## INTRODUCTION

Expatriate Resources Ltd. has a 100% interest in the Zamboni property which protects volcanogenic massive sulphide (VMS) targets selected from a regional geochemical data base documenting results of 1973 exploration by a joint venture managed by Archer, Cathro & Associates Limited. A total of 1072 claims were staked in 1995 and spring 1996. Grid soil sampling, geological mapping and prospecting were done on the Box claims, which now form the north-central part of the property, in summer 1995.

Field exploration was conducted during summer 1996 by crews working from Expatriate's base camp on Finlayson Lake and from a fly camp on the Clarence claims. The program consisted of airborne magnetic and electromagnetic surveys, geological mapping, prospecting, claim surveys, linecutting and soil geochemistry. The work was managed by Archer, Cathro & Associates (1981) Limited and supervised by the author. Appendix I contains the Author's Statement of Qualifications.

The main body of this report describes results of the geological mapping, prospecting and soil geochemistry. Results of the geophysical surveys are reported together with those from other Expatriate properties in "Report on an Electromagnetic and Magnetic Survey" by Aerodat Inc. dated June 13, 1996, copies of which were filed as a separate document.

PROPERTY, LOCATION AND ACCESS

The property is located in southeastern Yukon at latitude 61°36'N and longitude 130°46'W on NTS map sheet 105G/10 (Figure 1). It is comprised of 1072 contiguous mineral claims (Figures 2, 3, 4 & 5) registered with the Watson Lake Mining Recorder in the name of Archer, Cathro & Associates (1981) Limited which holds them in trust for Expatriate Resources Ltd.

Claim registration data is listed below.

\*Expiry dates include 1996 work filed for assessment credit but not yet accepted.

In 1996 the property was accessed by helicopter from Expatriate's base camp on Finlayson Lake (Km 232 on the Robert Campbell Highway). The property lies 7 km west of the base camp and 245 km northeast of Whitehorse. Helicopter support was provided by a Bell 206B Jet Ranger and Aerospatiale 350B, both contracted from Kluane Helicopters of Haines Junction. The helicopter was stationed at Expatriate's base camp for the summer. The Robert Campbell Highway and Finlayson Airstrip are located along the northeastern edge of the property.

During the 1996 exploration program claim post locations were surveyed using Trimble Geoexplorer GPS units. Field readings were corrected using base station data from Westmin Resources Limited's camp at Wolverine Lake. GPS survey data appears in Appendix II.

## GEOMORPHOLOGY

The Zamboni property covers a series of low hills and broad valleys on the northern flank of the Pelly Mountains. Most creeks drain into Campbell or Big Campbell Creeks which flow northwesterly into the Pelly River. There are several small lakes on the property.

Elevations range from 1400 m on a hilltop along the west side of the property to 1035 m on the banks of Big Campbell Creek. Topographic relief is gentle to moderate except in a canyon developed along Big Campbell Creek where it crosses the Clarence claims. Most of the property is blanketed by Pleistocene glacial till or glaciofluvial outwash.

