LIST OF FIGURES

SUMMARY

The Dromedary property is located east of the Tintina Trench in the western Selwyn Basin, 240 kilometres north of Whitehorse in the central Yukon. The property is situated on the slopes of Kalzas and Dromedary Mountains and covers a portion of the low-lying MacMillan River valley between these two mountains. The property is comprised of 344 claims in the Whitehorse and Mayo Mining Districts. Blackstone Resources Inc. has an option to earn a 100% interest in the property by conducting $500,000 in exploration and by making staged cash and stock payments.

The Dromedary property is located within the Selwyn Basin geological terrane near the boundary with the Cassiar Platform. The oldest units exposed in the area are Proterozoic-Cambrian "Grit Unit", and extensive areas of Cambro-Ordovician Kechika Group phyllite and limestone. Minor exposures of Ordovician Road River Group shale and siltstones are also present. The most extensive unit in the area of interest is the Mississippian Earn Group. Earn Group lithologies include chert pebble conglomerates of the Crystal Peak Formation, fossiliferous limestone of the Kalzas Formation, black silty shale, argillite and an unnamed middle Mississippian chert-siltstone containing massive barite. A Permian-Triassic sandstone-shale-limestone unit blankets earlier Paleozoic strata. Middle Cretaceous subvolcanic intrusions of the South Fork Formation and quartz monzonite-granodiorite of Cretaceous age (90-120 Ma) intrude the above stratigraphy resulting in local biotite and calc-silicate hornfels and skarn.

The Dromedary property was first acquired by Anaconda Canada Exploration Ltd. during a regional exploration program in 1980. Anaconda conducted extensive exploration, including EM, magnetometer and gravity surveys, between 1981 and 1982. They identified, from east to west, four areas of interest: Dromedary Creek, Dromedary Mountain, François grid and Kal-Cave. Drilling was completed on the Dromedary Mountain and Dromedary Creek areas by Anaconda. The next period of exploration, 1988-1990, was conducted by Dromedary Exploration Company Ltd. culminating in a two hole drill program. In 1996, Blackstone Resources Inc. conducted a 939 metre drill program to test geophysical anomalies at Dromedary Creek (one hole) and on the François Grid (four holes). This drilling intercepted syngenetic massive sulphide mineralization in all holes, the most significant results being on the François Grid. Here, narrow intervals of economic grade Pb-Zn massive sulphide mineralization, as well as massive pyrrhotite mineralization containing significant gold concentrations were intersected. Minor mapping, prospecting and sampling was done in the Kal-Cave area where a number of showings are known along a 7.5 kilometre long, Pb-Zn-Ag soil anomaly exists.

In 1997, geophysical surveys in the François Grid area have provided important refinements of the geological trends related to mineralization. In particular, the strong magnetic signature associated with massive pyrrhotite mineralization can be traced over 5 kilometres. The numerous coincident gravity and magnetic anomalies detected along this trend are attractive exploration targets as diamond drilling in 1990 and 1996 has established the relationship between coincident gravity-magnetic anomalies and Pb-Zn mineralization.

Geological and geochemical work on the François Grid was less definitive due to the extensive overburden cover in this area. Isolated outcrops and trench geology has confirmed that the geological section hosting massive sulphide mineralization extends across the grid area. Limited soil sampling has detected elevated base metal values associated with coincident gravity-magnetic geophysical anomalies. Work on the King Claims did not turn up any new mineralization but soil sampling detected elevated base metal values west of the previous drilling in this area.

In the Kal-Cave area (DMC Claims), about 20 kilometres west of the François Grid, mapping and sampling was concentrated along the 7.5 kilometre long, lead-zinc soil anomaly which was originally delineated in 1982. The work was intended to provide additional geological information and rock samples between two main areas of investigation by previous workers: the Cave Showing and the Kal Trench area. Several new showings were discovered along the soil anomaly despite a general lack of outcrop on the Kal-Cave grid area and, in particular, of the mineralized zone. These showings were located by searching

between the the widely spaced lines (400m) originally explored by Anaconda in the early 1980's. They are characterized by iron sulphide mineralization, carbonate porphyroblasts, manganese oxide staining, and hematitic weathering, and are associated with fossiliferous strata. Some of the better results from this work include select samples which returned up to 5.53% Pb and 5.83% Zn, and chip samples up to 1.24% Pb and 0.60% Zn over 1.0 metre.

A comprehensive drill program for a total of at least 3000 metres in 23 holes is proposed for 1998 in the François grid area. This program will test several of the numerous geophysical anomalies present. A drill spacing of 200 metres between sections should adequately test for a massive sulphide body of economic size. Additional work on the King Claims should be contingent on success in the François grid area.

There is evidence of mineralization along the entire 7.5 kilometre length of the Pb-Zn soil anomaly on the DMC Claims. Work in 1997 should narrow in on specific targets. More detailed mapping plus trenching in areas of sparse outcrop could provide the necessary information for a focused drill program. As well, detailed magnetometer and electro-magnetic surveys should help determine targets based on results from the François Grid area.

1.0 INTRODUCTION

The Dromedary property is situated in the western portion of the Selwyn Basin on the east side of the Tintina Trench, 240 kilometres north of Whitehorse in the central Yukon (Figure 1). The property was originally staked by Anaconda Canada Exploration Ltd. in 1980 following a regional exploration program directed towards sedimentary exhalative (SEDEX) Pb-Zn-Ag deposits. In 1996, Blackstone Resources Inc. acquired an option on the property from Gerry Carlson, who controlled the property after title transfer or options to Fleck Resources Ltd., Dromedary Exploration Company Ltd. and Energold Minerals Inc..

