1.0 CONCLUSIONS AND RECOMMENDATIONS

The 1995 Jazz exploration program consisted of geological mapping at 1:5000 scale, soil geochemical and lithogeochemical sampling and an airborne geophysical survey including magnetics and radiometrics. Two copper-gold soil geochemical anomalies were identified centred over two large hematite breccias. The stronger copper mineralization is found with the southern geochemical anomaly and consists of chalcopyrite, malachite and lesser azurite associated with northeast-trending, steeply-dipping faults and diorite bodies. Sediments located proximal to the hematite breccia body and on the flanks of the magnetic anomaly were found to host small zones of high grade stockwork and discontinuously veined chalcopyrite. Further work is recommended in the areas of the Bolt and the Lightning showings (#22350; 15.2% Cu, 0.74 g/t Au). This should include detailed mapping around the Lightning Showing followed by geophysical interpretation of the airborne magnetic data focusing on areas with low magnetic response between the Bolt and Lightning showings to identify drill targets.

The northern copper-gold soil geochemical anomaly hosts better copper mineralization. Chalcopyrite is predominantly the main copper sulphide with one location hosting chalcocite and bornite. The Chalcocite Showing contains trace amounts of chalcocite with associated bornite and chalcopyrite in a pitted and corroded potassium feldspar and magnetite-altered breccia. A number of anomalous rock samples collected within a radius of approximately 300 metres of the Chalcocite Showing are spatially related to a magnetic anomaly located in this area. Float and subcrop samples collected to the west of the Chalcocite Showing contain significant copper and gold values. This area is located near the breccia-sediment contact which has a low magnetic response. Work in this area should determine the style of mineralization and its association, if any, with magnetite-bearing areas. Interpretation of the airborne geophysical data will aid in the selection of targets for a diamond drill program. Possible areas to be tested by drilling should include the Chalcocite Showing with its associated magnetic anomaly and the fringe of the magnetic high and the breccia-sediment contact, uphill from samples 22329-22336.

2.0 INTRODUCTION

The Jazz claim group is located in the Wernecke Mountains, approximately 141 kilometres north-northeast of Mayo in east-central Yukon (Figure 1). The geological setting of the Wernecke Mountains is excellent for hosting Olympic Dam copper-uranium-gold-silver breccia type deposits and it was on this basis that the property was acquired through staking in June (Jazz 1-14) and August (Jazz 15-38) 1992. The Jazz 39-46 claims were added in July 1994 to cover the Bolt Showing and a geophysical airborne anomaly. The 1995 staking program added the Jazz 47-62 claims to cover breccia bodies identified by earlier work.

In August 1992 and in June 1993, Westmin Resources Limited carried out exploration programs on the Jazz 1-38 claims consisting of lithogeochemical sampling, geological mapping, and prospecting. Results were encouraging, with copper mineralization located at several localities. In September

PROPERTY LOCATION

1993, Newmont completed airborne magnetic and radiometric surveys over the claims and surrounding areas using proprietary equipment.

Work in 1994 consisted of geological mapping, prospecting, and contour soil geochemical sampling on the property. This work led to the discovery of the Bolt copper-gold-silver-cobalt Showing.

Work in 1995 consisted of grid establishment off an EDM surveyed baseline for soil geochemical sampling and control for property scale mapping at 1:5000. The soil sampling program was completed in 3 phases each of which extended the grid to the east to close off a favourable copper-gold soil geochemical anomaly. A detailed magnetic and radiometric geophysical airborne survey decreasing the line spacing to 200 metres was conducted in August. This work program was jointly conducted by Equity Engineering Ltd. and Pamicon Developments Limited on behalf of the Fairchild Joint Venture (Newmont Exploration Limited and Westmin Resources Limited). The same companies have been retained to report on the field work activities.

3.0 LIST OF CLAIMS

The Jazz property comprises 62 contiguous quartz mineral claims, located in the Mayo Mining District (Figure 2). The following claims* are owned 100% by Westmin Resources Limited of Vancouver, B.C. An underlying agreement indicates the claims are held in trust by Westmin on behalf of joint venture partners Newmont Mines Limited of Denver, Colorado and Westmin Resources.

^Subject to government approval of work filed in this report.

