilling

8 4x4 3/4 ton pickups
1 hiab-equipped flat-bed truck

Communication

Primary communication for the site was a Skycom satellite system provided by Infosat Telecommunications Ltd. of Burnaby, B.C. Of the four satellite lines, one was dedicated to a fax machine while the others were telephone lines located in the office, common room and core logging facility. The system provided to be very reliable. The only significant disruption occurred when a lightning strike 200 m from camp damaged some electronic components and the system was down for three days until an Infosat technician could arrive to replace them. Backup communication was supplied by a radio telephone (YJ3-9208) monitoring the Beaver Creek channel and a single side band radio (VGN 369) monitoring frequency 4441.

First Aid and Safety

There were four industrial first aid attendants in camp (two A tickets, one B and one C) and most of the drill contractor's employees held St. John standard certificates. A well equipped first aid tent and a four-wheel drive emergency transport vehicle were also on site.

There were two fire suppression stations on the property, one in the main camp and the other at the core logging facility. Each station contained a gasoline powered water pump, hose, two backpack water pumps, picks and shovels. Fire extinguishers were located throughout the camp, at work stations, and near equipment.

PHYSIOGRAPHY, VEGETATION, WILDLIFE, FISHERIES, HYDROLOGY AND CLIMATE

Physiography

The Casino property is located in the Dawson Range, a northwest-trending belt of well rounded ridges and hills that peak between 1500 and 1675 m. The hills rise above the Yukon Platform, most of which has been peneplaned at about 1250 m and deeply incised by mature dendritic drainages of the Yukon River watershed. Although the Dawson Range escaped Pleistocene glaciation, minor alpine glaciation has produced a few small cirques and terminal moraines. Local elevations range from 1580 m on a ridge along the western property boundary to 430 m on the banks of the Yukon River.

Vegetation

A vegetation survey was conducted by Hallam Knight Piesold Ltd. in July 1993. Sampling involved transect documentation of understorey and ground cover species. The species percent coverage was determined for dominant trees, tall shrubs, shrubs, herbs, mosses, lichens, liverworts, tree seedlings and fungi.

Treeline in the vicinity of the property is about 1370 m on south-facing slopes dropping to 1070 m on the cooler, north-facing slopes. The deposit is located above treeline and is lightly vegetated with lichen, moss, grass, wide spaced scrub birch, willow and a few stunted spruce. Below treeline, spruce and poplar are prevalent with some minor groves of birch and aspen. Slide alder, buckbrush and moss are common shrubs and ground cover. The largest trees are found in the lower reaches of Brittania and Casino Creek attaining maximum heights of 20 to 25 m. The Hallam Knight Piesold report on the vegetation at Casino by can be found in Appendix V.

Wildlife

Two aerial wildlife surveys were completed by Hallam Knight Piesold in early June and late September 1993. A wildlife observation log was maintained throughout the field season by Casino field employees and during the winter by the site watchman.

The Casino area provides good habitat for moose with sightings reported in both the Casino Creek and Brittania/Canadian Creek watersheds. A small population of caribou was seen in the headwaters of Canadian Creek from June to August. Frequent black bear sightings were reported on the property. Grizzly bear, often accompanied by cubs, were spotted intermittently throughout the summer. Lynx were sighted twice in the vicinity of lower Brittania Creek. Fox were observed throughout the summer in and around Patton Hill. Wolverine, pine marten and weasel were also sighted in the Brittania/Canadian Creek watershed. A variety of rodents were observed including beaver, hoary marmot, porcupine, bog lemming, boral vole and weasels. A detailed report on the wildlife study by Hallam Knight Piesold can be found in Appendix V.

Fisheries

Fisheries surveys were conducted by S. Blundell of Hallam Knight Piesold on three separate occasions in June, August and September at the Casino property. Electrofishing and baited traps were used to sample the areas within the defined reaches of Dip, Casino, Canadian and Brittania Creeks. Data collected from the survey was used to determine species presence, species composition and basic population characteristics of the watersheds surrounding Casino.

The Brittania Creek/Canadian Creek watershed seems to provide a spawning and rearing habitat for arctic grayling as they were found during all three fish surveys. Slimy sculpin, round whitefish and one juvenile burbot were also caught in the lower reaches of these creeks. Juvenile chinook salmon were observed in the lower reaches of Brittania Creek during the June and August surveys but not in September. Spawners were not observed in Brittania Creek therefore the value of this system for the purpose of spawning is questionable. Arctic grayling were found in the lower reach of Casino Creek during all three surveys. However, no fry were seen, suggesting that this system likely provides rearing habitat but little or no spawning habitat. Slimy sculpins were observed in the lower reaches of Casino and Dip Creeks in all three surveys. A detailed report on the fisheries study by Hallam Knight Piesold appears in Appendix V.

Hydrology

Hydrology staff gauges were installed by S. Blundell and J. Gibson of Hallam Knight Piesold at five stations (Figure 8) and monitored three times a week by Casino field personnel from June 3 to October 31. An automatic water level recorder was installed at the mouth of Casino Creek. Peak runoff was in late July at all stations, corresponding with high precipitation values. A detailed report on the data collected from the staff gauges is included in Appendix V.

As a follow up to the August 12, 1992 Proctor Gulch pH sampling (Figure 9), Proctor Gulch was tested again at the same stations on July 9, 1993 (Figure 10). Comparison of the data shows similar results with Proctor Gulch slightly more acidic (pH 3.5 to 3.7) and Casino Creek slightly less acidic (pH 5.9 to 5.6) in 1993 than in 1992.

Meteorology

A basic meteorological station consisting of a maximum and minimum thermometer (enclosed in a louvred housing) and a bucket rain gauge have been installed at the Casino camp. On site meteorological data collection began in March and is continuing throughout the winter by the site watchman. Temperatures and precipitation are measured twice daily by a Casino field employee. During the winter, snowfall is measured daily. An established snowpack station exists on the property and is monitored for Water Resources (YTG) by the Carmacks RMO.

The following data was collected from March 19 to November 30. Extreme maximum and minimum temperatures were 25.3°C (July 16) and -35.0°C (November 20), with monthly means ranging from 12.4°C (July) to -10.3°C (November). Monthly precipitation ranged from 4.60 mm (April) to 123.30 mm (July). A detailed report on the meteorological data collected at Casino can be found in the Hallam Knight Piesold report in Appendix V.

REGIONAL GEOLOGY

The following sections on the regional geology, property geology and mineralization are drawn extensively from a Pacific Sentinel report by J. Payne, B. Bower and C. Delong dated January 31, 1994 entitled Casino Deposit.

The Casino deposit occurs in a zone where the Yukon Cataclastic Terrane to the north is overlapped by the Yukon Crystalline Terrane to the south. An elongate band of ultramafic rocks 1 km north of the Casino deposit may occur along a major tectonic suture separating the two terranes. The southern terrane contains the Dawson Range Batholith with roof pendants and blocks of the metamorphic rock. The northern terrane is dominated by metamorphic rocks with scattered intrusions of the Coffee Creek Suite which is petrographically distinct from the Dawson Range Batholith. For the purposes of this report, the metamorphic rocks are undifferentiated and collectively referred to as the Yukon Metamorphic Complex.

Table 4 shows the major geological units with isotopic ages (where available). All isotopic dates are based on U-Pb ratios in zircons analyzed by Dr. J.R. Mortenson in 1993 at the University of British Columbia.

TABLE 4

DAWSON RANGE BATHOLITH (Middle Cretaceous)		
2	Quartz Diorite, Granodiorite	102-104 Ma
YUKON METAMORPHIC COMPLEX (Paleozoic?)		
1	undifferentiated gneiss, meta-diorite/amphibolite, quartzite	

Rocks of the Yukon Metamorphic Complex include quartz-biotite-plagioclase gneiss and metamorphosed granodiorite to quartz diorite with lesser quartzite and meta-diorite/amphibolite. All are complexly deformed. Original deformation probably occurred during the Late Triassic to Early Jurassic but may have been as early as Late Paleozoic. Weaker deformation probably accompanied the intrusion of the west-northwest trending Dawson Range Batholith.

The Dawson Range Batholith is dominated by medium- to coarse-grained quartz diorite to granodiorite, with occasional fine- to medium-grained diorite. It contains scattered to locally abundant centimetre-sized xenoliths of meta-diorite belonging to the Yukon Metamorphic Complex.

The Casino Intrusions are stocks up to 5 km across which intrude the Dawson Range Batholith. They are concentrated in a west-northwest trending belt along the Big Creek Lineament and its northwestern extension (including Casino). Most Casino Intrusions are dominated by biotite-bearing to leucocratic, granodiorite and quartz monzonite. Some contain a hypabyssal phase comprised of porphyritic dacite (Patton Porphyry at Casino).

Most of the major porphyry copper $\pm$ molybdenum $\pm$ gold occurrences in the Dawson Range lie in a 110 km long belt developed along the southwest side of the Big Creek Lineament and its northwesterly extension. The Casino deposit is located near the north end of the belt about 1 km southwest of the lineament.

PROPERTY GEOLOGY AND MINERALIZATION

The Casino deposit is hosted by an intrusive complex consisting of quartz monzonite (Unit 3), intrusion breccia (Unit 4), Patton Porphyry (Unit 5) and microbreccia (Unit 6). This complex cuts rocks of the Dawson Range Batholith (Unit 2) and Yukon Metamorphic Complex (Unit 1), and is itself cut by post-mineralization latite (Unit 7). The property geology is shown on Figure 11 while the major units are described below. The property was remapped in 1993 by J. Payne and the descriptions are primarily based on his mapping plus observations made by core loggers, notably B. Bower and C. Delong.

Yukon Metamorphic Complex (Unit 1) - Paleozoic?

These rocks occur as country rocks on the northwest side of the intrusive complex and as fragments in the intrusion breccias (Unit 4) in the northern and northeastern parts of the Casino deposit. The most common rock type is mafic gneiss consisting of plagioclase, biotite and quartz. Less abundant types include meta-diorite/amphibolite, quartz-rich and intermediate gneiss, and quartzite.

Dawson Range Batholith (Unit 2) - Middle Cretaceous (102-104 Ma)

The Dawson Range Batholith is the main country rock to the deposit. It is predominantly granodiorite in composition but also includes some quartz monzonite and diorite. The granodiorite is subdivided into a hornblende phase (mainly to the west, south and east) and a biotite-hornblende phase in the north. Early formed diorite is concentrated in the north and northeast, particularly east of the Casino Fault. Some intrusions are foliated near their margins, particularly in the north and in the block east of the Casino Fault.

Granodiorite is characterized by scattered hornblende phenocrysts ranging from 0.5 to 1.2 cm long. It commonly contains 10 to 20% mafic minerals with hornblende more abundant than biotite except in the biotite-hornblende phase to the north. Subhedral to euhedral plagioclase commonly shows prominent

GEOLOGY

MAR. 1984 | 1 :7500 | JSL M

compositional growth zoning from andesine cores to oligoclase rims. Quartz and K-feldspar are interstitial to plagioclase. Quartz forms interlocking aggregates of slightly to moderately strained grains. Minor patches of myrmekite occur in plagioclase grains adjacent to K-feldspar. The granodiorite is commonly brecciated on the southern margin of the deposit, ranging from crackle breccia to cataclastically deformed breccia. Fragment size generally decreases with increasing degree of brecciation.

Quartz monzonite contains less abundant mafic minerals (2 to 10%), lacks hornblende phenocrysts and usually exhibits more biotite than hornblende.

Diorite is normally comprised of andesine and hornblende in subequal proportions but in places primary biotite is more abundant than hornblende.

Casino Intrusions (Units 3-6) - Upper Cretaceous

Quartz monzonite (Unit 3) is characteristically leucocratic and is most abundant immediately west of the Casino Fault. This unit is fine- to medium-grained with about equal amounts of quartz, plagioclase and K-feldspar. These form aggregates of anhedral grains whose textures suggest that the rock crystallized from a near-eutectic liquid.

Intrusion breccia (Unit 4) occurs in the northern and eastern part of the deposit. It is heterolithic, containing fragments of Dawson Range Batholith and Yukon Metamorphic Complex in a matrix of fine-grained leucocratic quartz monzonite (Unit 3). Groundmass ranges from 2 to 40% while fragments range from a few centimetres to a few metres in diameter.

Patton Porphyry (Unit 5) (72-74 Ma) includes two or more episodes of hypabyssal, porphyritic dacite to rhyodacite. The main body of Patton Porphyry is a plug a few hundred metres across that lies northwest of Patton Hill. Contacts between the Patton Porphyry plug and the adjacent microbreccia range from sharply intrusive to gradational. Elsewhere, Patton Porphyry forms discontinuous dykes ranging from a few centimetres to 20 m wide that cut the quartz monzonite (Unit 3) and less commonly the Dawson Range Batholith.

Most Patton Porphyry intrusions contain 10 to 30% plagioclase and biotite phenocrysts in an aphanitic, medium to dark green groundmass of latite to rhyodacite composition. Plagioclase usually ranges from 2 to 7 mm long with occasional grains up to 2.5 cm while biotite ranges from 2 to 3 mm across. Quartz phenocrysts (0 to 5%) are usually 3 to 5 mm in size. Some chloritic aggregates may be altered hornblende grains.

At least two ages of Patton Porphyry are present. The early phase contains less abundant, commonly ragged plagioclase phenocrysts in a chloritic groundmass while the later phase exhibits more abundant, commonly subhedral to euhedral plagioclase phenocrysts in a vitreous, less chloritic groundmass. Episodic Patton Porphyry magmatism probably occurred before, during and after the main stage of hydrothermal alteration and mineralization. Much of the Patton Porphyry is poorly mineralized but strongly potassically altered, suggesting that it formed during and after the main stage of sulphide mineralization in the core of the deposit.

Microbreccia (Unit 6) forms a subvertical pipe in the core of the deposit and more irregular bodies to the southwest (Figure 11). It contains angular quartz grain and wallrock fragments in an extremely fine-grained rhyodacite to rhyolite groundmass of uncertain genetic origin. Quartz forms 10 to 20% of the rock, generally occurring as unstrained 1 to 2 mm crystals and crystal fragments. A few quartz grains have subhedral outlines, suggesting they may represent early formed phenocrysts in a silica-supersaturated magma. The subhedral grains are texturally similar to quartz phenocrysts in some of the Patton Porphyry intrusions.

Lithic fragments in any given part of the microbreccia usually belong to the adjacent wallrock type. This suggests only limited fragment transport and mixing in the microbreccia. In places the groundmass of the microbreccia exhibits a

very fine-grained, interlocking igneous texture while elsewhere the primary texture has been destroyed by strong potassic alteration.

Latite (Unit 7) probably Upper Cretaceous or Tertiary

This unit includes late dykes, sills and an explosion breccia pipe, all of which are dacitic in composition. Most dykes dip steeply and strike between 130 and 160°. Some are slightly porphyritic latite containing 5 to 10% plagioclase phenocrysts in a aphanitic to very fine-grained groundmass of plagioclase and K-feldspar. Other late dykes in the south-central part of the deposit contain 2 to 5% coarse quartz phenocrysts and 1 to 3% plagioclase phenocrysts in an aphanitic latite groundmass. On the east side of the Casino Fault, a latite dyke shows vesiculation with quartz-filled amygdules stretched parallel to steeply-dipping contacts.

The explosion breccia is an irregular, vertical pipe up to 100 m across. It contains subrounded fragments (mainly altered microbreccia with lesser quartz-phyric latite and Dawson Range Batholith) in a groundmass that ranges from rock flour (probably formed mainly by granulation of latite) to very fine-grained latite. The breccia has a gradation contact with a large latite dyke which shows strong sheeting parallel to its contacts.

All rocks belonging to Unit 7 were intruded after the main hydrothermal event and contain only minor base and precious metal mineralization, most of which is contained in altered microbreccia clasts.

Petrochemistry

The Dawson Range Batholith granodiorite, most Patton Porphyry and latite (Units 2, 5 and 7) have a granodiorite composition. Patton Porphyry has slightly less silica than latite or granodiorite. Quartz monzonite (Unit 3) and the K-feldspar-phyric phase of the Patton Porphyry are granitic in composition.

Structure

The largest fault on the property is the Casino Fault, a broadly curved, steeply-dipping strike-slip fault which trends 160 to 140° and offsets the eastern part of the Casino deposit right laterally about 200 m. On the east side of the Casino Fault numerous small faults were encountered in drill holes. Most of these have subhorizontal slickensides and chlorite-hematite alteration. Healed slickensides, local brecciation and development of open spaces at the intersection of fractures are common.

Other faults in the region include a northeast-trending strike-slip fault along Dip Creek southeast of Casino, a north-south fault that is inferred in a prominent valley along the western side of the deposit and a major fault on the east side of the deposit that separates hydrothermally altered rocks of the Casino Complex from fresh rocks of the Dawson Range Batholith.

Hypogene Alteration

The main hydrothermal alteration and mineralization event is centred on and generally related to the microbreccia (Figure 11). Both pervasive and fracture controlled features are important. The potassic core contains secondary K-feldspar, biotite, magnetite, sericite, anhydrite and often chalcopyrite, molybdenite and gold. The potassic core is bounded sharply to the south and southeast by a phyllic zone. This zone is dominated by quartz, sericite and pyrite with a very low base metal and precious metal content. A weakly mineralized porphyritic assemblage lies to the north of the core.

Potassic alteration is most prominent in the groundmass of microbreccia and in granodiorite bordering the microbreccia. Magnetite is present as braided networks of early veinlets. Purple anhydrite occurs in veins and less commonly as matrix to early brecciation. Gypsum, a common hydration product of anhydrite, occurs in veins and the matrix of late breccias. Ankeritic carbonate-gypsum

alteration overprints potassic alteration in the vicinity, and to the east, of the Casino Fault. This overprint is most apparent as late breccia matrix and irregular, open space fillings. In places it is associated with coarse-grained chalcopyrite.

Phyllic alteration is strongly fracture controlled and generally crosscuts higher temperature, K-feldspar stable alteration zones. Typically, quartz-pyrite veinlets are accompanied by texture-destructive quartz-sericite envelopes. Plagioclase is altered to sericite, biotite to pseudomorphic muscovite, and T-oxide and hornblende to a variety of assemblages containing chlorite, calcite, quartz or biotite. Tourmaline forms radiating disseminations and veinlets (with or without quartz). Phyllic alteration commonly removes chalcopyrite from the rock.

Zones of intermediate, probably non-equilibrium alteration, form a distinctive dull green sericite-chlorite-clay assemblage where K-feldspar is stable. This assemblage is pervasive but not texture destructive. The sericite-chlorite-clay suite forms irregular patches along the border of and within the zone of potassic alteration.

Sporadically developed in both the phyllic and potassic zones are clay-rich assemblages in which feldspars are altered to kaolinite, sericite or montmorillonite. Montmorillonite alteration commonly is centred on minor structures and appears to be a late stage overprint.

To the north, the weakly developed, propylitic alteration zone contains epidote, chlorite and calcite after plagioclase and mafic minerals.

Hypogene Mineralization

The bulk of the sulphide mineralization occurs in and adjacent to the microbreccia (Unit 6) and intrusion breccia (Unit 4). Molybdenite is concentrated moderately in the core and chalcopyrite is concentrated moderately towards the periphery just inside the potassic-phyllic alteration contact.

Chalcopyrite occurs in veins, disseminations and irregular patches. On the east side of the Casino Fault chalcopyrite distribution is strongly fracture controlled. The pyrite/chalcopyrite ratio ranges widely from less than 2:1 in much of the potassic zone to greater than 20:1 in the phyllic zone.

Molybdenite occurs as discrete flakes and selvages in early quartz veins. Molybdenite is not usually intergrown with other sulphides.

Native gold was identified in one polished section. It forms a grain 25 microns across in a fracture within a pyrite grain. Gold has a good correlation with copper.

Late stage, commonly vuggy, base metal veins were introduced mainly along steeply-dipping fractures trending 150 to 170°. These vary widely in mineralogy. Some veins are dominated by chalcopyrite and/or pyrite but many contain abundant sphalerite, galena and calcite/ankerite with less abundant quartz, tetrahedrite and chalcopyrite and minor bismuth-bearing minerals. Tetrahedrite and chalcopyrite commonly are intimately intergrown. Typically the late veins are geochemically anomalous in any or all of Ag, As, Au, Bi, Cu, Cd, Mn, Pb, Sb, Zn and locally W.

Supergene Alteration and Mineralization

Supergene overprinting often obscures hypogene alteration and has resulted in large scale remobilization of copper. Three supergene facies have been recognized but not all are present in every hole.

Leached cap occurs closest to surface and ranges from a few metres to greater than 150 m thick, averaging about 78 m in the area that has been drilled. In general the thinnest leached caps are found at low elevations while the thickest are found along the crest of Patton Hill. This zone characteristically exhibits boxworks after sulphides and is normally bleached due to supergene clay alteration. Sulphides are rare and are normally replaced by jarosite, goethite,

hematite and ferrimolybdite. Assaying has shown that copper is strongly depleted in this zone but that gold and molybdenum show little evidence of remobilization.

Supergene oxide zones are the least common of the supergene facies and rarely exceed 15 m in thickness. Ideally they occur at the base of the leached cap but in some instances they form large lenses within it. Supergene oxide zones are best developed on north-facing slopes and are often absent on more intensely leached south-facing slopes. Common secondary minerals in this zone include malachite, azurite, chalcanthite, brochantite, tenorite, neotocite, native copper and hematite. The copper minerals occasionally replace chalcopyrite but more typically are after chalcocite. Copper is usually enriched in this zone while gold and molybdenum are unaffected.

Supergene sulphide zones are found in most holes. They usually have a sharp upper contact and an irregular lower contact. Mineralization consists of chalcocite with minor covellite and traces of diagenite replacing or coating chalcopyrite and pyrite. Copper is strongly enriched averaging about 1.7 times the underlying hypogene grade. Although most copper appears to have been remobilized downward, there is also evidence for lateral remobilization. In a number of holes immediately north of the crest of Patton Hill the supergene sulphide zone is thin or absent even though the underlying hypogene mineralization is good grade, while some of the holes in the northern part of the deposit have thicker and higher grade supergene zones than would be suggested by the hypogene grade.

1993 DRILL PROGRAM

General

The 1993 drill program comprised 127 diamond drill holes totalling 50,316 m, including twenty 1992 holes that were deepened. Drill production averaged 22 m/shift/drill. Three holes were abandoned because of bad ground. Figure 12 graphs total drill production and average shift production. Details concerning drill production and mud consumption are summarized on Table 5 on the following page. Survey data for the drill holes can be found in Appendix VI, while drill collars are shown on the 1:5000 property maps (Figures 18 to 22). The objective of the 1993 drill program was to delineate the deposit.

Contractor

The diamond drilling and bulldozer support were contracted to E. Caron Diamond Drilling Ltd. of Whitehorse under terms negotiated by Pacific Sentinel. Up to six drill rigs were used and their start up and completion dates are listed in a Chronology of Significant Events in Appendix II. Three of the drill rigs were standard Longyear 38's, two were hydraulic modified Longyear 38's and one was a Val d'Or. All were skid mounted and wireline equipped. Three bulldozers (ripper-equipped Caterpillar D7, winch-equipped Caterpillar D7 and winch-equipped Caterpillar D6) were used to construct access roads, build drill sites and move the drills from site to site. The drills were operated on a seven day per week, 24 hour per day basis utilizing two, two-man crews per drill. A drill foreman supervised the work with help from a full-time assistant provided at no cost by the contractor. A truck driver was on site for much of the summer to operate the contractor's hiab-equipped, flat-bed truck which was used to unload aircraft and ferry supplies from Brittania Creek to the drill area.

Water Supply and Drilling Conditions

The three main sources of drill water in summer and fall were Canadian Creek (150 m northeast of Hole 93-248), Casino Creek (20 m north of Hole 93-214) and the junction of Proctor Gulch and Casino Creek. The Canadian Creek system was the most important and involved a 1500 m Victaulic waterline running from the sump to two 13,640 litre (3000 gallon) water tanks on top of Patton Hill, which acted as reservoirs for gravity-assisted waterlines that branched off to the various drills. When drilling started in March an attempt was made to use a well on Casino Creek that had been used for winter water supply in 1969; however, it quickly dried up. Sufficient water was discovered in the Canadian Creek sump but it was felt that the line would have been too long considering the cold temperature. To alleviate the problem a 9100 litre (2000 gallon) tank was mounted on the contractor's flat-bed truck and was used to carry water from Canadian Creek to storage tanks at the drill sites. This system continued until April 27.

Casing depths varied considerably ranging from 2.4 m to 55.2 m. Areas with higher than average casing depths were in the "West Pit" near Canadian Creek and in the vicinity of the Casino Fault. A table of casing depths and holes in which casing was left in can be found in Appendix VI.

Swelling clays were a problem in some drill holes. Hole 93-158 was abandoned at 151 m when the rods became stuck, likely from a clay seam encountered at 132 m. Hole 93-179 encountered a sand and clay seam at 366 m which eventually caused the rods to become stuck when the hole was completed at a depth of 648 m. The drill returned to this site later in the summer and most of the rods were recovered after blasting off the core barrel. Bad ground and caving caused the rods to become stuck at 140 m in hole 93-181. The drill was moved 3 m north to site 93-185 and the hole completed at 811 m.

Poor drilling conditions were encountered in most holes drilled near or through the Casino Fault, specifically holes 93-192, 202, 216, 222 and 223. Problems were generally stuck or broken rods, loss of water circulation and excessive rod and bit wear. The angle hole 93-216 was abandoned at 64 m but other nearby holes were completed by using a combination of slow drilling, thick mud mixture and frequent reaming.

In 22 of the 127 holes drilled in 1993 it was necessary or advantageous to reduce from HQ to NQ diameter rods. The average depth for reducing was 286 m.

Bit and rod wear were higher for angle holes than vertical, particularly in the holes that were drilled through the Casino Fault. Extremely acidic groundwater severely corroded and copper plated the inside of 76 m of HQ rods in hole 93-164.

The most common drill products used were bentonite and superpoly. Consumption of both these products increased when drilling through the leached cap and around the Casino Fault. A table of mud consumption in various regions of the property is shown on Table 5.

Downhole surveys were done every 150 m in vertical holes and 75 m in angle holes using a Sperry Sun Magnetic Directional Single Shot. Vertical holes produced minimal deflecting and rarely exceeded two degrees over the length of the hole. Of the five angle holes, one flattened at a rate of one degree for each 150 m while the other four steepened at an average rate of one degree every 60 m. The three angle holes drilled east into the Casino Fault deviated to the north at a rate of one degree every 100 m.

Logging and Core Handling Techniques

Procedures for core logging, collection of geotechnical data and core sampling were followed as outlined by E. Titley of Pacific Sentinel in Appendix VII.

Assay Techniques

Assaying was done by Chemex Labs Ltd. of North Vancouver. A total of 16,633 core samples were sent for gold, copper and molybdenum assay and ICP geochemical analyses.

Initial sample preparation included passing the entire sample through a TM Rhino crusher yielding a crushed product where greater than 60% of the sample passes a -10 mesh screen. A 200-300 g split was then taken using a stainless steel Jones riffle splitter. The crushed sample split was ground using a ring mill pulverizer with a chrome steel ring set so that 90% of the ground material passes a 150 mesh screen. Grinding with chrome steel leaves trace amounts of iron and chromium on the sample. Rejects are stored at Chemex in dry bins for later use in metallurgical studies. The pulps have also been retained.

Gold analyses were done by standard fire assay techniques. The prepared sample (29.166 g) was fused with neutral flux, inquarted with 4 mg of gold-free silver and then cupelled. Silver beads for AA finish were then digested for one-half hour in 1 ml nitric acid, then 3 ml of hydrochloric acid was added and digested for one hour. The sample was then cooled, made to a volume of 10 ml, homogenized and analyzed by atomic absorption spectroscopy. The detection limit is 0.03 g/t with an upper limit of 500 g/t.