In June and July of 1997, Blackstone Resources Inc. conducted an exploration program emphasizing geophysical surveys, geological mapping, and rock and soil sampling. This work was completed by Equity Engineering Ltd. for Blackstone Resources Inc.. Equity has also been retained to report on the results of the fieldwork.

2.0 LIST OF CLAIMS

The Dromedary property comprises two blocks of contiguous claims; one, made up of the Ace, Queen and King Claims, is located in Whitehorse Mining District (Figure 2a), and the other, comprising the DMC claims, is located in the Mayo Mining District (Figure 2b). The registered owner of the Ace, Nora 1-34 and DMC 1-36 claims is Gerry Carlson. Blackstone Resources Inc. has an option to earn a 100% interest in the Nora, Ace and DMC claims by expending $500,000 in exploration work and making stock payments totaling 200,000 shares over a three year period. The King and Queen claims were staked after the 1996 field program, and the Nora 35 to 40, King 17-20 and DMC 37 to 155 claims were staked during the 1997 field program; those claims that fall within three kilometres of the original Ace, Nora and DMC claims become part of the property under option and those outside of three kilometres are owned 100% by Blackstone Resources Inc.. Claim data for the Dromedary property is summarized in Table 2.0.1.

3.0 LOCATION, ACCESS AND GEOGRAPHY

The Dromedary property is located on the slopes of Kalzas Mountain and Dromedary Mountain, some 240 kilometres north of Whitehorse in the central Yukon (Figure 1). The center of the property is approximately equidistant from the towns of Mayo (95 km), Carmacks (115 km) and Faro (110 km). The nearest community is Pelly Crossing on the Klondike Highway located 85 kilometres to the west. The MacMillan River separates the DMC claims from the Ace-Nora-Queen-King claims to the east; the Pelly River flows south of the project area. The area falls within the Mayo and Whitehorse Mining Districts, centred at 62° 55' north latitude and 135° 00' west longitude.

The project is located in the Yukon Plateau physiographic province on the northern side of the Tintina Valley. Topography varies in the area of the Dromedary property from nearly flat on the François Grid, to relatively rugged on Dromedary Mountain and on the DMC claims, which are situated on the south-facing slope of Kalzas Mountain. Elevations range from below 600 metres on the François grid to over 1800 metres at the peak of Dromedary Mountain. Above treeline, at approximately 1400 metres, alpine vegetation predominates; lower elevations are covered by mixed forest of spruce, pine, alder, poplar and willow. Recently burned areas, such as on the DMC claims, are more difficult to traverse due to a thick tangle of new growth and fallen fire-killed trees. Outcrop exposure is extensive above treeline, but becomes more scarce further down the mountain slopes and is almost nonexistent on the flats of the

François grid. Permafrost is developed in poorly drained north-facing slopes and in valley bottoms covered by thick moss.

The area has a continental climate with low levels of precipitation and a wide temperature range. Summers are typically pleasant with long daylight hours, whereas winters are long and may be extremely cold. Snow cover usually disappears by the start of June and returns by the middle of September.

The 1997 exploration program was supported by a fly-in base camp in the south-central part of the Francois Grid on the Dromedary property. Most of the 1997 exploration of the DMC Claims was conducted from fly camps located on the property. Mobilization and demobilization was via the 760 metre long Clear Lake airstrip (6961600N, 491500E - UTM Zone 8) which is suitable for a Shorts Skyvan aircraft. Final mobilization to the camp and servicing of the camp was done by helicopter, supplied by Trans North Turbo Air, which was based in Mayo. A winter road exists into the Clear Lake area from Pelly Crossing. Float-equipped aircraft access the Pelly and MacMillan Rivers as well as the many lakes in the area.

4.0 PROPERTY EXPLORATION HISTORY

The Dromedary property was acquired by Anaconda Canada Exploration Ltd. during a regional exploration program for SEDEX Pb-Zn-Ag in 1980. During the early stages of the program, massive sulphide mineralization with lead, zinc and silver values was found in an extensive gossan zone on Dromedary Mountain while following up anomalous stream sediment geochemistry. A total of 728 claims were staked by Anaconda to cover this discovery and favourable stratigraphy. There is no record of exploration having been undertaken in this area prior to the work undertaken by Anaconda. A summarized history of the property after the discovery in 1980 up to the present is as follows:

- 1981(spring): Helicopter-borne magnetometer and EM survey followed by additional claim staking.
- 1981(summer): Line-cutting, geological mapping, soil sampling, ground geophysics (MaxMin II & magnetometer) and prospecting surveys. Reconnaissance prospecting resulted in the discovery of the Cave showing on Kalzas Mountain and additional staking. Seven diamond drill holes were completed on the Dromedary Mountain showing and three more on the Dromedary Creek target, for a total of 1900 metres.
- 1982(spring): Gravity survey.
- 1982(summer): Geological mapping, soil sampling, EM, gravity and magnetometer surveys on the Ace, Bush and Clare claims. Percussion hand drill soil sampling was undertaken to test geophysical anomalies in overburden covered areas on the François Grid.
- 1984: Anaconda closes Vancouver office and ceases exploration activities in Canada.
- 1985: Fleck Resources Ltd. acquires a total of 1,436 claims from Anaconda.
- 1988: Dromedary Exploration Company Ltd. acquired the Ace and Bum claims by option agreement from Fleck Resources Ltd. and conducted claim staking along with prospecting, soil sampling, geological mapping, geophysics and trenching. Rebagliati Geological Consulting Ltd. was commissioned to conduct a review of the Dromedary Project.
- 1990: Dromedary Exploration Company Ltd. conducted 434 metres (2 holes) of diamond drilling on the Francois Grid (Ace Claims). Placer Dome Inc. examined the property, including limited assaying of drill core, and recommended a large drill program. Due to a shift away from base metal exploration, the program was not undertaken.
- 1992: Kennecott Canada Inc. examined the property and conducted a small soil sampling program on the Cave showing area, which returned encouraging results. Kennecott did not continue, likely in response to sudden changes in management and a brief policy shift away from SEDEX targets.
- 1993: Energold Minerals Inc., owner of the Clear Lake deposit, optioned the property and carried out additional mapping, hand auger geochemical sampling and some ground magnetics. Energold was not able to raise sufficient financing to carry out their proposed drilling program.
- 1996: Blackstone Resources Inc. optioned the property and conducted a diamond drilling program (939 metres in 5 holes) and mapping and rock sampling program in the DMC Claims area.