4.0 LOCATION, ACCESS AND PHYSIOGRAPHY

The Jazz property is located in the Wernecke Mountains of east-central Yukon, approximately 141 kilometres northeast of Mayo (Figure 1). The property is located 10 kilometres south-southwest of Gillespie Lake within the Gillespie Creek drainage system. The claims are situated in the Mayo Mining District, centred at 64° 37' north latitude and 134° 08' west longitude.

The Wernecke Mountains may be accessed from Mayo by float plane to a number of well distributed

lakes and by wheeled aircraft to the 885 metre long gravel airstrip at Copper Point located in the Bonnet Plume River valley, 15 kilometres downstream from Fairchild Lake. Access during the 1995 field program was by fixed wing aircraft to the Copper Point airstrip and camp and thence by helicopter 42 kilometres south to the property.

Elevations on the Jazz property range from 1,213 metres along the creek valley to over 2,000 metres above sea level with relief varying from moderate to commonly steep and locally extreme. Most of the property lies above tree line with the exception of the lower slopes and the valley bottoms where the vegetation consists of stunted spruce, dwarf alder and willow. Climate in the area is characterized by six months of cold winter and three to four months of warm to hot summer with May through September the best months for exploration. The respective average daily January and July temperatures for Mayo are -29°C and 15.2°C with annual precipitation of 306 mm of which 40% is snow.

5.0 PREVIOUS WORK

5.1 Area Exploration History

The first copper occurrences were noted by trappers working in the area at the turn of the century. The Slab mineral Showing was first staked in 1910. In 1935, the McClusky copper occurrences were staked and the Bonnet Plume and Wind River area received sporadic exploration for copper over the next twenty years. Exploration activity was stimulated in the early 1960s when California Standard Company through their subsidiary, Crest Exploration Limited, worked on their world-class banded iron deposit in the Snake River area. In the early 1960s, the first copper showing was found at Dolores Creek by L. Brown. Bonnet Plume River Mines Ltd. conducted exploration from 1967 to 1969, at which time limited diamond drilling was completed (Laznicka and Edwards, 1979).

In 1971, the discovery of zinc-lead showings in the MacKenzie Mountains to the east brought exploration activity to the southeastern portion of the Wernecke Mountains. Continued lead-zinc exploration in the Proterozoic basin led to the discovery of uranium mineralization in 1974 by Archer, Cathro and Associates Ltd. In the period 1975 to 1980, a number of major companies (Urangesellschaft, Noranda) and joint ventures (Wernecke Joint Venture, Mountaineer Mines-Pan Ocean Oil Limited, Prism Joint Venture) were involved in exploration of breccia-related uranium mineralization. Also at this time Pan Ocean drilled coal reserves on their lower Bonnet Plume leases and outlined in excess of 500 million tonnes of low sulphur, high volatile bituminous coal in Cretaceous strata.

The 1980s saw minor work throughout the project area. Archer Cathro, Texaco, and Cyprus Gold embarked on limited exploration to test the gold potential of some of the known uranium or copper occurrences.

Recent exploration in the 1990s was conducted by BHP Minerals, Kennecott Canada, International

Prism Exploration, Cominco, Zelon Enterprises and Fairchild Joint Venture, on both copper-gold and zinc-lead targets. At present, there are over 2000 quartz claims recorded in the Bonnet Plume River area.

5.2 Property Exploration History

Minfile occurrence 106D/9-077, which lies within the Jazz claims, was previously staked in 1976. In 1977, the Prism Syndicate undertook geological and radiometric surveys (Assessment Report 090298) to assess the uranium showings. The claims were allowed to lapse and were restaked in 1992 by Equity Engineering Ltd. and Pamicon Developments Limited.

5.3 1992 Exploration Program

During August of 1992, Westmin Resources Limited carried out a preliminary exploration program on the Jazz property, consisting of lithogeochemical sampling, limited geological mapping and prospecting (Caulfield, 1992). The program was designed to determine the potential for an Olympic Dam copper-uranium-gold-silver breccia type deposit. A total of 54 grab samples and 27 lithogeochemical rock samples were taken.