For copper analyses, the prepared sample (0.5-2.0 g) was digested in a hot nitric-hydrochloric acid mixture, cooled, and then transferred into a 250 ml volumetric flask with a final matrix of 25% hydrochloric acid. The solution was then analyzed by atomic absorption. The detection limit is 0.01% with an upper limit of 10%.

For molybdenum analyses, the 2 g prepared sample was digested in aqua regia, cooled, then transferred into a 250 ml volumetric flask. Aluminum chloride was added to the solution as an ionization suppressant before being analyzed by

atomic absorption. The total molybdenum is reported as MoS2. The detection limit is 0.001% with an upper limit of 100%.

For the 32 element, inductively-coupled plasma-atomic emission spectroscopy (ICP-AES) geochemistry, the 1.0 g prepared sample was digested with concentrated nitric and aqua regia acids for two hours. The acid solution was diluted to 25 ml with demineralized water, mixed and analyzed on a calibrated Jarell Ash 1100 plasma spectrometer. The results were corrected for spectral ruler-element interferences.

During the drill program check samples were taken to determine assay precision and accuracy. Check assaying is continuing under the direction of R. Konst of Pacific Sentinel.

Results

Summary drill logs complete with assays can be found in Appendix VIII. Certificates of Analyses are in Appendix IX.

PLACER EXPLORATION AND SOIL GEOCHEMISTRY

An extensive placer exploration program was conducted on the 18 placer claims and 38 placer leases at Casino between June 2 and November 6. Assessment work on the leases consisted of excavation, sampling and mapping of 169 trenches, while assessment work on the placer claims came from overburden sampling in 23 diamond drill holes. The location of the placer claims, placer leases, trenches and drill holes can be found on Figures 13 and 14. The total heavy equipment hours used for the placer exploration program are listed below.

TABLE 6
PLACER EXPLORATION EQUIPMENT HOURS 1993

TYPE	TOTAL HOURS
D7 Bulldozer	137
D6 Bulldozer	126.5
Hitachi excavator	481.5

Trench locations were determined based on the assessment value required, geotechnical requirements and exploration potential. Where possible, trenches were located in areas that had been disturbed during earlier exploration programs because those areas were usually less frozen and would cause less environmental disturbance. All of the new trenches were first stripped of vegetation and top soil to allow thawing of the permafrost. The excavator was then used to dig the test pit into bedrock. There were some instances in which bedrock was not reached due to thick or frozen overburden. Once a trench was completed, it was immediately mapped and sampled while the surfaces were still fresh. Mapping consisted of detailed descriptions of surface material and bedrock. At least one soil sample, pan sample and, where applicable, rock chip sample was taken at 3 to 10 m intervals along the trench. Placer test pit descriptions were completed for each trench, including pit number, lease number, total expenditures, plan map, soil profile, panning concentrate description and sample locations. Copper,

gold, molybdenum and lead geochemical values were added later. Copies of the test pit descriptions and overburden drill hole sampling descriptions can be found in Appendix X.

Trench assays and soil geochemistry add to results from earlier sampling programs, as shown on 1:5000 geochemistry maps (Figures 19 to 22 illustrating copper, molybdenum, gold and lead, respectively). Gold values from chip samples of bedrock ranged from <5 to 1690 ppb over 10 m, while soil samples returned <5 to 1680 ppb. Copper assays from chip samples were between 2 and 1985 ppm with soil values from 6 to 3590 ppm. Molybdenum values were typically low except for areas of known mineralization. Lead values were low in the core of the deposit but were locally anomalous in the vicinity of peripheral lead veins.

The best gold results (568 ppb over 40 m, including 1690 ppb over 10 m) came from trench 9076-C located about 500 m south of Canadian Creek and 1 km west of the closest drill hole. Four other trenches in the same area also produced anomalous results for gold with weak copper and molybdenum support. The second best assays (1680 Au in soil and up to 800 ppb in rock) were from trench 9061-A which cut obliquely across the Casino Fault (Figure 14). The nearest drill hole to this trench is 200 m to the north. Copper values were high (2200 ppm) in the soil which was taken at the head of the trench but concentrations were low in the rocks. This suggests copper was remobilized from a source farther uphill.

The highest copper values (1985 ppm from rock chips and 3590 ppm in soil) were found in trench 9008-B, located between drill holes 93-180 and 93-217 about 200 m east of the Casino Fault. Gold assays from the trench were lower than expected, suggesting that some of this copper may also have been remobilized.

Gold and copper values from trenches along the flanks of Casino Creek in the southern part of the property were consistently low.

As expected, trenches close to the Bomber Vein produced several chip samples with >10,000 ppm lead over 2 to 3 m. Strongly anomalous lead assays were also obtained from veins exposed in trenches near the airstrip.

Soil sampling was done along an access road that was built by Eastfield Resources Ltd. through the western portion of the Casino property en route to the Ana claims. The road is located 100 to 200 m north of and parallel to Canadian Creek and was sampled every 100 m for 2500 m. Anomalous gold values were typically between 20 and 80 ppb with the highest being 645 ppb. Eleven of the 25 samples returned <50 ppb gold. Copper and molybdenum analyses returned background to weakly anomalous values.

GEOTECHNICAL STUDIES

Geotechnical site investigations were performed by Knight Piesold Ltd. under the direction of M. Gant from June 4 to October 1. The trenches excavated for placer exploration were also utilized for geotechnical studies. The geotechnical program is summarized below while a detailed report of the investigations can be found in Appendix XI.

Geotechnical test trenches were used to evaluate surficial materials and foundations for various mine site components including the tailings facility, waste dumps, open pit, millsite and leach pad sites. The excavation and mapping of the trenches provided a detailed description and characterization of the surficial material and bedrock. An on site laboratory allowed test work to determine physical characteristics and properties. Test work included particle size analyses, natural moisture content, Atterberg limits, Proctor compaction tests and laboratory air entry permeameter permeability tests.

SURVEYING AND AIRPHOTOS

All drill collars were surveyed by Lamerton & Associates of Whitehorse from permanent survey hubs established throughout the property. All 1993 holes (including those 1992 holes that were deepened) were marked with 1.5 m wooden plugs bearing an aluminum tag inscribed with hole number, date of hole, total depth and dip. Mine grid coordinates and elevations for all of the drill holes are listed in Appendix VI. Downhole surveys techniques are discussed in the 1993 Drill Program section while results are listed in Appendix VI.

Airphotos were flown on July 3 and 29 under the the supervision of Lamerton & Associates. Airphoto targets were surveyed using the GPS system by R. Hall of Focus Engineering. Eagle Mapping Services Ltd. converted all the 1:25,000 scale airphoto data to a digital format before plotting black ink mylar property maps at a scale of 1:10,000.

1993 ACTIVITY BY OTHERS

Several junior mining companies and government organizations performed geological or geophysical work in the Dawson Range during 1993. The most significant work is summarized below.

Eastfield Resources Ltd.

Eastfield explored two properties near Casino during summer 1993 on behalf of other junior mining companies that had optioned the properties.

The largest program was done on the Ana property, which lies immediately west of the Casino property (Figure 23). It consisted of road construction, geological mapping, soil geochemistry, IP and magnetometer surveys and six diamond drill holes totalling 804 m. The Ana property is owned by Eastfield (80%) and Breckenridge Resources (20%) which has an option to earn a further 50% interest. Surface work outlined a 1.8 by 1.0 km area of interest which was partially tested by the six widespread drill holes. Phyllic-altered intrusive breccia, Patton Porphyry and quartz monzonite were intersected. All holes contained chalcocite and chalcopyrite. Gold values were generally erratic and subeconomic but included some encouraging intervals of up to 1.92 g/t over 3 m (Eastfield News Release Oct. 5, 1993). Copper assays were not reported and are therefore assumed to have been low.

Eastfield also conducted soil geochemistry and ground geophysics on a 2.5 by 1.0 km grid at the Koffee property (Figure 23) which is under option to Rockwealth International Resources Inc. The surface work was followed up with one drill hole but poor ground conditions and budget restrictions resulted in the hole being abandoned at a depth of only 46 m. Chalcocite mineralization was reported in the drill core. No assays were released, implying low concentrations of gold and copper.

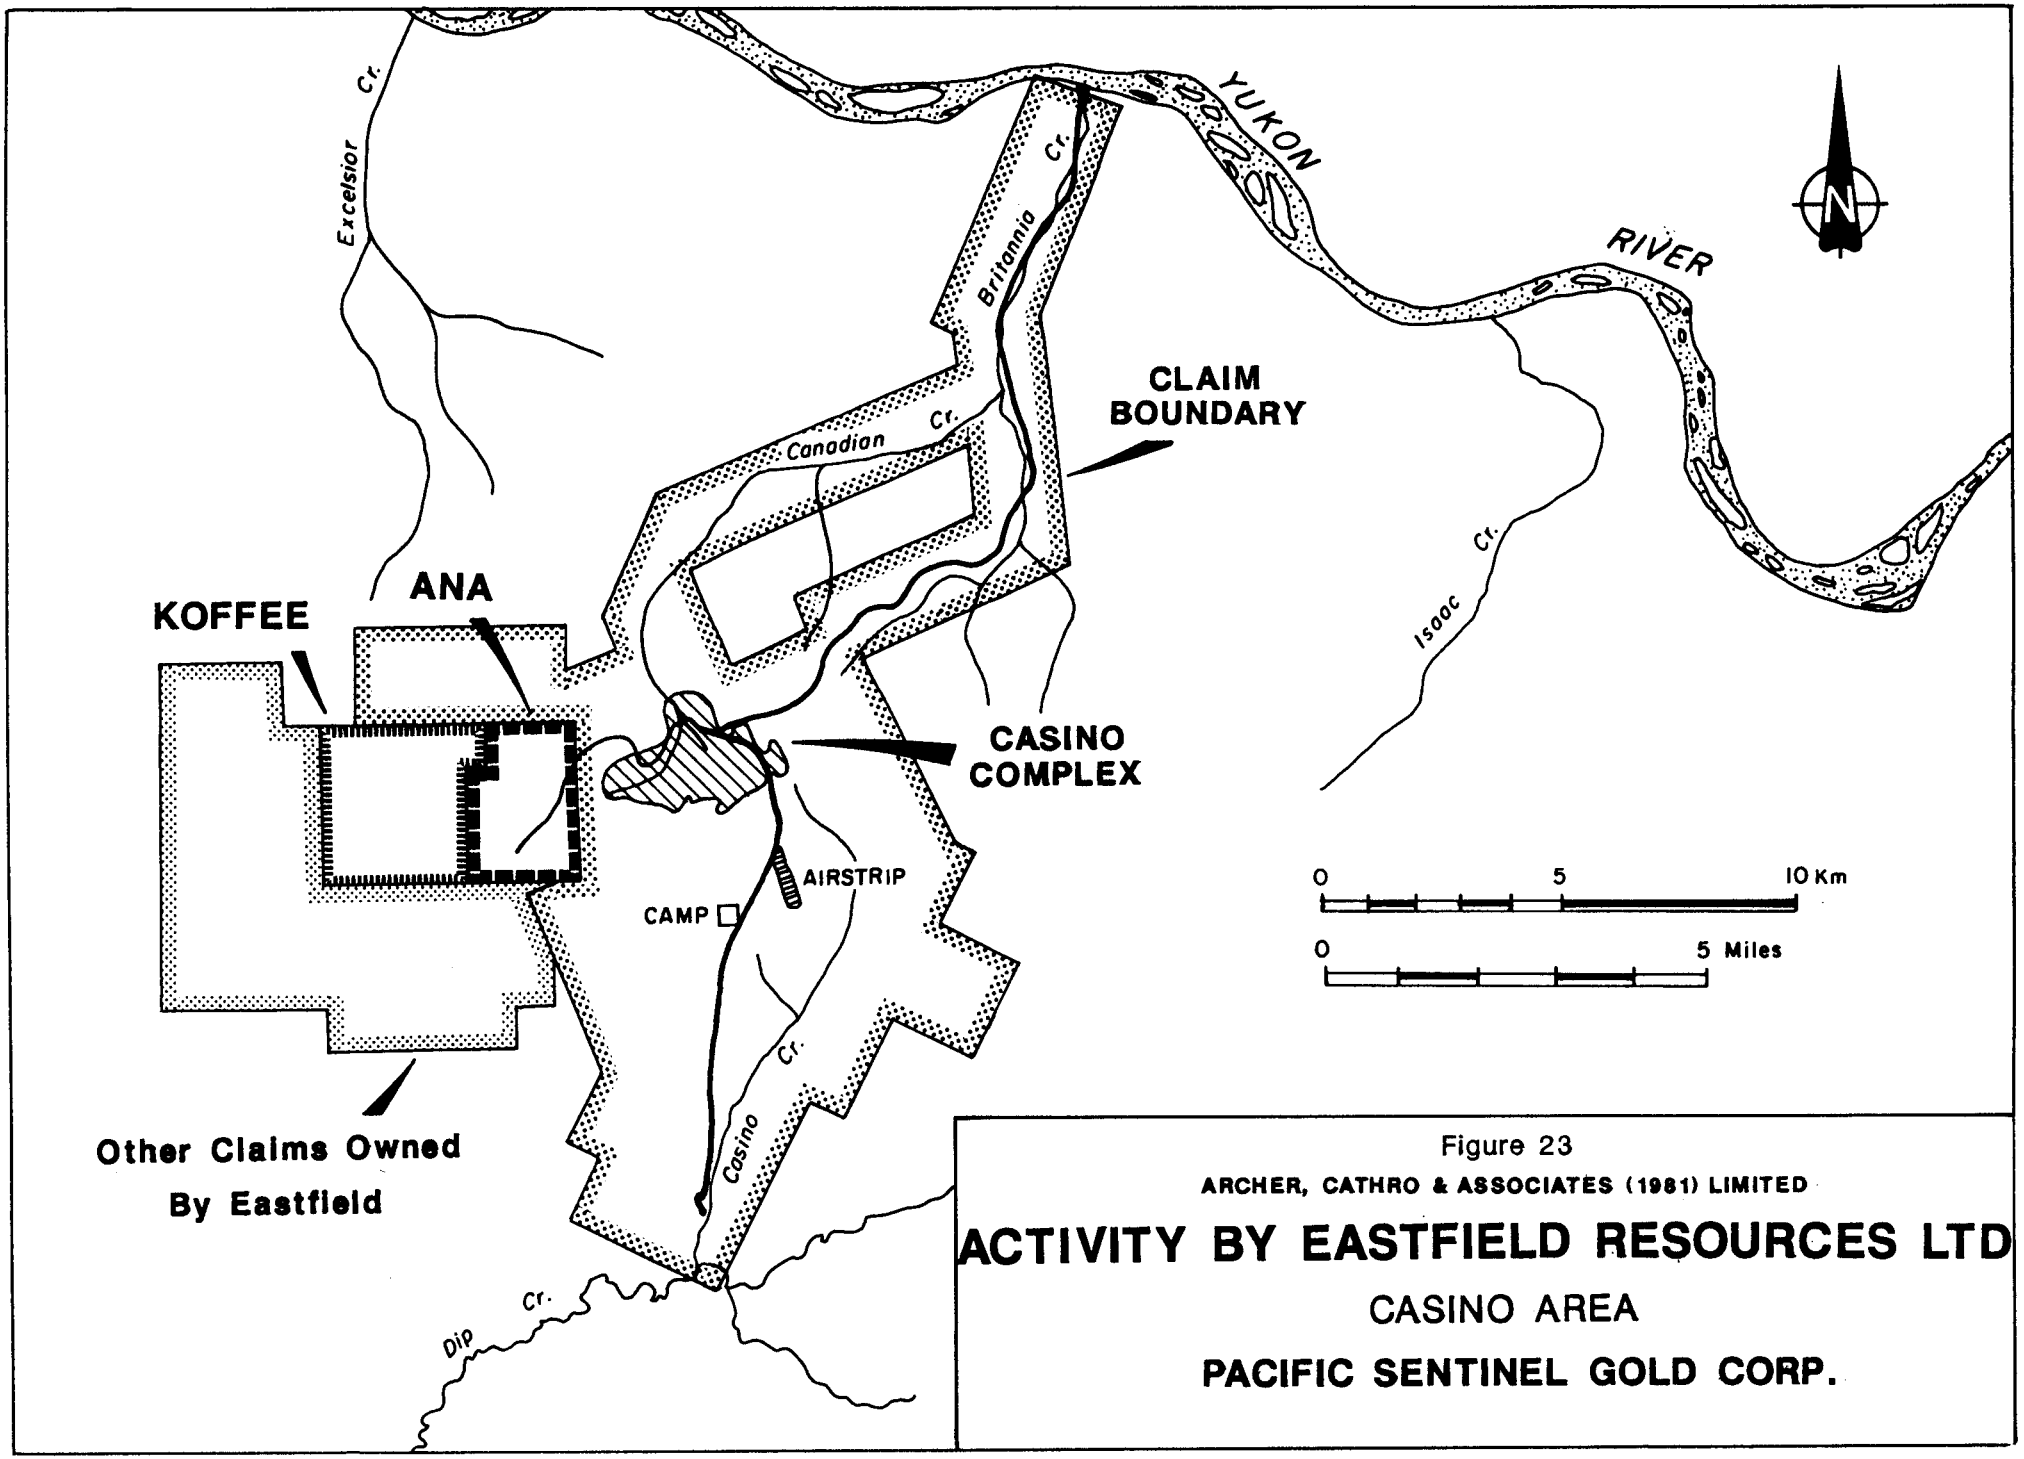

Figure 23

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

ACTIVITY BY EASTFIELD RESOURCES LTD

CASINO AREA

PACIFIC SENTINEL GOLD CORP.

Amarc Resources Ltd.

This private company conducted IP and magnetometer surveys to explore porphyry copper-gold-molybdenum mineralization at its Cash and Nitro properties located on the Casino Trail, approximately 85 km southeast of Casino. Results have not been announced.

Western Copper Holdings Ltd. and Thermal Exploration Ltd.

These junior companies mined approximately 270 tonnes of oxidized copper mineralization from the Williams Creek deposit (118 km southeast of Casino) and trucked the material to Carmacks where Lakefield Research constructed and operated a test solvent extraction electrowinning plant during the fall and winter. Copper recovery was reported to be excellent and there was no problem with freezing within the test column. This test was part of a feasibility study expected to be released in spring 1994.

Geological Society of Canada (GSC)

Dr. T. Lewis and W. Bentkowski of the GSC visited Casino from July 16 to 18 to conduct a downhole thermal gradient survey. Only drill holes in which casing had been left were probed. Of the fourteen holes re-entered, only four were sufficiently clear of permafrost and debris to allow the downhole survey (93-124, 162, 168, 175). Results and methodology of the survey are described in Appendix XII.

Sander Geophysics Ltd.

From August 8 to 19, Sander Geophysics Ltd. under contract with the GSC and Department of Indian and Northern Affairs conducted a helicopter-borne gamma ray spectrometer and magnetometer survey over a 2700 sq km area that included the Casino property (Figure 24). The results of the survey were shown on a poster at the Cordilleran Roundup in Vancouver in late January and are expected to be released as an open file in March 1994.

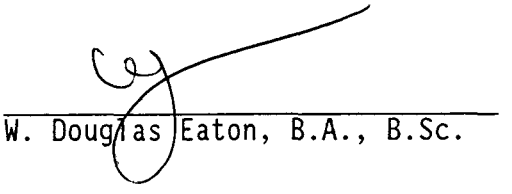
APPENDIX I

AUTHORS' STATEMENTS OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, W. Douglas Eaton, geologist, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in North Vancouver, British Columbia, do hereby declare that:

1. I graduated from the University of British Columbia in 1980 with a B.Sc. majoring in Geological Sciences.
2. From 1971 to present, I have been actively engaged in mineral exploration in British Columbia and Yukon Territory and on June 1, 1981, I became a partner in Archer, Cathro & Associates (1981) Limited.
3. I have personally participated in or supervised the field work reported herein and have interpreted all data resulting from this work.

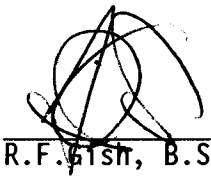


W. Douglas Eaton, B.A., B.Sc.

STATEMENT OF QUALIFICATIONS

I, R. Frank Gish, geologist, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Vancouver, British Columbia, do hereby certify that:

1. I graduated from the University of British Columbia in 1993 with a B.Sc. majoring in Geological Sciences.
2. From 1976 and 1986 to present, I have been actively engaged in mineral exploration in the Yukon Territory and am presently employed with Archer, Cathro & Associates (1981) Limited.
3. I have personally participated in and supervised the field work reported herein.



R.F. Gish, B.Sc.

STATEMENT OF QUALIFICATIONS

I, Brian Bower, of the City of Vancouver, Province of British Columbia, DO HEREBY CERTIFY THAT:

1) I am a Geologist residing at 206-2330 Maple Street, Vancouver, British Columbia.

2) I am a graduate from the University of British Columbia in 1986 with a B.Sc. in Geology.

3) I have worked in mineral exploration since 1984.

4) I was site manager on the Casino Project during the 1993 field season.

Brian Bower

Dated at Vancouver, British Columbia, this 25th day of February, 1994.

STATEMENT OF QUALIFICATIONS

I, John Payne, geologist, with business and residential address in North Vancouver, British Columbia, hereby certify that:

1. I am a graduate of Queen's University, Kingston, Ontario in 1961 with a B.Sc. in Geological Engineering and a graduate of McMaster University, Hamilton, Ontario in 1966 with a PhD. in Geochemistry.
2. I am a Fellow of the Geological Association of Canada.
3. From 1967 to the present, I have been actively engaged as a geologist in mineral exploration in British Columbia and Yukon Territory and have been doing so on a consulting basis.
4. I have carried out geological mapping and interpretation in the field work reported herein.

John G. Payne, PhD.

STATEMENT OF QUALIFICATIONS

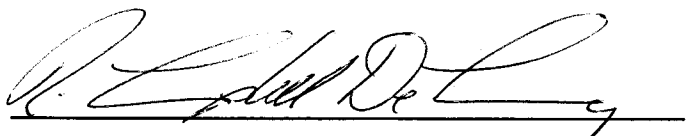
I, R. Campbell DeLong, of the City of Richmond, Province of British Columbia, DO HEREBY CERTIFY THAT:

1) I am a Geologist residing at 304-8080 Ryan Road, Richmond, British Columbia.

2) I am a graduate from Memorial University of Newfoundland in 1976 with a B.Sc. (Hon.) in Geology.

3) I have worked in mineral exploration since 1988.

4) I was a geologist on the Casino Project during the 1993 field season.



R. Campbell DeLong

Dated at Vancouver, British Columbia, this 25th day of February, 1994.

APPENDIX II

CHRONOLOGY OF SIGNIFICANT EVENTS

CHRONOLOGY OF SIGNIFICANT EVENTS 1993 CASINO PROJECT

March 5	Camp opens - T. Becker, C. Kuntz, T. Caron (E. Caron Diamond Drilling - CDD) and C. Vig (CDD) fly to property by helicopter.
March 6	Airstrip opens and first DC-3 flight arrives.
March 8-12	D. Lantz (Lamerton & Associates) surveys proposed drill sites.
March 12	Drill #1 starts.
March 16-18	D. Forster and E. Titley in for property tour.
March 19	Drill #2 starts.
March 20-21	G. Watson (Infosat) on site to install satellite telephone system.
March 30-April 1	D. Lantz surveys completed drill collars and proposed drill sites.
April 2	Drill #3 starts.
April 13-16	R. Cumming (Hobic Bit Industries) visits the property to help maximize drill production.
April 30-May 4	D. Larson (Rice Engineering & Operating Ltd.) visits the property to design an optimum drill mud and additive program.
May 8	Drill #4 starts.
May 17-18	D. Lantz surveys completed drill holes and proposed drill sites.
May 19	D. Forster tours the property with CBC radio reporter I. Marushko.
June 1-6	S. Blundell (Hallam Knight Piesold - HKP), T. Paull (HKP) and J. Gibson conduct hydrology and fisheries survey.
June 3	The first barge arrives at Britannia Creek.
June 11	Drill #5 starts.
June 16	Eastfield Resources crew flies to Casino airstrip and begins to set up camp on adjoining claims.
June 17	B. Scott from Yukon Occupational Health and Safety Officer inspected the Casino job site.
June 18-22	D. Lantz and R. Hall (Focus Engineering) on site to locate and install airphoto targets.
June 28-29	R. Banner, B. Brown (Knight Piesold - KP) and J. Haile (KP) in for property tour.

July 3	Two airphoto lines are flown before clouds prevent further photography.
July 6-9	S. Blundell and J. Gibson visit property for hydrology study.
July 7	D. Eaton and D. Forster tour property with YTG government officials, including J. Ostashek (Government Leader) and J. Devries (Minister of Economic Development).
July 8-11	E. Titley visits property.
July 11-12	D. Lantz surveys completed drill holes and proposed drill sites.
July 12	Drill #6 starts.
July 13	D. Forster and B. Dickinson in for tour.
July 16-18	T. Lewis (GSC) and W. Bentkowski (GSC) conduct downhole thermal gradient survey on selected Casino drill holes.
July 27-28	K. Pelletier (EDA) and C. Wallace (EDA) tour the property.
July 29	The remainder of the airphotos were flown.
August 2-3	D. Lantz surveys completed drill holes and proposed drill sites.
August 10	D. Forster and S. Cousens host a Yukon media tour of Casino.
August 10-13	S. Blundell and T. Paull conduct fisheries study.
August 11-13	R. Shives (GSC), L. Rebolledo (GSC) and S. Johnson (EDA) tour the property and examine drill core.
August 16	J. Mortensen (GSC), H. Poulson (GSC) plus four Chinese geologists tour the property.
August 21	D. Lantz surveys completed drill holes and proposed drill sites.
August 25	D. Cornett (Water Resources), A. von Finster (Fisheries and Oceans) and R. White (RERC) tour the property.
August 30	D. Forster tours the property with Chief P. van Bibber and elders I. Harper, J. Alfred, W. Curry and D. Isaac from the Selkirk First Nations while D. Eaton accompanies Chief E. Fairclough and elders M. Vance, J. Sam, F. Blanchard and V. Mullet from the Little Salmon-Carmacks First Nations.
September 7-9	J. Gibson and W. Kettley (Water Resources) conduct duplicate sampling at water quality test sites and soil sample the Proctor Creek drainage.
September 10-11	D. Lantz surveys completed drill holes and proposed drill sites.

September 13	S. Bishop (Kennecott Canada - KC) and R. Hulstein (KC) tour the property.
September 21-28	S. Blundell conducts hydrology, fisheries and wildlife survey.
September 28	J. Wolchuk (Carmacks RMO) and P. Rienks (Carmacks Land Use Officer) visit Casino while inspecting operations by placer miners and other exploration companies in the area.
September 29	D. Forster tours property with a CBC North and Northern Native Broadcasting television crew.
September 30	A. Gomi (Mitsui) tours the property with D. Forster and D. Niosi (PSG).
October 5	D. Lantz surveys completed drill holes and proposed drill sites.
October 12	D. Lantz surveys completed drill holes and proposed drill sites.
October 12-14	J. Gibson conducts hydrology survey.
November 6	Drill #1 finishes.
November 7	Drills #3 and #5 finishes.
November 8	Drill #4 finishes.
November 9	Drill #2 finishes.
November 9-10	D. Lantz surveys completed drill holes.
November 10	Drill #6 finishes. L. Smith (winter watchman) arrives at Casino camp.
November 12	Camp closes except for winter watchman.