The Dromedary property is located 15 kilometres north of the Clear Lake SEDEX Pb-Zn deposit. Although exploration in this area stretches back to 1965 following the discovery of the Faro orebody 80 kilometres to the south, the Clear Lake massive sulphide deposit was not discovered until 1978 by drilling. The deposit is hosted by carbonaceous argillite, siltstone, chert and tuff of the Devono-Mississippian Earn Group with geological reserves of 6.1 million tonnes grading 11.34% Zn, 2.15% Pb and 40.8 g/t Ag, using a cut-off of 7% combined Zn-Pb.

5.0 1997 EXPLORATION PROGRAM

The main objective of the 1997 exploration program was to refine geophysical (gravity, magnetic and electromagnetic highs) anomalies on the François Grid to enhance geological trends in preparation for future drilling. In addition, 50 man-days were spent geological mapping, prospecting, hand trenching and auger soil sampling to further delineate potential drill targets. One crew day was spent mapping, prospecting, and soil sampling on the King Claims in the eastern part of the property. As well, one day was spent examining the geology and mineral showings on Dromedary Mountain for comparative purposes.

On the DMC Claims, the main objective was to investigate the 7.5 kilometre long Pb-Zn-Ag soil anomaly, and its associated showings, which traverses the claims from west to east. Thirty-four man days were spent on the DMC Claims conducting geological mapping, prospecting, and rock and soil sampling, working out along strike from the known showings (the Kal and Cave Showings). The focus of the work was to uncover additional mineralization along the trace of this extensive soil anomaly.

Specifically, the 1997 program on the Dromedary Property consisted of:

François Grid Area (Ace and Queen Claims)

- 39.80 line kilometres of line-cutting.
- 31.26 line kilometres of gravity survey.
- 70.75 line kilometres of magnetometer surveying.
- geological mapping, prospecting
- 7 hand trenches to expose bedrock in areas of shallow overburden.
- 12 rock samples, 3 grab and 9 chip samples
- 56 auger soil samples on a mini-grid centred at 5400W and 700S.

King Claims

- geological mapping and prospecting, claim tagging (1 day)
- 5 rock samples
- 66 soil samples

DMC Claims

- geological mapping and prospecting.
- 79 rock samples, including 5 assay results.

- 70 soil samples collected in areas of mineralization.

- staking of an additional 119 claims to consolidate the ground position in the area.

6.0 REGIONAL GEOLOGY

The Dromedary property is located within the Selwyn Basin terrane near the boundary with the Cassiar Platform. Reconnaissance geological mapping of the Glenlyon 1:250,000 map sheets (105L) was carried out by the Geological Survey of Canada (GSC) from 1949 to 1956 (Campbell, 1967). Anaconda mapped the property at 1:5,000 (Hall, 1983). The following discussion and Figure 3 are based on Anaconda's mapping, but in order to be consistent with the GSC mapping, Campbell's unit numbers are used except for that of the Road River Group. The oldest units include minor exposures of Upper Proterozoic-Cambrian 'Grit Unit' (**Unit 1**) and extensive areas of Cambro-Ordovician Kechika Group phyllite and limestone (**Unit 4**), which is time correlative with stratigraphy hosting the Anvil deposits at Faro (Figure 3). Campbell (1967) and later, Gabrielse et al (1977), assigned the phyllite and limestone to the Anvil Range Group which is Mississippian or younger in age. These rocks are presumed to be erosional windows below unconformably overlying rocks (Hall, 1983). Although not recognized by Campbell, minor exposures of Ordovician Road River Group (**Unit 9**) are exposed in a few localities. The most extensive unit on the property are west-northwesterly trending strata of the Mississippian Earn Group (**Unit 13u**). The Earn Group includes extensive chert-pebble conglomerate of the Crystal Peak Formation (**Unit 11**), a proximal facies of turbidite fan complexes deposited in troughs developed by early to middle Paleozoic rifting. Fossiliferous limestone (**Unit 12**), unnamed middle Mississippian chert-siltstone, containing massive barite (**Unit 13**), and Permian-Triassic sandstone-shale-limestone (**Unit 10**) blanket the earlier Paleozoic strata.

Middle Cretaceous subvolcanic intrusions and volcanic rocks of the South Fork Formation (**Unit 21**) and quartz monzonite-granodiorite (**Unit 20a**) of Cretaceous (90-120 Ma) age intrude and overly the above stratigraphy. Age dates indicate that these intrusive suites may be comagmatic. Sedimentary units in intrusive contact aureoles are metamorphosed to biotite and calc-silicate hornfels and skarn, rendering identification of the protolith difficult. The magnetic signature of the South Fork intrusive plugs is subdued and has an annular magnetic pattern, and is likely caused by pyrrhotite hornfels surrounding the quartz monzonite.