5.4 1993 Exploration Program

During August 1993, Westmin Resources Limited carried out a second exploration program on the claim group consisting of geological mapping, prospecting and follow up of mineralized zones defined by the 1992 work. A total of 12 grab, 19 lithogeochemical, and 1 chip sample was taken (Baknes, 1994).

In September 1993, an airborne geophysical survey was completed over the present claims area by Newmont Exploration Limited using proprietary company equipment (Wiles, 1993). Survey data collected included magnetometer and radiometric (U, K and Th) data at 1000 metre line spacings.

5.5 1994 Exploration Program

The 1994 exploration program carried out by Newmont Exploration Limited consisted of property scale mapping at 1:10000 and detailed mapping at 1:200 over the Bolt Showing. Surveys included rock, contour soil geochemical and stream sediment (Hofmann et al, 1994).

6.0 1995 EXPLORATION PROGRAM

Work on the Jazz 1-62 claims was initiated by surveying in a north-south oriented baseline with an EDM Total Station. Using this baseline for control, a soil geochemical grid was established in which samples were collected at 100 metre intervals on 100 metre spaced lines. The soil geochemical program was undertaken in three phases, each of which extended the grid to cover open-ended anomalies. A total of 462 soil samples was collected.

Geological mapping was undertaken at 1:5000 in anomalous areas defined by either the 1994 and 1995 airborne geophysical surveys or by soil or lithogeochemical surveys. A total of 133 rock samples were collected including 8 chip, 124 grab and 1 float. In the field, sample locations were marked by a metal tag and a combination of pink and blue flagging. All samples were shipped to Chemex Labs and analyzed for gold-lanthanum plus 24-elements by ICP geochemistry. Overlimit assays were performed for copper. Rock description forms, analytical procedures and analytical certificates are included in the appendices of this report.

An airborne geophysical program was undertaken in late July and early August, collecting magnetic and radiometric data. The geophysical survey focused on tightening up data collected from the 1993 airborne geophysical survey with lines flown at 200 metre spacings. The survey was conducted by Newmont Exploration Limited using proprietary equipment and is reported separately.

7.0 REGIONAL GEOLOGY

This summary of the regional geology is based on work by Delaney (1985), Thorkelson and Wallace (1993b, 1994b) and Pamicon Developments Limited (unpublished, 1977). References to earlier work are cited in Delaney (1985). Work by Thorkelson and Wallace is based on 1:50,000 mapping of NTS sheets 106C/13 and 106D/16 published jointly by the Yukon and Canadian governments (Thorkelson and Wallace, 1993a, 1994a, 1995b).

The Wernecke Mountains are cored by 14,000 metres of generally fine-grained terrigenous and carbonate rocks of Helikian (Middle Proterozoic) age that are cut by hematite breccia and intruded by mafic sills and dikes. The succession, named the Wernecke Supergroup, is subdivided into three groups (oldest to youngest): Fairchild Lake, Quartet, and Gillespie Lake. To the east and south, the Hadrynian (Late Proterozoic) Pinguicula Group unconformably overlies the Wernecke Supergroup. Paleozoic carbonate rocks bound the western margin, and Cretaceous and Tertiary sediments fill the area to the north in the Bonnet Plume Basin (Norris and Hopkins, 1977). A table of rock types and formations is presented on the legend following Figure 3.

The main structural components on the northern edge of the Wernecke terrane are the southeast-trending fault splays (Deslauriers, Knorr, and Snake River faults) of the Richardson Fault array (Norris and Hopkins, 1977). These faults, which bound the Cretaceous/Tertiary Bonnet Plume

8.0 PROPERTY GEOLOGY

Geological mapping was completed at a scale of 1:5000 on the Jazz property (Plates 1, 2 and 3). The Jazz property is underlain by a sequence of late Proterozoic Wernecke Supergroup sediments, which have been subdivided into Quartet Group (**PQ**) siliciclastics and Gillespie Lake Group (**PGL**) carbonates. Small folded wedges of a spherulitic mafic volcanic unit **psv** (?basalt) have been fault emplaced within the northeast breccia. Hematite breccias and diorite bodies have intruded the sedimentary package.