1.0 BACKGROUND

The Casino Property lies within the Dawson Range Ecoregion, as described by Oswald and Senyk (1977). The characteristic terrain features are smooth, rolling topography, with moderate to deeply incised valleys. Major drainage channels extend below 1000 m elevation. Most of the terrain lies between 1000 m and 1500 m elevation. The ecoregion straddles the boundary between the discontinuous widespread and scattered permafrost subzones (Brown 1967). Cryoplanation terraces are fairly common in the unglaciated portion. The valley bottoms, with impeded drainage, have prominent permafrost features such as peat plateaus, palsas, hummocky tussock fields and polygons. The climate is continental and cold, with mean annual temperatures in the vicinity of -7°C and average annual precipitation of approximately 330 mm.

The following presents an outline of the 1993 environmental monitoring program and a summary of the data compiled to date for Pacific Sentinel Gold Corporation's Casino Project at Casino Creek, Yukon Territory (Figure 1). The period of the study was designed to coincide with the exploration program (March to October 1993) such that much of the data collection could be carried out by Casino field personnel. The baseline environmental program for 1993 included meteorology, hydrology, water quality, stream sediments, vegetation, soils, wildlife, fisheries, benthics and periphyton analyses of the area. This document provides a brief description of the monitoring components, the location of the sampling stations and the results. Field techniques followed during the program are presented in Casino Project Baseline Environmental and Socioeconomic Studies (Hallam Knight Piesold Ltd., November 1993).

2.0 RESULTS

2.1 Meteorology

2.1.1 Temperature

For the period of April to December 1993 the mean monthly temperature ranged from -13.2 to 12.4°C (Figure 2). Extreme maximum and minimum temperatures recorded were 25.3°C (July 16)

and -35.0°C (November 20), respectively (Table 1). Compared to previous years the Yukon Territory experienced a particularly mild fall, with a high temperature of 15°C recorded in early October at the project site.

2.1.2 Precipitation

Maximum precipitation was observed in July, with a monthly cumulative value of 123.3 mm (Figure 3). Four substantial rainfall events were recorded, with average daily values of 18.5 mm. Minimum precipitation occurred in December, with a monthly cumulative value of 0.5 mm. Precipitation was comprised of exclusively snow for the months of March, April, November and December. Mixed snow and rain occurred in October (Table 2).

2.1.3 Snow Pack

Based on seventeen years of snow survey data for the area (Station # 09CD-SC01) snow pack depletion in 1993 was above normal for the Casino Project area (Table 4). Snow densities were higher than average (29%, May 1993), indicating a wet snowpack. Snow melted rapidly in early May during a period of warm weather.

2.2 Hydrology

Preliminary water level graphs from all hydrology stations are presented in Figures 4 to 9 and a flow measurement summary is presented in Table 3. Peak runoff was observed in July 1993 at all stations, corresponding with high precipitation values. Daily fluctuations that were observed from June to September were due to permafrost thaw. More dramatic daily fluctuations observed in October were likely due to permafrost thaw and snow melt combined.

2.3 Surface Water Quality

Water quality data for samples taken from June to October 1993 are presented in Table 5. The

pH values of water samples collected from June to October ranged from 3.86 to 7.92 and were within the Canadian Council Ministers of the Environment (CCME) guidelines criteria except at Site W8 (Table 6). Water hardness and alkalinity levels ranged from 26.6 (W7) to 207.0 (W8) mg/L $CaCO_3$ and <1.0 (W8) to 87.0 (W1) mg/L, respectively. Turbidity and total suspended solids values ranged from 0.31 (W3) to 32.2 (W8) NTU and <1 to 46 (W8) mg/L, respectively.

Ammonia levels were frequently below detection limits (<0.005 mg/L) and were below CCME criteria (1.37 mg/L) in all samples. Nitrate and nitrite levels were below CCME criteria (40 mg/L) in all water samples. Sulphate levels for all water quality sampling sites except W8 were within the CCME water quality criteria (<100 mg/L) and ranged from 12.5 to 79.8 mg/L. Sulphate levels at site W8 were above the allowable limits throughout the sampling period and values ranged from 170 to 236 mg/L. Fluoride levels were above CCME guidelines twice at site W8 during the sampling period (0.21 and 0.23 mg/L). Levels of cyanogen-like compounds (detected as cyanide) were above CCME guidelines (0.005 mg/L) in 28.8% (15/52) samples at sites W1, W2, W3, W5 and W9.

Levels of total and dissolved antimony, arsenic, chromium, cobalt, mercury, molybdenum, nickel, selenium and uranium were within CCME criteria for total metals in all samples. The following metals were above CCME water quality criteria:

- Total aluminum which ranged from 0.013 to 3.93 mg/L exceeded the CCME guideline of 0.05 mg/L in 50% of the samples (sites W2, 3, 4, 5, 6a, 6b, 7, 8 and 9). The dissolved fraction which normally comprised 80% of the total value also exceeded the guideline in 21% of the samples (sites W2, 3, 8 and 9).

- Cadmium levels were above criteria (>0.0002 mg/L) in 19% of the total metals sample from sites W3, 4, 7 and 8 and ranged from <0.0002 to 0.0043 mg/L. Levels of dissolved cadmium were above CCME guidelines for total metals in 15.4% (W7 and 8) and values ranged from below detection limits to 0.0013 mg/L.

- Copper was above criteria (>0.002 mg/L) in 65% of the total metals samples (sites W1,

2, 3, 4, 5, 6a, 7, 8 and 9) and values ranged from <0.001 to 0.594 mg/L. Dissolved copper levels were above criteria in 53.8% of the water samples (site W1, 2, 3, 4, 5, 7, 8 and 9) and ranged from below detection limits to 0.594 mg/L.

- Levels of total iron were above criteria (>0.3 mg/L) in 21% of the total metals samples (sites W4, 6a, 6b, 8 and 9) and ranged from <0.03 to 9.09 mg/L. Levels of dissolved iron were above criteria in 13.5% (W8), and ranged from <0.03 to 6.7 mg/L.

- Zinc levels were above CCME criteria in 17% of the total metals samples (sites W1, 8 and 9) and ranged from <0.005 to 0.04 mg/L. One sample from W1 was above CCME, but this elevated level was likely due to contamination. Zinc levels were above CCME guidelines in 13% (W8) of the dissolved metals samples, and values ranged from below detection to 0.148 mg/L.

Levels of total lead, manganese and silver were within CCME criteria (Table 6) at all water quality sampling stations except W8. Site W8 had the following metal characteristics:

- Lead levels were above CCME criteria in 57% of the total metals water samples and 14% of the dissolved metal samples and ranged from <0.001 to 0.003 and <0.001 to 0.002 mg/L, respectively.

- Manganese levels were above criteria in 100% of the total metals samples and ranged from 0.356 to 0.484 mg/L. Dissolved manganese levels were also above criteria in 100% of the water quality samples and ranged from 0.355 to 0.484 mg/L.

- Silver levels were above criteria in 29% of the total metals samples and ranged from <0.0001 to 0.0002 mg/L.

In general, the water samples from site W8 have a low pH, high water hardness and alkalinity and contain high levels of sulphates and metals. Many of these characteristics are likely to be contributed by Proctor Gulch, a tributary that confluences with Casino Creek upstream from site

W8. Although full water quality analysis has not been conducted for Proctor Gulch, in-situ sampling indicates that it has a very low pH and contains high levels of dissolved solids.

2.4 Stream Sediments

Stream sediments were sampled in September 1993 at sites W1, 3, 4, 5, 8, 9, S8a and S8b (Figure 10). Sediments from all stations except site S8a (14.5%) contained very low quantities of organic carbon. Loss on Ignition (LOI) values ranged from 0.55 to 3.28% (Table 7).

Mercury levels were low in all samples and ranged from 0.01 to 0.045 (S8a) mg/kg. Silver and tin levels were below detection levels in all samples. Copper and molybdenum levels were highest in upper Casino Creek (S8a), but were lower at site W8 in Casino Creek, below the Proctor Gulch confluence. Arsenic levels in Proctor Gulch sediments were high (48.6 mg/kg) as were sediments in Casino Creek below Proctor Gulch. A certain degree of arsenic deposition has occurred below the confluence. Although zinc levels in both upper Casino Creek (S8a) and Proctor Gulch (S8b) were within the range of the other samples taken, averaging 77.20 and 77.50 mg/kg, respectively, the level detected in Casino Creek below the Proctor Gulch confluence was elevated. It appears that a deposition of zinc has occurred at this site due to a precipitation of the metal in response to a pH shift in the water.

2.5 Vegetation

Within the Dawson Range Ecoregion, which encompasses the Casino Property, open black and white spruce stands occur in valleys and on lower slopes with black spruce prevailing on wetter sites and white spruce on better drained sites. Where black spruce occurs as a continuous forest stand, feathermoss tends to dominate the understorey and form a complete ground cover. The best tree growth occurs along the White and Yukon River valleys, where white spruce, trembling aspen, balsam poplar and paper birch are constituents of mixed stands. Willow species, scrub birch, Labrador tea, moss and lichens are principal understory species. Scrub birch and willow form

extensive stands from valley bottoms to well above treeline. Sedge tussock fields, usually hummocky and supporting ericaceous shrubs, willows, lichens and sphagnum, are prevalent where drainage is impeded, a common situation on lower slopes and valley bottoms. On south facing slopes, sagewort, grasses and forbs occur as a continuous cover with trembling aspen stands occupying protected draws and gulleys (Oswald and Senyk 1976).

A vegetation survey was conducted in the Casino Project area in July 1993. Vegetation transects were analyzed to determine the species presence and the relative quantity of plants (Tables 8a and 8b). In lower Britannia Creek, near the Yukon River confluence dominant trees are balsam poplar and paper birch. Some white spruce also exist. Understory species consist of prickly rose, tall larkspur, tall lungwort, highbush cranberry and fireweed. Meadow horsetail, tufted hairgrass and sweet scented bedstraw were the main ground cover species. An extensive layer of leaf litter was noted.

Level to gently sloping valley bottom sites in upper Britannia Creek and Canadian Creek have moderately open black spruce stands, with some balsam poplar and scattered willow growth. Labrador tea, shrubby cinquefoil and tall lungwort are common herb layer species. The hummocky ground also supports lingonberry, pink wintergreen, horsetail, single delight, and variety of lichen, mosses and fungi.

Slopes and well-drained ridges with good soil cover consist mostly of trembling aspen varying from sparse growth on south-facing slopes, to dense growth on east and west-facing slopes. White spruce may occur occasionally. Pasture sage, prickly rose, common juniper, soopolallie and grasses are the most common herb layer species. Some twinflower, northern bedstraw, goldenrod, fireweed, mountain death-camass, hairy scorpion weed and pink campion also occur.

Alpine areas are dominated by scrub birch with a sparse distribution of stunted (Krummholz) black spruce. Variable willow and Labrador tea (two species) are the most common species in the shrub layer. The herb layer is comprised mostly of bog blueberry and bog cranberry. Several species of wild flowers such as monkshood, three-toothed saxifrage and black-tipped groundsel are distributed in patches and are frequently associated with talus rock aggregates. Ground cover

consists of golden fuzzy fen moss, sphagnum moss, feather moss and a variety of lichen (freckled, reindeer, green kidney, curled cretaria, rock worm).

In upper Casino Creek the tree layer is comprised mostly of black spruce. The shrub layer consists of Sitka willow and scrub birch, with some labrador tea. The herb layer consists of bog blueberry, tall lungwort, pink mountain-heather, coltsfoot, Labrador lousewort, mountain heliotrope and cloudberry. The lichen and moss layer is comprised of freckled lichen, moonshine cetraria, reindeer lichen, pixie cup lichen, rock worm lichen, sphagnum moss and golden fuzzy fen moss.

In low, wet areas adjacent to Casino Creek and Dip Creek, willows are the dominant vegetation. Species include Sitka willow, Little tree willow and Barratt's willow. Scattered black spruce are often present, and white spruce and balsam poplar are also present to a lesser extent. Dwarf shrubs consist of wild rose, shrubby cinquefoil, Northern black currant and Labrador tea. The herb layer species are very diverse and include horsetail, lungwort, bog blueberry, fireweed, single delight and vetch. Ground cover consists mostly of several species of grasses, freckled lichen and reindeer lichen.

Beyond the perimeter of the creeks is an extensive muskeg. Low densities of black spruce exist in these areas, but consist of Krummholz formation. Scrub birch is the most common shrub with the occasional occurrence of mountain alder. The herb layer consists mostly of Labrador tea (both species), bog cranberry and cloudberry. The entire area is covered by sedge/cottongrass tussocks and reindeer lichen.

2.6 Soils

Soil samples were collected in September 1993 from the proposed mill site, starter pit, waste rock dump and tailings storage areas for the purpose of developing a reclamation plan (Figure 11).

All samples taken from the proposed mill site had low clay fractions and were found to have a high sand/silt ratio (Table 9a). Samples collected from the starter pit area also had high gravel/sand/silt

fractions except for one organic rich sample taken from Patton Gulch which could not be analyzed for texture due to the high peat content. Samples from the waste rock disposal area were variable; one sample consisted mostly of silt and clay and another was composed of gravel and sand. Soil texture from samples collected in the tailings areas were also found to be variable; several samples had high silt content, while others were high in gravel and sand.

The capacity of the soil to exchange cations provides some information on its inherent nutrient holding capacity. Soils from the proposed waste rock disposal and tailings storage facility had higher cation exchange values than those samples collected in the proposed mill site and starter pit areas (Table 9b).

Soils ranged from very strongly acidic to neutral (Kennedy 1992); the pH values ranged from 4.7 to 6.8. The most alkaline soil was found in the tailings storage disposal area and the most acidic soil was found in the starter pit area.

Salinity is defined as the amount of soluble salts in the soil, and is expressed as electrical conductivity (EC) of soil saturation. According to Christie (1980) values less than 1.0 mmhos/cm provide favourable conditions for plant growth. On average, salinity values ranged from 0.7 to 2.0 mmhos/cm, but none of the soils were considered saline (>4.0 mmhos/cm) (Michaud 1981). On average, soils in the starter pit and waste rock disposal areas were considered more favourable for plant growth.

Total sulphur and nitrogen ranged from 0.001 to 0.31% and 0.02 to 0.9%, respectively. The lowest values detected in soils from the tailings storage area and the highest from the starter pit area. All soils examined in the project area had good iron content, ranging from 45 to 525 ppm. Copper values were variable and ranged from 1.1 (tailings storage area) to 65.0 ppm (starter pit area). Zinc values ranged from 0.6 to 13.0 ppm. Manganese values were variable and ranged from 5 ppm in the starter pit to 525 ppm in the tailings storage area. Aluminum values were high in some samples; soils from the mill site and the starter pit contained 2100 ppm and 2000 ppm aluminum, respectively.

2.7 Fish and Wildlife Observations

2.7.1 Wildlife

From general observations recorded in the fish and wildlife log (Table 10) it was noted that the Casino Project area provides moderately good habitat for moose. Frequent sightings of moose were reported in both the Casino Creek and Britannia/Canadian Creek watersheds. A population of caribou were observed in the vicinity of the Canadian Creek headwaters from June to August.

Black bear were frequently seen throughout the Casino Project property. Several sightings of grizzly bear were also noted during the summer months, and were often observed to be accompanied by cubs. Lynx were sighted twice in the vicinity of lower Britannia Creek. In addition, wolf tracks and scat were observed along Casino Creek at several sites. Several fox were observed in the vicinity of Patton Hill. Wolverine, pine marten and weasel were also observed in the vicinity of the Britannia Creek/Canadian Creek watershed. Snowshoe hare were observed throughout the project area. A variety of rodents were observed in the project area including beaver, hoary marmot, porcupine, bog lemming, boreal vole and weasels.

Several species of birds were sighted in the area including ravens, spruce grouse, ptarmigan, grey owls and hawks. Flocks of sandhill cranes were also observed during migration.

The following observations were made during a pellet count survey conducted concurrently with the vegetation study:

- snowshoe hare sign were observed throughout the study area; in particular in the deciduous forests adjacent to both watersheds.
- fox scat was observed in the Casino Creek valley
- signs of a vole species were observed in the upper Britannia Creek valley in the areas forested by black spruce

- bear dung observed in lower Britannia Creek vegetation and in lower Casino Creek
- beaver activity in lower Casino Creek

Aerial Survey

June 1993

Caribou (1) observed on Leslie Ridge, south of the Casino Project

Black bear cubs (3) observed on slopes above Canadian Creek

Several ptarmigan observed in area of both watersheds

September 1993

Moose (one male and one female) observed in Casino Creek valley, near the Rude Creek/Dip Creek confluence.

Moose (two males) observed in the area adjacent to Canadian Creek.

Moose (one male) observed in area adjacent to lower Britannia Creek.

Several ptarmigan observed in area of both watersheds.

2.7.2 Fish

Fisheries surveys were conducted in the Canadian/Britannia Creek and Casino/Dip Creek watersheds in June, August and September, 1993 to determine the spawning, rearing and overwintering potential of both creeks.

Britannia Creek/Canadian Creek Watershed

Arctic grayling were found throughout the system during all three fisheries surveys (June, August and September 1993) (Table 11). These creeks appear to provide good spawning and rearing habitat, especially the lower reaches of the system. Grayling fry were observed in Britannia Creek at the Yukon River confluence during the August and September surveys. Slimy sculpin were also observed in the lower reaches of Britannia Creek. In addition, several round whitefish adults and fry were present in these areas. One juvenile burbot was captured at this sample site during the September survey. Juvenile chinook salmon were observed in the lower reaches of Britannia Creek during the June and August surveys but were not observed in September. This system may provide some rearing potential for chinook salmon. Spawning salmon were not observed in Britannia Creek during the study. Therefore, the value of this system for the purpose of spawning is questionable and requires further investigation.

Casino Creek/Dip Creek Watershed

Arctic grayling were observed in the lower reach of Casino Creek watershed during all three surveys (Table 11). Fry were not observed. Therefore, it is likely that this system provides good rearing habitat, but little to no spawning habitat. Due to the occurrence of decreased water levels and the development of anchor ice in winter months the quality of overwintering habitat in Casino Creek is poor. Slimy sculpin were observed in the lower reaches of Casino Creek and in Dip Creek during all three surveys.

2.8 Benthic Invertebrates and Periphyton

Benthic invertebrate and periphytic algal samples were collected in August 1993 in the project area at water quality stations W1, 2, 3, 4, 5, 7, 8 and 9.

2.8.1 Benthic Invertebrates

Site W1, in lower Britannia Creek had a benthic population that consisted of 79% facultative organisms, dominated by several dipteran species (Table 12). This area of the creek has been heavily affected by the Yukon River, as high flows have resulted in back-watering. Also, placer mining was conducted in the 1980's. Site W2, in Britannia Creek near the Canadian Creek confluence, showed a more diverse population of benthic organisms and 72% of the population were sensitive organisms. This site had the lowest population density, 1776 organisms per m^2. Site W3, in lower Canadian Creek supported a benthic population that consisted of 63% facultative organisms and was dominated by several species of dipterans and one species of plecopteran. Both Site W7, in upper Canadian Creek, and W8 in upper Casino Creek supported benthic populations that were comprised of 65% tolerant organisms. Both of these sites have been disturbed; Site W7 has historically been the site of placer mining, and Site W8 is below the confluence of Proctor Gulch, a tributary which contains naturally high metal levels and very low pH (4.0). Sites W7 and W8 had the highest density of organisms, ranging from 5823 to 5888 organisms per m^2. Site W4 in lower Casino Creek had a benthic population that consisted of 47% facultative and 33% sensitive organisms. Sites W9 and W5 on Dip Creek, above and below the Casino Creek confluence, respectively, supports benthic populations that were comprised of 69% to 79% facultative organisms. These populations were dominated by several species of diptera.

2.8.2 Periphyton

Britannia Creek/Canadian Creek Watershed

Site W1 samples contained 100% diatoms (Table 13) which were mixed with silt. Samples from Site W2 contained small amounts of algae which were comprised of 97 to 99% diatoms, with small quantities of blue-green algae present. Site W3 samples contained small to moderate amounts of algae which were variable in species composition. Replicates were comprised of 5 to 80% diatoms, with several species of filamentous and crustose blue-green algae being occasionally predominant. Site W7 samples contained very little algae which was comprised mostly of crustose blue-green algae with small numbers of diatoms present.

Casino Creek/Dip Creek Watershed

Samples from Site W4 contained very little to moderate amounts of sediments which consisted of mostly algae with a small amount of silt. Diatoms comprised 93 to 98% of the periphyton (Table 13). Small amounts of blue-green and red algae were also present in the samples. Samples from W5 contained moderate amounts of silt and algae. Species composition varied considerably amongst the replicates. Diatoms comprised 25 to 98% of the periphyton in the samples and filamentous red alga was occasionally predominant. Samples from Site W8 contained small amounts of sediment composed of soft detritus and bacteria, but no algae were observed in any of the samples. Samples from Site W9 contained very little sediment, which was comprised of algae and relatively little silt. Diatoms comprised 35 to 95 % of the periphyton and several blue-green algal species were common or present in all replicates. Filamentous red algae was also common in several replicates.

Chlorophyll "a" Content

Chlorophyll "a" values for the Britannia Creek/Canadian Creek watershed ranged from 0.034 (Site W8) to 0.235 (Site W3) mg/cm^2 (Table 14). Values for the Casino Creek/Dip Creek watershed ranged from 0.023 (Site W8) to 0.132 (Site W4). The lowest values detected were collected from sites W7 and W8, upper Canadian and Casino Creeks, respectively. The highest chlorophyll "a" value detected was from a periphyton sample collected from site W3, in lower Canadian Creek.

Table 8a
Vegetation Study - Species Composition

Site #1: Lower Britannia Creek near Yukon River

Gradient: < 1%	Altitude: 396 m (1300 ft)
Observations:	Area shows evidence of a burn Extensive leaf litter covers forest floor
Species present:	Prickly rose (*Rosa acicularis*) Fireweed (*Epilobium angustifolium*) Sweet scented bedstraw (*Galium triflorum*) Meadow horsetail (*Equisetum pratense*) Tall larkspur (*Delphinium glaucum*) Balsam poplar (*Populus balsamifera* ssp. *balsamifera*) Paper birch (*Betula paperifera*) Trembling aspen (*Populus tremuloides*) Tall Lungwort (*Mertensia paniculata*) Tufted hairgrass (*Deschampsia caespitosa*) Highbush cranberry (*High-bush cranberry*)
Most Common:	Prickly rose 30% Meadow sweet Horsetail 5% Tall larkspur 5% grasses 3% Fireweed 2% Highbush cranberry 2%
% Cover:	40%

Site #2: Confluence of Britannia Creek and Canadian Creek

Gradient: < 1%

Altitude: 579 m (1900 ft)

Observations: Thick moss cover, transect area contains several swampy areas.

Species Present:
Pink Wintergreen (*Pyrola asarifolia*)
Shrubby Cinquefoil (*Potentilla fruticosa*)
Bog Cranberry (*Vaccinium oxycoccus*)
Alpine milk-vetch (*Astragalus alpinus*)
Meadow horsetail (*Equisetum pratense*)
Golden fuzzy fen moss (*Tomenthypnum nitens*)
Blueberry willow (*Salix myrtillifolia*)
Labrador Tea (*Ledum groenlandicum*)
Black Spruce (*Picea mariana*)
Prickly rose (*Rosa acicularis*)
Lichen-Witches Hair and Wax Paper
Tall Lungwort (*Mertensia paniculata*)
Single Delight (*Moneses uniflora*)
Grasses
Black Mushrooms
Green and Grey Reindeer Lichen
Wild Rhubarb (*Polygonum alaskanum*)
Bog blueberry (*Vaccinium uliginosum*)
Ground cover willow (*Salix* sp.)
Yellow Lichen
Iceland Poppy (*Papaver nudicaule*)
Freckled Lichen (*Peltigera aphthosa*)
Witches Butter
Mountain Wormwood (*Artemesia tilesii*)
Blackening Russula-black mushroom associated with mixed subboreal forests

Most Common:
Moss, almost 100% ground coverage
Bog Cranberry 20%
Labrador Tea 20%
Pink Wintergreen (*Pyrola asarifolia*) 5%
Scrubby Cinquefoil 2%
Wild Rhubarb < 1%
Single Delight (patchy distribution) < 1%
Mertensia (rough leaved species) 1%
Black Spruce 10%
Willow 1%
Poplar < 1%
Horsetail 2%

% Cover: 30

Site #3: Upper Britannia Creek, south aspect slope above road

Gradient: 53% (28°) Altitude: 762 m (2500 ft)

Observations: Slope is extremely steep and shows signs of erosion.

Species Present:
Common Yarrow (*Achillea millefolium*)
Northern Bedstraw (*Galium boreale*)
Northern Geranium (*Geranium erianthum*)
Common Juniper (*Juniperus communis*)
Goldenrod (*Solidago multilineatus*)
Fireweed (*Epilobium angustifolium*)
Prickly rose (*Rosa acicularis*)
Willow (*Salix* sp.)
White Spruce (*Picea glauca*)
Paper Birch (*Betula papyrifera*)
Balsam Poplar (*Populus balsamifera* ssp. *balsamifera*)
Soopolallie (*Shepherdia canadensis*)
Pussytoes sp. (*Antennaria* sp.)
Grasses
Mountain Death-camass (*Zygadenus elegans*)
Hairy Scorpion-Weed (*Phacelia mollis*)
Twinflower (*Linnaea borealis*)
Pink Campion (*Silene repens*)
Pasture Sage (*Artemesia frigida*)
Blue columbine (*Aquilegia brevistyla*)

Most Common:
grasses 25%
common juniper 5%
willow 5%
northern bedstraw 3%
soopolallie 3%
prickly rose 3%
blue columbine 2%
goldenrod 2%
yarrow 1%
fireweed 1%

% Cover: 5

Site #4: Alpine meadow, north facing slope

Gradient: 6° Altitude: 1219 m (4000 ft)

Observations: Large outcropping of talus rocks, in vicinity of tor aggregate. Large holes in ground, wild flowers almost exclusively associated with talus rock aggregates.

Species Present:
Bog cranberry (*Vaccinium oxycoccus*)
Variable willow (*Salix commutata*)
Monkshood (*Aconitum delphinifolium*)
Freckled lichen (*Peltigera aphthosa*)
Gray reindeer lichen (*Cladina rangiferina*)
Green reindeer lichen (*Cladina mitis*)
Sphagnum moss (*Sphagnum fuscum*)
Black spruce (*Picea mariana*)
Labrador tea (*Ledum groenlandicum*)
Northern Labrador Tea (*Ledum palustre*)
Grass with triangular stem (Sedge sp.)
Bistort (*Polygonum bistorta*)
Sweet Coltsfoot (*Petasites frigidus*)
Scrub birch (*Betula glandulosa* var. *glandulosa*)
Chocolate chip lichen (*Solorina crocea*)
Green kidney lichen (*Nophroma arcticum*)
Curled cretaria (*Cetraria cucullata*)
Rocky mountain woodsa (*Woodsia scopulina*)
Golden fuzzy fen moss (*Tomenthypnum nitens*)
Three toothed saxifrage (*Saxifraga tricuspidata*)
Field Chickweed (*Cerastium arvense*)
Black-tipped Groundsel (*Senecio lugens*)
Rock worm lichen (*Thamnolia vermicularis*)

Most common:
Scrub birch 30%
Labrador tea 10%
Northern Labrador Tea 10%
Sphagnum moss and Golden fuzzy fen moss-almost full ground coverage
Black spruce 3%
Monkshood 1%
Reindeer lichen 5% (mixed with mosses)
Sweet coltsfoot 5%

% Cover: < 1

Site #5: Lower Casino Creek, muskeg

Gradient: < 1°

Altitude: 640 m (2100 ft)

Observations: Area consists mostly of moss and sedge tussocks. A majority of the black spruce observed are stunted (Krummholz) and are frequently associated with patches of permafrost.