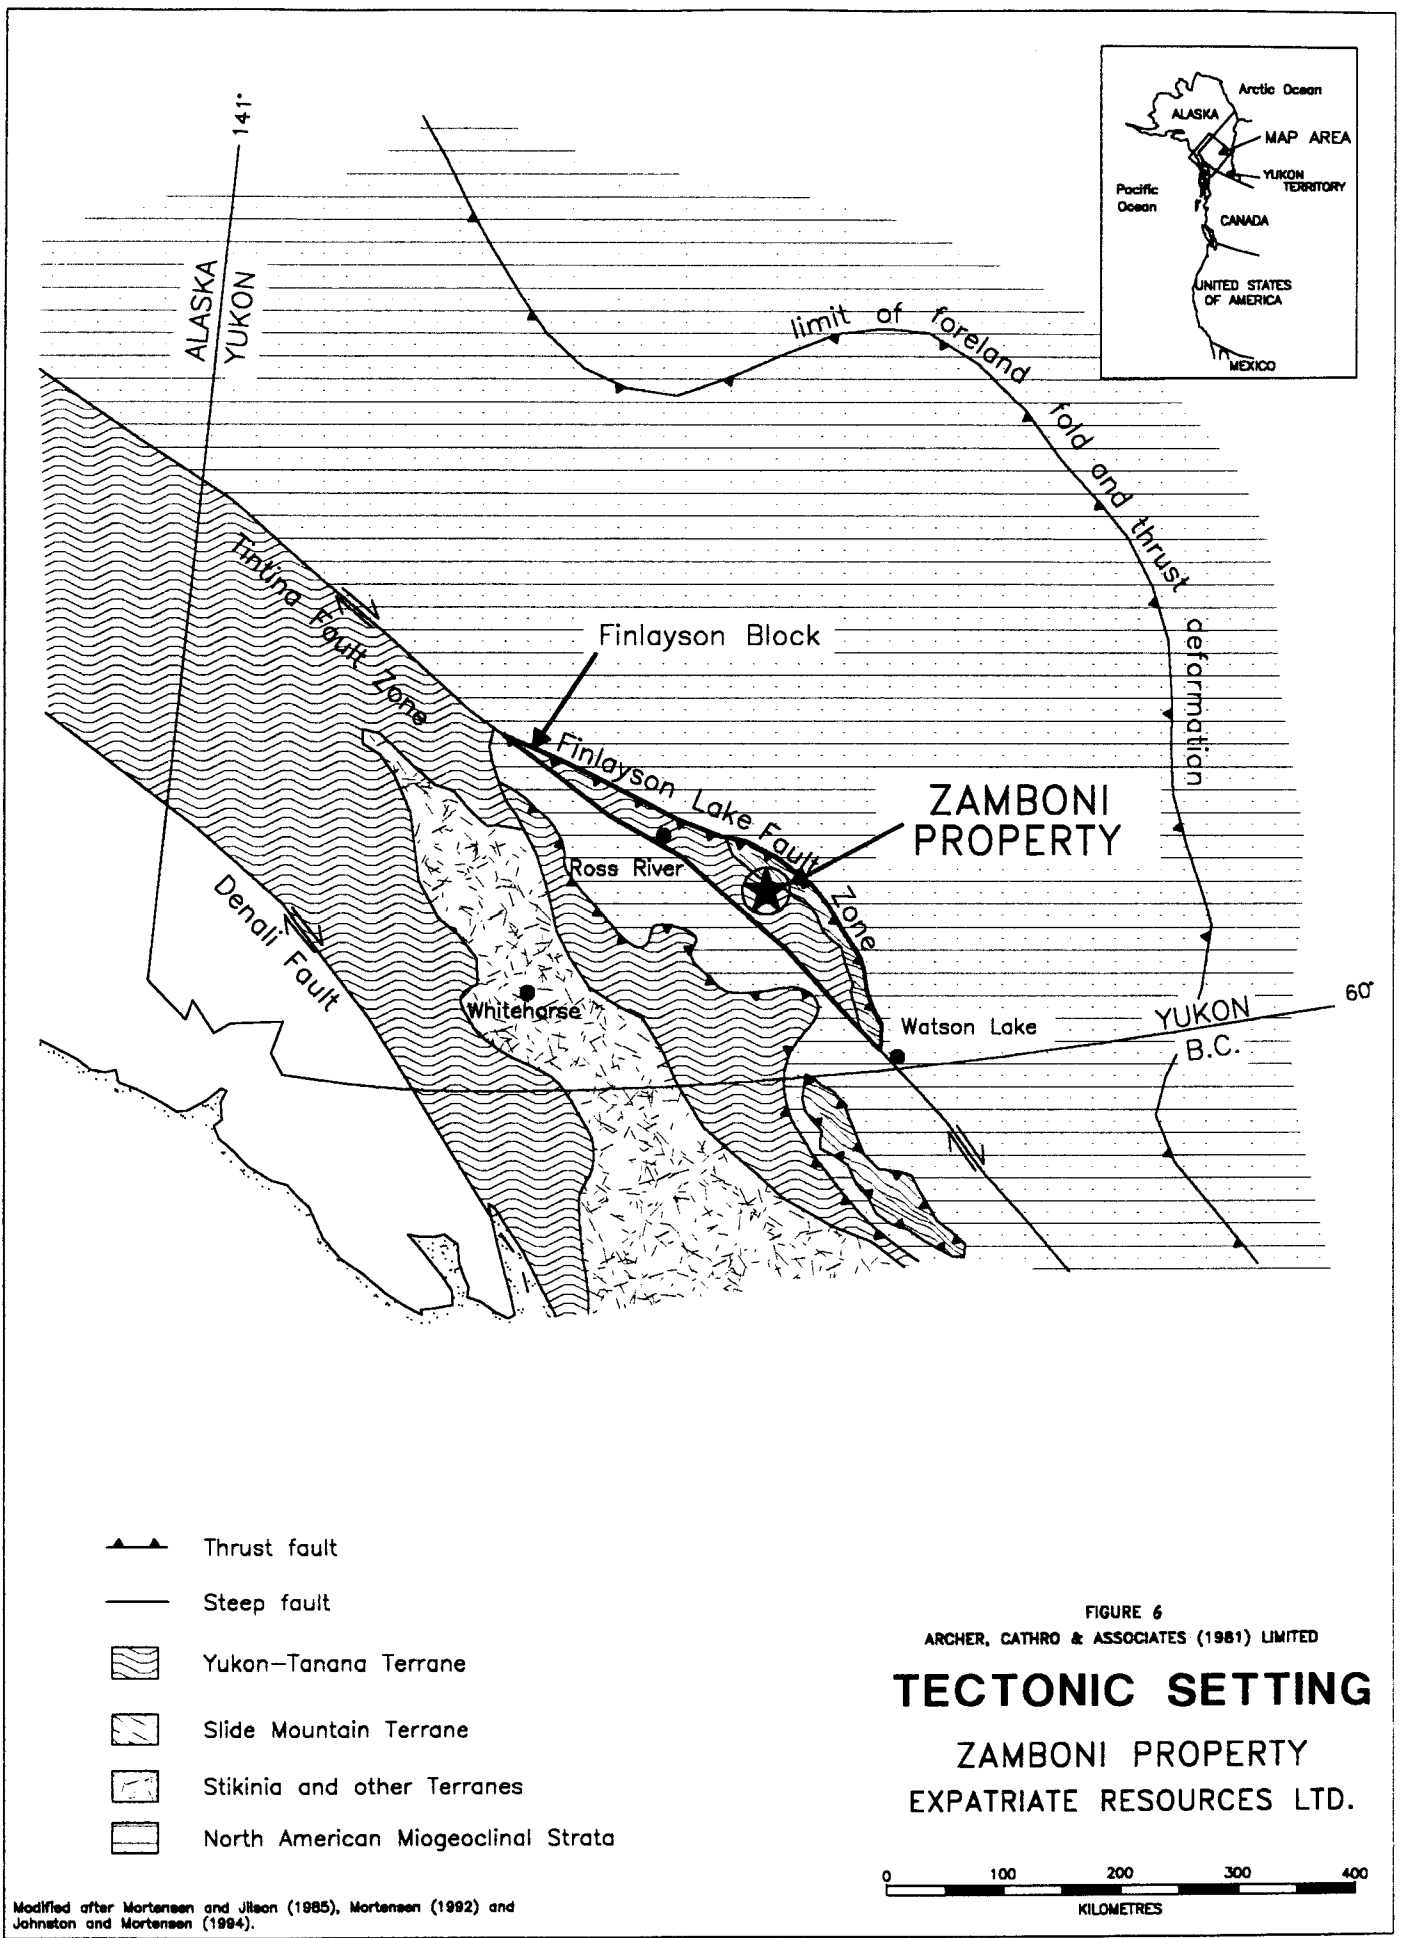

The entire property is below treeline. Vegetation consists of mature black spruce or poplar forests at lower elevations giving way to stunted black spruce and buckbrush on upland plateaus. Grassy meadows, swamps and beaver dams are common along the major drainages.

## REGIONAL GEOLOGY

The Zamboni property is located within the Finlayson Block, a 380 by 60 km area comprised primarily of the Yukon-Tanana and Slide Mountain geologic terranes (Figure 6). These terranes represent the innermost of the accreted or "suspect" terranes in the Canadian Cordillera (Mortensen and Jilson, 1985). The northeastern margin of the block is the Finlayson Lake Fault Zone a complex zone of steep and shallow faults related to transpressive suturing. The southwestern boundary of the block is the Tintina Fault, a major strike-slip fault with at least 450 km of dextral displacement during Late Cretaceous and/or Early Tertiary time (Tempelman-Kluit et al, 1976).

Regional mapping of the Finlayson Lake area was completed by the Geological Survey of Canada (GSC) in the mid to late 1970's (Tempelman-Kluit, 1977, 1979). More recent regional studies have been published by Mortensen and Jilson (1985) and Mortensen (1992). The following discussion of the regional geology (Figure 7) is based partly on the published work and partly on unpublished mapping completed in 1996 (Tempelman-Kluit, personal communication, 1996).

The Yukon-Tanana Terrane consists largely of Paleozoic continental margin and/or arc stratigraphy deposited on a continental basement of uncertain origin (Mortensen, 1992). The Yukon-Tanana Terrane in the Finlayson Lake area contains three major packages, collectively termed the Layered Metamorphic Sequence. The lowermost unit consists of garnet-mica schist with interbanded marbles, calc-silicates and calcareous schists near the top. The middle unit is a carbonaceous quartzite, schist or phyllite with rare conglomerates and locally extensive felsic and mafic volcanic interbands. Radiometric dating of the felsic metavolcanics in the Finlayson Block has consistently resulted in Late Devonian to Mississippian crystallization ages. Immediately south of Finlayson Lake, large isolated outcrops of marble and quartzite which are poorly dated as Early

Modified after Mortensen and Jilson (1985), Mortensen (1992) and Johnston and Mortensen (1994).

Modified after Mortenson and Jean (1985)

Pennsylvanian to Early Permian (Tempelman-Kluit, 1979) form the uppermost unit of the Yukon-Tanana Terrane.