The Quartet Group consists of grey to black, locally feldspathized, well-bedded shale (**Unit sh**) and argillite (**Unit arg**). Shales and argillites on the west side of the property strike north-south and dip moderately to the east where they are conformably overlain by Gillespie Lake Group carbonates and sharply abut heterolithic breccia. Steep southerly dipping northeast normal faults cutting the southern part of the property have inserted thin panels of Quartet Group siliciclastics into Gillespie Lake Group carbonates. Thin rafts of Quartet Group siliciclastics present in the northeastern breccia are believed to be pendants. Bedding within the pendants is similar to those observed outside of the breccia. The Gillespie Lake Group consists of a brown weathering dolomitic siltstone (**Unit dol slts**) and orange to brown weathering dolomite (**Unit dol**). The dolomitic siltstone locally contains thin shaley partings which is indicative of the transition between the Quartet and Gillespie Lake groups. The dolomite is generally thick-bedded, fine-grained and locally contains 1-5 centimetre thick interbeds of cherty argillite and shale. Dolomites swing from an east-west strike and moderate southerly dip in the east half of the property to a more northerly strike and easterly dip on the west part of the property. These sedimentary units are open-folded and have an east-west striking axial plane dipping to the east.

The Wernecke heterolithic hematite breccia (**Unit bht**) grossly resembles a concordant body with the long axis trending over a distance of 3.5 kilometres east-west and a width greater than 700 metres. The breccias are matrix-supported with the matrix composed of chlorite, quartz, specular hematite, carbonate and locally sericite +/- biotite and feldspar. In the central regions of the breccia, layering and a crude sorting of clasts was noted possibly suggesting bedding that might have developed upon venting of the breccia (Baknes, 1994). The northern breccia appears to be folded with Quartet Group siliciclastics forming the core of a large anticline and the Gillespie Lake Group carbonates draped over the outer edges of the breccia. The northeastern and southwestern boundaries of the breccia have been abruptly terminated by east-west and northeast striking, steeply dipping faults juxtaposing Quartet Group siliciclastics and Gillespie Lake Group carbonates against breccia.

Unit **bhm** is a homolithic breccia which is generally found in small isolated outcrops on the northern and southern limits of the breccia and is locally found within the heterolithic breccia. The degree

of alteration, fragmentation and rotation generally increase towards the core of the breccia. Fragments range in size from less than 1 centimetre in matrix-supported breccia to over 1 metre near the sediment breccia transitions.

Narrow diorite dykes (**Unit di**) are found associated with faulting or sedimentary blocks that have been incorporated into the breccia bodies. The diorites are fine- to medium-grained, variably altered by chlorite, sericite, carbonate +/- potassium feldspar +/- magnetite +/- biotite.

9.0 MINERALIZATION

Copper sulphide mineralization on the Jazz property occurs predominantly in the form of chalcopyrite and in one locality, as chalcocite and bornite. Secondary copper is found ubiquitously with chalcopyrite, chalcocite and bornite in the form of malachite and lesser azurite. Other metallic minerals identified on the Jazz property include specular hematite, magnetite, pyrite and tetrahedrite (which was collected in 1992).

Chalcopyrite occurs mainly within the breccia on the property and also in sediments proximal to the breccia, usually in high grade veins or small zones of stockwork. Chalcopyrite within the breccia is generally spotty, occurring as fine-grained disseminations and fine fracture-controlled veinlets mineralizing areas of 10-20 metres in diameter. Strong chlorite and lesser carbonate alteration is commonly associated with chalcopyrite mineralization. Random lithogeochemical samples collected from the southwestern breccia are generally above background levels with values as high as 2690 ppm in copper and 15 ppb gold.

Stronger mineralization occurs with more frequency in the northeast breccia and appears to increase towards the margins of the body. A series of highly anomalous subcrop to float samples collected near the dolomite-breccia contact on the southwest end of the northeastern breccia returned significant copper and gold values. Samples 22329, 22331, 22332, 22333, 22334, 22335 and 22337 returned values ranging from 0.61%-2.28% copper and 5-120 ppb gold. Chalcopyrite and pyrite occur in fractures and blebs within the breccia. Chalcopyrite, pyrite and carbonate stringers occur in and near diorite bodies in zones with intense chlorite and magnetite alteration.