Species Present:
Scrub birch (*Betula glandulosa* var. *glandulosa*)
Cloudberry (*Rubus chamaemorus*)
Black spruce (*Picea mariana*)
Bog cranberry (*Vaccinium oxycoccus*)
Labrador tea (*Ledum groenlandicum*)
Northern Labrador tea (*Ledum palustre*)
Lichen-Moonshine Cetraria on Scub birch
Scheuzer's cottongrass (*Eriophorum scheuchzeri*)
Green reindeer lichen (*Cladina mitis*)
Bog blueberry (*Vaccinium uliginosum*)
Freckled lichen (*Peltigera aphthosa*)
Trembling aspen (*Populus tremuloides*)

Most common:
Scrub birch 50%
Northern Labrador tea 10%
Bog cranberry 10%
Cloudberry 5%
Cottongrass/moss-almost complete ground cover

% Cover: < 1

Site #6: Lower Casino Creek, creek side

Gradient: 1° Altitude: 640 m (2100 ft)

Observations: One side of site approximately 20 m from creek bank. Evidence of recent flooding along this perimeter, area appears to be slightly transitional, but is representative of vegetation that is present along the length of Casino Creek and Dip Creek.

Species Present:
Meadow horsetail (*Equisetum pratense*)
Labrador tea (*Ledum groenlandicum*)
Prickly rose (*Rosa acicularis*)
Tall Lungwort (*Mertensia paniculata*)
Willow (3 spp.- Little tree willow,)
Bog cranberry (*Vaccinium oxycoccus*)
Reindeer lichen
Freckled lichen (*Peltigera aphthosa*)
Black spruce (*Picea mariana*)
Vaccinium sp. (bog cranberry?)
Sphagnum moss
Tufted wheat grass
Canary grass
Pink Wintergreen (*Pyrola asarifolia*)
Fireweed
Wax paper lichen (on birch)
Twinflower
Common Yarrow (*Achillea millefolium*)
Single delight (*Moneses uniflora*)
Shrubby cinquefoil (*Potentilla fruticosa*)
Scrub birch
Alpine milk-vetch (*Astragalus alpinus*)
Northern black currant (*Ribes hudsonianum*)
Sweet coltsfoot
Mountain wormwood (*Artemesia tilesii*)

Most common:
horsetail 15%
Wild rose 10%
Labrador tea 10%
Tufted wheat grass 15%
Wintergreen 7%
Twinflower 7%
Sphagnum moss 15%

% Cover: 30

Site #7: Upper Casino Creek, south west slope

Gradient: 15° Altitude: 914 m (3000 ft)

Site #7: Upper Casino Creek, south west slope

Gradient: 15°

Altitude: 914 m (3000 ft)

Observations: Transect situated below Casino Creek/Proctor Gulch confluence. Proctor Gulch has a low pH, ranging from 3.2 to 4.5, sediments are orange indicating a high iron (and other metals) content. Most of the Black spruce trees were stunted (may be due to permafrost).

Species present:

Black spruce (*Picea mariana*)
Scrub birch
Sweet coltsfoot
Labrador tea (*Ledum groenlandicum*)
Northern Labrador Tea (*Ledum palustre*)
Tall Lungwort (*Mertensia paniculata*)
Bog blueberry (*Vaccinium uliginosum*)
Sphagnum moss
Rock worm lichen
Tufted wheat grass
Many bladed, short, bending grass
triangular stem with three inflourescenses (Sedge sp.)
Labrador lousewort (*Pedicularis labradorica*)
Mountain heliotrope (*Valeriana capitata*)
Pink mountain-heather (*Phyllodoce empetriformis*)
moonshine lichen
waxpaper lichen
old man's beard
Reindeer lichen
Freckled lichen (*Peltigera aphthosa*)
Pixie cup lichen
Cloudberry

Most common:

Scrub birch 20%
Black spruce 10%
Labrador tea 15%
Northern Labrador Tea 5%
Vaccinium sp. 7%
Sphagnum moss 35%
Mertensia 5%
Bent grass 5%
Pink mountain-heather 5%
Reindeer lichen 5%
Cloudberry 3%

% Cover: 25

Wildlife and Fisheries Log

Date	Species	Location
June		
02	Fox	Moves from drill to drill – pet
03	Frog	Britannia Cr – on road
03	Black Bear	Britannia Cr – on road
03	Moose 2yr old	Britannia Cr – on road
05	Porcupine	Britannia Cr, below Canadian Cr
05	Moose	Canadian Cr
06	Moose	Britannia Cr, below Cnadian Cr
06	Black Bear	Britannia Cr road
09	Brown Fox	Patton Hill
10	Grizzly Bear	Britannia Cr – south road
10	Cow Moose, 1 Calf	mid Casino Cr
12	Marten	Britannia Cr
12	Black Bear	Casino Cr access
14	Cow Moose & 2 Calves	Above Britania Cr
14	Black Bear	Lower Britannia Cr
15	Bald Eagle	Hole 136, flew overhead
15		towards river
16	Caribou (12adults 12Calves)	Valley NW of Canadian Ck Pass
21	Black Bear	N. Yukon River on south side of hill
21	Caribou	N of "Canadian tire"–north side of hill
21	Moose	Ridge West of Patton Hill – up high
21	Fox/coyote	Near drill rigs
22	Caribou (1 male 1 female)	Hole 169
23	Caribou (4 male)	Patton Hill at top of ridge
23	Caribou(1 female)	Hole 169
23	Bald Eagle	
24	Caribou (3 male 2 female)	Hole 169
26	Caribou (1)	Patton Hill at top of ridge
27	Caribou (1 male)	Cariboo on road to river & Canadian Tire
27	Caribou (2 male 1 female), Whistler (1)	Hole 169
28	Caribou (5)	Top of Patton Hill & up Canadian Cr
28	Caribou (5 male 9 female 3 newborn)	Hole 169
29	Grizzly Cub(heard mother nearby)	South of airstrip

*Note: Numerous caribou sightings appear to be a herd of about 7 which roam the hill above Canadian Tire – reports of caribou within 10 feet of people.
Numerous sightings of a red/black/silver fox. Vistis each dirll and comes to within 20feet of people.

Date	Species	Location
July		
01	Adult Grizzly Bear	Yukon River
01	Big Beaver	Britannia Cr
02	Black Bear & 2 cubs	Britania Cr rd near jctn with Canadian Cr
11	Black Bear	Britannia Cr
11	Cow & calf Moose	Down Casino Cr

07	3 Shrew (mite)	Kitchen and storage area
10	Hawks (2)	Claim line 21 Upper Canadian Cr
11	Weasel	Kitchen
12	Lynx	On road to Yukon near 2nd crossing
12	Caribou bull (1)	On road to yukon west of Pass
13	Ravens (2), Squirrels (1)	Hill cut at proposed Tailings dam site
13	Black Bear (1)	Hill cut at proposed tailing dam site
13	Hawk (1)	Lower Dip Cr claim line 2
15	Rabbit (1), Squirrels (2)	Hill cut at proposed tailings dam site
15	Dark Fox	First level of tents
16	Squirrels (3)	Brynelsen Cr
17	Black Bear (1)	Tailings dam Access Rd bet Brynelsen & Austin Cks
18	Grouse (2)	Tailings dam access rd – 2km west of camp
19	Black Bear	Britannia Ck
19	Weasel – eating a mouse	Between airstrip and camp
20	Raven (2)	At camp
21	Boreal Vole	Above camp
21	Pair Raven	Camp
21	Flock of Crane circling in fog	Above camp
27	Owl (black)	Top end of runway
27	Beavers (1 male 54 pds, 1 female 32 pds)	1st road crossing of Canadian Cr
27	Caribou bulls (2)	Head of Canadian Cr
31	1 small flock Canadian Geese	Above Canadian Tire
31	Fox	Around all the drills

Date	Species	Location
September		
07	Small Owl	In camp
07	Grey Owl	Above tent
10	Large black Bear	On road to Yukon River
11	Porcupine	Dip Creek Rd
12	fox, Ravens	Dump
12	1 large flock birds – sandhill Cranes (geese)	Patton Hill
13	Caribou (8)	Near Canadian tire
14	Small Black Bear	Across Yukon River from Barge
16	Moose – 1 cow & 1 calf	Meloy Ck Rd 1 km south of camp
17	1 large bull Moose	Junction Casino & Dip Ck
17	Wolf tracks	Junction Casino & Dip Ck
17	1 large flock birds – geese / sandhill Crane	Camp
22	large bull Moose (1)	Junction Dip & Casino Cks
23	Black Bear (1)	North side Casino Creek near Dip
23	bull Moose (1)	Near Fuel tanks at Canadian Cr
24	1 cow Moose & 1 yearling calf	1 km NE of pump shack
26	Pine Marten (1)	Britannia Cr bet 1st & 2nd Cr crossing
26	Rabbit (1)	Britannia Cr bet 1st & 2nd Cr crossing
26	Snow geese or white swans (2) (flying south along river bank)	Yukon River barge landing
27	Pine Marten (1)	South of Camp
29	young bull Moose (1)	Dip Creek
29	large bull Moose (1)	Britannia Cr
October		
31	Moose – 1 big bull, 1 cow	Road below Airport
November		
	Moose	Drills near 93–124
	Moose	Head of Britannia Ck
	2 bull Moose	Head of Casino Ck/upper
	Moose – 1 bull 1 cow calf	Lower Casino Ck
	Wolverine (1)	Down Britannia Ck
	Lynx (2)	Down Britannia Ck
	Spruce grouse (6–8)	Down Britannia Ck
	Ruffed grouse (6 appr.)	Down Britannia Ck
	Marten (3)	Down Britannia Ck
	ptarmigan (some flocks of 15–25)	Upper Britannia
	Marten (2)	
	Snowshoe Hare (small numbers)	
	Marten (4)	Casino Ck
December		
	Moose (population same as November)	
	Wolves (approx. 8 in the area)	
	Wolverine (4 in the area)	
	Lynx (2 or 3 in the area)	
	Marten (numerous, 24 caught in Dec.)	
	Snowshoe hare (population in area is increasing)

SUMMARY

Exploration of the Casino Cu-Au-Mo porphyry system will involve diamond drilling and detailed geological work. At the request of D.B. Forster and A. Archer and on behalf of Pacific Sentinel Gold Corp., this manual was prepared as a guide for the collection of geological and technical data. Its purpose is to standardize data collection procedures, document standard practice and aid in the development of a reliable database. The logging, sampling and data compilation procedures detailed in this manual are derived from experience on the Mt. Milligan, Kemess and Fish Lake Projects and are comparable with others in the mineral exploration industry in British Columbia and Yukon. This manual is intended as a guide for data collection personnel and as summary for persons interested in reviewing those aspects of the technical program. Users of the manual are encouraged to forward their comments and suggestions so that it may be kept up to date and accurately reflect the work being performed. Note that this manual assumes all logging is done in the metric system.

MANUALS

1 Geotechnical Log

1.1 INTRODUCTION

A variety of geotechnical information is required for mine feasibility and development studies. Geotechnical data from drill core should be collected from all diamond drill holes in an advanced exploration project on a mineral prospect. This information, when gathered during the delineation and infill phases of a drilling program, provides a good over-all sample of a mineralized deposit, with numerous, well-distributed geotechnical data points. The data can be readily used in mine evaluation and design studies.

1 Geotechnical Log

Geotechnical logging is the first procedure to be performed on diamond drill core when it arrives from the drill. It is important that geotechnical parameters are measured before the core is broken up or the footage markers are moved by other logging and sampling procedures. This logging can be done at the same time as metric conversion. Trained personnel should perform the work using this manual as a guide. Data should be recorded on the logging form provided in Appendix D-1.

NOTE: Shaded columns will be calculated later and do not need to be filled out.

1.2 EQUIPMENT LIST

- pencil, eraser, metric conversion calculator, retractable metric tape measure (minimum 5 metres), clipboard, geotechnical logging forms, geological hammer, knife, aluminum tags, eye protection.

1.3 PROCEDURE

1. ARRANGE CORE BOXES ON BENCH
   - individual core boxes are oriented on the logging bench so that the lowest depth (nearest to the surface) core for each box is in the top left corner.
   - consecutive boxes are arranged so that the core is logged as you would read a book, from the top upper left (nearest to the surface or collar) row by row to the bottom lower right (nearest to the end of hole E.O.H or total depth T.D.).

2. METRIC CONVERSION (If necessary)
   - write the metric depth with permanent waterproof black marker on an a dry marking block.
   - when removing a depth marker block to write the metric depth, put a pen or some other object in the box at that point to ensure that the marker goes back in the correct position.
   - round off to two decimal places (i.e. 91' = 27.74m).

3. RECORD METRIC DEPTHS (**FROM, TO**)
   - record the start and end of each drill run marked by driller's markers. The "TO" of one run is the same as the "FROM" for the next run.
   - record to two decimal places.
   - check for depth markers before the first piece of core in the first core box. There should be two markers here and they are often missing! Since casing is generally reamed 0.5 to 4 metres into bedrock, the first depth marker should record "ledge" (base of overburden or top of bedrock), the second marker before the first piece of core should record "casing" (bottom of casing).
   - writing must be **neat** and **legible**, preferably written in dark pencil. These logs will get faxed and photocopied several times!

4. CALCULATE DISTANCE BETWEEN DEPTH MARKERS (**LENGTH**)

   LENGTH = TO - FROM

   - record to two decimal places.

5. CORE RECOVERY (**REC**)

   - to get an accurate measurement, visualize a centreline down the interior of the core and measure only intact pieces along that line. See Figure 1 for example.
   - a recommended measuring technique is to "accumulate" the length on the tape measure so that the last measurement is the total to be recorded.
   - do not measure re-drilled, ground or rubbly material at the start of the run, especially after a mis-latch or bit change.
   - be sure to record sections with zero recovery.
   - record driller's comments such as "triconed interval", "no core", "mis-latch", "bit change", etc. in the remarks column of the logging form.
   - record to two decimal places.

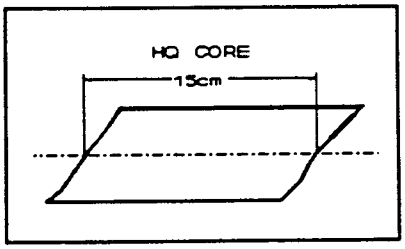

Figure 1 Measure core along centerline. Example shows minimum length piece for HQ RQD.

6. CALCULATE PERCENT RECOVERY (**REC%**)

REC% = (**REC/LENGTH**) * 100

- if REC > 110% check for misplaced or incorrect depth markers, ask driller to explain if necessary.
- if REC < 50%, record reasons for low recovery in remarks (i.e. gouge 69.9 to 71.2 metres). Ask driller to give reasons for poor recovery, if necessary.
- record to the nearest 1%.

7. ROCK QUALITY DESIGNATION (**RQD**)
   - measure total length of all intact pieces of core greater than 2.5 times the diameter of the core. The following lengths are the minimum inclusion size for various core sizes:

     BQ - 7.5 cm long pieces or greater
     NQ - 10.0 cm long pieces or greater
     HQ - 15.0 cm long pieces or greater

   - the correct way to determine RQD is to measure between "natural" breaks ignoring those caused during the drilling process. However, if it is not possible to differentiate between the two, then assume all breaks are natural.
   - record the sum of all lengths measured to two decimal places.
   - remember RQD cannot be greater than REC!

8. PERCENT RQD (**RQD%**) Shaded column
   - not necessary to calculate while logging, as this will be calculated when data entered.

RQD% = (**RQD/LENGTH**)*100

9. DEGREE OF BREAKAGE (BRKG)
   - the scheme for classifying degree of breakage is summarized in Table I.
   - the degree of breakage is a visual estimate of the quality of the rock in terms of the number of natural fractures or breaks.

TABLE 1

Classification Scheme for Degree of Breakage

Category	Mean Spacing of Breaks or Diameter of Fragments cm	Quality Descriptions
1	<1.5	Mostly fault gouge with or without minor rock fragments.
2	<1.5	Gouge and crushed rock.
3	<1.5	Crushed rock with or without minor gouge.
4	1.5-5	Crushed rock - no gouge.
5	1.5-5	Crushed rock - diameter of pieces <2.5 cm.
6	1.5-5	Crushed rock - diameter of pieces <5 cm.
7	5-7.5	Mean spacing 5 to 7.5 cm.
8	7.5	Mean Spacing 7.5 cm.
9	7.5-10	Mean spacing 7.5 to 10 cm.
10	10-15	Mean spacing 10 to 15 cm.
11	15	Mean spacing 15 cm.
12	15-20	Mean spacing 15 to 20 cm.
13	20-30	Mean spacing 20 to 30 cm.
14	30-60	Mean spacing 30-60 cm.
15	>60	Mean spacing >60 cm.

10 ROCK HARDNESS (HARD)

- the scheme for classifying rock hardness is summarized in Table II. (N.B. geologists, do not confuse with Moh's scale of mineral hardness).
- this scheme gives a reasonable first estimate of the unconfined compressive strength of the material.
- protect eyes from rock and steel fragments when hammering core.
- for hammering test use an average piece of core about the minimum length for an RQD reading (i.e. 10 cm for NQ core). Hammer from about 30cm (1 ft.) up, trying to swing consistently each time.
- if more than one level of rock hardness is present in a run, record the lowest value.

TABLE 2

Qualitative Estimation of Rock Hardness and Approximate Unconfined Compressive Strength

HARDNESS	CONSISTENCY	FIELD PERFORMANCE	APPROXIMATE RANGE OF UCS	
			MPa	psi
0	Extremely soft rock	Indented by thumbnail.	0.2-0.7	28-100
1	Very soft rock	Crumbles under firm blows with point of geological pick; can be peeled with a pocket knife.	0.7-7.0	100-1000
2	Soft rock	Can be peeled with a pocket knife with difficulty; shallow indentations made by firm blow of geological pick.	7.0-28	1000-4000
3	Average rock	Cannot be scrapped or peeled with a pocket knife; specimen can be fractured with single blow of a hammer and/or geological pick.	28-56	4000-8000
4	Hard rock	Specimen requires more than one blow with hammer and/or geological pick to fracture it.	56-112	8000-16000
5	Very hard rock	Specimen requires many blows of hammer and/or geological pick to fracture it.	112-224	16000-32000
6	Extremely hard rock	Specimen can only be chipped with geological pick.	>224	>32000

11. DEGREE OF WEATHERING (**WTHR**)
    - the degree of weathering or oxidation of the rock is used to define the upper boundary of unweathered bedrock and to delineate faults or other zones of intense weathering and oxidation.
    - the most common iron oxide to look for is limonite, which occurs as an orange, brown or red rusty to earthy material. Check for limonite on fractures.
    - the degree of weathering is visually estimated using Table III.

TABLE 3

Classification of Degree of Weathering

CODE	DESCRIPTION
1	Residual soil - original fabric destroyed.
2	Completely weathered - original fabric and relict structures remain but, rock is decomposed and friable.
3	Highly weathered - rock is discoloured and strength is significantly reduced by weathering.
4	Moderately weathered - rock is discoloured, but strength is only slightly affected, discontinuities weathered.
5	Slightly weathered - rock strength unchanged, weathering on joints only.
6	Fresh and Unweathered.

12. CROSS JOINT COUNT (**XJNT**)
    - record the number of cross joints by counting the number of natural breaks which are not along the bedding plane (if unable to differentiate between cross joints and bedding joints described below, assume all joints are cross joints).
    - if the run is entirely gouge, or has a large number of breaks, record 50 as a maximum value in this column.

13. CROSS JOINT FREQUENCY (**XJ/M**) Shaded column
    - not necessary to calculate while logging, will be calculated after data entry.

    XJ/M = (XJNT/LENGTH)

14. BEDDING JOINT COUNT (**BJNT**)
    - record number of bedding joints in sedimentary rocks by counting the number of natural breaks parallel to the bedding plane.
    - if the run has a large number of breaks record 50 as the maximum value in this column.

15. BEDDING JOINT FREQUENCY (**BJ/M**) Shaded column
    - not necessary to calculate while logging, will be calculated after data entry.

    BJ/M = (BJNT/LENGTH)

16. SURFACE CHARACTERISTICS OF JOINTS (**SURF**)
    - record joint surface characteristics using Figure 1 as a guide.

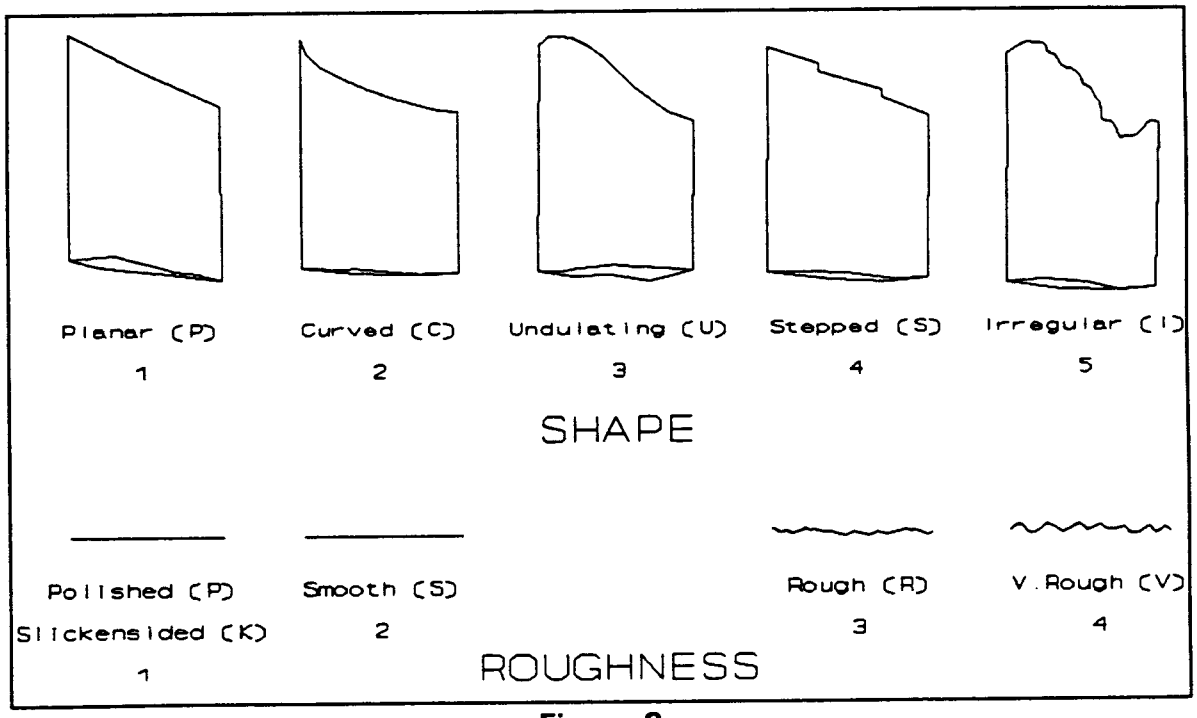

Figure 2
Classification of the Surface Characteristics of Joints
Shape and Roughness

17. REMARKS
    - record drillers comments, and important features such as faults, gouge, triconed intervals, etc.

18. MARK CORE BOXES
    - measure the distance from the nearest marker block to the start and end of each core box, taking into account the recovery for the interval, and mark these depths on the box with black waterproof marker.
    - when geotechnical logging is complete, clearly mark each core box with an aluminum tag giving the hole number, box number, from and to depth for the box.

2 Geological Log

2.1 INTRODUCTION

The evaluation of geologic data is a fundamental part of the discovery, exploration and development of a mineral prospect. In many advanced exploration projects, a large portion of the geologic information is derived from diamond drill core logging. These logs must give a clear, complete and accurate description of the lithology, alteration, veining, mineralization, structure and weathering encountered in each drill hole. The logs must also meet the requirements of all members of the exploration team, including geologists, engineers, managers and others. This can best be accomplished by recording information in three formats; in a numerical form which is readily entered into a computer database, in written form with detail sufficient for geological compilation and other technical studies, and in summary form for quick reference.

Geological logging should be performed by a qualified geologist or geological engineer using this manual as a guide to data recording procedures. This manual is not intended as a guide to the geology itself. It is assumed that all geologists involved in core logging will have a detailed introduction to the geology of the project area prior to logging their first hole.

Logging should be carried out on the forms provided. Header information should be filled out as soon as it becomes available.

The geologic log form may be used as a combination "computer log" form with additional information in a more traditional "written log" format. The geological computer code section is filled out by the geologist in the manner described in the field notes. To ensure that the Geological log fulfils its purpose, **all** appropriate columns **must** be filled out by the geologist for **all** cored intervals. It is also recommended that a written log portion is recorded by the geologist as remarks, for the same **From-To intervals** as the computer coded section. This log should contain the names of the **major units** and **sub-units** and provides a full written description of the **lithology, alteration, veining, mineralization, structure** and **weathering** encountered. It is generally not necessary to keypunch the written log information.

Geological logging is performed after geotechnical logging has been completed on that section of core. (Avoid breaking core until geotechnical logging is complete!) The core is washed off with water and given a quick visual scan prior to detailed geological logging and coding. As logging progresses, K-spar etching and staining, and specific gravity logging are performed. The core is logged in detail and the Geological codes are filled out for the computer log. The geologist then marks out and records the sample intervals and the core is ready for photography and sampling. Geological logs and a synoptic logs must be produced for every drill hole, including abandoned holes with no core, special purpose holes (i.e. metallurgical holes, geotechnical holes, etc.).

2.2 GEOLOGIST'S RESPONSIBILITIES

Each geologist is responsible for a specific drill hole or drill holes. The geologist should:

- verify the set-up before the drill moves onto it.
- line up the drill on the correct azimuth and set the head on inclined holes.
- name the hole number and check it off the list.
- supervise the drill and regularly monitor its progress.
- regularly confer with the project geologist or engineer and the driller as to the status of the hole.
- record the geological codes and written log on the appropriate forms.
- supervise the geotechnical logging.
- supervise the S.G. logging.
- mark out and tag samples to be assayed.
- record the sampling log.

- ensure that all core photographs are taken.
- supervise downhole surveying where necessary.
- examine all core before shutting down the drill.
- determine whether the casing should be left in the hole.
- mark the hole with a permanent, protective marker, (i.e. an aluminum tag on a flagged, squared pole inserted in the hole), after the drill has moved off the set-up.
- fill out the sample requisition form.
- supervise the core splitting, preparation of samples for shipment and racking of split core.
- visually inspect the split core.
- submit samples for thin section, ICP multi-element scans, whole rock analyses and other special analyses where necessary.
- complete and record down hole survey test corrections.
- complete the synoptic log.
- sketch the drill hole in cross-section.
- file the completed assay tag books.
- create the drill hole file and file all logs, assay results and other data pertaining to the hole.
- transmit all necessary information to head office.
- submit the logs for keypunching.
- inspect the results of the drill hole collar survey.
- review the assays and investigate unexpected or unusual results.

2.3 NOTE ON HOLE NUMBERING

It is essential from a data handling point of view that no conflicting or confusing drill hole numbers exist. To avoid some common drill hole numbering problems:

- all drill hole numbers should be consecutive integers with the year drilling started as a prefix.
- there should be only one series of integers with no duplications, i.e. if the last hole drilled on the property was "87-34" then the next hole started in 1992 should be "92-35".
- do not start the numbering series over or change the numbering procedure within a property. All diamond drill holes, percussion holes, underground holes, geotechnical holes, metallurgical holes, holes drilled by company X on zone Y, phase III holes, etc., should be numbered consecutively as they are drilled with no duplications.
- do not use suffixes, such as "92-34a" and "92-34b".
- an abandoned hole should have its own number, particularly if core was

recovered or if it was surveyed. The next attempted hole from the same set-up should have a new number.
- if drill holes are to be identified by property, add another prefix before the year. In this case it may be necessary to use a different integer series for each property.
- in a multi-drill program, keep an up-to-date master list of drill hole numbers used on the wall in the office. Each geologist records the next hole number, their initials, the time, date and drill rig number as each new drill hole is collared.