This sequence of units is generally correlative with a similar stratigraphic sequence in ancestral North America (Mortensen and Jilson, 1985; Tempelman-Kluit, personal communication, 1996). The lowermost is correlated with the Lower Cambrian Atan Group and the middle carbonaceous assemblage is correlated with the offshore, Silurian-Devonian Nasina quartzite assemblage. The felsic volcanics are most similar to locally extensive Mississippian siliceous volcanics in the North American stratigraphy. Local calcareous phyllites and massive greenstones near the top of the lower unit are lithologically similar to the Kechika Group and Lower Paleozoic alkalic and potassic greenstones, respectively.

Gneiss and augen gneiss invariably occur low in the Yukon-Tanana succession beneath either the lowermost calcareous unit or the middle carbonaceous unit. Mortensen and Jilson (1985) considered the gneisses to be metamorphosed Mid-Paleozoic plutonic rocks. Conversely Tempelman-Kluit (personal communication, 1996) considers these gneisses to be at least in part recrystallization of earlier stratigraphy. Radiometric dating of the gneisses has consistently resulted in Late Devonian to Mississippian ages (Mortensen, 1992). The gneisses occur in structural culminations with diameters on the order of 10 km and structural relief up to about 1 km.

The Devonian-Mississippian Simpson Suite (Mortensen, 1992) forms thick intervals of hornblende granodiorite and quartz monzonite higher in the Yukon-Tanana stratigraphic sequence. Mortensen and Jilson (1985) interpreted this suite as intrusive. Tempelman-Kluit (1979, 1996) mapped the suite as an allochthonous slice emplaced on top of the structural pile.

Slide Mountain Terrane consists of Late Devonian to Late Triassic disrupted oceanic crust (Mortensen, 1992). Lithologies include massive and sheared greenstone, chert and mafic to ultramafic plutonic rocks occurring as fault-bounded slices along thrust faults and steep faults. These units are most abundant near the northeastern edge of the Finlayson Block but are also found throughout it.

Younger units unconformably overlie units from Slide Mountain, Yukon-Tanana and North American Terranes. Mesozoic clastic rocks are Late Triassic, immature sediments containing cobbles from both Slide Mountain and Yukon-Tanana Terranes. Young volcanic rocks consist of Late Cretaceous to Tertiary felsic volcanic flows and volcanoclastic deposits. They are usually found in close proximity to the Tintina Fault Zone.