The Chalcocite Showing is a small mineralized zone located in the northeast breccia (Plate 1). Chalcocite, with lesser bornite, occurs in trace amounts associated with chalcopyrite and abundant magnetite in a pitted and corroded potassic-altered heterolithic breccia. The Chalcocite Showing is located proximal to the magnetic airborne anomaly in the northeast part of the property, suggesting that this small zone may form part of a larger deep seated mineralized body. Heterolithic breccia near the Chalcocite Showing contains significant chalcopyrite mineralization. Anomalous sample results collected from the Chalcocite Showing area are shown in Table 9.0.1.

Table 9.0.1
Chalcocite Showing Rock Geochemistry

Sample	Type	Width(m)	Cu(%)	Au(ppb)	Ag(ppm)
22664	Grab	0.7	1.28	390	3.0
22665	Chip	2	1.76	290	<.1
22666	Grab	1	10.5	1430	67.0
22674	Grab	4	0.15	30	<.2
22676	Chip	0.2	24.4	830	<.2
22677	Grab	2	0.03	270	26.4
22678	Grab	5	5.47	350	<.2
22679	Grab	-	1.47	185	3.4
22680	Select	-	1.64	765	22.0
22681	Select	-	0.93	75	5.4
22684	Grab	15	0.69	55	1.2
22716	Grab	-	3.17	60	6.2
22724	Grab	-	1.53	135	3.2

The Bolt Showing was discovered in 1994, located in a creek in the central part of the property. Mineralization consists of an approximately 2 metre wide massive chalcopyrite and pyrite vein hosted in a coarse-grained ankerite +/- quartz vein proximal to diorite. The vein strikes north-northeast and dips steeply to the east (Hofmann, et al, 1994). Chip sampling from the Bolt showing included a 1.7 metre section with 16.05% copper, 2370 ppb gold, 73 ppm silver and 343 ppm cobalt.

10.0 SOIL GEOCHEMISTRY

The soil geochemical survey for the Jazz grid was conducted on a grid with 100 metre line separation and 100 metre sample intervals from an EDM-surveyed north-south baseline. Locations of 1995 soil samples have been displayed with proportional symbols on Plates 6 and 7. Table 10.0.1 lists threshold levels for the Fairchild Joint Venture soil geochemical samples, determined from the entire project area.

Table 10.0.1
Soil Geochemical Thresholds-Fairchild Joint Venture

PERCENTILE	COPPER (ppm)	COBALT (ppm)	GOLD (ppb)	RATING
75th	250	50	10	background/high background
90th	500	80	25	high values
98th	1800	200	90	moderately anomalous
				definitely anomalous

The soil geochemical survey on the Jazz property identified anomalies coincident with Wernecke breccia mapped on the property. The Jazz south anomaly (>75th percentile), situated over the breccia body, defines an area 500 metres (east-west) by greater than 600 metres (north-south). The heart of the anomaly is situated on the ridge and contains values as high as 115 ppb gold and 2220 ppm copper. Isolated high grade mineralized zones (less than 10 metres in diameter), related to north-south steeply-dipping faults cross-cutting the breccia body, are likely responsible for the elevated copper and gold values. Mineralization in the breccia is spotty and weakly anomalous where observed. The northern part of the soil anomaly may be exaggerated due to downhill dispersion in talus fans where chalcopyrite and malachite are common in float.

The copper-gold soil geochemical anomaly on the northeastern side of the property, as defined by the 75th percentile, is restricted to the breccia. This anomaly covers an area of approximately 1 kilometre by 1 kilometre with the southern and northeastern boundaries undefined. Copper-gold values exceeding the 90th percentile form large irregular anomalies that appear to be associated with the peripheries of the breccia and near areas where sedimentary pendants are exposed within the breccia. The soil geochemical data supports the rock sampling survey which shows that best mineralization is concentrated around the breccia-sediment contact with more patchy mineralization within the breccia and surrounding carbonates.

11.0 GEOPHYSICS

The 1995 Newmont airborne geophysical survey further defined the anomalous areas reported by Wiles (1993). The survey was flown in late July and early August at a line spacing of 200 metres.