2.4 EQUIPMENT LIST

- pencil, eraser, calculator, retractable metric tape measure, clipboard, geological logging forms (header page and other pages), sampling logging form (if necessary), synoptic logging form, consecutively numbered dual tag sample tags, swing magnet or magnetic susceptibility meter, hand lens, pocket knife, geological hammer, water bucket, brush, 20 ml bottle of dilute HCl, binocular microscope, staple gun, flagging tape, sample requisition form, eye protection.

2.5 PROCEDURE

1. RECORD HEADER INFORMATION
   - fill out all header information as it becomes available.
   - approximate collar co-ordinates and elevation should be recorded, (i.e. geophysical grid co-ordinates), if the collar survey is not immediately available.

2. WASH CORE
   - wash core with a stiff brush using water to remove cuttings, mud, grease and dirt prior to logging.

3. VISUALLY SCAN CORE
   - visually scan core while washing down. Look for lithologic contacts, structural features, alteration and mineralization, and mark with a yellow lumber crayon for future reference.
   - scanning the core is an iterative process of examining every piece of core, wetting it down and re-examining it several times to determine the major rock unit and sub-unit boundaries.

4. ASSESS HOLE

- concentrate on the "big picture" during the initial examination, particularly if drilling is still in progress, (i.e. has the target been intersected?, are there any significant new discoveries?, new units? etc.)
- the decision to continue drilling or to shut down the hole is often made during initial examination. Where possible, shut-down decisions should be made after careful examination of **all** core under suitable conditions, (i.e. under lights in the core shack, **not** at the drill at night).
- in general, drilling should continue beyond the target depth: well past areas of significant mineralization, and also well past any major contacts, marker units, or faults that are encountered. Stopping a hole too soon is usually worse than drilling too far. When in doubt consider leaving the casing in the hole.
- many geologists keep a scratch log and sketch the geology in cross-section prior to detailed logging to keep things in perspective.

5. MEASURE & MARK ROCK UNIT BOUNDARIES
   - use a **yellow lumber crayon.**
   - measure rock unit boundaries from the nearest driller's marker. Make adjustments for core recovery if necessary when marking the depth of a rock unit boundary.
   - mark the contact depth on the core or core box.

6. RECORD GEOLOGICAL CODES
   - record FROM - TO's to the nearest decimal place, or to two decimal places if necessary.
   - all appropriate columns must be filled out using the applicable codes, a copy of which should be added to the appendix of this manual.
   - for coding purposes, it is most useful to record the total content (i.e. all K-spar or carbonate) in the alteration-mineralization column, even though there may be primary and secondary components to the material.
   - **always** record an estimate of the pyrite, chalcopyrite content, even if low or zero.
   - record the presence of other possible ore-bearing minerals, particularly sulphides, oxides or native metals (i.e. chalcocite, native copper, bornite, etc.) These occurrences should also be fully described in the written log portion.

7. RECORD WRITTEN LOG
   - record for each geologic rock unit.
   - describe geology in detail. It is useful to organize comments into a

standard format, for example:

MAIN ROCK TYPE NAME - record colour, grain size, texture, mineralogy, orientation of planar surfaces (if any) for each of the following:
- the protolith (if recognized).
- phenocrysts (including percent distribution, shape, degree of crystallinity).
- clasts or fragments (including percent distribution, lithology, texture, sorting, roundness, sphericity, support).
- the matrix or groundmass.

ALTERATION - including type if recognized, percent distribution, details of replacement, contact relationships.

VEINING - including percent overall, distribution, width, orientation (angle with respect to long axis of core), contact relationships).

MINERALIZATION - including percent distribution, location, details of replacement, crystallinity and with particular emphasis on mode of occurrence of sulphides and native elements.

STRUCTURE - faults, shear zones and zones of breakage (include percent gouge, width, orientation, surface characteristics, contact relationships).

WEATHERING - level of weathering, depth of leached zone, depth of supergene zone, zone indicator minerals.

OTHER - also record any special characteristics or features, i.e. orientation of stratigraphic tops indicators, etc.
- record the relative strength of magnetic minerals.
- record possible reasons for zones of poor core recovery and/or missing core.
- record the nature of all lithologic contacts.

- writing must be **neat** and **legible**, preferably written in dark pencil. These logs will get faxed and photocopied several times!

8. MARK OUT AND RECORD SAMPLE INTERVALS
   - mark with a **red lumber crayon**
   - sample and assay the entire length of all drill holes from prospective areas, (possible exceptions include holes drilled specifically for metallurgical, geotechnical or condemnation purposes).
   - do not include any "foreign" or inappropriate material as described in the Geotechnical logging section (1.3.5 A and B). Clearly mark these sections "Do Not Sample" with flagging tape or remove them from the core box.

- each drill rig should have its own series of consecutively numbered, two tag sample books.
- samples should be 2.0 metres core length, wherever possible, and no greater than 2.5 metres (except in zones of poor recovery), and no less than 1.0 metre (except for samples of veins, which should not be less than 0.3 metres).
- samples intervals should not cross volcanic-intrusive contacts, contacts of post-mineral dykes greater than 1.0 metre core width and contacts of mineralized veins greater than 0.3 metres core width.
- sample intervals should correspond with the nearest metre in all other circumstances.
- measure samples from the nearest depth marker, taking into account core recovery if necessary.
- mark the sample boundary and depth on the core and the core box with a red lumber crayon.
- record the sample From-To on the geological form along with the sample number.
- record the sample From-To in the sample tag book for each sample tag number.
- place the dual sample tags at the start of each sample interval.
- break the sample with a hammer at the red line boundary.

9. RECORD SYNOPTIC LOG

- record synoptic log as drilling progresses, particularly header information.
- describe PURPOSE of hole prior to drilling, describe the target briefly.
- describe COMMENTS of hole after drilling completed, give a very brief comment on the results of the hole i.e. "good mineralization encountered", or "abandoned redrilled from same set-up as hole ddh X"
- for each rock type, summarize the from-to, alteration and mineralization information in the columns provided. Use one line for each rock type.

10. REVIEW THE CORE

- it is good practice to briefly check the split core before it is racked and look for alteration and mineralization that was not apparent unsplit.
- review the core after the assays have been returned if the results are significantly higher or lower than expected, or if very high grade results are returned.
- note and date any changes to geology logs that have already been keypunched on the log to ensure that new information can easily be recognized and the database updated.

2 Geological Log 16

3 Specific Gravity Log

3.1 INTRODUCTION

Specific gravity (S.G.) is an important factor used to estimate the tonnage and metal content of mineral deposits. Regularly-spaced S.G. measurements of diamond drill core samples provide numerous, well-distributed data points throughout a deposit area. These measurements may be used to estimate the in-situ dry bulk density for various rock types. The in-situ dry bulk density value is used to estimate tonnages and therefore determine the metal content of the rock.

The specific gravity of a rock sample is the ratio of the mass of a given volume of rock to the mass of an equal volume of water. There are several ways to determine specific gravity. The method described in this manual involves weighing **unsplit drill core** samples in air and then weighing the samples submersed in water. This method provides a reasonable specific gravity determination for most core samples which are large enough and competent enough to withstand submersion in water. However, the S.G. of relatively impermeable samples with numerous unconnected void spaces will be underestimated by this method; (values obtained in this situation may actually be closer to the dry bulk density). If a significant amount of core is too broken or incompetent to be measured using this method, a separate procedure should be established for this material (i.e. a laboratory analysis of crushed reject). As a check on the validity of the overall results of the field determinations, it is recommended that a subset of the results (5 to 10% of the total) be compared with results obtained using an independent method, (i.e laboratory analysis of crushed reject).

A specific gravity determination assumes zero void space; this differs from what is found in many rock masses where voids and fractures are common. An in-situ bulk density estimate includes the effect of natural pores, vugs, fractures, and other voids which occur in the rock mass. The term "dry" bulk density specifies that the moisture content of the voids is assumed to be zero. Dry bulk densities are used in tonnage calculations for reserve estimates because assay results (contained metal per unit volume) assume zero moisture content. Therefore, when the dry bulk density is multiplied by the volume, a tonnage value is obtained which may then be multiplied by grade to give the total metal content. If a straight S.G. value were used in the foregoing calculation on a rock with 5% void space, the metal content would be over-estimated by 5%. If a wet bulk density value were used in the same calculation, the metal content would be over-estimated by up to 3%. In a rock mass with no void spaces, the specific gravity of the rock is essentially equal to the in-situ bulk density. In some rock masses, particularly in the upper highly weathered sections of some

mineralized deposits, the in-situ bulk density may be significantly less than the specific gravity. In all cases it is appropriate to measure the specific gravity. However, care must be taken so that the two are not confused, and where necessary, the in-situ bulk density should be evaluated separately.

Personnel involved in S.G. logging should have the method demonstrated to them by before performing this work. Logging forms are provided for data entry in Appendix B.

3.2 EQUIPMENT LIST

- pencil, eraser, calculator, specific gravity logging forms, triple beam balance (minimum 2.0 kilogram capacity), bucket full of clean water, two wire "cages" (described below), for suspending core samples in air and in water (the wire cages can be made of fine steel wire, do not use copper or brass wire).

3.3 PROCEDURE

1. SELECT SAMPLES
   - samples should be selected every eight metres from pieces of whole unsplit core which are competent enough to be submersed in water and weigh from 200 to 1500 grams.
   - the exact depth location of the sample, and the correct sample number should be recorded in the log.
   - samples should be taken as close to the eight metre interval as possible
   - if the sample at the eight metre interval contains concentrations of magnetite, pyrite and/or veins, this should be noted in the log, and the sample should still be measured. A geologist may need to verify the S.G. if it falls outside the acceptable range. High or low values are acceptable, as long as they reflect a realistic distribution of such values within the deposit.

2. PREPARE BALANCE
   - ensure the balance is clean and level.
   - prepare the "cages".
   - check that the balance arm and the "cage" apparatus underneath moves freely (i.e. make sure the cage does not come into contact with the frame or the edges of the bucket). The cage itself should be under water. It may be necessary to counteract the added weight of the cage by wrapping a length of wire of sufficient weight around one of the beams

so that the balance can be zeroed with no weight in the tray. (Make sure that this wire does not interfere with the balance apparatus and cannot move during weighing).
- weighing tray must be clean and dry.
- ensure the water in the bucket is clean by replacing it daily.

3. ZERO THE BALANCE
   - zero the balance with the "cage" attached underneath.
   - counterweights provided with the balance have two weights stamped on them. The actual weight is usually stamped on the bottom of the counterweight. It represents the true weight of the counterweight. The balance arm weight is stamped on the top of the counterweight. It represents the effective weight of the counterweight when placed on the balance arm. The actual weight is less than the balance arm weight.
   - select counterweight(s) of about 500 to 1000 grams actual weight.
   - place the counterweight(s) in the weighing tray.
   - adjust the counterweights on the triple beam side to equal the actual weight stamped on the bottom of the counterweight(s) in the tray.
   - if the sides do not balance, turn the fine adjustment knob to achieve exact balance.
   - empty the weighing pan and remove all counterweights from the triple beam side and ensure all non-removable counterweights are in their zero notch on their beam.
   - check for balance with no weight in the tray. The sides may not balance exactly but should be very close to balancing, if not repeat the procedure from step 2.
   - this method zeros the balance in the range of the samples to be weighed.

4. WEIGH THE SAMPLE IN AIR (Ma)
   - for the purposes of this procedure assume:

   WEIGHT = MASS

   - record all weights to two decimal places.
   - weigh dry samples in air first.
   - samples are weighed in the stainless steel weighing tray or in the "cage" (left side).
   - add a 250 gm or 500 gm counterweight on to the triple beam (right) side.
   - a common type of triple-beam balance has three non-removable counterweights. The two larger non-removable counterweights run along

notched beams and measure in increments of 100 gm and 10 gm respectively. These weights must end up in a notch when weighing a sample.

- the smallest non-removable counterweight which measures in increments of 0.1 to 1.0 gm slides freely to any point on the beam.
- adjust the counterweights until balance is achieved.
- once balance is achieved, sum all the effective weights of the counterweights and record the mass in air (**Ma**) of the sample to two decimal places.
- writing must be **neat** and **legible**, preferably written in dark pencil. These logs will get faxed and photocopied several times!

5. WEIGH THE SAMPLE IN WATER (Mw)
   - place the sample in the cage and suspend it underneath the balance to submerse the entire sample in water. **The sample must be completely submersed.** No part of the sample may show above water or touch the sides, or the bottom of the bucket. If the sample fragments while underwater do not record this sample. Select another sample or reweigh the sample in air again when dry and use the new **Ma**. (The effect of unfilled voids will be factored in when the bulk density is estimated later).
   - adjust the counterweights to balance and record the weight in water (**Mw**).
   - to maintain consistency in the method, submerse all samples for the same length of time, (i.e. only as long as it takes to obtain the weight in water Mw).

6. CALCULATE THE SAMPLE VOLUME (Vc)
   - the volume of the core sample (**Vc**) is calculated as follows:

$$\mathbf{Vc = Ma - Mw}$$

7. CALCULATE THE SPECIFIC GRAVITY (S.G.)
   - the specific gravity is calculated as follows:

$$\mathbf{S.G. = Ma / Vc}$$

   - all calculations should be performed on each sample immediately after it is weighed. Any S.G. values which are less than 2.5 or greater than 3.2 should be reweighed, recalculated and verified by a geologist. These calculations will also be checked after they are keypunched.

4 Core Photography

4.1 INTRODUCTION

It is a widely held practice in British Columbia and the Yukon to photograph drill core from major exploration projects. Three or four boxes of unsplit wetted core are usually photographed at once. The photographs are assembled in an album and form part of the permanent record for the drill program.

4.2 EQUIPMENT LIST

- core stand, 35 mm camera with wide angle lens, flash unit or photographic lamps, 100 to 400 ASA colour print film, water sprayer, magic marker and paper for labels.

4.3 PROCEDURE

1. SET CORE ON PHOTO STAND
   - the photo stand should be adjacent to the core logging area.
   - if indoors, it should be well-lit and away from windows for consistent light.
   - if outdoors, heavy shadow areas should be avoided. It is recommended that a portable frame wrapped in translucent white plastic is constructed to place around the core when photographing it to diffuse the light.
   - it should be set up so that it is easy to place and remove the core boxes from the stand.
   - the stand should hold 3 to 4 boxes of core depending on the angle and the distance from the camera lens.
   - the ideal arrangement is to have the camera set and mounted in a fixed location above the photo stand.
   - arrange boxes in logging order.
   - make a label with **HOLE NO.**, **BOX NO.s**, **PROJECT NAME** and **FROM** of first box and **TO** of last box . This label must be clear and legible, and large enough to be read in the resulting photograph.

2. PHOTOGRAPH CORE
   - use readily available, high resolution 100 ASA film (i.e. Fuji HR100 or equivalent).
   - the exposure, aperture and focal length should be pre-set for consistent results.

- wet the core.
- ensure the flash or lights are set, the label is in place and all the core is wet.
- compose photograph, ensuring all the core and the label is in the field of view, focus and shoot.

5 Sampling for Assay (Core Splitting)

5.1 INTRODUCTION

This section of the manual describes the duties of core splitter personnel. It deals with procedures involved in preparing the core to be split, splitting the core in half using a core splitter, sampling the core and preparing the samples for shipment. For discussion on the selection and marking out of samples, see section 2.5.8 of Geology Logging.

The most common procedure for sampling diamond drill core in an exploration project is to split the core in half with a splitting machine or cut it in half with a diamond saw. One half of the core goes into the sample bag which is sent to the assay lab for analysis, the other half is retained in the core box and stored in a core rack for future reference. A two metre sample of half NQ core, yields approximately 4.5 kg of material for assay. When properly split, this sample is representative of the entire length of core sampled, and provides, for most ore types, sufficient material for assaying and other studies.

The core is ready to be sampled after geotechnical logging, geology logging, S.G. logging and core photography are complete and the geologist has submitted the core to be split. Core splitting personnel should be receive detailed instructions before performing this work and use this manual as guide to sampling procedures. It must be stressed that core splitting and sampling work is an important part of the sample preparation process. Careful, methodical work is the key to successful sampling. Core splitting personnel should not hesitate to contact a geologist immediately if there are any questions about sampling procedures, specific samples, or if any problems arise during sampling, (i.e. mixed-up samples, samples that seem too large or too small, missing tags, etc.). It is best to make a note of sampling problems in the log--**even if they cannot be corrected!**--than to ignore them.

NOTE: Do not wear metallic jewellery when sampling, i.e. gold rings, copper bracelets, etc. should **not** be worn.

5.2 EQUIPMENT LIST

Longyear (or similar make) HQ-NQ core splitter, 2 steel or aluminum cake or bread tins to use as sample tins, whisk brush or compressed air unit, spare splitter blades and hardware, wrenches for splitter hardware, short handled 2 lb. sledge hammer, axe handle, two U-bolts, waterproof black magic markers, aluminum tags, pen, 1" nails, eye protection, hearing protection, dust masks,gloves, tablespoon, 12" x 16" 0.4 mil poly bags, twist ties, burlap sacks, shipment tags, completed sample tag book, completed sampling log, completed sample requisition form.

5.3 PROCEDURE

1. MARK SAMPLES WITH ALUMINUM TAGS
   - permanently mark the assay sample locations by affixing an aluminum tag with the sample number and from-to interval written on it underneath the first piece of core at the start of each sample interval.
   - the sample number is on the sample tag which is placed at the start of the sample in the core box.
   - the from-to interval is written on the core itself or on the core box in red lumber crayon. If the from-to interval is unclear, check the sampling log or contact a geologist.

2. ARRANGE CORE BOXES
   - place core to be sampled within reach of the splitting machine.
   - start at the top of the hole with box 1.
   - arrange core boxes so that the lowest depth (nearest surface) is in the top left corner. The core is split along the rows from left to right, then row by row from top to bottom, as you would read a book.
   - samples should be split in consecutive order to avoid mix-ups.

3. MARK SAMPLE BAGS
   - mark sample bags with sample numbers to be used with a permanent black marker. Double-check the marked bags prior to sampling to make sure the sample numbers are correct and that there are no errors, omissions or duplications.

4. PREPARE EQUIPMENT
   - the core splitting area should be swept out and cleaned at the end of each shift.
   - clean out sample tins by inverting them and tapping them on the table

or clean with compressed air to remove all traces of rock material.
- brush off groove of splitting machine with whisk or clean with compressed air to remove all traces of rock material.
- arrange sample tins on either side of the splitting machine to catch the split sample.

5. SPLIT THE CORE
- always wear safety glasses when hammering or splitting core. Hearing protection, dust masks and gloves are also recommended.
- start sampling at the red line marked on the core and/or the core box.
- do not sample material marked "rubble", "caved" or "do not sample", leave it in the box.
- pull dual sample tag from core box and place in sample bag with corresponding number.
- break core so that it will fit into the splitting machine (less than 10 cm long).
- ideally, one half of the core, representing the material from one side of the cylinder of core, will go into the sample. The other half will remain in, or be replaced in the core box in the same position as it was prior to splitting. Pieces of core which have been stained for K-spar (yellow stain) should be sampled so that the stained piece is retained in the core box, stained side up.
- place core in machine so that it rests in the groove.
- orient core so that the plane of foliation (i.e. bedding, shearing, etc.), or the plane of any veins or lithologic contacts are perpendicular to the groove in the splitting machine. This will tend to give the best split, and reduces possible sampling bias.
- wheel down on the core to break it. (It is recommended that an axe handle is attached to the wheel by securing it with U-bolts. This will give the extra leverage necessary to break core by turning the wheel).
- if the core does not break with the wheel, hammer on the plunger in the centre of the wheel until the core breaks.
- the core should split in half with each halve landing in opposite sample tins.
- if the core is not fully or completely split or is "full-round" in cross-section, re-insert in the same orientation and split again. Do not allow any "full-round" pieces to be placed in the sample bag or the core box.
- if the core is soft cut the core with a knife or scrape with a spoon to take half the sample and place it in the sample tin.
- if the core is very rubbly, take approximately half the fragments for the sample tin.

- if the core breaks into a series of thin disks, (full-round), break each disk in half with a hammer and put one half in the sample tin.

6. BAG SAMPLE, RETURN HALF TO CORE BOX
   - one tin is the "sample tin" where the sample is allowed to collect until the entire length of sample has been split or the tray is full. This material then goes into the bag with the sample tag.
   - the other side is the "return tin". This material is returned to the core box after each piece is broken.
   - for a right handed person, the sample is usually collected in the sample tin on the left.
   - after each split is made replace the "return" piece in the core box in the same orientation as it was before being split.
   - **never leave a sample unfinished!** Always complete and bag an entire sample before leaving the splitting area or performing other work.

7. CLEAN EQUIPMENT BETWEEN SAMPLES
   - at the end of each sample, thoroughly clean out the sample tins and the splitting machine to avoid cross-contamination between samples.

8. SEAL AND ARRANGE SAMPLE BAGS
   - when the sample is completely split, seal bag with twist tie and place with other samples from the same hole in order.

9. PLACE SAMPLE BAGS IN SHIPPING SACKS
   - when an entire hole is completely split, the sample bags are ready to be placed in the shipping sacks.
   - place the samples, five to a bag, in the shipping sacks in consecutive order.

10. MARK SHIPPING SACKS
    - number the shipping bags (i.e. 1 of 12, 2 of 12, etc.)
    - do **NOT** mark the drill hole number on **anything** which is shipped to the assay lab.
    - record the shipping sack number for each set of five samples on the sampling log.
    - attach shipping labels on **each** shipping sack, with the address of the assay lab and the address of the company.

11. SHIP SAMPLES TO THE ASSAY LAB
    - complete the sample requisition form and include it in the first shipping

sack.
- seal the shipping sacks and ship a complete hole's worth of sample sacks in the same shipment.

12. RACK THE SPLIT CORE
- after a hole is completed, notify the geologist who logged the hole. They may wish to look at the split core.
- when the geologist is finished with the core, place the core in the core racks in consecutive order by hole, from top to bottom column-wise, then from left to right in the rack.

6 Sample Storage

6.1 INTRODUCTION

Sample storage deserves a reasonable amount of attention in an advanced exploration project. Sample materials provide solid evidence which backs up the exploration data. These materials may be used extensively in the development phase, and it is therefore wise to plan for and provide good storage facilities. All in-situ rock material recovered during a diamond drill coring program should be retained indefinitely in appropriate long-term storage facilities for future use.

6.2 SAMPLE HANDLING

Diamond drill core material should be handled with a great deal of care as it passes through the logging, sampling and shipping procedures which prepare it for assay. The "sample" becomes smaller as the original material is split and divided in several steps along the way to final assay analysis. Each time a split is taken or the sample is divided or subsampled, a "reject" is created. The main forms of "reject" material are:

1. Half of the split core which remains in the box.
2. Crushed material which remains in the sample bag.
3. Pulverized material or "pulp" which is stored in a paper bag.

If the proper sampling procedures are followed, each "reject" should be a **representative sample** of the original cylinder of rock from which it was taken. Thus the remaining rock material or "reject" has considerable value, especially when its

replacement cost is considered. This material should be maintained as a representative sample wherever possible, and stored according to its value. Careful storage and documentation of this material also enhances the ability of geologists, metallurgists, geochemists, engineers and others to independently analyze and evaluate the deposit.

N.B. Rejects which have been improperly sampled, or have been sampled for metallics gold assay, are no longer representative samples and should be marked as such. They generally can not be used again.

6.3 LONG TERM STORAGE

Split diamond drill core and unsampled diamond drill core are generally stored in permanent core racks which are constructed at the exploration site. These structures should be designed to allow easy access to individual core boxes and to shelter the core from the elements. Crushed sample rejects and pulps are generally stored at the assay laboratory in the short term. For the longer term, crushed sample rejects (roughly 4 to 5 kilograms each), should be stored, sorted by assay file number, in wooden boxes mounted on wooden pallets (i.e. apple crates). These crates should be covered if the rejects are stored out-of-doors. Pulps take up the least amount of space of all sample materials (100 to 500 grams each), and should be provided with the best long term storage facilities. Pulps are stored sorted by assay file number in flat cardboard boxes. These boxes should be shelved in a dry warehouse, in an orderly manner, allowing easy access to individual boxes.

6.4 CATALOGUING

All rock materials and samples in storage should be catalogued so they can be identified and pulled for further study. It is recommended that a "Master Assay List" be prepared and kept up-to-date. This list should be a cross-referenced index of all diamond drill holes, sample numbers, lab file numbers and check sample numbers. Every undertaking which causes core material, rejects or pulps to be consumed, re-numbered, duplicated or changed in character (i.e. become non-representative samples), should be carefully documented and filed with the master list. Metallurgical studies, check sampling, special assaying, acid-base accounting, engineering and environmental studies are the most likely to be of concern. All users of the material should discuss their requirements and outline a plan for minimizing disruption to the samples and the storage system.

7 Data Compilation

7.1 INTRODUCTION

The on-going compilation of data is an essential part of an advanced exploration project. This manual describes data compilation which involves: appropriate duplication and filing of original records, transmittal to head office and filing of a duplicate set of records, keypunching and loading of data into a computer database, verification of the computer database, and generation of plans, cross-sections, and other output in the ultimate preparation for reserve estimation work. Data must be compiled in a timely fashion so that it may be readily retrieved soon after it is originally recorded in the field. Compilation in the field should take place on original working copies, which are the most up-to-date and pertinent to the exploration process. Compilation in the head office involves the maintenance of a duplicate set of records and the creation of a master computer database, from which working copies may be distributed from time to time. Field personnel have the responsibility of keeping the head office personnel informed of corrections and changes to be made to the duplicated data set and the master computer database. Head office personnel have the responsibility of conferring with field personnel on all aspects of geologic compilation and the technical details regarding data collection.

7.2 ORIGINAL COPY FILING

The original copies of all diamond drill logs, and all documents pertaining to each drill hole should be filed by drill hole in a secure metal cabinet. It is useful to have three legal size (8.5" x 14") file folders of different colours, i.e. plain, red and blue, for each drill hole. The plain manila file folder would contain all geologic information, including the coded geological forms, synoptic log, S.G. log, downhole survey logs, synoptic cross-section, thin section reports, and any additional geologic logs or other notes pertaining to the drill hole. The red file folder would contain all sampling and assay information, including the sampling log, sample requisition form, all assay results, geochemical results, multi-element results, whole rock analyses, metallic assays, screen analyses, oxide analyses, and check sampling results. The blue file folder would contain all geotechnical and engineering logs, including the geotechnical log, packer test results, piezometer readings, metallurgical sampling information, and other specific engineering logs or notes. Each of the three file folders for each drill hole would be filed in a single hanging file holder.

Core photographs should be filed by drill hole in order in photograph album binders. Albums with removable photograph inserts are the best suited for this purpose.

Negatives should be sorted by drill hole and stored separately from the albums. Core photographs are generally compiled and stored at the head office. Down hole survey tests and completed sample tag books should be kept at for at least 18 months in a safe place at the exploration site.

7.3 DATA TRANSMITTAL

Completed data logs should be transmitted from the exploration site to the head office when all the logging for the drill hole is complete. It is the responsibility of the geologist in charge of the drill hole to ensure that the following completed logs are faxed to the head office as soon as the logging is complete:

- geotechnical
- geological (with all collar and downhole survey information)
- sampling
- synoptic
- synoptic cross-section
- specific gravity log

The geologist should also ensure that the exposed photographic film of the core is sent to the head office, and that assay requisition forms are sent to the assay lab. Arrangements should also be made with the assay lab to have all analytical results faxed to the exploration site as soon as they become available.