Mesozoic intrusive activity in the Finlayson Block includes two suites. The first is comprised of several unmetamorphosed Early Jurassic mafic and intermediate composition plutons. The second suite consists of Late Cretaceous two-mica quartz monzonite and granite (Mortensen and Jilson, 1985).

Structurally Yukon-Tanana schists and gneisses contain a pervasive, flat- to gently-dipping foliation. Close examination of this fabric indicates that it commonly is a closely spaced crenulation cleavage. Large-scale folds related to this fabric can rarely be mapped in the field. In most cases bedding and earlier fabrics are transposed into near parallelism with this dominant fabric. Later crenulation cleavages are present only locally. Some of the Cretaceous intrusions have a mild deformation fabric, others are massive and do not contain a foliation.

Thrust faults within the Finlayson Block juxtapose lithologic sequences with similar deformation fabrics. Thrusting postdates the Late Paleozoic Slide Mountain lithologies and predates the Cretaceous intrusives. Recent mapping also suggests, but does not definitively prove, the presence of major late extensional faults juxtaposing differing sequences (Tempelman-Kluit, personal communication, 1996). East-northeast trending, steep normal faults disrupt all earlier deformation fabrics.

Metamorphic grades range from lower greenschist facies to middle amphibolite facies. Contact hornfels around plutonic units occur locally.

Metamorphism and deformation are tentatively correlated with transpressive suturing of these suspect terranes with ancestral North America. Suturing is restricted to the time interval of post-Triassic continuing into the Cretaceous. Whether deformation is continuous or sporadic has not been fully verified at present.

The discovery of the Kudz Ze Kayah and Wolverine VMS Deposits within the Finlayson Block in the last few years (Johnston and Mortensen, 1994) has refocused exploration activities in the area. Both deposits occur within metasedimentary and metavolcanic sequences of the Yukon-Tanana Terrane and are associated with felsic volcanics present in the middle unit of that terrane.

### REGIONAL MINERALIZATION

A total of fifty-one mineral occurrences have been reported within the Finlayson Block (DIAND, 1995). Of these, twenty-one are known or suspected to be volcanogenic in origin while veins, skarns and asbestos occurrences comprise most of the remainder. Although the better known volcanogenic occurrences are thought to be of the Kuroko-type, some Besshi-type mineralization is also present (Morin, 1981; Johnston and Mortensen, 1994) and the recently discovered Ice Deposit appears to be Cyprus-type. Two occurrences have definite economic potential, the Kudz Ze Kayah and Wolverine Deposits (Figure 7). These Kuroko-type occurrences are the main "type-deposits" for Expatriate's exploration in the district and are briefly described below.

The Kudz Ze Kayah (ABM) Deposit lies within Yukon-Tanana Terrane near the centre of the block (Cominco Exploration, 1995; Whiteway, 1995). It is a VMS deposit hosted by an overturned assemblage of felsic pyroclastics, aphanitic massive rhyolites and metasiliclastic rocks belonging to the middle unit of the Layered Metamorphic Sequence. Although both the sulphides and wallrocks are highly strained and exhibit pervasive schistosity, compositional layering in the vicinity of the deposit is relatively undeformed with a consistent, shallow northerly dip. Sphalerite, chalcopyrite and galena are the main economic minerals while the gangue includes various mixtures of magnetite, barite, pyrrhotite, pyrite and carbonate. The deposit averages about 18 m thick and has been traced 700 m along strike and up to 400 m downdip. Open pit mineable ore reserves are reported to be 11 million tonnes grading 5.9% zinc, 0.9% copper, 1.5% lead, 130 g/t silver and 1.3 g/t gold (Schultze, 1996). Preliminary studies suggest that satisfactory

lead, zinc and copper concentrates can be produced using conventional flotation processes (Cominco Exploration, 1995). The mineralization responds well to magnetic and electromagnetic surveys but geochemical response is somewhat erratic because the entire deposit is covered by 2 to 10 m of glacial till.

The Wolverine Deposit is located 25 km east of the Kudz Ze Kayah property near a contact between Yukon-Tanana and overlying Slide Mountain rocks. It consists of the Wolverine and Lynx Zones which are hosted by rhyolitic metavolcanics and argillites lying within the middle unit of the Layered Metamorphic Sequence. The mineralization consists primarily of semi-massive to massive pyrite and sphalerite with varying amounts of galena, chalcopyrite, tetrahedrite and native gold. The surface expression of the Wolverine Zone is marked by a vegetation kill zone containing weakly malachite-stained argillite while the Lynx Zone is blanketed by glacial till. Westmin has traced the deposit 700 m along strike and up to 450 m downdip and it is still open. The mineralization averages 6.1 m thick and dips shallowly to the north. Both zones contain significantly more zinc and precious metals than Kudz Ze Kayah. The current geological inventory is reported to be 5,311,000 tonnes grading 12.96% zinc, 1.41% copper, 1.53% lead, 359.1 g/t silver and 1.81 g/t gold (Westmin News Release, November 30, 1996). Soil geochemistry outlined weakly to moderately anomalous values along the projected surface trace of the deposit while magnetic surveys easily traced a laterally extensive, banded iron formation which occurs about 80 m up-section from the massive sulphide horizon. Interpretation of electromagnetic results is complicated by the presence of graphite within the argillite.

