INTRODUCTION

Nordac Resources Ltd. has a 100% interest in the Touchdown property which protects previously discovered lead-zinc-silver mineralization and strong soil geochemical anomalies. The Touchdown 1-30 claims were staked in July 1995 and forty claims were added in February 1996, bringing the total to seventy.

This report describes geological mapping, prospecting and soil geochemistry conducted by Nordac during the 1996 field season. The work was completed by a four-person crew operating from a fly camp on the property. It was managed by Archer, Cathro & Associates (1981) Limited and supervised by the author. Appendix I contains the author's Statement of Qualifications.

HISTORY

The property was staked by various groups between 1947 and 1967. Field work during this period was limited to prospecting and minor hand trenching with the focus on lead-zinc-silver vein mineralization.

In 1972 Wolf Lake Joint Venture staked the Lampoon claims and performed minor grid and contour soil sampling plus geological mapping. Exploration was directed toward tungsten-bearing skarns however, samples were routinely analyzed for other metals, including lead, zinc, copper and silver. Geochemical response for lead and zinc was uniformly strong with values up to 3500 and 6900 ppm, respectively (Archer and Cathro, 1972). Silver values were sporadic while copper was generally subdued. Mineralized specimens reportedly returned up to 8.4% zinc, 1.3% lead, 4.5% copper and 0.93% molybdenum. No follow-up work was reported.

Parts of the area were restaked between 1974 and 1984 and received additional soil sampling, trenching and VLF-EM surveys. Most of the work was completed by B.A. Resources Limited which optioned the claims to West-Mar Resources Limited in 1988. Samples of massive sphalerite and lesser galena taken from a quartz vein reportedly assayed 33.5% zinc, 0.62% lead and 655 g/t silver.

Nordac conducted four mandays of cursory prospecting and geological mapping after staking the Touchdown 1-30 claims in summer 1995. This work relocated an old vein showing, specimens from which returned up to 44.60% zinc, 12.30% lead, 0.05% copper, 95 g/t silver and 1.48 g/t gold (Wengzynowski, 1996). Chalcopyrite-rich float was also discovered and a specimen yielded 3.13% copper, 0.42% zinc and 127 g/t silver.

PROPERTY, LOCATION AND ACCESS

The Touchdown property is located in southeastern Yukon at latitude 60°23'N and longitude 130°49'W on NTS map sheet 105B/7 (Figure 1). It is comprised of seventy contiguous mineral claims registered with the Watson Lake Mining Recorder in the name of Archer, Cathro & Associates (1981) Limited which holds them in trust for Nordac Resources Ltd. Claim registration data is listed below while locations are shown on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
Touchdown 1-30	YB60062-YB60091	February 15, 2002
31-70	YB75546-YB75585	February 15, 2002

*Expiry dates include work done in 1996 which has been filed but not yet accepted for credit.

GPS survey data was acquired for most claim post locations using handheld Trimble Geoexplorer GPS units. Data was corrected using Westmin Resources Limited's base station data accumulated near Wolverine Lake some 120 km north and is documented in Appendix II.

In 1996 the claims were accessed by helicopter from the Silver Hart camp 6 km to the southeast. Access to the Silver Hart is possible by a summer four-wheel drive road which leaves the Alaska Highway at Kilometre 1160 and extends 37 km north to the camp. A bulldozer trail continues from this point 7 km north to the Meister River. A spur off the trail extends west onto the eastern edge of the claim block as illustrated in Figure 2.

GEOMORPHOLOGY

The claims lie 50 km southwest of the Tintina Trench and cover an upland region within the Cassiar Mountains. Creeks draining the property flow into the Mister and Rancheria Rivers which are part of the Liard River watershed.

Local elevations range from 1100 m near the Mister River to 1750 m on a ridge crest in the centre of the property. Topographic relief is moderate to steep, averaging 20°. Slopes in the western part of the claim block exceed 30°. Pleistocene valley glaciers deposited thick accumulations of glacial till in valley bottoms and lateral moraines up to 1300 m. Hillsides above 1300 m usually exhibit a thin cover of talus.