7.4 DUPLICATE COPY FILING

A duplicate copy of all drill hole logs and assay results should be kept in the head office. The filing system should be the same as the one used to file the hard copy originals. This filing must be kept up-to-date on a daily basis, as this set will provide a full back-up in the event that the original data set is destroyed. A complete print-out of all verified data from the computer database, sorted by drill hole, should also be kept separate from the computer data storage system. Copies of these print-outs should also be sent to the exploration site and filed there for reference purposes. It is recommended that the following information is copied from the individual drill hole files and made into special topic files:

- thin section reports
- check assay results
- multi-element results
- oxide assay results

- whole rock analyses
- metallics assay results

7.5 KEYPUNCHING

All data logs should be keypunched into a set of intermediate text files as soon as the data is received. The format of the keypunched text files should be similar to the original written files. The keypunched text files should be backed up onto diskette or tape and archived for future reference.

7.6 COMPUTER DATABASE

Once the keypunching is complete, the intermediate text files of logging data are imported and/or merged into the final exploration database. Caution should be exercised when importing or merging data to avoid translation and merging errors. It is recommended that a sole individual be assigned the task of database manager and be responsible for all data loading and merging. To avoid merging errors, a single series of sample numbers should be used for all sampling, including check sampling.

7.7 VERIFICATION

All keypunched and merged data should be verified against the original version and corrected. Verification should be performed by manually comparing each data entry in the **final unverified database** (after all database manipulations are complete), against the **most original data record** available. In the case of drill logs, the final unverified database is checked against the original hand coded geological forms. In the case of assays, the assay lab should demonstrate that it uses a method of checking any keypunched data (i.e. the actual assayer's worksheets, where applicable) against the data recorded on the assay certificate. This can be accomplished either by double entry (i.e. the data is keypunched once from start to finish, and then keypunched again, and the two files are compared and differences noted through a computer utility), or by manual verification of each work sheet record against the certificate record. This will ensure that the assays recorded on the certificates are correct. To ensure that individual assays on the laboratory assay certificate match the company's unverified database records, manual verification is required. Manual verification is best performed in two person teams. One person reads aloud the data from one record and another person checks the other record visually for errors.

7.8 COMPUTER OUTPUT

Once verification and correction of the final database is complete for a series of holes, computer output can be generated. This output can be in many forms, commonly:

- printed data lists
- ASCII test files on diskette
- plotted cross-sections
- plotted surface plans
- plotted level plans

7.9 GEOLOGIC COMPILATION

Geologic compilation should involve the correlation and interpolation of lithology, structure, alteration, mineralization and weathering zones in a series of two dimensional views to create a model which is three dimensionally sound. This is accomplished by detailed re-examination and comparison of drill core and geologic logs from neighbouring drill holes, and the creation of a two dimensional model of the geology, usually on vertical cross-sections. It is essential that this model is checked, either by creating other two dimensional views, such as bench plans and/or longitudinally oriented cross-sections, or by true three dimensional modelling.

The importance of completing a geologic interpolation which is three dimensionally sound, particularly with regard to lithology and structure, cannot be over-emphasized. The continuity of geologic features in three dimensions is an important consideration in detailed exploration drilling, infill drilling, underground exploration and ore reserve estimation.

Although a complete discussion of geologic compilation and three dimensional modelling is outside the scope of this manual, the following approach to this process is one which has been successfully used on other projects.

- geologic compilation is done in sectional views.
- drill hole traces are plotted with geologic information to a suitable scale and with a distance between sections which corresponds to the overall drill pattern.
- where-ever possible, the geologists most familiar with the drill core should perform the correlation work.
- consecutive sections are regularly overlain on a light table and checked for continuity, and re-checked prior to digitizing.
- digitize cross-sections, ("snap" digitized outlines to 3D contact points on drill hole traces, if possible).

- plot a set of bench plans (same as the block model benches) with geological "ticks" (points where geologic information from the cross-sections intersects the mid-points each bench), along with the drill hole traces on the bench (the actual data points).
- re-interpolate the geology on the bench plans and digitize the new interpolation (as above, "snap" to 3D points).
- re-plot the cross-sections and continue the interpolation if necessary, or use the new bench plan model to create the rock model.

The bench plan phase of interpolation produces a model which is incrementally interpolated to the same scale as the block model used in reserve estimation.

8 Check Assaying

8.1 INTRODUCTION

Check assaying is good insurance against the possibility of inaccurate, misrepresented or biased assay results--a major area of concern in any exploration project! A properly established check assaying program can highlight areas of concern in the sampling process and in the assay results as work progresses. A successful program of check sample analysis will allow a positive statement to be made about the reliability and reproducibility of the original assay results.

Check assaying programs are generally designed to investigate the precision and accuracy of the original assay results reported by the original assay lab. This is accomplished by re-submitting re-numbered blind duplicates of the original pulps to the original lab and to a second lab for standard assay. Check assaying programs may also be set up to look into the suitability and reliability of the sample preparation method used, the suitability of various types and sizes of samples and subsamples, and the reproducibility of high grade and/or metallic bearing samples. This manual describes a procedure for selecting and submitting blind duplicate pulp samples and matching the paired data for analysis. Analysis of the paired data, and discussion of the results of this analysis is outside the scope of this manual. It is strongly recommended that a qualified person review the paired data and report on the findings in a timely manner, making recommendations for further investigation, if required.

8.2 SELECTION OF CHECK SAMPLES

Check samples can be selected by a combination of random sampling as the project progresses and by periodic selection from the completed set of assay results. The random samples tend to be well distributed and timely, but include many gangue samples and few higher grade samples. The periodic checks focus on the important higher grade assays. The following steps can be used as a guide to selecting periodic blind pulp samples for check assaying:

1 Create a computer file with all the verified assays in it. This file should have the following information: diamond drill hole number, from, to, sample number, Au assay, Cu assay, Mo assay and lab file number. Obtain a count of the total number of assays.

2 Sort the data by Au assay value, with the highest Au values at the top of the list.

3 Select about 5% of the total samples for checking as follows:

a) determine the number of samples to be selected for checking.

Total samples X 0.05 = Number to be selected for checking

b) select all of the highest 3% of the Au assays and append them to a separate file.

Total samples X 0.03 = Number of top Au assays to be selected

c) remove the top 3% Au values and resort by Cu value.

d) select all of the highest 1% remaining Cu assays and append them to the same file as the top 3% Au values.

Total samples X 0.01 = Number of top Cu assays to be selected

e) remove the top 1% remaining Cu values, and also remove all values in the range from the detection limit to low background from the list.

f) sort by drill hole and select samples randomly over a range of drill holes to include samples from various time periods and zones.

8.3 PREPARATION AND ASSAY

Ideally, the pulps selected in section 8.2 should be sent to the company for splitting and re-numbering under the direct supervision of a qualified company geologist or geochemist. Since most mining exploration companies do not have the proper facilities or the personnel available to perform this work, the splitting and re-numbering of the pulps should be performed at a second lab. The second lab should also perform the second or intra-lab check on the duplicate pulp.

Pulps should be divided into two samples using standard analytical laboratory techniques which avoid imparting any sampling bias or causing cross-contamination of the pulps. One split is returned to the original pulp bag for assay by the second lab. The second split goes into the renumbered bag for that sample. Care must be taken so that there is no way of determining the identity of the original sample from the re-numbered pulp. This re-numbered pulp is then sent to the original lab for standard analysis.

All check assaying should be performed using the same standard techniques used in the original analysis. As with original assays, the labs should demonstrate that all keypunched data has been verified against the assay certificates where applicable.

8.4 MATCHING PAIRED DATA

When the original analytical results for the check assays are returned from the original and second assay lab, the checks are merged with the original results. Merging will result in three matched pairs for comparison as follows:

A Original lab, original assay vs Original lab, blind assay
B Original lab, original assay vs Second lab, blind assay
C Original lab, blind assay vs Second lab, blind assay

These pairs can be analyzed by a variety of statistical techniques, including: histograms, scatterplots, regression analysis, etc. Pair A is the most important to consider, as it reflects the precision of the original lab in reproducing its own results. Pairs B and C compare the relative accuracy of the two labs and generally has slightly poorer correlation than Pair A.

8.5 VERIFICATION

All data, and check assay data in particular, should be verified. This is accomplished by manually checking the matched pair file against the three sets of assay certificates and the re-numbering list. This must be done prior to performing any statistical analysis.

9 Database Management

9.1 INTRODUCTION

The master computer database will contain all the diamond drill hole information to which the interpolated, geologic, topographic and engineering information will be added for ore reserve estimation. The key to proper database management is **maintaining the integrity of the master version** of the database as exploration proceeds. This involves keeping the master database reasonably up-to-date, ensuring that the data in it has been verified against the original records, that corrections to the data are properly applied, and that all transactions involving the database are carefully documented. To properly maintain this integrity, there should be **only one** person solely in charge of the master database.

A strict rule of database management is that there exists only **ONE** official master version of the database. Many copies of this database may exist; however for any additions, corrections or modifications to be database to take effect, they must be documented and submitted to the database manager to be recorded in the official master version. This manual describes techniques for maintaining the integrity of a master drill hole database.

9.2 LOADING DATA

The master computer database should contain the following sets of data for each diamond drill hole:

HEADER
- diamond drill hole number as a string (i.e. "92-57")
- diamond drill hole number as an integer (i.e. "57")
- core size (i.e. NQ, HQ, XX for no core)

- zone
- claim the ddh is collared in
- assay type (i.e. totally assayed, partly assayed, geochem., not assayed, etc.)
- type of ddh (i.e. infill, delineation, step-out, wild-cat, geotech., metallurgical, etc.)
- depth of casing
- verification level (i.e. all, collars surveys only, assays, none, etc.)

COLLAR SURVEY
- northing
- easting
- elevation
- azimuth
- inclination (dip)

DOWNHOLE SURVEYS
- depth of survey
- azimuth
- inclination

GEOTECHNICAL DATA
- all columns from the log
- all calculated columns

GEOLOGICAL DATA
- all columns from the computer log
- all intervals to be calculated

ASSAY AND S.G. DATA
- from, to, sample number from sampling log
- original assay certificate number
- assay results from lab certificates
- S.G.'s from S.G. log keyed to sample number
- all intervals to be calculated

9.3 MANIPULATIONS

"Manipulations" refers to all calculations which must be performed on data after it has been keypunched, including calculation of from-to intervals, percent recovery, etc. All manipulations should be performed **prior** to verification. The results of all manipulations should be checked, as they are generally not a part of the regular verification process. If manipulations are to be made within the master database, the

entire master database should be backed up, dated and archived prior to manipulation.

9.4 VERIFICATION AND CORRECTION

Section 7.5 describes the procedure for verifying keypunched and merged data in the master database. It is the responsibility of the database manager to ensure that the appropriate corrections are also verified. Once the final data manipulations have been made, and the database has been verified and corrected, the verification level should be noted in the database header. At this point it is also wise to make the database "read only" or "write protected". Corrections which post-date the verification process, should be noted as a memo to the database and these memos maintained in separate hard-copy file in chronological order. The database should be backed-up after each correction, and the dated back-up kept in a secure place separate from the master database.

APPENDICES

APPENDIX A

STAINING PROCEDURE FOR DETERMINATION OF POTASSIUM FELDSPAR

Potassium feldspar has an important association with alkalic and calc-alkalic copper porphyry deposits. It may occur as a primary component of intrusive "porphyry" rocks and surrounding volcanic rocks. It is also important as a secondary mineral in copper porphyry deposits, occurring in syn-mineralization veins, dykes, and alteration halos which define the "Potassic Zone". Fine grained K-spar is indistinguishable from fine plagioclase feldspar and fine silica in hand specimen. The sodium cobaltnitrite staining procedure is a good field test which allows for rapid evaluation of the potassium feldspar content of a rock.

CAUTION: HYDROFLUORIC ACID (HF) IS EXTREMELY TOXIC!

- improper handling of this acid can be fatal!
- contact with the eyes causes permanent blindness!
- inhaling the fumes causes permanent lung damage!
- contact with the skin causes severe burns and may cause permanent tissue and bone damage!
- even very dilute HF will burn flesh!

SAFETY PRECAUTIONS

- allow only trained personnel to handle hazardous materials such as HF.
- read all safety information provided by law with each shipment of reagents and keep these with the reagents.
- keep plenty of fresh water, an eye rinsing device and HF antidote handy at all times.
- perform etching in a well ventilated area preferably under a fume hood.
- do not allow HF to come into contact with the face, skin or clothing, **always** keep exposed skin covered, wear rubber gloves, and protective eye wear when handling HF or etched rocks.

APPENDIX A
K-SPAR STAINING

NOTES FOR SUCCESSFUL STAINING

A. Use safety equipment.
B. Keep reagents above 10 degrees C.
C. Make up new Sodium Cobaltinitrite solution after staining 20 to 40 specimens.
D. Use "semi-conductor grade" (48%) HF for etching rocks.
E. Change the HF solution at least every two days.
F. Do not attempt to etch cold or frozen rocks.
G. Do not etch for too long.
H. Change the rinse water daily.
I. Keep the fume hood area clean.

MIXING SODIUM COBALTNITRITE SOLUTION

1. Empty stale chemicals into a designated waste pail.
2. Wash out plastic staining dish.
3. Add approximately 20 ml of hot water to plastic mixing bottle.
4. Measure 20 grams of Sodium Cobaltnitrite on balance.
5. Add Sodium Cobaltnitrite powder to mixing bottle, replace lid and shake thoroughly to dissolve crystals.
6. Pour solution into shallow plastic container. Keep lid on when not in use.

PREPARING HYDROFLUORIC ETCH BATH

1. Carefully pour HF into dry, shallow plastic container.
2. Keep lid on container when not in use.

STAINING PROCEDURE

1. Sample should be at room temperature and free of grease, mud and dirt.
2. Rinse sample in water, then place sample in HF etching tray using tongs. (unlike some acids, water can be safely added to HF).
3. Etch sample in HF solution for approx. 20 to 45 seconds.
4. Remove sample with tongs and rinse in water.
5. Place etched side in Sodium Cobaltnitrite solution for approximately 60 to 90 seconds.
6. Rinse sample thoroughly in water. Do **NOT** wipe the stained surface.

APPENDIX VIII

SUMMARY DRILL LOGS

093190

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-123	**Total Depth**	452.43 m		
Northing	254,955.09	**Casing Depth**			Left In
Easting	111,630.63	**Survey Data**	**Azimuth**	**Dip**	**Instrument**
Elevation	1160.84 m	**Collar**		-90.0°	
Core Size	HQ to 182.88 and NQ to 452.43	306.6 m	317°	-88.9°	Sperry Sun
Drilling Started	June 9, 1992/May 1, 1993	452.9 m	338°	-88.8°	Sperry Sun
Drilling Finished	June 12, 1992/May 6, 1993				
Logged by	T. Becker				

Purpose/Target: To deepen drill hole 92-123 and to test the zone at depth.

Comments: Dominately heterolithic breccia with zones of Patton Porphyry, mainly altered to potassic in matrix with phyllic clasts.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-124	Total Depth	485.24 m		
Northing	254,870.06	Casing Depth	13.41 m		Left In
Easting	111,621.84	Survey Data	Azimuth	Dip	Instrument
Elevation	1150.60 m	Collar			
Core Size	HQ to 182.88, NQ to 485.24	306.93 m	325°	-88.9°	
Drilling Started	June 12, 1992/May 6, 1993	459.33 m	310°	-89.0°	
Drilling Finished	June 15, 1992/May 12, 1993				
Logged by	T. Becker				

Purpose/Target: Hole 92-124 encountered good mineralization to 182.88 m.
Hole 93-124 tested the extension of the zone to 485.24 m

Comments: Dominately heterolithic breccia with Patton Porphyry dykes,
mainly altered to potassic in matrix with phyllic/argillic clasts.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-125	Total Depth	558.39 m
Northing	254,973.24	Casing Depth	Left Out
Easting	111,256.87	Survey Data	Azimuth / Dip / Instrument
Elevation	1242.51 m	Collar	-90.00°
Core Size	HQ to 213.36 m in 1992; NQ in 1993	306.9 m	127° / -89.75° / Sperry Sun
Drilling Started	June 16, 1992/May 16, 1993	456.3 m	260° / -89.25° / Sperry Sun
Drilling Finished	June 21, 1992/May 23, 1993	556.9 m	293° / -89.50° / Sperry Sun
Logged by	M. Dittrick		
Purpose/Target:	Redrill 92-125 to depth.		

Comments: Overall potassic alteration with occasional small zones of phyllic/ argillic; sulphides relatively low; veining relatively weak.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-126	Total Depth	596.49 m		
Northing	254,880.76	Casing Depth			Left Out
Easting	111,181.76	Survey Data	Azimuth	Dip	Instrument
Elevation	1320 m	Collar			
Core Size	HQ to 243.84 m; NQ to 596.49 m	306.9 m	331°	-89.0°	Sperry Sun
Drilling Started	June 22, 1992/May 26, 1993	459.3 m	330°	-88.6°	Sperry Sun
Drilling Finished	June 27, 1992/May 31, 1993	596.5 m	329°	-88.5°	Sperry Sun
Logged by	M. Dittrick				

Purpose/Target: To extend 92-126 in order to check mineralization to depth.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-127	Total Depth	402.34 m		
Northing	254,969.57	Casing Depth	7.22 m		Left Out
Easting	111,098.06	Survey Data	Azimuth	Dip	Instrument
Elevation	1310.88 m	Collar		-90.00°	
Core Size	HQ	304.8 m	213(T)	-89.25°	
Drilling Started	June 27-June 29, 1992/May 8, 1993				
Drilling Finished	July 15-July 19, 1992/May 18, 1993				
Logged by	M.P. Phillips				
Purpose/Target:	Deepen Hole 92-127.				
Comments:	Visually copper grades low.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-128	Total Depth	535.53 m
Northing	254,890.45	Casing Depth	Left Out
Easting	111,103.03	Survey Data	Azimuth / Dip / Instrument
Elevation	1336.40 m	Collar	-90°
Core Size	HQ	306.93 m	300° / -89° / Sperry Sun
Drilling Started	June 30, 1992/May 25, 1993	480.66 m	007° / -89° / Sperry Sun
Drilling Finished	July 7, 1992/June 2, 1993		
Logged by	M.P. Phillips		
Purpose/Target:	Deepen 92-128.		

Comments: Better copper associated with potassic alteration having strong secondary KF and Bi, magnetite and gypsum. Zones with this assemblage were not numerous and overall grade is estimated at 0.15% Cu.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-129	Total Depth	514.50 m		
Northing	255,044.24	Casing Depth	18.29 m		Left Out
Easting	111,263.25	Survey Data	Azimuth	Dip	Instrument
Elevation	1220.29 m	Collar		-90.0°	
Core Size	HQ to 449.43/NQ to end	457.20 m	278°	-88.5°	Sperry Sun
Drilling Started	July 7, 1992/August 21, 1993				
Drilling Finished	July 12, 1993/August 29, 1993				
Logged by	F. Gish/L. Brommeland/B. Thurston				

Purpose/Target: To test continuity of mineralization on 255,040 N drill section at depth.

Comments: Moderate hypogene copper mineralization; strong molybdenum.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-131	**Total Depth**	361.49 m
Northing	255,052.23	**Casing Depth**	Left Out
Easting	111,022.65	**Survey Data**	**Azimuth** / **Dip** / **Instrument**
Elevation	1284.83 m	**Collar**	-90.0°
Core Size	HQ	306.9 m	015° / -89.7° / Sperry Sun
Drilling Started	July 19, 1992/July 21, 1993		
Drilling Finished	July 25, 1992/July 25, 1993		
Logged by	P. Fischl		

Purpose/Target: This hole was deepened to test for ore grade mineralization encountered at similar depths in adjacent holes (93-145, 93-141).

Comments: This deepened section encountered moderately to strongly potassic altered heterolithic microbreccia (mostly coarse). Section carries weak to moderate Cu mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-132	**Total Depth**	481.28 m		
Northing	254,810.34	**Casing Depth**	7.92 m		Left In
Easting	111,102.22	**Survey Data**	**Azimuth**	**Dip**	**Instrument**
Elevation	1359.62 m	**Collar**		-90.0°	
Core Size	HQ	457.2 m	008°	-88.7°	Sperry Sun
Drilling Started	July 25, 1992/July 10, 1993				
Drilling Finished	July 31, 1992/July 14, 1993				
Logged by	P. Fischl/M. Sze				

Purpose/Target: This hole was deepened to test for ore grade mineralization encountered at depth in adjacent holes (93-152, 93-128, 93-150).

Comments: Encountered moderately mineralized milled breccia (MBCP) and weakly mineralized Patton Porphyry (PPDP).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-134	Total Depth	569.06 m		
Northing	254,637.62	Casing Depth	6.1 m		Left Out
Easting	110,930.64	Survey Data	Azimuth	Dip	Instrument
Elevation	1343.33 m	Collar			
Core Size	HQ	303.9 m	045°	-89.00°	Sperry Sun
Drilling Started	August 4, 1992/August 6, 1993	459.3 m	080°	-89.25°	Sperry Sun
Drilling Finished	August 7, 1992/August 14, 1993				
Logged by	C. DeLong				

Purpose/Target: Extend 1992 hole to test for deeper mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-135	Total Depth	407.52 m		
Northing	254,386.60	Casing Depth	2.44 m		Left Out
Easting	110,743.43	Survey Data	Azimuth	Dip	Instrument
Elevation	1374.95 m	Collar		-90°	
Core Size	HQ to 255.73 m; NQ to 407.52 m	407.52 m	Not readable		Sperry Sun
Drilling Started	August 7, 1992/July 4, 1993				
Drilling Finished	August 11, 1992/July 8, 1993				
Logged by	M.P. Phillips				

Purpose/Target: Deepen Hole 92-135.

Comments: Drill hole intersected granodiorite microbreccia cut by a narrow latite dyke. Potassic altered with secondary K-spar, occasional magnetite/hematite and minor gypsum and biotite which is overprinted by vein, envelope and pervasive phyllic alteration. Weak chalcopyrite with occasional sections better grade minor chalcocite coating.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-136	Total Depth	648.31 m		
Northing	254,539.54	Casing Depth			Left In or Out*
Easting	111,008.93	Survey Data	Azimuth	Dip	Instrument
Elevation	1373.94 m	Collar		-90.0°	Sperry Sun
Core Size	HQ to 213.36/NQ to end	304.8 m	250°	-88.0°	Sperry Sun
Drilling Started	August 11, 1992/June 12, 1993	459.3 m	230°	-89.5°	Sperry Sun
Drilling Finished	August 14, 1992/June 22, 1993	648.3 m	260°	-88.0°	Sperry Sun
Logged by	M.P. Phillips				
Purpose/Target:	Deepened 92-136.	*Casing betwen 685-700 feet abandoned.			

Comments: Granodiorite is cut by narrow dykes of latite, porphyry and "milled breccia". The generally weak potassic alteration is overprinted by narrow-wide sections of phyllic alteration. Better grades occur where potassic alteration contains magnetite or strong K-spar flooding.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-138	Total Depth	575.16 m		
Northing	254,702.83	Casing Depth	3.66 m		Left In
Easting	111,184.84	Survey Data	Azimuth	Dip	Instrument
Elevation	1323 m	Collar		-90°	
Core Size	HQ	325.2 m	035°	-89°	Sperry Sun
Drilling Started	August 18, 1992/June 23, 1993	459.3 m	N/A	-90°	Sperry Sun
Drilling Finished	August 22, 1992/June 29, 1993				
Logged by	T. Case				

Purpose/Target: To redrill hole 92-138 with known mineralization.

Logged by	T. Becker				

Purpose/Target: Delineation hole; extending Hole 92-139 (274.62 m).

Comments: Hole intersected three major rock types (LTXH, PPDK and WRGD), cut by a breccia zone (MBNX) and minor dykes (LTXH and PPDB).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-140		Total Depth	389.23 m		
Northing	254,881.86		Casing Depth	2.44 m		Left In
Easting	111,023.17		Survey Data	Azimuth	Dip	Instrument
Elevation	1339.32 m		Collar		-90.0°	
Core Size	HQ		152.4 m	060°	-89.5°	Sperry Sun
Drilling Started	August 27, 1992/July 16, 1993		304.8 m	250°	-89.5°	Sperry Sun
Drilling Finished	August 31, 1992/July 19, 1993					
Logged by	P. Fischl					
Purpose/Target:	This hole was deepened to test for ore grade mineralization encountered at similar depths in adjacent Holes 93-128 and 93-141.					
Comments:	This deepened section encountered weakly mineralized Patton Porphyry (PPDP), exhibiting mostly weak to moderate potassic alteration.

Hole Number	93-141	Total Depth	498.96 m		
Northing	254,960.13	Casing Depth			Left Out
Easting	110,956.22	Survey Data	Azimuth	Dip	Instrument
Elevation	1306.93 m	Collar		-90.0°	
Core Size	HQ	166.77 m	305°	89.5°	Sperry Sun
Drilling Started	September 1, 1992/May 18, 1993	331.25 m	340°	89.5°	Sperry Sun
Drilling Finished	September 4, 1992/May 25, 1993	441.77 m	260°	89.5°	Sperry Sun
Logged by	M.P. Phillips				

Purpose/Target: Deepen 92-141.

Comments: The drill hole cut strong potassic altered homolithic and heterolithic breccia near the contact of older Patton Porphyry plug(?) Copper about 0.2% at top and weakens to bottom.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-142	Total Depth	387.40 m		
Northing	255,052.28	Casing Depth	4.27 m		Left In
Easting	110,932.31	Survey Data	Azimuth	Dip	Instrument
Elevation	1283.74 m	Collar		-90.00°	
Core Size	HQ	325.2 m	098°	-89.20°	Sperry Sun
Drilling Started	September 4, 1992/August 17, 1993				
Drilling Finished	September 8, 1992/August 20, 1993				
Logged by	P. Fischl/F. Gish				
Purpose/Target:	This hole was deepened to test for ore grade mineralization encountered at similar depths in Hole 93-131, 100 m east.				
Comments:	Intersected weakly mineralized, potassic altered, heterolithic coarse milled microbreccia (MBCX).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-143	Total Depth	424.89 m		
Northing	255,052.10	Casing Depth	3.05 m		Left In
Easting	111,179.64	Survey Data	Azimuth	Dip	Instrument
Elevation	1252.32 m	Collar			
Core Size	HQ to 170.38 m; NQ to 424.89 m	309.98 m	117°	-89.05°	Sperry Sun
Drilling Started	September 8, 1992/July 17, 1993				
Drilling Finished	September 12, 1992/July 20, 1993				
Logged by	W.D. Mann				

Purpose/Target: Deepen Hole 92-143 which stopped in mineralized rock.

Comments:

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-144	Total Depth	390.75 m		
Northing	254,950.663	Casing Depth	14.33 m	Taken Out	
Easting	111,705.283	Survey Data	Azimuth	Dip	Instrument
Elevation	1156.553 m	Collar 0.0 m	---	-90.00°	
Core Size	HQ	152.4 m	220°	-89.75°	Sperry Sun
Drilling Started	March 12, 1993	293.2 m	133°	-89.50°	Sperry Sun
Drilling Finished	March 26, 1993				
Logged by	B. Bower				

Purpose/Target: To redrill adjacent to old DDH P37 and test the zone to depth.
(Delineation drill hole)

Comments: This DDH intersected numerous breccia sections with disseminated chalcopyrite.
High angle fault/shear structures were common throughout this hole.

END OF HOLE											

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-145	Total Depth	456.29 m		
Northing	255,050.365	Casing Depth	5.48 m		Left In
Easting	111,100.676	Survey Data	Azimuth	Dip	Instrument
Elevation	1280.123 m	Collar 0.0 m	---	-90°	
Core Size	HQ	153 m	240°	-88.65°	Sperry Sun
Drilling Started	March 19, 1993	313 m	208°	-88.87°	Sperry Sun
Drilling Finished	March 30, 1993				
Logged by	M. Dittrick				

Purpose/Target: Redrill adjacent to former percussion hole (R1) to test the zone to depth.