## REGIONAL GEOCHEMISTRY

Published geochemical data for the Finlayson Lake area are limited to reconnaissance scale stream sediment sampling conducted in the late 1980's by the GSC (Hornbrook and Friske, 1988; Friske et al, 1990). The sampling was done at an approximate density of one sample per 10 sq km. Each sample was analyzed for twenty elements including common indicator elements for VMS deposits such as copper, lead, zinc, silver and arsenic. Anomalous results were obtained from creeks draining some previously known VMS occurrences (DIAND, 1995, Yukon Minfile 105G/32, 34 and 40) but many others, including the streams draining the Wolverine Deposit, produced near background values. Anomalous results were also obtained from several drainages where there were no known mineral occurrences. Follow-up exploration has since located showings in many of the anomalous creeks with the most significant discovery to date being the Kudz Ze Kayah Deposit.

Expatriate was able to supplement the published reports with private data summarizing results of 1973 exploration managed by Archer Cathro on behalf of a joint venture (Cathro, 1973). The reconnaissance prospecting and geochemical sampling program explored for lead-zinc mineralization in the lower unit of the Layered Metamorphic Sequence but because the data provides relatively uniform coverage over the entire region, it is also suitable for evaluating areas underlain by the favourable middle unit. The Archer Cathro samples included approximately 5000 soils and stream sediments collected at a density of approximately one sample per sq km. They were all analyzed for lead, zinc, copper and molybdenum. As might be expected, this closer spaced sampling outlined many more areas of anomalous geochemical response than the

government survey. Almost all of the known volcanogenic occurrences showed up as anomalies on this survey, including Kudz Ze Kayah and Wolverine.

The following table illustrates regional geochemical backgrounds for the metals and anomalous thresholds used for target selection.

**GEOCHEMICAL BACKGROUNDS AND ANOMALOUS THRESHOLDS**

	<u>Background</u>	<u>Anomalous Thresholds (ppm)</u>			<u>Peak Value</u>
		<u>Weak</u>	<u>Moderate</u>	<u>Strong</u>	
Copper	25	50	100	200	1720
Lead	30	50	100	200	<4000
Zinc	80	200	500	1000	<4000
Molybdenum	<1	2	5	10	65

The Zamboni property was staked to protect targets selected from the Archer Cathro data. Peak values from 1973 sampling at Zamboni were 160 ppm copper, 290 ppm lead, 760 ppm zinc and 30 ppm molybdenum.

Copper, lead and zinc are major metals in most VMS occurrences in the Finlayson Lake area and are obvious indicator elements. Molybdenum is present in anomalous quantities in the banded iron formation overlying the Wolverine Deposit (Meade, personal communication, 1995) and appears to be slightly enriched in the felsic metavolcanic rocks. Based on the geochemical signature in the vicinity of known occurrences its presence can be used to distinguish copper anomalies associated with volcanogenic mineralization from those derived from ultramafic rocks.

## REGIONAL GEOPHYSICS

The only published geophysical data for the Finlayson Lake area resulted from airborne magnetic surveys conducted in 1961 by the GSC on behalf of the Department of Mines and Technical Surveys. The surveys were flown with fixed-wing aircraft at a nominal elevation of 300 m above ground level on east-west lines spaced approximately 1.6 km apart. Results are presented on a 1:250,000 scale map (DMTS, 1961) and in more detail on a series of 1:50,000 maps.

The largest, most intense areas of positive magnetic response are associated with obducted ultramafic rocks belonging to the Slide Mountain Terrane. Within the Campbell Range Belt where dips are usually moderate to steep, the anomalies are narrow and elongate while in the remainder of the block where the ultramafic rocks occur along shallowly-dipping thrust faults, they are much broader.

A series of secondary positive anomalies was also recorded over Yukon-Tanana rocks but until recently they had no obvious explanation. Prospecting and mapping have now shown that magnetite occurs locally within schists of the middle unit of the Layered Metamorphic Sequence. The greatest documented concentration of magnetite is found in the hanging wall of the Wolverine Deposit where it forms several thin horizons approximately 80 m up-section from the massive sulphide mineralization. Magnetite is also a significant constituent of the mineralization at Kudz Ze Kayah.

A pronounced linear zone of positive magnetic response occurs over a 10.5 km length along the property's western margin. Obducted ultramafic rocks belonging to the Slide Mountain Terrane have been observed in this belt. Two smaller zones of equally strong response are located along the southern property boundary. These zones coincide with Jurassic intrusive bodies. A third positive magnetic anomaly was outlined in the northeastern corner of the property. This anomaly is broader and less intense than the other two zones and its source has not yet been determined.

## PROPERTY GEOLOGY AND MINERALIZATION

With the exception of actively eroding banks along the larger creeks, outcrops are rare due to extensive glacial till cover. Property geology is shown on Figure 8 while the seven main rock types are described below. The first two belong to the Mesozoic Plutonic Suite, the third is part of the Slide Mountain Terrane while the remainder are part of the Paleozoic Layered Metamorphic Sequence of the Yukon-Tanana Terrane.

Pink granite, probably Cretaceous in age, forms bluffs along the banks of Big Campbell Creek. It weathers into large, angular, pinkish-grey blocks while fresh surfaces are pink, coarse-grained and unfoliated. Mineralogy consists of about 50% quartz, 40% feldspars and 10% biotite.

Jurassic hornblende=biotite diorite is composed of 70 to 80% feldspars, 10 to 20% hornblende, 5 to 15% biotite and 3 to 5% quartz. It is massive to moderately foliated and weathers white to grey. Its ferromagnesian content is sufficient to give the diorite a moderately strong aeromagnetic signature.