About 70% of the property is above treeline (1350 m). Vegetation consists of dense growths of black spruce, balsam and alder to 1200 m, giving way to isolated stands of stunted black spruce interspersed with buckbrush and willow to 1350 m. Sparse buckbrush, moss and lichen predominate above 1350 m.

REGIONAL GEOLOGY

The Touchdown property lies within a belt of metamorphic rocks belonging to the Yukon-Tanana Terrane and Cassiar Platform (Figure 3). This belt extends from northern B.C. across the Yukon into Alaska. The northeastern edge is defined by the Tintina Fault Zone, a series of subparallel transcurrent faults which have produced about 450 km of dextral offset in Late Cretaceous and/or Early Tertiary times (Tempelman-Kluit, et al, 1976). The southwestern side is bound by the Teslin Suture, a deep-seated high angle fault zone.

Yukon-Tanana Terrane and Cassiar Platform rocks are composed largely of Paleozoic stratigraphy which has been intruded by Jurassic to Cretaceous plutons as illustrated on Figure 4. Both terranes are considered "suspect terranes" representing variably distal metamorphosed equivalents of North American Continental Margin sediments. Yukon-Tanana, the furthest outboard of the two terranes, is overthrust onto Cassiar Platform rocks by the D'Abbadie Thrust Fault. Some imbrication of the two terranes is also recognized and the structural position is further complicated by normal faulting. The regional metamorphic fabric within both terranes trends northwesterly and dips moderately toward the northeast.

Geology in the Rancheria area was mapped at 1:250,000 scale in 1960 by the Geological Survey of Canada [GSC] (Poole et al, 1960). More detailed mapping in the Rancheria District (105B/1,2,7 & 8) was done in 1985 and 1986 at 1:50,000 scale by the Department of Indian and Northern Affairs [DIAND] (Lowey and Lowey, 1986; Amuken and Lowey, 1987) in response to numerous base and precious metal discoveries in the area.

REGIONAL MINERALIZATION

The Cassiar Platform and intrusive rocks of the Rancheria area are host to numerous mineral occurrences including silver-lead-zinc±copper±gold veins, tin-tungsten-zinc skarns and lead-zinc-silver replacement bodies. The most significant discoveries in this region to date are the Midway, Logan and Silver Hart Deposits. The Midway Deposit is classified as a manto replacement body hosted in Devonian age strata and has drill-indicated reserves of 1.9 million tonnes grading 410 g/t silver, 7.0% lead and 9.6% zinc (NBCMI, 1991). Vein and shear-hosted mineralization occurs within the Cretaceous Marker Lake Batholith at the Logan Deposit where reserves are estimated at 12.3 million tonnes grading 6.17% zinc and 26 g/t silver (DIAND, 1995). The Silver Hart Deposit consists of a series of high grade silver-bearing veins reportedly containing 99,000 kg of silver (DIAND, 1995).

REGIONAL GEOCHEMISTRY

Published geochemical data for the Rancheria area is limited to reconnaissance scale stream sediment sampling conducted in the late 1970's by the GSC (Hornbrook, 1980). The sampling was done at an approximate density of one sample per thirteen sq km. Each sample was analyzed for twenty elements including copper, lead, zinc and silver.

Nordac was able to supplement the published reports with private data summarizing results of 1971-72 exploration managed by Archer Cathro on behalf of the Wolf Lake Joint Venture (Archer and Cathro, 1971 and 1972). The Archer Cathro samples include approximately 3600 soils and stream sediments collected at a density of about one sample per three sq km. They were analyzed for zinc, lead, silver, copper, molybdenum and tungsten and provide relatively uniform coverage over most of the region.

The following table illustrates regional geochemical background for pathfinder metals and anomalous thresholds used for target selection.