A magnetic anomaly is centred over breccia in the southwestern claims area and trends north into Gillespie Lake Group carbonates with a weaker response suggesting that the breccia carries into this area at depth. The eastern boundary of the magnetic anomaly has a very sharp gradient

into a magnetic low indicative of a steep contact. A smaller magnetic anomaly on the northeastern breccia is due to disseminated magnetite in spotty outcrops of diorite within this area. The potassium and uranium anomalies are centred over Wernecke breccia. The Wernecke breccias contain potassium feldspar, sericite and chlorite, but no uranium minerals have been identified.

Respectfully submitted,

Kelly A. Owerko, Geologist

STATEMENT OF EXPENDITURES

STATEMENT OF EXPENDITURES

JAZZ 1 - 62 MINERAL CLAIMS

CANADA -- In the matter of geological and geochemical assessment work filed on the
Jazz Mineral Claim Group

I, Michael A. Stammers agent for Westmin Resources Limited, 904, 1055 Dunsmuir Street,
Vancouver, B.C. do solemnly declare that a program consisting of geological mapping and
geochemical survey work was carried out on the Jazz 1-62 Mineral Claims during the period May
10 to September 20, 1995 (refer to note 5 below).

The following expenses were incurred during the course of this work and in the compilation and
reporting of the results:

PROFESSIONAL FEES AND WAGES

Michael A. Stammers, P.Geo.	\$1200.00
3 days @ \$400/day	
Randy Vance, Geologist	400.00
1 day @ \$400/day	
Richard Gorton, Geologist	400.00
1 day @ \$400/day	
Odie Christiansen, Geologist	400.00
1 day @ \$400/day	
Kelly Owerko, Geologist	6175.00
19 days @ \$325/day	
Kathi Hoffman, Geologist	2275.00
7 days @ \$325/day	
John Dickie, Geologist	4225.00
13 days @ \$325/day	
Kris Carruthers, Sampler	2025.00
9 days @ \$225/day	
Tim Sullivan, Sampler	1125.00
5 days @ \$225/day	
Dan Corpe, Sampler	250.00
1 day @ \$250/day	
Yvonne Thornton, Sampler	1350.00
6 days @ \$225/day	
Chris Hope, Sampler	900.00
4 days @ \$225/day	
Ed Sinnott, Sampler	450.00
2 days @ \$225/day	
Pete Beattie, Sampler	250.00
1 day @ \$250/day	

Bob Wagner, Sampler		
3 days @ \$250/day	750.00	
Andrew Robinson, Sampler		
1 day @ \$225/day	225.00	
Kirsten Davis, Sampler		
1 day @ \$225/day	225.00	
Jim Snell, Sampler		
2 days @ \$225/day	450.00	
Prorated Wages	<u>7368.00</u>	\$30,443.00

EXPENSES

Field Supplies - Geology	27.90
Field Supplies - Geochem.	401.88
Field Supplies - Drilling	76.07
Field Supplies - Other/Camp	286.90
Auto Expense	2.35
Photocopies	5.33
Maps	7.74
Reproductions	21.71
Report Materials	376.49

Freight - Misc.	13.45	
Licenses	34.34	
Telephone - Long Distance	214.34	
Telephone - Space Tel	1822.21	
Management Fees	7316.33	
Office Supplies	<u>124.97</u>	<u>\$68,252.92</u>

TOTAL: **\$98,685.92**

Notes:

1. Wages are based on actual man days spent on the property.
2. Helicopter charges are based on actual hours flown.
3. Assay charges are based on actual numbers of samples from the property.
4. General expenses (all other costs) are prorated according to man days allocated to each property.
5. When applying work for 1995 assessment credits the following list of criteria were applied:
 - a) 'Soft work, including geochemistry and geology was applied to the Jazz 1-14 claims only up to and including July 6, 1995.
 - b) 'Soft' work, including geochemistry and geology was applied to the Jazz 15-38 claims only up to and including August 24, 1995.
 - c) Only work completed after July 27, 1995 was applied to the Jazz 47-62 claims.

And I make this solemn declaration conscientiously believing it to be true and knowing that it is of the same force and effect as if made under oath and by virtue of the Canada Evidence Act.

Dated at Vancouver in the Province of British Columbia this 30 day of November, 1995.

Michael A. Stammers, P.Geo. FGAC.