TABLE 6.0.1
TABLE OF FORMATIONS

Intrusive Units

Cretaceous to Tertiary

South Fork Formation

Unit 21: Hornblende plagioclase and quartz biotite porphyry, intrusive breccia

Cretaceous

Unit 20a: Granodiorite, quartz monzonite

Stratigraphic Units

Permian-Triassic

Unnamed

Unit 10: Calcareous sandstone, micaceous silty shale (with minor fossil plant remains), arenaceous limestone (rare brachiopods). This unit was assigned a Mississippian or earlier age by Campbell; conodonts collected from the property by Hall (1983) give a Triassic age.

Devonian - Mississippian

Unit 13u: Undivided, may include Units 13, 12, & 11
Unnamed

Unit 13: Chert with silty shale partings, lenses of massive barite and nodular barite, argillite and limestone.
Kalzas Formation
Unit 12: Fossiliferous limestone (abundant crinoid and spirifer brachiopods), laminated fossiliferous sandy limestone, black silty shale (brachiopods), and crinoidal quartz sandstone.
Crystal Peak Formation
Unit 11: Chert pebble conglomerate, chert lithic sandstone, interbedded siltstone-shale

ROAD RIVER GROUP
Ordovician to Silurian

Unit 9: Graptolitic, siliceous and graphitic shale, siltstone

KECHIKA GROUP
Cambrian-Ordovician

Unit 4: Calcareous muscovite phyllite and wavy banded limestone, calcareous siltstone

Lower Cambrian or Earlier

Unit 1: Quartzite, interbedded sandstone and limestone

7.0 PROPERTY GEOLOGY

The geology of the Dromedary property is dominated by the Devono-Mississippian Earn Group sedimentary rocks and Cambro-Ordovician Kechika Group sedimentary rocks that are arranged in thrust panels, which result in repetitions of the stratigraphic sequence (Figure 3). These thrust sheets are northwest-trending, dipping to the south as part of a major imbricate thrust and fold belt (Hall, 1983). Cretaceous-aged granodiorite intrusions metamorphose and deform the sedimentary rocks in intrusive contact aureoles.

The geology in the François Grid area consists of at least two thrust panels of Earn Group chert, argillite and limestone of **Unit 13**, **13u**, and lesser **Unit 11** (Figure 4). These have been over thrust by limestone, siltstone and phyllite of the Kechika Group. Stratigraphy generally dips to the southwest. Mapping, hand trenching and the drill core from within **Unit 13** on the François Grid area show a mixed section of pyritic shaley phyllite and dark chert to siliceous siltstone. Minor limestone units have also been noted. Narrow beds of disseminated and wispy sulphides, primarily pyrrhotite and/or pyrite, are common in the section.

Overall, the geology in the area of the King Claims is very similar to the François Grid area (Figure 5). The same mixed section of shaley phyllite and siliceous siltstone to quartzite is present (**Unit 13**) overlain by limy, "Swiss cheese", phyllites of the Kechika Group (**Unit 4**). Fossiliferous shale of **Unit 13** with Mn-oxide staining and carbonate alteration (calcite) is also present. In general, bedrock exposure in the King Claim area is quite poor.

The south part of the DMC Claims (Kal-Cave area) is underlain by Cambro-Ordovician phyllites and limestone of the Kechika Group (**Unit 4** - Figure 6a,b). This section has been thrust onto a sequence of undivided Devono-Mississippian shale, siltstones and quartzite (**Unit 13u**) with beds of chert-pebble

conglomerate. At this point, there is some question whether units 13 on the François Grid, and 13u on the DMC Claims are not, in fact, the same unit. In the north part of the DMC claims, previous workers have identified additional occurrences of chert-pebble conglomerate (Crystal Peak Formation, **Unit 11**) as well as barite horizons (**Unit 13**), and shales and siltstones of the Ordovician-Silurian Road River Group. Cretaceous granodiorite to quartz monzonite intrusions have intruded, deformed and metamorphosed sediments to biotite and calc-silicate hornfels, and skarn in intrusive contact aureoles. Another thrust fault exists to the north of the DMC claims resulting in the repetition of units 13u and 11.

In the course of mapping in 1997, some evidence was found that may indicate the stratigraphy of unit 13u is older than Devono-Mississippian. Graptolites, characteristic in this area of Silurian aged Road River Group rocks, were found along a ridge top, well within the mapped extent of unit 13u (near line 4800E, 1750N). This fossil discovery indicates that there may be more thrust panels including Road River rocks present in this area than have been recognized, or, that unit 13u is actually older than Devono-Mississippian.

7.1 Mineralization

Mineralization on the property occurs as four types: syngenetic massive sulphides, bedded barite, skarn and quartz veining (Hall, 1983). From east to west, the mineralized areas are:

Dromedary Creek massive pyrrhotite mineralization in close association with fossiliferous argillite.

Dromedary Mountain poddy, massive pyrrhotite to pyrhhotite-galena-sphalerite mineralization, with a gold signature, in argillite (Unit 13) at the contact with the overlying thrust panel of Kechika Group rocks. Skarn mineralization, weak pyrrhotite-pyrite, can be found in altered rocks of the Kechika Group, characterized by tremolite, chlorite and magnetite. Bedded barite occurs on the north slope of Dromedary Mountain within Earn Group rocks.

François Grid massive to laminated massive sulphide mineralization including gold-rich pyrrhotite and laminated to massive galena -sphalerite, found in association with cherty argillite (Unit 13) in drill hole intersections over 2 kilometres of strike length. Several gossanous areas on Lone Mountain, in the western part of the François Grid, area have been investigated with the only significant mineralization being quartz-arsenopyrite-galena veining.