Comments:

Note: No sample interval 197.21 to 199.03 - assigned arithmetic average of grade of adjoining samples.											

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-146	Total Depth	666.10 m		
Northing	254,962.78	Casing Depth	8.53 m		Left In
Easting	111,536.91	Survey Data	Azimuth	Dip	Instrument
Elevation	1166.52 m	Collar		-90.0°	
Core Size	HQ/NQ	151.49 m	274°	-88.4°	Sperry Sun
Drilling Started	March 26, 1993	309.98 m	270°	-88.0°	Sperry Sun
Drilling Finished	April 11, 1993	459.03 m	260°	-88.0°	Sperry Sun
Logged by	B. Bower	611.73 m	258°	-88.6°	Sperry Sun

Purpose/Target: To redrill adjacent to told Hole P31 and test the zone at depth (delineation drill hole).

Comments: Logging completed by S. de Wit. Reduced to NQ at 410.87 m.

END OF HOLE											

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-148	Total Depth	597.41 m
Northing	255,002.06	Casing Depth	7.92 m Left Out
Easting	110,497.89	Survey Data	Azimuth / Dip / Instrument
Elevation	1242.39 m	Collar	-90.00°
Core Size	HQ 3.05-422.15 m, NQ 422.15-597.41 m	144.8	114° -89.50° Sperry Sun
Drilling Started	April 3, 1993	304.8	92° -89.75° Sperry Sun
Drilling Finished	April 22, 1993	457.2	57° -89.25 ° Sperry Sun
Logged by	M. Dittrick	597.4	73° -89.00 ° Sperry Sun

Purpose/Target: Drill adjacent to previous holes (P12 and P26) to test the West Zone to depth.

Comments: Fractures along and perpendicular to core axis made core extremely blocky to 210 m.
Stockwork common in upper 200 m. Rehealed shears at 430-443, 492-499.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-149	Total Depth	696.62 m		
Northing	254,966.98	Casing Depth	6.10 m		Left In
Easting	111,366.17	Survey Data	Azimuth	Dip	Instrument
Elevation	1201.36 m	Collar		-90.00°	Sperry Sun
Core Size	HQ	154.53 m	146°	-88.10°	
Drilling Started	April 14, 1993	306.63 m	136°	N/A	
Drilling Finished	April 30, 1993	477.62 m	N/A	-88.75°	
Logged by	B. Bower	611.73 m	244°	-89.00°	

Purpose/Target: To redrill hole P36 and test extension of ore zone to depth.

Comments: This hole stayed in copper mineralization throughout the hole.
Stopped hole at 696.62 m and left casing.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-150	Total Depth	547.12 m		
Northing	254,707.33	Casing Depth	549.00 m		Left In
Easting	111,100.31	Survey Data	Azimuth	Dip	Instrument
Elevation	1354.24 m	Collar		-90.0°	
Core Size	HQ	154.5 m	175°(T)	-89.5°	Sperry Sun
Drilling Started	April 13, 1993	325.2 m	260°(T)	-89.5°	Sperry Sun
Drilling Finished	April 24, 1993				
Logged by	M.P.Phillips/S. de Wit				

Purpose/Target: Redrill adjacent to old drill holes P46, P46A and R46B to test zone at depth.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-152	Total Depth	578.06 m		
Northing	254,799.77	Casing Depth	4.27 m		Left In
Easting	111,184.85	Survey Data	Azimuth	Dip	Instrument
Elevation	1341.91 m	Collar		-90.00°	
Core Size	HQ	184.98 m	304°	-89.67°	Sperry Sun
Drilling Started	April 25, 1993	313.03 m	335°	-89.40°	
Drilling Finished	May 5, 1993	453.24 m	025°	-89.20°	
Logged by	J. Reeder	578.06 m	325°	-89.35°	

Purpose/Target: In-fill drilling between Holes P-132 and P-139 and to test mineralization at depth.

Comments: Intersected moderate Cu%; hole ended Cu mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-153	Total Depth	392.28 m		
Northing	254,502.51	Casing Depth	7.92 m		Left In
Easting	110,702.33	Survey Data	Azimuth	Dip	Instrument
Elevation	1330.59 m	Collar			
Core Size	HQ	152.4 m	322°	-89.25°	Sperry Sun
Drilling Started	May 6, 1993	159.1 m	Unreadable		
Drilling Finished	May 13, 1993	322.2 m	313°	-88.80°	Sperry Sun
Logged by	L. Brommeland

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-154	**Total Depth**	581.25 m
Northing	254,543.07	**Casing Depth**	4.27 m Left In
Easting	111,093.92	**Survey Data**	**Azimuth** **Dip** **Instrument**
Elevation	1365.21 m	**Collar**	
Core Size	HQ	172.80 m	290° -89.00°
Drilling Started	May 5, 1993	309.98 m	283° -89.00°
Drilling Finished	May 18, 1993	459.33 m	267° -88.67°
Logged by	Jeff Reeder	581.25 m	265° -88.67°

Purpose/Target: Delineation of SW portion of the Casino Deposit.

Comments: Intersected fine Cu mineralization throughout.

Hole Number	93-156	Total Depth	797.66 m		
Northing	254,617.20	Casing Depth	5.18 m		Left Out
Easting	111,184.92	Survey Data	Azimuth	Dip	Instrument
Elevation	1298.10 m	Collar			
Core Size	HQ	309.98 m	340°	89°	
Drilling Started	May 19, 1993	459.33 m	293°	88°	
Drilling Finished	June 7, 1993	762 m	315°	88°	
Logged by	J. Reeder				

Purpose/Target: Delineation drilling of the SW corner of the Casino Deposit.

Comments: Consistent chalcopyrite mineralization throughout, intersected high copper mineralization from 500 - 733 m.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-157	Total Depth	380.09		
Northing	254,400.16	Casing Depth	2.44 m		Left In
Easting	110,497.42	Survey Data	Azimuth	Dip	Instrument
Elevation	1333.64 m	Collar			
Core Size	HQ	149.96 m	252°	-88.95°	Sperry Sun
Drilling Started	May 23, 1993	304.80 m	278°	-88.50°	Sperry Sun
Drilling Finished	May 28, 1993				
Logged by	L. Brommeland				

Purpose/Target: Testing high gold values in 1985 bulldozer trench.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-158	Total Depth	150.88 m		
Northing	254,399.68	Casing Depth	3.66 m		Left In
Easting	110,300.53	Survey Data	Azimuth	Dip	Instrument
Elevation	1333.31 m	Collar			
Core Size	HQ	150.88 m	028°	-88.95°	Sperry Sun
Drilling Started	May 29, 1993				
Drilling Finished	June 1, 1993				
Logged by	Lena Brommeland				

Purpose/Target: High gold values in trenches: exploration step-out hole.

Comments: This hole was stopped prematurely due to the rods getting stuck down the hole and subsequently snapping off. Drilling ended in supergene sulphide mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-159	Total Depth	517.25 m		
Northing	254,965.13	Casing Depth	Left Out		
Easting	111,177.80	Survey Data	Azimuth	Dip	Instrument
Elevation	1280.20 m	Collar		-90.0°	
Core Size	HQ to 378.56 m; NQ to end	154.50 m		-90.0°	Sperry Sun
Drilling Started	June 1, 1993	309.98 m		-89.0°	Sperry Sun
Drilling Finished	June 11, 1993	462.38 m		-88.5°	Sperry Sun
Logged by	M. Dittrick/T. Case				

Purpose/Target: Infill drill hole between 93-127 and 93-125 to confirm depth of mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-160	Total Depth	291.69 m		
Northing	254,999.78	Casing Depth	51.8 m		Left Out
Easting	110,299.64	Survey Data	Azimuth	Dip	Instrument
Elevation	1226.68 m	Collar			
Core Size	HQ	154.5 m	289°	-88.8°	Sperry Sun
Drilling Started	June 1, 1993	291.7 m	016°	-88.5°	Sperry Sun
Drilling Finished	June 6, 1993				
Logged by	C. DeLong				

Purpose/Target: Test northwestern extremities of mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-161	Total Depth	441.05 m		
Northing	254,968.43	Casing Depth	3.05 m		Left Out
Easting	111,022.66	Survey Data	Azimuth	Dip	Instrument
Elevation	1311.60 m	Collar		-90°	
Core Size	HQ	182.6 m	200°	-90°	Sperry Sun
Drilling Started	June 2, 1993				
Drilling Finished	June 9, 1993				
Logged by	M.P. Phillips				
Purpose/Target:	Routine definition drilling.				

Comments: Drill hole intersected QXPX - homolithic breccia with potassic alteration cut by bands of phyllic alteration. Better copper mineralization is associated with potassic alteration having secondary potash. Above average amounts of magnetite and gypsum.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-162	Total Depth	425.81 m		
Northing	254,999.21	Casing Depth	1.83 m		Left In
Easting	110,700.66	Survey Data	Azimuth	Dip	Instrument
Elevation	1267.11 m	Collar			
Core Size	HQ	154.53 m	142°	-89.0°	Sperry Sun
Drilling Started	June 6, 1993	300.84 m	245°	-89.5°	Sperry Sun
Drilling Finished	June 15, 1993	425.81 m	012°	-88.5°	Sperry Sun
Logged by	L. Brommeland				

Purpose/Target: Infill hole to test continuity of mineralization between 93-148 and 93-141.

Comments: Abundant native copper in supergene sulphide zone. (Analyze for metallic Cu?)

CASINO PROJECT

Hole Number	93-163	Total Depth	320.34 m		
Northing	254,699.34	Casing Depth	5.18 m		Left In
Easting	111,298.81	Survey Data	Azimuth	Dip	Instrument
Elevation	1269.22 m	Collar			
Core Size	HQ	154.53 m	175°	-89.5°	
Drilling Started	June 8, 1993	306.93 m	150°	-89.5°	
Drilling Finished	June 13, 1993				
Logged by	J. Reeder				

Purpose/Target: Delineation drilling - east side of Casino Deposit.

Comments: Intersected breccia with a phyllic overprint, good copper mineralization in supergene.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-164	Total Depth	795.53 m		
Northing	254,872.02	Casing Depth	4.57 m		Left Out
Easting	111,272.02	Survey Data	Azimuth	Dip	Instrument
Elevation	1283.17 m	Collar			
Core Size	HQ	304.8 m	065°	-89.4°	Sperry Sun
Drilling Started	June 12, 1993	457.2 m	094°	-88.2°	Sperry Sun
Drilling Finished	July 5, 1993	609.6 m	075°	-88.1°	Sperry Sun
Logged by	C. DeLong	795.5 m	067°	-88.0°	Sperry Sun

Purpose/Target: Infill drilling to test continuity of mineralization.

Comments: Fairly continuous, moderate to good mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-165	Total Depth	468.48 m		
Northing	254,399.14	Casing Depth	3.05 m		Left In
Easting	111,099.47	Survey Data	Azimuth	Dip	Instrument
Elevation	1372.98 m	Collar			
Core Size	HQ	152.4 m	230°	-89.25°	
Drilling Started	June 14, 1993				
Drilling Finished	June 22, 1993				
Logged by	J. Reeder/T. Case				

Purpose/Target: Delineation drilling of the southern extension of the Casino Deposit.

Comments: Intersected low to moderate Cu mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-166	Total Depth	303.28 m		
Northing	255,398.62	Casing Depth	21.34 m		Left Out
Easting	110,499.49	Survey Data	Azimuth	Dip	Instrument
Elevation	1246.77 m	Collar		-90°	
Core Size	HQ	154.53 m	60°	-89°	Sperry Sun
Drilling Started	June 15, 1993	303.28 m	50°	-89°	Sperry Sun
Drilling Finished	June 20, 1993				
Logged by	M. Sze				
Purpose/Target:	Wild cat - copper/gold geochem.				

Comments: Drill hole intersected two major rock units (WRXY, WRGD) crosscut by minor dykes (QMFX, PPDB, LTDX, WRAP).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-167	Total Depth	303.89 m		
Northing	255,402.15	Casing Depth	13.4 m		Left Out
Easting	110,096.60	Survey Data	Azimuth	Dip	Instrument
Elevation	1200.32 m	Collar		-90.00°	
Core Size	HQ	154.53 m	290°	-89.25°	Sperry Sun
Drilling Started	June 20, 1993	303.89 m		-90.00°	Sperry Sun
Drilling Finished	June 25, 1993				
Logged by	M. Dittrick				

Purpose/Target: Exploration hole following up mag anomaly to the northwest.

Comments: No supergene oxide zone was encountered. 28.04 m overburden sampled for placer potential.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-168	Total Depth	569.06 m		
Northing	254,499.62	Casing Depth	4.57 m		Left In
Easting	111,199.28	Survey Data	Azimuth	Dip	Instrument
Elevation	1330.99 m	Collar			
Core Size	HQ	154.53 m	335°	-89.25°	Sperry Sun
Drilling Started	June 22, 1993	306.93 m	290°	-89.75°	Sperry Sun
Drilling Finished	July 1, 1993	569.06 m	270°	-89.25°	Sperry Sun
Logged by	J. Reeder				

Purpose/Target: Delineation drilling of the southeast part of the Casino Deposit.

Comments: Intersected low grade Cu mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-169	Total Depth	352.65 m		
Northing	254,406.36	Casing Depth	15.85 m		Left Out
Easting	110,293.52	Survey Data	Azimuth	Dip	Instrument
Elevation	1332.86 m	Collar 0.00 m		-90°	
Core Size	HQ to 164.59 m; NQ to 352.65 m	182.88 m	003°	-89°	Sperry Sun
Drilling Started	June 24, 1993				
Drilling Finished	July 2, 1993				
Logged by	M. Sze				

Purpose/Target: Wild cat hole - gold high. Twins 93-158 (rods were stuck @ 150.88 m).

Comments: Shear zone between 135.3 - 142.3 m.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-170	**Total Depth**	316.08 m		
Northing	255,799.02	**Casing Depth**	11.58 m		Left Out
Easting	110,274.12	**Survey Data**	**Azimuth**	**Dip**	**Instrument**
Elevation	1227.14 m	**Collar**			
Core Size	HQ	154.5 m	330°	-89.5°	Sperry Sun
Drilling Started	June 26, 1993	304.8 m	315°	-89.0°	Sperry Sun
Drilling Finished	July 2, 1993				
Logged by	M. Dittrick				

Purpose/Target: Exploration hole testing Au and Cu geochem and geophysical anomalies.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-171	Total Depth	550.77 m		
Northing	254,600.28	Casing Depth	29.8 m		Left Out
Easting	111,297.76	Survey Data	Azimuth	Dip	Instrument
Elevation	1251.26 m	Collar		-90.0°	
Core Size	HQ	152.4 m	245°	-89.3°	Sperry Sun
Drilling Started	July 1, 1993	306.9 m	340°	-89.2°	Sperry Sun
Drilling Finished	July 9, 1993	456.3 m	320°	-89.1°	Sperry Sun
Logged by	J. Reeder/T. Becker/P. Fischl				

Purpose/Target: Delineation hole testing the southeast side of deposit.

Comments: Hole encountered granodiorite (WRGD) cut by latite breccias (LTXH) and pebble dykes (LTDA). Breccias with good K-spar in matrix.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-172	Total Depth	316.08 m		
Northing	255,500.34	Casing Depth	3.66 m		Left Out
Easting	110.898.27	Survey Data	Azimuth	Dip	Instrument
Elevation	1254.92 m	Collar			
Core Size	HQ	143.6 m	Cannot read		
Drilling Started	July 3, 1993	316.1 m	290°	-82.25°	Sperry Sun
Drilling Finished	July 10, 1993				
Logged by	L. Brommeland				

Purpose/Target: To test northern extent of mineralization.

Comments: Favourable supergene mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-173	Total Depth	617.22 m		
Northing	254,498.25	Casing Depth	8.53 m		Left In
Easting	110,800.12	Survey Data	Azimuth	Dip	Instrument
Elevation	1336.91 m	Collar			
Core Size	HQ	154.53 m	293°	-89.00°	Sperry Sun
Drilling Started	July 7, 1993	306.93 m	268°	-88.75°	Sperry Sun
Drilling Finished	July 16, 1993	459.33 m	285°	-87.50°	Sperry Sun
Logged by	T. Case	611.73 m	287°	-87.00°	Sperry Sun

Purpose/Target: To test the continuity between Holes 93-151 and 93-153.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-174	Total Depth	781.81 m		
Northing	254,866.01	Casing Depth	13.7 m		Left Out
Easting	111,367.85	Survey Data	Azimuth	Dip	Instrument
Elevation	1237.14 m	Collar			
Core Size	HQ to 219.46 m; NQ to end	341.38 m	122°	-88.5°	Sperry Sun
Drilling Started	July 7, 1993	490.73 m	105°	-88.5°	Sperry Sun
Drilling Finished	July 22, 1993	609.60 m	172°	-89.3°	Sperry Sun
Logged by	C. DeLong/M. Dittrick				

Purpose/Target: Delineation drilling.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-175	**Total Depth**	413.61 m		
Northing	254,502.71	**Casing Depth**	4.9 m		Left In
Easting	110,595.69	**Survey Data**	**Azimuth**	**Dip**	**Instrument**
Elevation	1345.37 m	**Collar**		-90.0°	
Core Size	HQ to 277.67 m; NQ to end	304.8 m	330°	-89.5°	Sperry Sun
Drilling Started	July 8, 1993	412.5 m	270°	-89.0°	Sperry Sun
Drilling Finished	July 15, 1993				
Logged by	M.P. Phillips				
Purpose/Target:	Grid drilling.				
Comments:	The drill hole cut normal, brecciated and milled potassic altered granodiorite with a moderate-strong phyllic overprint. Hypogene copper mineralization is weak. Better grades occur in a 57 m wide supergene sulphide zone. Phyllic veining and pyrite content indicate this area is in pyrite halo.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-176	**Total Depth**	474.57 m
Northing	255,030.32	**Casing Depth**	10.97 m Left Out
Easting	111,616.08	**Survey Data**	**Azimuth** **Dip** **Instrument**
Elevation	1171.80 m	**Collar**	
Core Size	HQ to 247.19 m; NQ to end	154.53 m	015° -89.25° Sperry Sun
Drilling Started	July 11, 1993	306.93 m	198° -89.25° Sperry Sun
Drilling Finished	July 21, 1993	462.38 m	210° -88.25° Sperry Sun
Logged by	L. Brommeland		

Purpose/Target: To test northern extent of mineralization on east side of fault.

Comments: Strong hypogene mineralization within heterolithic intrusion breccia.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-177	Total Depth	252.07 m
Northing	254,501.37	Casing Depth	5.5 m Left In
Easting	110,501.20	Survey Data	Azimuth / Dip / Instrument
Elevation	1324.24 m	Collar	-90°
Core Size	HQ	152.4 m	280° / -88° / Sperry Sun
Drilling Started	July 15, 1993		
Drilling Finished	July 21, 1993		
Logged by	M.P. Phillips		
Purpose/Target:	Grid drilling.		
Comments:	Granodiorite is cut by Casino "milled" breccia and intruded by later narrow latite intrusive and breccia dykes. Copper content is low. The high pyrite/chalcopyrite ratio and phyllic alteration indicate the drill hole is in the pyrite halo.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-178	Total Depth	465.43 m		
Northing	254,399.96	Casing Depth	11.58 m		Left Out
Easting	110,900.53	Survey Data	Azimuth	Dip	Instrument
Elevation	1387.94 m	Collar			
Core Size	HQ	154.53 m	066°	-89.00°	Sperry Sun
Drilling Started	July 17, 1993	306.93 m	010°	-89.50°	Sperry Sun
Drilling Finished	July 23, 1993	462.38 m	272°	-89.25°	Sperry Sun
Logged by	T. Case				

Purpose/Target: Delineation of the southern boundary of the deposit.

Comments: Hole 93-178 is largely in granodiorite and milled, brecciated granodiorite.
Overall the chalcopyrite mineralization is weak and the chalcocite is moderate to strong.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-179	Total Depth	648.31 m
Northing	254,400.88	Casing Depth	3.66 m Left Out
Easting	110,599.44	Survey Data	Azimuth Dip Instrument
Elevation	1356.34 m	Collar	
Core Size	HQ to 66.14 m; NQ to end	182.9 m	-90.0° Sperry Sun
Drilling Started	July 21, 1993	304.8 m	-90.0° Sperry Sun
Drilling Finished	August 4, 1993	457.2 m	290° -89.5° Sperry Sun
Logged by	M.P. Phillips	609.6 m	032° -89.4° Sperry Sun
Purpose/Target:	Grid drilling.		
Comments:	The drill hole cut strong phyllic-altered brecciated granodiorite with narrow bands of Casino milled breccia and bottomed in 288 m of granodiorite. The top 140 m were in the Sox Zone. White sulphate coating below the hypogene contact to 350 m. Trace to minor chalcocite coats mainly pyrite. Chalcopyrite occurs as fine disseminations and crack fillings.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-180	Total Depth	410.57 m		
Northing	254,870.44	Casing Depth	38.4 m		Left Out
Easting	111,700.27	Survey Data	Azimuth	Dip	Instrument
Elevation	1146.18 m	Collar			
Core Size	HQ	410.57 m	050°	-89.5°	Sperry Sun
Drilling Started	July 23, 1993				
Drilling Finished	July 29, 1993				
Logged by	L. Brommeland				

Purpose/Target: Delineation hole to test extent of mineralization southeast of 92-124.

Comments: Poorly developed supergene zone, moderate hypogene mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-181	Total Depth	186.12 m		
Northing	254,800.37	Casing Depth	10.67 m		Left In
Easting	111,363.93	Survey Data	Azimuth	Dip	Instrument
Elevation	1260.92 m	Collar		-90.0°	
Core Size	HQ				
Drilling Started	June 22, 1993				
Drilling Finished	July 27, 1993				
Logged by	M. Dittrick				
Purpose/Target:	Delineation drill hole.				
Comments:	Hole shut down prematurely due to rods stuck.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-183	Total Depth	651.36 m
Northing	254,450.25	Casing Depth	3.05 m Left Out
Easting	111,000.74	Survey Data	Azimuth Dip Instrument
Elevation	1397.85 m	Collar	-90.0°
Core Size	HQ	306.9 m	035° -88.5°
Drilling Started	July 26, 1993		
Drilling Finished	August 6, 1993		
Logged by	C. DeLong		

Purpose/Target: Delineation drilling.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-184	Total Depth	447.14 m
Northing	255,135.11	Casing Depth	18.3 m Left Out
Easting	111,098.95	Survey Data	Azimuth / Dip / Instrument
Elevation	1237.59 m	Collar	-90.0°
Core Size	HQ to 328.3 m; NQ to end	154.53 m	060° / -89.7° / Sperry Sun
Drilling Started	July 25, 1993	304.80 m	080° / -89.3° / Sperry Sun
Drilling Finished	August 5, 1993	447.14 m	050° / -89.3° / Sperry Sun
Logged by	P. Fischl		

Purpose/Target: This hole tested the northern margin of the deposit for mineralization encountered in adjacent holes (93-145, R-25 and R-29).

Comments: This hole intersected a weakly to moderately mineralized section of heterolithic intrusion breccia (IXAX), with smaller sections of fine-grained quartz monzonite (QMFX), fine-grained diorite (WRDR) and medium-grained granodiorite (WRGD).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-185	Total Depth	810.77 m		
Northing	254,802.61	Casing Depth	10.67 m		Left Out
Easting	111,362.67	Survey Data	Azimuth	Dip	Instrument
Elevation	1261.12 m	Collar			
Core Size	HQ to 338.63 m; NQ to end	152.4 m	247°	-88.5°	Sperry Sun
Drilling Started	July 26, 1993	304.8 m	200°	-89.0°	Sperry Sun
Drilling Finished	August 13, 1993	457.2 m	228°	-88.0°	Sperry Sun
Logged by	M. Dittrick	807.7 m	312°	-88.0°	Sperry Sun

Purpose/Target: Redrill 93-181 (hole aborted at 185.9 m due to stuck rods) - drill moved 3 m and redrill (93-185).

Comments: Collared in supergene oxide.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-186	Total Depth	670.56 m		
Northing	254,796.45	Casing Depth	3.66 m		Left Out
Easting	111,616.81	Survey Data	Azimuth	Dip	Instrument
Elevation	1148.42 m	Collar		-90.00°	
Core Size	HQ to 422.76 m; NQ to end	163.68 m	360°	-89.50°	Sperry Sun
Drilling Started	July 30, 1993	297.79 m	337°	-89.25°	Sperry Sun
Drilling Finished	August 14, 1993	459.33 m	Cannot read		Sperry Sun
Logged by	L. Brommeland/T. Case	620.88 m	291°	-89.70°	Sperry Sun

Purpose/Target: To test southwestern extent of mineralization in the northeast extension zone.

Comments: Chalcopyrite mineralization is very good in bottom of hypogene. Hole ended in grade due to depth.

Core Size	HQ to 315.47 m; NQ to end	304.8 m	345°	-89°	Sperry Sun
Drilling Started	August 4, 1993				
Drilling Finished	August 14, 1993				
Logged by	M.P. Phillips				

Purpose/Target: Routine grid drilling.

Comments: The drill hole intersected granodiorite and bottomed in a 22 m wide dyke of porphyritic latite (unit 6/5a).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-189	Total Depth	328.27 m		
Northing	254,200.14	Casing Depth	6.10 m		Left In
Easting	110,500.16	Survey Data	Azimuth	Dip	Instrument
Elevation	1388.28 m	Collar			
Core Size	HQ	157.58 m		-90.0°	Sperry Sun
Drilling Started	August 4, 1993	309.68 m	290°	-89.5°	Sperry Sun
Drilling Finished	August 9, 1993				
Logged by	W.D. Mann				

Purpose/Target: Test southwest limit of deposit.

Drilling Started	August 6, 1993		170.7 m	182°	-45.0°	Sperry Sun
Drilling Finished	August 15, 1993		304.8 m	183°	-43.5°	Sperry Sun
Logged by	P. Fischl		440.7 m	184°	-42.0°	Sperry Sun

Purpose/Target: To test for the latite breccia body encountered in hole 93-163, 270 m south and 95 m west of hole 93-190.

Comments: This hole encountered quartz monzonite (QMIE), milled microbreccia (MBNQ) and granodiorite (WRGD). Supergene sulphide zone is moderately mineralized with copper while the hypogene zone is weak to locally moderately mineralized.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-191	**Total Depth**	493.47 m		
Northing	254,600.37	**Casing Depth**	9.14 m		Left Out
Easting	110,799.99	**Survey Data**	**Azimuth**	**Dip**	**Instrument**
Elevation	1318.21 m	**Collar**			
Core Size	HQ	157.58 m	088°	-89.3°	Sperry Sun
Drilling Started	August 9, 1993	306.93 m	040°	-89.4°	Sperry Sun
Drilling Finished	August 17, 1993	462.08 m	012°	-89.0°	Sperry Sun
Logged by	W.D. Mann				

Purpose/Target: Test western edge of deposit.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-192	Total Depth	455.07 m		
Northing	254,863.91	Casing Depth	7.62 m		Left Out
Easting	111,367.67	Survey Data	Azimuth	Dip	Instrument
Elevation	1236.99 m	Collar	90°	-55.0°	Brunton Compass
Core Size	HQ	77.11 m	87°	-55.0°	Sperry Sun
Drilling Started	August 14, 1993	153.31 m	87°	-57.0°	Sperry Sun
Drilling Finished	August 26, 1993	228.60 m	87°	-59.0°	Sperry Sun
Logged by	M. Dittrick	320.04 m	87°	-60.5°	Sperry Sun
		395.63 m	88°	-61.5°	Sperry Sun
		453.54 m	87°	-62.0°	Sperry Sun

Purpose/Target: Hole 93-192 was drilled at an angle of -55° in order to locate the position and orientation of the Casino Creek Fault.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-193	Total Depth	649.83 m		
Northing	254,480.37	Casing Depth	19.5 m		Left In
Easting	110,900.12	Survey Data	Azimuth	Dip	Instrument
Elevation	1366.80 m	Collar		-90.00°	
Core Size	HQ to 372.47 m; NQ to end	154.5 m	024°	-89.25°	Sperry Sun
Drilling Started	August 15, 1993	306.9 m	038°	-88.75°	Sperry Sun
Drilling Finished	August 28, 1993	607.6 m	038°	-87.50°	Sperry Sun
Logged by	T. Case				

Purpose/Target: To test for ore grade mineralization encountered in adjacent holes (93-151, 93-178 and 93-183) near the southern margin of the deposit.