GEOCHEMICAL BACKGROUNDS AND ANOMALOUS THRESHOLDS (ppm)

<u>Metal</u>	<u>Background</u>	<u>A n o m a l o u s T h r e s h o l d s</u>			<u>Peak Value</u>
		<u>Weak</u>	<u>Moderate</u>	<u>Strong</u>	
Zinc	80	200	500	1000	5000
Lead	25	50	100	200	1000
Silver	0.1	1	2	5	20
Copper	15	50	100	200	554

Close spaced reconnaissance soil sampling in the vicinity of and on the Touchdown claim block in 1971 returned extremely anomalous values for zinc (6900 pm), lead (3500 ppm) and silver (20 ppm) while copper values were generally low.

PROPERTY GEOLOGY AND MINERALIZATION

Geology

Bedrock exposure on the property is restricted to ridge tops and creek cuts. Foliation is generally well developed and trends northwesterly with moderate to gentle dips toward the northeast. All units are conformable except intrusive rocks which exhibit irregular contacts. Isoclinal folds are observed in outcrops but large scale features have not been mapped. Veins, dykes and sills are developed parallel and perpendicular to foliation. Four rock types are recognized on the property and described as follows in approximate order of formation (Figure 5).

Quartz-muscovite-biotite±garnet schist is tan to grey, well foliated and slabby weathering. Biotite and muscovite alternate as the dominant mica present. Most of this unit is unmineralized however, several outcrops exhibit strong surface oxidation as a result of pyrrhotite and pyrite weathering. Where present the sulphides are fine grained, disseminated and comprise between 5 and 20% of the rock. Garnetiferous varieties of this unit are found in the northeast part of the property near the Meister River. Garnets are brown and range from 1 to 4 mm in diameter.

Limestone is grey, buff weathering and banded. Trace amounts of pyrite and pyrrhotite occur as thin laminae (2 to 4 mm wide).

Diopside±garnet±marble skarn is moderately banded, resistant weathering and varies in colour from green to white. This unit is up to 30 m thick and consists of alternating diopside and diopside-garnet rich bands. Some narrow bands contain 60 to 80% coarse almandine garnet (≤20 mm in diameter) in a white marble matrix.

Granodiorite is grey, non-foliated and blocky weathering. Composition is relatively consistent with approximately 60% feldspar, 20% quartz, 15% biotite and 5% muscovite.

Varieties of this unit include discontinuous quartz-feldspar porphyry dykes and sills.

Mineralization

Prospecting by Nordac between 1995 and 1996 discovered five types of mineralization on the property. Rock samples collected in 1996 were sent to Chemex Labs Ltd. in North Vancouver where they were analyzed geochemically for 32 elements by Induced Coupled Plasma (ICP) technique. Ore grade analyses for copper, lead, zinc, silver, gold, tin and germanium were performed on select samples. Sample locations are shown on Figure 6 while Certificates of Analysis appear in Appendix III. The various types of mineralization and sample results are described as follows.

- I. Diopside skarn float and outcrops are mineralized with 5 to 10% brown and blackjack sphalerite which occurs as bands parallel to foliation. The sphalerite is often oxidized on weathered surfaces leaving a strongly pitted texture in the host rocks. Float specimens collected returned up to 8.40% zinc, 0.07% lead, 29 g/t silver and 40 ppb gold. One hand trench exposed a 26 m width of variably mineralized skarn. A chip sample taken across an 8 m section of the strongest mineralization returned 1.87% zinc, 0.01% lead and 4 g/t silver.