Kal-Cave area stringer and foliation parallel galena-sphalerite mineralization in association with pyrite-pyrrhotite in siliceous siltstone and shaley phyllite (Unit 13u), in showings found along a 7.5 kilometre long Pb-Zn-Ag soil anomaly. Bedded barite is present in this area associated with Earn Group rocks, in particular Crystal Peak Formation conglomerate.

7.1.1 François Grid and King Claims

On the François Grid, wispy pyrrhotite in cherty argillite was found in outcrop on line 3300 West, east of the drill holes completed in 1996. This occurrence could represent the strike extension of the pyrrhotite-rich stockwork located in the hanging wall to mineralization in drill holes FRN96-02 and -04. Analysis of this rock did not detect any significant base metal concentrations.

Five trenches were dug to investigate anomalous soil sample results in the area around line 5400W and 700S on the François Grid. Very finely disseminated sulphide mineralization was noted in several of the trenches. This is likely pyrrhotite or pyrite mineralization as the analytical results from the trenches were not elevated in lead or zinc. An additional two trenches were dug east of drill hole 90-1, on line 6100W at 800-825S. Neither of these trenches encountered significant mineralization.

No significant new mineralization was located on the King Claims in 1997.

7.1.2 DMC Claims

Two main showings, separated by about 5 kilometres, have been identified by previous workers on the DMC Claims; the Kal Trenches, which consists of several, trenched occurrences over several hundred metres of strike, and the Cave showing, which consists of three showings, the Cave, Fossil and Falls, stacked within a stratigraphic section (Hall, 1982; Keyser, 1990; Sellmer and Zuran, 1993). Mapping and prospecting in 1997 identified the significant field characteristics of the mineralization in the area of the Kal Trenches. The Pb-Zn mineralization is situated within a sequence of fossiliferous, calcareous quartzite, shale and siltstone and is characterized by strong Mn-oxide staining, dolomitic porphyroblasts, hematization (after pyrrhotite?), and calc-silicate alteration.

There are some differences in the host stratigraphy and the style of mineralization between the Kal and Cave showings. The geological section at the Cave Showing is dominated by "cherty", shaley rocks in the structural hanging wall whereas the Kal Trenches have predominantly quartzite and, locally, chert pebble conglomerate. Mineralization at the Cave Showing is observable over a wider section of stratigraphy, almost 100 metres thick. The Cave Showing has considerable Fe-oxide associated with it, ferricrete being one of its most distinctive characteristics. Galena and sphalerite mineralization is less obvious, overshadowed by strong pyrite-pyrrhotite mineralization. The iron sulphide mineralization occurs in a relatively siliceous rock, as fine grained disseminations up to 15% of the rock. Within the section of the Cave Showing, the Fossil Showing has characteristics similar to the mineralized zone at the Kal trenches; MnO staining, carbonatization, fossiliferous stratigraphy. It is assumed at this time that the Kal Trench zone is correlative with the middle of the Cave Showing area stratigraphy, the Fossil Zone.

Using the characteristics of the mineralized zone at the Kal Trenches as a guide, mapping and prospecting traced the mineralized stratigraphy west from about 6400E to 3600E where extensive overburden covers the trace of the zone. Working east from the Cave Showing at 1400E, mineralized stratigraphy can be traced to about 3200E. Several showings were located along the mineralized horizon in the course of mapping and prospecting. These showings are described below:

Gully Showing

Located about half way between the two main showings, (about 2.5 kilometres from each), this showing occurs in a small bluff on the margin of a gully where it crosses a low ridge. Mineralization is hosted in fossiliferous, shaley phyllite and occurs as disseminated and wispy galena and sphalerite. Select samples from this showing returned up to 5.53% Pb and 5.83% Zn (Sample #010469). Chip samples from this zone returned up to 1.2% Pb and 0.6% Zn over 1.0 metres (Sample # 596765). The soil anomaly associated with this mineralization is strongest just north of the gully which lies on the north side of the showing. It is possible that the best mineralization in the Gully Showing area is recessive and poorly exposed, consistent with the mineralized horizon on the Kal-Cave Grid in general.

Tim Zone

This zone is located about one kilometre west of the Kal Trench area along the trend of the mineralized horizon. Although there is very little outcrop exposure in the area, samples of manganese oxide stained, weathered float returned consistently anomalous values in lead and zinc over about 300 metres of strike. These values range up to 0.18% Pb (Sample # 596756) and 0.47% Zn (Sample #010417). Float with disseminated galena and sphalerite, which returned 0.93% Pb and 0.88% Zn (Sample 010419), was located about 400 metres east of the Tim Zone.

Tom Showing

Originally located in 1996 (Caulfield and Weber, 1996), the Tom Showing has been extended about 30 metres east in 1997. The distance between the two occurrences is about the extent of outcrop in this area. The Tom Showing appears to be a narrow zone of, at least partly, fracture controlled mineralization in well foliated phyllite. A 1.6 metre chip sample across the original showing returned 0.5% Pb and 0.7% Zn (Sample 010413). A grab sample of similar material east of the showing contained 2.27% Zn and 0.88% Pb (Sample 101453).

Ferricrete Zone

Abundant ferricrete occurs between 2400E and 3200E, along the base of the slope about 150 metres north of the baseline. Lead and zinc values are weakly elevated in the ferricrete but better values were found in float samples up slope in the vicinity of anomalous soil samples from the 1982 grid. The stratigraphy in this area likely represents an eastward extension from the Cave Showing which is characterized by abundant iron-rich mineralization and ferricrete. The best values from rocks in the area of the Ferricrete Zone are 1010 ppm Pb (Sample 010422) and 928 ppm Zn (Sample 010464).