Ultramafic rocks, primarily peridotite, occur in a south-trending, 1 km wide band near the western property boundary. The peridotite is dark green, tough, dense, microcrystalline and unfoliated. It bears up to 30% serpentinite in pistachio green stringers and up to 5% magnetite as a fine-grained admixture in the groundmass. Magnetite was also observed as <1 mm octahedra along fractures. It gives the rock a strong aeromagnetic signature. Locally the peridotite contains up to 3% pyrrhotite in fine-grained blotchy disseminations and in one locality a vein of fibrous chrysotile was noted. Pervasive buff weathering quartz-carbonate alteration is developed within the ultramafic west of Big Campbell Creek. Magnesite is the dominant mineral in some of the quartz-carbonate zones with specimens assaying up to 20.5% magnesium.

DRAWN: AB PROJ: FP DATE: 18-FEB-97

The other four units are members of the Layered Metamorphic Sequence. Foliation attitudes in these units generally strike to the north or northeast and dip variably to the south or southeast.

Fine-grained felsite of rhyolitic composition varies in colour from white to bluish grey. Goethite and jarosite are common along fractures while sericite and ankerite are occasionally present. The felsite varies greatly in degree of foliation and sometimes exhibits prominent flaser banding that is best observed on weathered surfaces.

Chlorite schist is dark green, strongly foliated and variably mylonitic. It sometimes exhibits dark green serpentine along fractures.

Quartz-graphite schist varies from dark grey to coal black, depending upon graphite content. Foliation is intense and in some exposures mylonitic rodding is evident. Some outcrops along Big Campbell Creek show contorted foliations. Several andesitic dykes of unknown age cut the schist in one locality along Big Campbell Creek. The dykes are up to 10 m thick and are only weakly foliated. Their contacts with the schist weather to form prominent limonite gossans. The dykes are strongly carbonate altered and all surfaces effervesce readily in 10% hydrochloric acid.

Serpentine schist is lustrous pale green and often displays strong crenulations and chevron folds with 1 to 5 cm wavelengths. Powdery white clay minerals are common along foliations surfaces while fresh surfaces have a greasy feel.

### PROPERTY GEOCHEMISTRY

In 1995 grid soil sampling was done on the Box claims (Wengzynowski, 1996) while in 1996 some of the Clarence and adjacent Zamboni claims were grid sampled and the remainder of the property was reconnaissance sampled. The grid sampling was done at 100 m intervals along lines spaced 100 m apart using cut baselines for control. The reconnaissance samples were taken at 100 m intervals along claim lines, except where frozen or swampy ground prevented sample collection. All sample locations are marked with 0.5 m wooden lath bearing aluminum tags inscribed with the sample numbers and, where applicable, the grid coordinates. Figures 9 through 12 illustrate sample locations.

The samples were sent Chemex Labs Ltd. in North Vancouver where they were screened to -80 mesh, digested in nitric-aqua regia and geochemically analyzed for 32 elements using the Induced Coupled Plasma (ICP) technique. Certificates of Analysis are listed in Appendix III. Results for copper, lead and zinc are shown on Figures 13 through 24 while anomalous thresholds and peak values for six VMS pathfinder metals are as follows.

<u>Element</u>	<u>Threshold Values (ppm)</u>				<u>Peak Value</u>
	<u>Weak</u>	<u>Moderate</u>	<u>Strong</u>	<u>Extreme</u>	
Copper	50	100	200	NA*	274
Lead	50	100	200	NA*	370
Zinc	200	500	NA*	NA*	612
Molybdenum	2	5	10	20	68
Silver	1	2	NA*	NA*	4.8
Cobalt	30	50	80	NA*	90

\*NA = not applicable because property values did not reach the threshold.

In general soil geochemical response is subdued on the Zamboni property relative to most other Expatriate properties in the Finlayson Lake area. Eleven targets have been identified but most are only moderately anomalous for some of the main VMS pathfinder metals, as illustrated on the following table.

Peak Values (ppm)