- II. Diopside-garnet-marble skarn float is mineralized massive chalcopyrite. Although some nearly massive specimens were discovered, average float contains between 5 and 10% chalcopyrite. Mineralization of this type is restricted to a float train in the western part of the property. Specimens assayed as high as 29.10% copper and 238 g/t silver.
- III. Quartz±carbonate vein material contains massive patches of sphalerite and galena often with selvages that are strongly manganese stained. A specimen from a 0.35 m wide vein collected in 1995 returned 44.60% zinc, 12.30% lead, 0.05% copper, 95 g/t silver and 1.48 g/t gold (Wengzynowski, 1996).
- IV. Quartz-siderite breccia float contains up to 20% coarse-grained sphalerite with traces of galena and chalcopyrite. No samples of this type were collected for analysis.
- V. Narrow bands of cubic galena (≤ 2 cm wide) were found in an isolated limestone outcrop. No samples were taken.

PROPERTY GEOCHEMISTRY

Grid soil sampling was conducted in a six square kilometre area using four baselines that were oriented at 147° and cut to line-of-sight where necessary. One metre lath bearing aluminum tags inscribed with grid coordinates were placed at 100 m slope corrected intervals along the baselines. Soil sample lines were run perpendicular to the baseline and each sample site was marked with a 0.5 m lath and inscribed aluminum tag. Samples were taken at 100 by 100 m spacing on the grid. Reconnaissance soil samples were collected at 100 m intervals along claim lines outside the grid area and on a contour line along the southern side of the claim block.

Samples were sent to Chemex where they were screened to -80 mesh, digested in nitric-aqua regia and geochemically analyzed for 32 elements using the ICP technique. Soil sample locations are shown on Figure 6 and Certificates of Analysis are contained in Appendix III. Results for four indicator elements (zinc, lead, silver and copper) are plotted on Figures 7 to 10 while anomalous thresholds and peak values are as follows.

Anomalous Thresholds (ppm) and Peak Values (ppm)

<u>Element</u>	<u>Weak</u>	<u>Moderate</u>	<u>Strong</u>	<u>Peak</u>
Zinc	200	500	1000	>10,000
Lead	50	100	200	872
Silver	1	2	5	15.2
Copper	50	100	200	365

Anomalous geochemical response is restricted to the southwestern half of the grid. This 3 sq km area is best defined by zinc with the intensity of the response progressively increasing as the sample locations move away from a creek bisecting the central part of the grid up to a long

slope toward a broad ridge crest. An 1800 by 450 m zone of moderate zinc response was outlined along the southwestern edge of the grid. Strongly anomalous values within the zone define a northwesterly trend which is parallel to local foliation. Lead, silver and copper response within the anomaly is more subdued than zinc but shows a similar distribution pattern.

Local glacial direction within the grid area is believed to be from west to east and glacial smearing is at least partially responsible for the large area of zinc response. Hydromorphic dispersion may also account for part of the zinc anomaly because the slope is semi-saturated from seeps.

The strongest geochemical response coincides with mineralized areas discovered near the ridge crest and within creek cuts. Reconnaissance samples yielded only weakly elevated values for most metals.

CONCLUSIONS AND RECOMMENDATIONS

The Touchdown property is underlain by metasediments and intrusive rocks of the Cassiar Platform. Geochemical sampling has outlined a 3 sq km area of weakly anomalous zinc response within which are clusters of strongly anomalous values. Lead, silver and copper response coincides with zinc but is less intense. Glacial smearing and hydromorphic transport likely explain the extensive zinc anomaly.

The two most common types of mineralization found on the property are sphalerite-bearing diopside skarn and manganiferous sphalerite-galena rich siderite vein material. Most mineralization is found in the area of strongest soil geochemical response. Skarn specimens returned up to 8.40% zinc however, chip samples across widths greater than 1 m yielded less than 2% zinc with low values for most other metals. Vein specimens returned some high values for zinc, lead, copper, silver and gold but exposures discovered to date are variably mineralized and appear to be relatively discontinuous.

Further work is warranted on a low priority basis and should focus on the higher grade veins which resemble mineralization at the nearby Silver Hart Deposit. This work would consist of hand trenching across known occurrences and detailed prospecting along strike.

Respectfully submitted,