Additional mineralization was detected along the mineralized horizon on the Kal-Cave Grid. The better samples are listed in Table 7.1.1.

Facies changes and zonation in the mineralizing system could account for the differences in mineralization and alteration style between the showings. The greater intensity of alteration and mineralization at the two main showing area suggests that these may be located near hydrothermal vents. The narrow and lesser developed zones (based on current data) elsewhere could be more distal to vents. Structural controls on mineralization, such as local basins, have not been identified.

8.0 SOIL GEOCHEMISTRY

Soil sampling was done in two areas of the main Dromedary Property: the King Claims and the François Grid. Soil sampling was also done in three areas of the DMC Claims: a mini-grid around the Gully Showing, a single line on strike west of mineralization at the Cave Showing, and a single line east of the Tom Showing. All samples were analysed at Chemex Labs for 32 elements (by ICP-AES) and gold (fire assay-AAS on a 30 g sample). Statistical analysis of the results of the soil sampling caan be found at the back of Appendix F.

8.1 King Claims

A total of 66 soil samples were taken, both along the central claim line to the King 1-16 claim block and along two lines designed to cross the prospective stratigraphy at right angles. Samples were taken at 100 metre intervals along the claim line, as well as at each claim post location and were dug to the B-horizon. The two cross lines were sampled at 25 and 50 metre intervals.

Statistical analysis of the results from this soil sampling survey (Appendix F) indicate a concentration of anomalous results (greater than 95th percentile) for lead, zinc, copper and barium, in the area around drill hole 81-8 which intersected a massive pyrrhotite body. Another area of anomalous results, particularly for zinc and barium is along the claim line between the number 1 and 2 posts for King 3 and 4 claims. This anomaly is on the slope toward Dromedary Creek west of the drill holes in this area.

8.2 François Grid

A small auger soil sampling grid was done in the vicinity of anomalous soil and rock samples taken in 1982 around 5400W and 700S. This area was chosen for sampling because of the apparent shallow depth of overburden. A total of 56 samples were taken at 25 metre spacing along lines spaced 50 metres apart. The samples were taken at depths between 45 and 130 centimetres. The object was to take all samples as close to bedrock as possible, essentially sampling the C-horizon of the soil.

Results of the survey show anomalous lead and zinc values concentrated near the centre of the grid, at 5450W and 700S. A weak northeast-southwest trend is apparent, particularly when looking at

some of the elements associated with mineralization in this area, such as barium and phosphorous. The low level for anomalous results (95th percentile for Pb = 28.5 ppm) may suggest that mineralization is weak in this area. Conversely, it may be that overburden is deeper than expected and is masking the geochemical response in soil relating to mineralization.

8.3 DMC Claims

Gully Grid

A total of 51 soil samples were taken on the Gully Grid, designed to test the mineralized horizon over about 300 metres of strike around the Gully Showing (at 4050E, 550N). Samples were taken at 25 metre intervals along lines spaced 100 metres apart.

Based on statistical analysis for the entire Kal-Cave Grid (Anaconda's 1982 data), the cut off for highly anomalous lead in this area is 60 ppm (95th percentile). A narrow lead and zinc anomaly (1 to 2 samples wide) with values up to 278 ppm Pb and 908 ppm Zn lies just north of the Gully Showing (Figure 8a). This anomaly arcs across the ridge and is strongest on line 4000E. The anomaly trends toward anomalous base metal values (91 ppm Pb and 445 ppm Zn) in soil samples from Anaconda's work on line 4400E, adjacent to a small ferricrete zone.

Line 700E

A short soil line was completed at 700E, between 1000N and 1250N for a total of eleven samples (Fig. 8b). Results from this line indicate a continuation of anomalous results from the Cave area showings. Lead and zinc values up to 110 ppm and 498 ppm respectively were found. These values are supported by anomalous results in barium, copper, manganese, and phosphorous. Also, magnesium values from this line are the highest in the 1997 sampling.

Line 5550E

Another short soil line was completed from the baseline to 200N at 5550E, also for a total of nine samples (Fig. 8c). This line was located east of the Tom Showing to look for continuation of that mineralization. Results of the sampling were weak in general. However, there is a single sample anomaly in lead (86 ppm) located along strike from the Tom Showing.

9.0 GEOPHYSICAL SURVEYS

Gravity and magnetic surveys were conducted on the François Grid during the 1997 field program. The surveys were done on fill-in lines to the grid surveyed by Anaconda in 1981 and 1982. This fill-in provided geophysical information at 100 metre line spacing from line 3000W to 6600W and 200 metre line spacing from 6600W to 8700W. The lines were surveyed to 1000-1300N and 1000-1800S in the east part of the grid, and from 450-900N to 2000S in the western part of the grid. The results of these surveys were tied into previous results from Anaconda on both the François and Lone Mountain grids.

A summary of the results of the geophysical surveys is included in this report as Appendix D. Overall, the surveys provided high definition data over several strong magnetic and gravity anomalies which are related to stratigraphy and to mineralized zones in the François Grid area. A total of 19 separate anomalies have been identified by the gravity survey. The geophysical data defines at least three major trends of coincident gravity and magnetic highs as well as several isolated gravity-magnetic and gravity-only highs. The most significant anomalous trend crosses the entire François Grid from east to west, a distance of over 5.8 kilometres. Lead-zinc mineralization associated with the geophysical anomalies has been located along this trend over 2.2 kilometres. The rest of this trend, as well as the

other anomalous trends on the François Grid have not been tested for mineralization and have only minimal surface geological information available. The geophysical surveys on the François Grid have provided compelling reason for more exploration, particularly diamond drilling, in this area.