Comments: Encountered weakly to locally moderately mineralized granodiorite (WRGD) and granodiorite breccia (WRGX). Hole abandoned at 649.83 m due to sand (i.e. no recovery of core).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-194	Total Depth	447.14 m		
Northing	254,810.33	Casing Depth	4.3 m		Left Out
Easting	111,022.60	Survey Data	Azimuth	Dip	Instrument
Elevation	1349.79 m	Collar		-90.00°	
Core Size	HQ	154.5 m	168°	-88.90°	Sperry Sun
Drilling Started	August 15, 1993	306.9 m	214°	-88.63°	Sperry Sun
Drilling Finished	August 22, 1993				
Logged by	C. DeLong				

Purpose/Target: Delineation drilling.

Comments: Some well developed supergene oxide 85 - 100 m.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-195	Total Depth	380.39 m
Northing	254,299.79	Casing Depth	11.58 m Left Out
Easting	110,299.78	Survey Data	Azimuth / Dip / Instrument
Elevation	1355.01 m	Collar	-90.00°
Core Size	HQ	154.53 m	095° / -88.30° / Sperry Sun
Drilling Started	August 15, 1993	380.39 m	080° / -88.00° / Sperry Sun
Drilling Finished	August 24, 1993		
Logged by	T. Becker		

Purpose/Target: Delineation driling of the southeast boundary of the deposit.

Comments: Hole intersected Dawson Range granodiorite with moderate to strong phyllic alteration and a high pyrite content.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-196	Total Depth	483.72 m		
Northing	254,299.21	Casing Depth	4.27 m		Left Out
Easting	110,699.43	Survey Data	Azimuth	Dip	Instrument
Elevation	1404.20 m	Collar		-90.0°	
Core Size	HQ	157.58 m	083°	-89.3°	Sperry Sun
Drilling Started	August 17, 1993	306.93 m	108°	-88.9°	Sperry Sun
Drilling Finished	August 25, 1993	462.38 m	072°	-88.6°	Sperry Sun
Logged by	W. Mann/M. Sze				

Purpose/Target: To delineate southern extent of mineralization.

Comments: Hole intersected Dawson Range granodiorite and a small latite dyke.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-198	Total Depth	392.28 m		
Northing	255,000.65	Casing Depth	4.88 m		Left Out
Easting	110,899.97	Survey Data	Azimuth	Dip	Instrument
Elevation	1292.35 m	Collar		-90.00°	
Core Size	HQ	157.58 m	140°	-89.50°	Sperry Sun
Drilling Started	August 24, 1993	306.63 m	203°	-89.15°	Sperry Sun
Drilling Finished	September 1, 1993				
Logged by	T. Becker/S. de Witt				

Purpose/Target: Delineating hole.

Comments: The hole intersected milled breccia (MBFH, MBCH, MBNX, MBCP) and heterolithic intrusion breccia (IXPA) cut by a Patton Porphyry Dyke.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-200	Total Depth	522.12 m		
Northing	254,873.86	Casing Depth	24.38 m		Left Out
Easting	111,448.32	Survey Data	Azimuth	Dip	Instrument
Elevation	1191.11 m	Collar		-90.00°	Brunton Compass
Core Size	NQ	304.8 m	010°	-88.75°	Sperry Sun
Drilling Started	August 26, 1993	484.7 m	020°	-88.50°	Sperry Sun
Drilling Finished	September 6, 1993				
Logged by	M.P. Phillips				

Purpose/Target: To test the area a short distance west of the Casino Creek fault zone and east of 93-174.

Comments: Decreasing copper grade below about 355 m is due to increasing distance with depth from the microbreccia cut in 93-174.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-201	Total Depth	388.01 m
Northing	254,727.61	Casing Depth	4.27 m Left In
Easting	110,938.81	Survey Data	Azimuth / Dip / Instrument
Elevation	1337.77 m	Collar	-90.00°
Core Size	HQ	154.5 m	342° -89.20° Sperry Sun
Drilling Started	August 29, 1993	304.8 m	312° -89.35° Sperry Sun
Drilling Finished	September 5, 1993		
Logged by	P. Fischl		

Purpose/Target: Twinned Hole P-44 which encountered mostly ore grade mineralization.

Comments: Encountered strongly potassic altered, weakly to moderately mineralized milled microbreccia (mostly MBFP) and partially milled Patton Porphyry (PPDP).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-202	Total Depth	264.26 m		
Northing	255,035.81	Casing Depth	12.19 m		Left In
Easting	111,392.99	Survey Data	Azimuth	Dip	Instrument
Elevation	1190.54 m	Collar			
Core Size	HQ	153.06 m		-90°	Sperry Sun
Drilling Started	August 31, 1993				
Drilling Finished	September 7, 1993				
Logged by	L. Brommeland				

Purpose/Target: Infill drill hole on 255,000 N fence; to test continuity of mineralization.

Comments: Difficult drilling from top to bottom due to presence of Casino Fault. Large void encountered at depth. Drilling beyond void resulted in the rods "snapping off" near surface.

Elevation	1265.11 m	Collar		-90.00°	
Core Size	HQ	152.4 m	313°	-89.25°	Sperry Sun
Drilling Started	September 1, 1993	303.89 m	0°	-89.00°	Sperry Sun
Drilling Finished	September 7, 1993				
Logged by	T. Case				

Purpose/Target: To test continuity of mineralization just west of the 110,900 E fence.

Comments: Supergene sulphide Cu mineralization is moderate to strong; hypogene Cu mineralization is very weak.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-205	Total Depth	620.88 m		
Northing	255,002.06	Casing Depth	15.24 m		Left Out
Easting	111,800.92	Survey Data	Azimuth	Dip	Instrument
Elevation	1157.15 m	Collar			
Core Size	HQ	152.40 m	193°	-88.5°	Sperry Sun
Drilling Started	September 6, 1993	304.80 m	210°	-88.0°	Sperry Sun
Drilling Finished	September 20, 1993	457.20 m	188°	-87.0°	Sperry Sun
Logged by	B. Thurston	620.88 m	203°	-86.5°	Sperry Sun

Purpose/Target: Delineate north-east boundary of deposit.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-206	Total Depth	370.94 m
Northing	254,799.82	Casing Depth	4.88 m Left Out
Easting	110,938.17	Survey Data	Azimuth / Dip / Instrument
Elevation	1325.83 m	Collar	-90.0°
Core Size	HQ	154.5 m	327° / -88.5° / Sperry Sun
Drilling Started	September 7, 1993	304.8 m	340° / -88.5° / Sperry Sun
Drilling Finished	September 11, 1993		
Logged by	P. Fischl		

Purpose/Target: This hole twinned percussion hole P-54 which encountered some copper mineralization.

Comments: Intersected a weakly mineralized section of Patton Porphyry (CPXX, PPDP) and milled microbreccia (MBFP) cut by porphyritic latite (LPXX).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-207	Total Depth	397.76 m
Northing	254,786.03	Casing Depth	4.57 m Left In
Easting	111,456.92		
Elevation	1209.70 m		
Core Size	HQ		
Drilling Started	September 7, 1993		
Drilling Finished	September 14, 1993		
Logged by	M. Dittrick		

Survey Data	Azimuth	Dip	Instrument
Collar		-90.0°	
204.22 m	42°	-89.5°	Sperry Sun
323.09 m	109°	-89.5°	Sperry Sun

Purpose/Target: Delineation drill hole to test the mineralization and alteration to depth in the east-central zone of the deposit.

Comments: Granodiorite intersected throughout the entire hole. Alteration was dominantly vein-controlled phyllic overprinting weak potassic or sericite-clay-chlorite alteration.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-208	Total Depth	380.08 m		
Northing	255,164.82	Casing Depth	4.88 m		Left Out
Easting	110,949.74	Survey Data	Azimuth	Dip	Instrument
Elevation	1244.71 m	Collar		-90.00°	Brunton Compass
Core Size	NQ	152.40 m	085°	-89.75°	Sperry Sun
Drilling Started	September 7, 1993	304.80 m	070°	-89.50°	Sperry Sun
Drilling Finished	September 14, 1993	380.08 m	070°	-89.50°	Sperry Sun
Logged by	M.P. Phillips				

Purpose/Target: Define westerly limits of mineralization intersected in 93-184 and 197.

Comments: Low grade copper and better molybdenite was intersected in potassic altered heterolithic intrusion breccia and intrusive diorite.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-209	Total Depth	418.19 m
Northing	255,101.43	Casing Depth	34.14 m Left Out
Easting	111,600.71	Survey Data	Azimuth / Dip / Instrument
Elevation	1182.67 m	Collar	-90.00°
Core Size	HQ	156.06 m	238° / -88.75° / Sperry Sun
Drilling Started	September 8, 1993	417.58 m	232° / -87.50° / Sperry Sun
Drilling Finished	September 20, 1993		
Logged by	L. Brommeland		

Purpose/Target: To test northern extent of mineralization on the east side of Casino Fault.

Comments: Narrow supergene zone and moderately mineralized hypogene zone.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-211	Total Depth	367.89 m		
Northing	254,879.81	Casing Depth	8.23 m		Left Out
Easting	110,940.91	Survey Data	Azimuth	Dip	Instrument
Elevation	1319.10 m	Collar	N/A	-90.00°	
Core Size	HQ	152.40 m	338°	-89.33°	Sperry Sun
Drilling Started	September 12, 1993	304.80 m	015°	-88.66°	
Drilling Finished	September 18, 1993				
Logged by	T. Case				

Purpose/Target: To test continuity of mineralization in the 110,900 E fence.

Comments: Hole is entirely Patton Porphyry - brecciated at top. Copper mineralization is weak. Supergene sulphide zone absent.

Hole Number	93-213	Total Depth	529.44 m			
Northing	255,232.71	Casing Depth	29.87 m			Left Out
Easting	110,998.74	Survey Data		Azimuth	Dip	Instrument
Elevation	1229.51 m	Collar			-90.00°	Brunton Compass
Core Size	HQ		152.4 m	165°	-89.25°	Sperry Sun
Drilling Started	September 14, 1993		306.9 m	175°	-89.00°	Sperry Sun
Drilling Finished	September 27, 1993		457.2 m	170°	-88.75°	Sperry Sun
Logged by	M.P. Phillips					

Purpose/Target: The purpose was to test the northern extent of copper-molybdenum mineralization in the Casino Creek Zone.

Comments: Fair-good grade copper-molybdenum mineralization indicates that the Casino Creek Zone extends at least as far as this drill hole.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-214	Total Depth	656.23 m
Northing	254,869.61	Casing Depth	18.29 m Left Out
Easting	111,538.01	Survey Data	Azimuth / Dip / Instrument
Elevation	1160.35 m	Collar	-90.00°
Core Size	HQ	154.5 m	336° / -89.80° / Sperry Sun
Drilling Started	September 19, 1993	304.8 m	197° / -89.50° / Sperry Sun
Drilling Finished	October 2, 1993	457.2 m	133° / -89.75° / Sperry Sun
Logged by	P. Fischl	602.6 m	129° / -89.20° / Sperry Sun

Purpose/Target: To extend zone of high grade mineralization encountered in Holes 93-124 (90 m east) and 93-192 (90 m west, angled -55° towards 93-214).

Comments: This hole intersected a moderately to strongly mineralized section (Cu+Mo) of heterolithic intrusion breccia (IXAF, IXAC) cut by dykes of Patton Porphyry (PPDP/PPDQ).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-216	Total Depth	87.48 m
Northing	255,046.89	Casing Depth	10.36 m Left In
Easting	111,262.61		
Elevation	1220.31 m		
Core Size	HQ		
Drilling Started	September 21, 1993		
Drilling Finished	September 28, 1993		
Logged by	L. Brommeland		

Survey Data	Azimuth	Dip	Instrument
Collar	090°	-46°	Brunton Compass
75.29 m	084°	-46°	Sperry Sun

Purpose/Target: Angle hole drilled perpendicular to the Casino Fault in order to define location and true thickness of fault.

Comments: Hole abandoned well short of target depth (and short of Casino Fault) due to excessive caving.

Northing	254,900.00	Casing Depth	36.88 m Left Out
Easting	111,800.10	Survey Data	Azimuth / Dip / Instrument
Elevation	1144.78 m	Collar	-90.00°
Core Size	HQ	152.4 m	080° / -89.75° / Sperry Sun
Drilling Started	September 21, 1993	304.8 m	030° / -89.50° / Sperry Sun
Drilling Finished	October 3, 1993	457.2 m	243° / -89.20° / Sperry Sun
Logged by	C. DeLong		

Purpose/Target: Further delineate mineralization east of Hole 93-144.

Comments: Fracture-controlled chalcopyrite, less disseminated, inconsistent.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-218	Total Depth	435.86 m
Northing	255,027.79	Casing Depth	16.76 m Left Out
Easting	111,531.27	Survey Data	Azimuth / Dip / Instrument
Elevation	1174.66 m	Collar	-90.0°
Core Size	HQ	158.50 m	280° / -88.0° / Sperry Sun
Drilling Started	September 26, 1993	292.61 m	294° / -88.5° / Sperry Sun
Drilling Finished	October 3, 1993		
Logged by	M. Dittrick		

Purpose/Target: Delineation drill hole to test mineralization to depth in the eastern portion of the deposit.

Comments: Mineralization in the upper granodiorite/diorite and intrusion breccia was average but very low in the lowermost quartz monzonite.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-219	Total Depth	383.74 m		
Northing	255,234.58	Casing Depth	26.2 m		Left Out
Easting	111,098.93	Survey Data	Azimuth	Dip	Instrument
Elevation	1218.22 m	Collar		-90.0°	Brunton Compass
Core Size	HQ to 265.48 m; NQ to end	154.5 m		-90.0°	Sperry Sun
Drilling Started	September 27, 1993	306.9 m	185°	-89.5°	Sperry Sun
Drilling Finished	October 5, 1993				
Logged by	M.P. Phillips				

Purpose/Target: Determine extent of mineralization east of hole 93-213 and north of hole 93-184.

Comments: Copper mineralization was disappointing. This drill hole defines the northeastern limits of mineralization in this area.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-220	Total Depth	407.52 m		
Northing	255,029.59	Casing Depth	26.21 m		Left Out
Easting	111,450.43	Survey Data	Azimuth	Dip	Instrument
Elevation	1179.05 m	Collar		-90.00°	Brunton Compass
Core Size	HQ	159.11 m	209°	-88.75°	Sperry Sun
Drilling Started	September 29, 1993	306.93 m	214°	-88.25°	Sperry Sun
Drilling Finished	October 11, 1993				
Logged by	L. Brommeland/T. Case				

Purpose/Target: To test continuity on the 255,045N drill fence.

Comments: A limited strong zone of supergene sulphide mineralization intersected but lacks strong hypogene mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-222	Total Depth	367.89 m
Northing	254,787.36	Casing Depth	33.5 m Left Out
Easting	111,546.30	Survey Data	Azimuth / Dip / Instrument
Elevation	1167.08 m	Collar	-90.0°
Core Size	HQ	158.8 m	335° / -89.5° / Sperry Sun
Drilling Started	October 3, 1993	309.4 m	281° / -89.4° / Sperry Sun
Drilling Finished	October 11, 1993		
Logged by	P. Fischl		

Purpose/Target: To extend southward the zone of high grade copper and molybdenum mineralization encountered in Hole 93-214, 80 m north of 93-222.

Comments: Encountered a section of quartz monzonite (QMFX, QMIE), with lesser diorite (WRDR) and minor granodiorite (WRGD), containing a moderately mineralized supergene zone and a weakly to locally moderately mineralized hypogene zone.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-223	Total Depth	553.82 m		
Northing	254,969.87	Casing Depth	10.36 m		Left In
Easting	111,458.60	Survey Data	Azimuth	Dip	Instrument
Elevation	1172.86 m	Collar		-90.0°	
Core Size	HQ	152.4 m	297°	-89.5°	Sperry Sun
Drilling Started	October 4, 1993	304.8 m	217°	-88.8°	Sperry Sun
Drilling Finished	October 20, 1993	548.6 m	305°	-89.6°	Sperry Sun
Logged by	C. DeLong				

Purpose/Target: To redrill near Hole 92-130 which was lost at 140.35 m.

Comments: Excellent mineralization to 140 m; good, but less consistent, to 490 m.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-224	Total Depth	243.84 m
Northing	254,701.73	Casing Depth	3.66 m Left Out
Easting	111,498.99	Survey Data	Azimuth Dip Instrument
Elevation	1204.29 m	Collar	-90.0°
Core Size	HQ	152.4 m	245° -89.1° Sperry Sun
Drilling Started	October 4, 1993		
Drilling Finished	October 7, 1993		
Logged by	M. Dittrick		

Purpose/Target: Definition drilling along line 254,700N to test mineralization and alteration to depth east of hole 93-163 and south of hole 93-207.

Comments: The entire hole consisted of phyllic altered granodiorite except for the upper 41.98 m which was supergene clay altered.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-225	Total Depth	320.65 m
Northing	255,002.42	Casing Depth	12.2 m Left In
Easting	110,802.38	Survey Data	Azimuth / Dip / Instrument
Elevation	1276.10 m	Collar	-90.0°
Core Size	HW	152.4 m	332° / -85.5° / Sperry Sun
Drilling Started	October 5, 1993	306.9 m	-90.0° / Sperry Sun
Drilling Finished	October 11, 1993		
Logged by	S. de Wit

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-226	Total Depth	252.98 m
Northing	254,699.59	Casing Depth	12.19 m Left In
Easting	111,600.49	Survey Data	Azimuth Dip Instrument
Elevation	1164.11 m	Collar	-90.0°
Core Size	HQ	155.45 m	290° -89.5° Sperry Sun
Drilling Started	October 8, 1993		
Drilling Finished	October 11, 1993		
Logged by	M. Dittrick		

Purpose/Target: Definition drilling along 254,700N to test mineralization and alteration to depth east of Hole 93-224 (along southern edge of proposed "Starter Pit").

Comments: Copper mineralization occurred dominantly as chalcocite coatings on pyrite in the supergene sulphide zone.

Easting	110,398.93	Survey Data	Azimuth Dip Instrument
Elevation	1238.26 m	Collar	-90.0°
Core Size	HQ	154.53 m	225° -88.0° Sperry Sun
Drilling Started	October 12, 1993	304.80 m	020° -88.7° Sperry Sun
Drilling Finished	October 18, 1993		
Logged by	P. Fischl		

Purpose/Target: To extend zone of copper mineralization encountered in Holes P-5, 93-148 and 93-160 (West Zone).

Comments: This hole encountered weakly mineralized, potassic-altered Patton Porphyry (PPDP), with a few short sections of milled breccia (MBCX, MBNX), intrusion breccia (IXAX) and granodiorite (WRGD).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-229	Total Depth	270.36 m		
Northing	254,705.02	Casing Depth	7.01m		Left Out
Easting	110,797.26	Survey Data	Azimuth	Dip	Instrument
Elevation	1302.61 m	Collar		-90.0°	
Core Size	HQ	270.36 m	045°	-89.5°	Sperry Sun
Drilling Started	October 11, 1993				
Drilling Finished	October 17, 1993				
Logged by	T. Becker				

Purpose/Target: Delineation hole to test west-central area of deposit.

Comments: Drill hole intersected Patton Porphyry with weak potassic alteration cut by weak to moderate phyllic (5) veins. No major structures or shears intersected.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-230	Total Depth	246.89 m		
Northing	224,999.77	Casing Depth	40.54 m		Left Out
Easting	110,098.53	Survey Data	Azimuth	Dip	Instrument
Elevation	1222.68 m	Collar		-90.00°	Brunton Compass
Core Size	HQ	164.59 m	160°	-89.25°	Sperry Sun
Drilling Started	October 12, 1993				
Drilling Finished	October 16, 1993				
Logged by	M. Sze/T. Case				

Purpose/Target: To confirm extent of supergene mineralization seen in Hole P-11 (at 254,984N; 110,062E) and test the extent of the west pit.

Comments: Strong supergene Cu mineralization, very weak hypogene Cu mineralization.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-232	Total Depth	397.76 m		
Northing	254,999.01	Casing Depth	22.5 m		Left Out
Easting	110,599.96	Survey Data	Azimuth	Dip	Instrument
Elevation	1255.89 m	Collar		-90.0°	Brunton Compass
Core Size	HQ	154.5 m	035°	-88.0°	Sperry Sun
Drilling Started	October 17, 1993	306.9 m	060°	-88.5°	Sperry Sun
Drilling Finished	October 26, 1993				
Logged by	M.P. Phillips				

Purpose/Target: Define easterly limits of mineralization in Hole 93-148.

CASINO PROJECT

Hole Number	93-234	Total Depth	343.51 m
Northing	255,000.76	Casing Depth	20.7 m Left Out
Easting	110,400.35	Survey Data	Azimuth / Dip / Instrument
Elevation	1229.24 m	Collar	-90°
Core Size	HQ	157.8 m	010° / -89° / Sperry Sun
Drilling Started	October 19, 1993	304.8 m	015° / -89° / Sperry Sun
Drilling Finished	October 25, 1993		
Logged by	P. Fischl		

Purpose/Target: To delineate zone of copper mineralization encountered in Holes 93-148 and 93-160 (West Zone).

Comments: This hole encountered a section of heterolithic intrusion breccia (IXAX, IXAC, IXAF) with minor granodiorite (WRGD) and milled breccia (MBFW) containing a moderately mineralized supergene zone and a weakly mineralized hypogene zone.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-236	Total Depth	337.41 m		
Northing	255,098.83	Casing Depth	40.8 m		Left Out
Easting	111,499.22	Survey Data	Azimuth	Dip	Instrument
Elevation	1185.69 m	Collar		-90.0°	
Core Size	HQ	160.6 m	206°	-89.2°	Sperry Sun
Drilling Started	October 21, 1993	306.9 m	102°	-89.0°	Sperry Sun
Drilling Finished	October 29, 1993				
Logged by	C. DeLong				

Purpose/Target: To delineate the north side of the starter pit.

Comments: Some zones of good fracture-controlled chalcopyrite.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-237	Total Depth	233.17 m
Northing	255,100.91	Casing Depth	36.58 m Left Out
Easting	110.200.75	Survey Data	Azimuth Dip Instrument
Elevation	1215.87 m	Collar	-90°
Core Size	HQ	152.40 m	190° -89° Sperry Sun
Drilling Started	October 21, 1993		
Drilling Finished	October 28, 1993		
Logged by	M. Dittrick		

Purpose/Target: Delineation drilling in West Pit Zone.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-238	Total Depth	352.65 m
Northing	255,100.23	Casing Depth	3.66 m Left Out
Easting	110,599.92	Survey Data	Azimuth Dip Instrument
Elevation	1253.30 m	Collar	-90.00°
Core Size	HQ	157.6 m	138° -88.25° Sperry Sun
Drilling Started	October 21, 1993	310.0 m	131° -89.00° Sperry Sun
Drilling Finished	October 28, 1993		
Logged by	B. Thurston		
Purpose/Target:	West Pit

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-239	Total Depth	366.98 m
Northing	255,098.83	Casing Depth	19.51 m Left Out
Easting	110,399.45	Survey Data	Azimuth / Dip / Instrument
Elevation	1230.21 m	Collar	-90.00°
Core Size	HQ	154.53 m	104° / -89.00° / Sperry Sun
Drilling Started	October 26, 1993	304.80 m	117° / -89.25° / Sperry Sun
Drilling Finished	November 2, 1993		
Logged by	P. Fischl		

Purpose/Target: Delineation drilling of the West Zone.

Comments: This hole encountered a section of granodiorite (WRGD) with a moderately mineralized supergene zone and a weakly mineralized hypogene zone.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-242	Total Depth	271.62 m		
Northing	255,202.27	Casing Depth	36.58 m		Left Out
Easting	110,099.92	Survey Data	Azimuth	Dip	Instrument
Elevation	1203.57 m	Collar			
Core Size	HQ	154.53 m	085°	-89.4°	Sperry Sun
Drilling Started	October 29, 1993	271.58 m	105°	-88.8°	Sperry Sun
Drilling Finished	November 3, 1993				
Logged by	W.D. Mann				

Purpose/Target: Delineation, West Pit area, Canadian Creek Camp.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-243	Total Depth	349.61 m		
Northing	255,099.81	Casing Depth	6.74 m		Left Out
Easting	110,499.78	Survey Data	Azimuth	Dip	Instrument
Elevation	1242.36 m	Collar		-90.0°	
Core Size	HW	157.6 m	280°	-89.1°	Sperry Sun
Drilling Started	October 29, 1993				
Drilling Finished	November 4, 1993				
Logged by	S. de Wit				

Purpose/Target: Supergene mineralization in West Pit.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-244	Total Depth	236.83 m		
Northing	255,399.63	Casing Depth	25.30 m		Left Out
Easting	110,299.41	Survey Data	Azimuth	Dip	Instrument
Elevation	1222.67 m	Collar		-90.0°	Brunton Compass
Core Size	HQ	152.4 m	002°	-88.5°	Sperry Sun
Drilling Started	October 30, 1993				
Drilling Finished	November 4, 1993				
Logged by	J. Weber				

Purpose/Target: To test area between Holes 93-166 and 93-167.

Comments: This hole intersected diorite, heterolithic intrusion breccia, quartz monzonite and granodiorite.

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-246	Total Depth	234.70 m		
Northing	254,900.17	Casing Depth	20.1 m		Left Out
Easting	110,100.38	Survey Data	Azimuth	Dip	Instrument
Elevation	1232.02 m	Collar		-90.0°	Brunton Compass
Core Size	HQ	214.9 m	030°	-89.5°	Sperry Sun
Drilling Started	November 1, 1993				
Drilling Finished	November 6, 1993				
Logged by	M.P. Phillips				

Purpose/Target: To define limits of copper mineralization in the Patton Gulch area.

Comments: The drill hole cut weak oxide, supergene sulphide and hypogene copper mineralization.

Hole Number	93-247	Total Depth	249.02 m		
Northing	255,100.17	Casing Depth	2.68 m		Left Out
Easting	110,299.56	Survey Data	Azimuth	Dip	Instrument
Elevation	1219.39 m	Collar		-90.0°	
Core Size	HQ	171.6 m	140°	-88.6°	Sperry Sun
Drilling Started	November 3, 1993				
Drilling Finished	November 7, 1993				
Logged by	P. Fischl				

Purpose/Target: Delineation drilling of the West Zone.

Comments: This hole encountered weak to locally moderately mineralized granodiorite (WRGD) and minor diorite (WRDR).

SUMMARY DRILL LOG
CASINO PROJECT

Hole Number	93-250	Total Depth	258.17 m
Northing	254,900.53	Casing Depth	6.71 m Left In
Easting	110,299.32	Survey Data	Azimuth / Dip / Instrument
Elevation	1239.75 m	Collar	-90.0° Brunton Compass
Core Size	HQ	157.58 m	058° -88.5° Sperry Sun
Drilling Started	November 4, 1993		
Drilling Finished	November 9, 1993		
Logged by	J. Weber		

Purpose/Target: Delineation drilling in southern portion of West Pit area.

Comments: Patchy mineralization in both supergene sulphide and hypogene zones.