CHEMEX LABS LTD ANALYTICAL PROCEDURES

1. TRACE ANALYSIS

Gold

Fire Assay Collection/ Atomic Absorption Spectroscopy (FA-AA)

Chemex Code: 983

A 30g sample is fused with a neutral lead oxide flux inquarted with 6mg of gold-free silver and then cupelled to yield a precious metal bead.

These beads are digested for 30 mins in 0.5ml concentrated nitric acid, then 1.5ml of concentrated hydrochloric acid are added and the mixture is digested for 1 hr. The samples are cooled, diluted to a final volume of 5ml, homogenized and analyzed by atomic absorption spectroscopy.

Detection limit: 5 ppb

Upper Limit: 10,000 ppb

Arsenic ppm - Chemex Code 13

A 1.0 gram sample is digested with HNO_3 - aqua regia acids for approximately 2 hours. The digested solution is diluted to volume and mixed. An aliquot of the digest is acidified and reduced with NaBH_4 and arsenic content determined using flameless atomic absorption.

Detection limit: 1 ppm

24-Element Geochemistry Package (24-ICP)

Inductively-Coupled Plasma Atomic Emission Spectroscopy (ICP-AES)

The 24 element rock geochemistry package provides quantitative analysis of all major elements (except silicon) as well as most important trace elements.

A prepared sample (0.50g) is digested with perchloric, nitric and hydrofluoric acids to dryness. The residue is taken up in a volume of 25ml of 10% hydrochloric acid and the resulting solution is analyzed by inductively-coupled plasma atomic emission spectroscopy. Results are corrected for spectral interelement interferences. For this project only uranium and lanthanum were also analyzed.

Chemex Code	Element	Detection Limit	Upper Limit
573	Aluminum	0.01 %	15 %

PREPARATION METHODS

201 - DRY, SIEVE TO -80 MESH

a) Geochemical soil/silt samples are usually received in High/wet-strength 4x6 soil gusset bags. Sample sets are ordered, and dried for 12 to 24 hours at 50 deg. C.

b) The dried sample is hammered, to desegregate the soil particles, and then poured from the gusset bag into an 8 inch dia. 80 mesh stainless steel screen.

c) The sieve is shaken horizontally over a large clean piece of paper, where the -80 mesh fraction accumulates. When all the -80 fraction has passed through the sieve the +80 portion is discarded.

d) The -80 fraction is poured into a 2x3 coin envelope, which contains the exact same number as the submitted sample, for distribution to the analytical lab.

202 - DRY, SIEVE TO -80 MESH, SAVE +80 FRACTION

a) and b) see sections a) and b) of 201 c) The sieve is shaken horizontally over a large clean piece of paper, where the -80 mesh fraction accumulates. When all the -80 fraction has passed through the sieve the +80 portion is poured into a new 4x6 gusset bag (which contains the same number as the submitted sample), boxed, and filed. d) The -80 fraction is poured into a 2x3 coin envelope, which contains the exact same number as the submitted sample, for distribution to the analytical lab.

203 - DRY, SIEVE TO -35 MESH

a) Geochemical soil/silt samples are usually received in High/wet-strength 4x6 soil gusset bags. Sample sets are ordered, and dried for 12 to 24 hours at 50 deg. C.

b) The dried sample is hammered, to desegregate the soil particles, and then poured from the gusset bag into an 8 inch dia. 35 mesh stainless steel screen.

c) The sieve is shaken horizontally over a large clean piece of paper, where the -35 mesh fraction accumulates. When all the -35 fraction has passed through the sieve the +35 portion is discarded.

d) The -35 fraction is put into a ring grinder and rung to approximately 150 mesh. The pulp is put into a 2x3 coin envelope (same sample numbered envelope) for distribution to the analytical lab.

PREPARATION METHODS - ROCK/ORE

205 - GEOCHEM RING

- a) Samples arrive in poly or olefin rock bags. Samples are ordered prior to crushing.
- b) The sample is poured into a primary jaw, and crushed to approximately 1/4 inch. This is secondary crushed in a roll crusher to approximately 10 mesh.
- c) The crushed sample is then split using a Jones Riffle splitter to approximately 200 to 250 grams. The reject is poured into the original bag for storage, or return to client.
- d) The sample split is put into a Rocklabs (large ring) ring mill, and rung to approximately 150 mesh. The pulped sample is poured into a 4x6 tin-top bag, (which has been labeled with the original number), for distribution to the analytical lab.