10.0 DISCUSSION AND RECOMMENDATIONS

The potential to host large tonnage SEDEX deposits in the western part of the Selwyn Basin was first recognized by Anaconda personnel in the early 1980's. The presence of stratabound sulphides and barite in close association with coarse clastic rocks of the Earn Group indicated a depositional environment and setting not unlike that hosting the Tom and Jason deposits (29 Mt of 6.8% Zn, 5.78% Pb, 64 g/t Ag) in the MacMillan Pass area and the Clear Lake deposit (6.1 Mt of 11.34% Zn, 2.15% Pb, and 40.8 g/t Ag) located 15 kilometres south of the property. Similar to other productive SEDEX camps, stratabound and stratiform mineralization, dominated by pyrrhotite, have been found occurring over a strike length of 40 kilometres at Dromedary. At Howard's Pass, a series of stratiform lead-zinc showings extending along 40 kilometres of strike length were defined prior to discovery of the main deposit.

10.1 François Grid and King Claims

The 1997 field program on the François Grid was successful in delineating the magnetic and gravity geophysical signature associated with mineralized horizons which were intersected in previous drilling by Blackstone Resources Inc.. Blackstone's 1996 program encountered economic grades of Pb-Zn-Ag massive sulphide mineralization, and identified a broad zone of chlorite-silica-pyrrhotite alteration, possibly a feeder zone to the massive sulphide mineralization. The Au-bearing, massive pyrrhotite intersected in drill hole 90-1 is undoubtedly equivalent to lower zone mineralization in drill holes FRN96-02, and -04 (Figure 4). These correlative horizons are 1000 metres apart and demonstrate the excellent continuity of the mineralization at this stratigraphic level. The magnetic anomaly associated with the massive pyrrhotite mineralization intersected in 1990 and 1996 has been traced over 4 kilometres to the west and 1 kilometre east by geophysical surveying in 1997. Several large gravity anomalies coincident with this magnetic feature (Appendix D) represent attractive targets for further exploration. Mineralization with similar character on the King Claims indicates that the system is more widespread.

Auger soil sampling from 1997 and 1982 has detected weak to moderate Pb-Zn soil anomalies (Figure 7) corresponding to magnetic-gravity anomalies A and B (Appendix D) on the François Grid. These anomalies lie along strike from massive pyrrhotite and/or galena-sphalerite to the east and west. Similar soil anomalies on the King Claims are associated with the massive pyrrhotite body in that area.

An aggressive program of diamond drilling is recommended for the Dromedary Property. This program will investigate the greater than 5 kilometre long, coincident gravity-magnetic anomaly and trace the mineralization encountered in drill holes FRN96-02 and 04 on the François Grid. A drill program of at least 3000 metres in 23 drill holes would test most of the significant geophysical and geochemical targets on the François grid at an acceptable step-out spacing of approximately 200 metres. This program will be subject to modification as new information is gained by the drilling.

Additional geophysical work should be done on the west part of the François Grid once it is determined that the anomalies detected in 1997 are in fact related to lead-zinc mineralization. The density of the geophysical information in the west part of the François Grid should be brought up to the level of the east part of the grid (100 metre spacing on cut lines). Geological and geochemical evaluation of the Lone Mountain area should be done in light of the new geophysical information available. Any further work on the King Claims should be contingent on success in the François Grid area as the targets on these claims are of lesser calibre.

It would be advisable to stake additional claims to the north and south of the François grid area to provide protection in the event of a discovery. The south boundary of the property may be too close

for complete development of an ore-body dipping south from the area of current investigation. Less is known about the rocks to the north but there are several interesting geophysical anomalies which lie close to the current boundary in this area. One or two claim widths should be sufficient in both cases.

10.2 DMC Claims

Several new mineralized showings along the trend of a significant lead and zinc soil anomaly over 7.5 kilometres in length were discovered in the 1997 field program on the DMC 1-155 Claims. The showings were found by searching between the widely spaced lines originally explored by Anaconda in the early 1980's. Overall, the mineralized zone is characterized by iron sulphide mineralization, carbonate porphyryblasts, manganese oxide staining, and hematitic weathering, and is associated with fossiliferous strata. Galena and sphalerite mineralization occurs as narrow stringers to wispy disseminations in a zone which is sub-parallel to the bedding overall. The consistent association of the mineralized zone with a fossil-rich horizon and its bedding parallel orientation indicates the mineralization is most likely stratabound, characteristic of SEDEX deposits.

Detailed soil sampling in 1997 has detected weak to moderate Pb-Zn soil anomalies corresponding to the strike of the mineralized zone which crosses the DMC Claims. These anomalies lie along strike from galena-sphalerite mineralization in several showings and provide additional indication of the continuity of the mineralized zone.

Work in 1998 should concentrate on filling in more geological information on the mineralization found to date and expanding the mineralized zone overall. Additional mapping and prospecting would likely turn up more showings. A trenching program could fill in needed geological information in areas of anomalous soils and sparse outcrop such as west of the Kal Trenches, and east of the Cave area showings. Magnetometer and electro-magnetic surveys may prove useful on the DMC Claims as they have in the François grid area. Any new survey lines should be done intermediate to the old Anaconda grid to avoid duplication of information and give a more detailed picture of the grid area. An alternative way to achieve detailed, blanket geophysical coverage of the DMC Claims would be a closely spaced airborne survey. This fill in work should lead to more definitive drill targets along this very large geochemical anomaly

It is recommended that a study of the fossil record in the Kal-Cave stratigraphy be undertaken to determine the age of the host rocks to most of the mineralization. The apparent presence of graptolite fossils, which reach only to the upper Silurian, in the Devono-Missippian Earn Group rocks of Unit 13u is inconsistent. If Unit 13u is in fact older, possibly upper Silurian in age, it opens up new potential for exploration in a different section of stratigraphy. A Silurian age would be consistent with the lead isotope data obtained on mineralization from the François Grid and Kal-Cave areas of the Dromedary Property (Appendix G) and the huge Howard's Pass deposit in the eastern Selwyn Basin. Detailed geological mapping should be done to determine the relationship to the mineralized zone of the apparent "trough fill" sediments, the pebble conglomerates which occur north of the Kal Trench and Tim Zone areas. As well, the mapping should attempt to identify other areas with similar conglomerate units as this is a key component to the SEDEX deposit model which is being applied on the Dromedary Project.