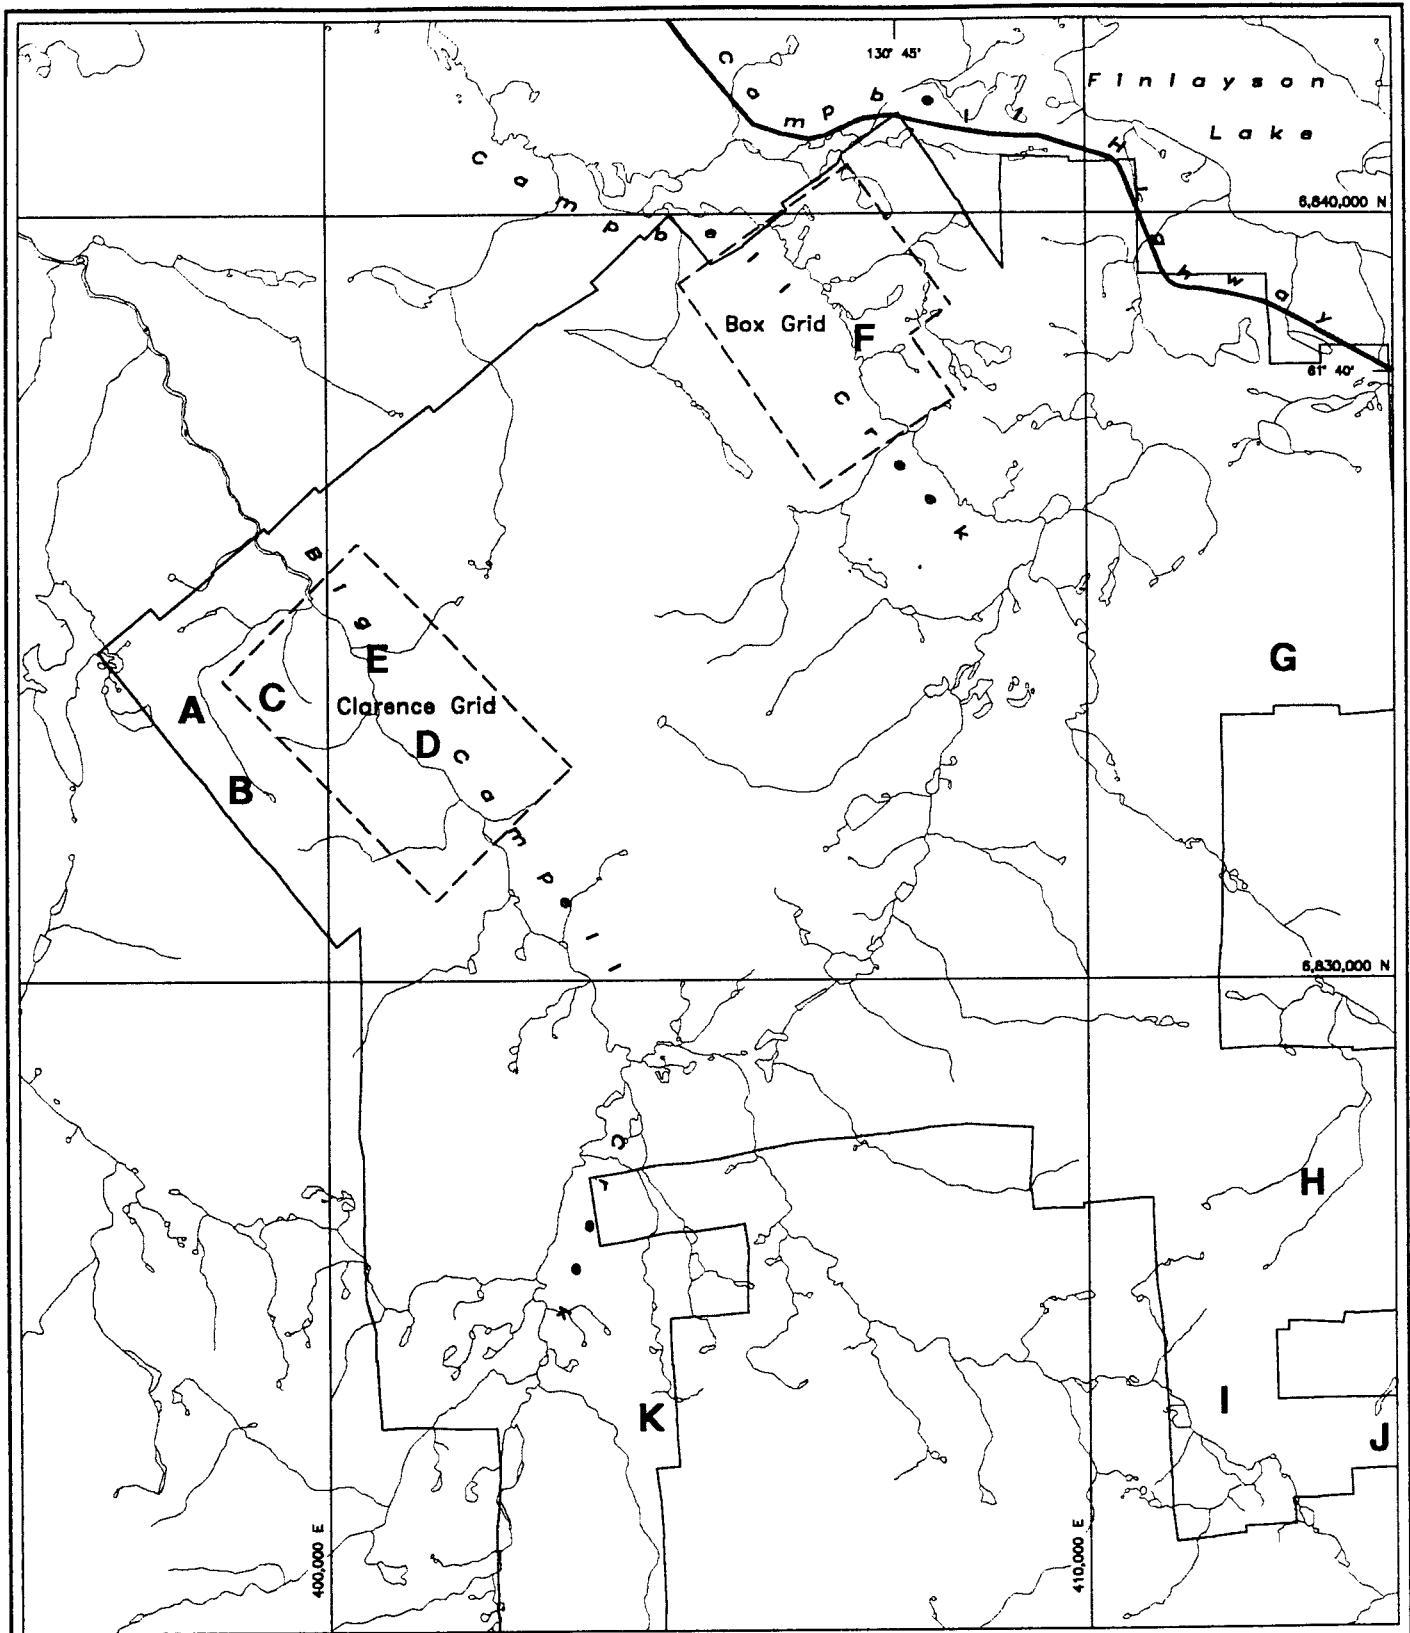

<u>Target</u>	<u>Copper</u>	<u>Lead</u>	<u>Zinc</u>	<u>Molybdenum</u>	<u>Cobalt</u>
A	61	66*	290*	1	14
B	162*	8	90	1	52*
C	137*	18	508*	9*	40
D	72	218*	550*	3	17
E	142*	42	244	20*	28
F	131	248*	294	18	35
G	82*	58	150	19*	33
H	114*	20	196	6*	27
I	121*	12	202	15*	54
J	198*	22	590	15*	46
K	114*	18	106	1	44*

\*Metals characteristic of the anomaly.

The targets are briefly described below while their locations are shown on Figure 25.

Target A was discovered on a reconnaissance line and consists of weakly anomalous lead and zinc values over a length of 600 m. Nothing is known about geology in the area.

Target B is located about 1 km southeast of Target A on the same reconnaissance line. Three samples taken over a length of 400 m returned weakly to moderately anomalous copper and cobalt results. The area is mapped as Yukon-Tanana Terrane but it is only 500 m west of a large block of Slide Mountain Terrane ultramafic rocks. The anomaly may be due to high backgrounds in the ultramafics.

DATE: MAR. 3/87	

Target C covers a 400 by 200 m area that is believed to be underlain by ultramafic rocks. Samples in the area produced weak to moderate copper, zinc and molybdenum response. While the copper may be explained by high background in ultramafics, zinc and molybdenum are not characteristic of that unit.

Target D consists of scattered weakly to moderately anomalous zinc and lead values within an 800 by 200 m area on the north bank of Big Campbell Creek. The target is underlain by Layered Metamorphic Sequence rocks.

Target E lies about 1 km downstream from Target D in the same geomorphological and geological setting. It is characterized by weak to moderate copper response with weak to extremely anomalous molybdenum support.

Target F lies on the 1995 Box Grid and was previously described in detail (Wengzynowski, 1996). It consists of weakly to strongly anomalous lead values scattered on the banks of Campbell Creek. The lead is supported by even more erratic copper, molybdenum and zinc results. The area is underlain by phyllite and quartz-muscovite schist of the Layered Metamorphic Sequence.

Target G is a broad, poorly defined anomaly encountered on three reconnaissance sample lines. The target is about 2500 by 2000 m and is characterized by weak to strong molybdenum response with weak copper support. Nothing is known about geology in the vicinity of the anomaly but it generally coincides with a broad aeromagnetic high.

Target H covers two reconnaissance sample lines and is approximately 1200 by 500 m. Weakly to moderately anomalous copper and molybdenum values typify the target. The area is mapped as Layered Metamorphic Sequence.