217 - GEOCHEM RING - ENTIRE SAMPLE (Used for samples 200 grams or less)

- a) The entire sample is put into a Rocklabs (large ring) ring mill, and rung to approximately 150 mesh. The pulped sample is poured into a 4x6 tin-top bag (correctly labeled), for distribution to the analytical lab.

208 - ASSAY RING

- a) Samples arrive in poly or olefin rock bags. Samples are ordered prior to crushing.
- b) The sample is poured into a primary jaw, and crushed to approximately 1/4 inch. This is secondary crushed in a roll or cone crusher to approximately 10 mesh.
- c) The crushed sample is then split using a Jones Riffle splitter to approximately 200 to 250 grams. The reject is poured into the original bag for storage, or return to client.

d) The sample split is put into a Rocklabs (large ring) ring mill, and rung to approximately 150 mesh. The pulped sample is poured into a 4x6 tin-top bag, (which has been labeled with the original number), sealed prior to being distributed to the analytical lab.

207 - ASSAY ROTARY PULVERIZE

a) and b) - see sections a) and b) under 208 c) The crushed sample is then split using a Jones Riffle splitter to approximately 250 to 350 grams. The reject is poured into the original bag for storage, or return to client. d) The sample split is ground in a Bico rotary pulverizer and screened to 140 mesh. The +140 material is visually inspected for metallics. e) If NO metallics are found, then the +140 fraction is hand ground to -140. The entire sample is then homogenized (by rolling). f) IF metallics are found, they are put into a separate coin envelope, kept with the original sample, and fused separately. The entire -140 fraction is homogenized.

APPENDIX F

GEOLOGIST'S CERTIFICATE

•

GEOLOGIST'S CERTIFICATE

I, Kelly A. Owerko, of 5740 Hyde Street, Burnaby, in the Province of British Columbia, DO HEREBY CERTIFY:

1. THAT I am a Consulting Geologist with offices at Suite 207, 675 West Hastings Street, Vancouver, British Columbia.
2. THAT I am a graduate of the University of Saskatchewan with a Bachelor of Science degree in Geology.
3. THAT this report is based in part on property work I personally completed and/or directly supervised, government publications and assessment reports filed with the Yukon division of Indian and Northern Affairs.
4. THAT I have no interest in the property described herein, nor in any securities of any company associated with the property, nor do I expect to receive any such interest.

DATED at Vancouver, British Columbia, this 30 day of November, 1995.

Kelly A. Owerko, Geologist

MAP NO: 106D/9

ASSESSMENT REPORT: X

DOCUMENT NO: 093379

PROSPECTUS:

MINING DISTRICT: Mayo

CONFIDENTIAL: X

TYPE OF WORK: Geology,
geochem

OPEN FILE:

REPORT FILED UNDER: Newmont Exploration Ltd.

DATE PERFORMED: May 10- Sept. 20, 1995

DATE FILED: January 17, 1996

LATITUDE: 64 37

AREA: McClusky Lake

LONGITUDE: 134 08

VALUE: \$20800

CLAIM NAME AND #: Jazz 1-62

WORK DONE BY: Kelly Owerko

WORK DONE FOR: Newmont Exploration Ltd.

Remarks: Two copper-gold soil anomalies were identified over two large hematite breccia bodies.

[illegible]

Au Geochemistry	
Pre 95	1995 Samples

PROJ: NAD 83
N: 544000 - 548000
Y: 7168000 - 7169000
U: 10
Units are meters.

Grid North

Magnetic Declination, 1995, for the center of this map is: 30° 53' East of True North
Annual Change West 13.8'

Grid North is 0° 52.5' East of True North for center of map

NTS Map: 108-D/9

Scale 1:15,000

NEWMONT EXPLORATION LTD.
WESTMIN RESOURCES, PAMCON DEVELOPMENTS, EQUITY ENGR.
FAIRCHILD PROJECT, YUKON TERRITORY, CANADA
MAYO MINING DISTRICT