Target I lies about 3 km southwest of Target H in a similar geological setting. Molybdenum response is slightly stronger but copper is nearly identical. This target also straddles two reconnaissance lines and is about 1200 by 400 m.

Target J is located 2 km east of Target I and has almost an identical geochemical response. The anomalous samples occur over a 700 m length along a reconnaissance line.

Target K covers a 500 by 400 m area on the east side of a diorite stock. It consists of weakly to moderately anomalous copper values with weak cobalt support.

CONCLUSIONS AND RECOMMENDATIONS

Although the Zamboni property is underlain by units of the Layered Metamorphic Sequence which have potential to host VMS mineralization, soil geochemical response is relatively subdued. Eleven targets have been identified but none is assigned a high priority.

Future work should consist of additional wide spaced soil sampling in the vicinity of the targets coupled with geological mapping and prospecting traverses to explain the source of the anomalies.

Respectfully submitted,

**APPENDIX I**

**AUTHOR'S STATEMENT OF QUALIFICATIONS**

## STATEMENT OF QUALIFICATIONS

I, W. Douglas Eaton, geologist, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in North Vancouver, British Columbia, do hereby declare that:

1. I graduated from the University of British Columbia in 1980 with a B.Sc. majoring in Geological Sciences.
2. From 1971 to present, I have been actively engaged in mineral exploration in British Columbia and Yukon Territory and on June 1, 1981, I became a partner in Archer, Cathro & Associates (1981) Limited.
3. I have personally participated in or supervised the field work reported herein and have interpreted all data resulting from this work.

A handwritten signature in black ink, consisting of a large, stylized 'W' and 'E' followed by a long horizontal stroke extending to the right.

W. Douglas Eaton, B.A., B.Sc.

**APPENDIX II**  
**GPS SURVEYS**

**Zamboni Property**  
**GPS Survey Coordinates**

**Data Quality:** Standard = The surveyed positions were recorded in 3D mode and were differentially corrected. The reported UTM coordinates are within 1 to 5 meters of their actual locations; Poor = >25% of the surveyed positions were recorded in 2D mode; Uncorrected = The surveyed positions were not differentially corrected; N/S = No survey data available.

**Base Station:** W = Westmin Resources Limited base station at Wolverine Lake; WL = Ministry of Environment, Lands and Parks base station at Williams Lake; DL = Ministry of Environment, Lands and Parks base station at Dease Lake; RR = Department of Renewable Resources (Forestry) at Whitehorse.