Respectfully submitted,

STATEMENT OF EXPENDITURES
DROMEDARY PROPERTY
ACE, NORA, QUEEN, AND KING CLAIMS
June 19 to July 21, 1997

CANADA) In the matter of an evaluation program on the Dromedary property

I, Murray I. Jones, of Equity Engineering Ltd., 207, 675 West Hastings Street, Vancouver, B.C. do solemnly declare that a program consisting of line cutting, geochemical sampling, geological mapping, prospecting and geophysical surveying was carried out on the ACE, NORA, QUEEN and KING Mineral Claims between June 19 and July 21, 1996. The following expenses were incurred during the course of this work and in the compilation and reporting of the results:

FRANÇOIS GRID AREA - ACE, NORA, AND QUEEN CLAIMS

STATEMENT OF EXPENDITURES
DROMEDARY PROPERTY, DMC 1-155 CLAIMS
June 30 to July 21, 1997

CANADA) In the matter of an evaluation program on the Dromedary property

I, Murray I. Jones, of Equity Engineering Ltd., 207, 675 West Hastings Street, Vancouver, B.C. do solemnly declare that a program consisting of, geochemical sampling, geological mapping, and prospecting was carried out on the DMC Mineral Claims between June 30 and July 21, 1996. The following expenses were incurred during the course of this work and in the compilation and reporting of the results:

1997 GEOPHYSICAL PROGRAM ON THE DROMEDARY PROPERTY

TABLE OF CONTENTS

INTRODUCTION

In the spring of 1997 a recovery and compilation of geophysical survey data was started on the Dromedary Property. This earlier work was performed by Anaconda Canada Exploration Ltd. in 1982 and 1983 under the direction of Mr. Alan Scott. The survey area was selected, in part, on the basis of airborne EM and magnetic anomalies detected by Geoterrex in 1981.

From June 28 to July 21, 1997 MWH Geo-Surveys Ltd., read and levelled 1253 new gravity stations and 104 repeat stations on the Francois Grid. New grid lines were selected to fill in the wide line separations used by Anaconda. A station spacing of 25m was used. The new levelling information was used to integrate the Anaconda gravity data into the 1997 compilation.

Between July 9 and 19, 1997 Amerok Geosciences Ltd. collected 68.7 line kilometres of magnetometer readings at a station spacing of 12.5m. The results of Anaconda's 1982 magnetometer survey were adjusted to level with the 1997 survey.

The four main gravity anomalies identified by Alan Scott in 1983 were reestablished. Several new gravity anomalies with or without coincident magnetic responses were observed.

PREVIOUS WORK

Anaconda named this area the Selwyn Project and established two cut grids, the Lone Mountain and the Francois. Between May 27 and September 15, 1982 Anaconda completed 42 line kilometres of linecutting and chaining, 40 line kilometres of total field magnetometer and horizontal loop electromagnetic surveys and 23 line kilometres of gravity and levelling surveys. A cursory study of the Anaconda maps indicated that the data was worth salvaging.

Quoting from Alan Scott's 1983 Geophysical Report "The exploration target on the Francois Grid is stratabound, sediment hosted, Ag/Pb/Zn massive sulphides. The objectives of the geophysical work were to assist geological mapping in this heavily overburden covered area by line to line correlation of geophysical responses, and the direct identification of targets for follow up trenching and/or drilling."

Profiles and plan maps of this work were located. Most of the magnetometer readings were read off a plan map and entered into a spreadsheet program. A few lines were only available as stacked sections. The gravity and elevation data was scaled from stacked sections and entered into a spreadsheet. There was no attempt to digitize the HLEM profiles.

The compilation of the Anaconda data confirmed Alan Scott's interpretation of four gravity anomalies. His designations of A, B, C and D are retained in the current interpretation. Anomalies A to C were well defined and found in an area of relatively flat topography. They were closely related to both magnetic and HLEM anomalies. Anomaly D had a higher amplitude but was less well defined and found in an area of more rugged relief.

Unfortunately, the Anaconda gravity and elevation profiles were either not levelled to each other or the necessary field notes were not located.

While MWH Geo-Surveys Ltd. was on the property several repeat readings were collected on the 1982 Anaconda grid. These repeats were used to achieve a rough levelling of the old and new data.

LOCATION AND ACCESS

The Dromedary Property is located approximately halfway between the towns of Mayo and Faro, Yukon Territory. The Francois and Lone Mountain grids are situated to the west of Dromedary Mountain.

The baseline for the Francois grid is a westward extension of the baseline for Anaconda's 1981 Ace grid.

GROUND CONTROL

All gravity stations were surveyed by MWH Geo-Surveys Ltd. for vertical position using a Sokkisha SET5 total station transit. Horizontal control was as shown on picket line sketches. X and Y coordinates (eastings and northings) were not surveyed by the gravity crew.

To translate Anaconda's Francois grid from local grid coordinates to UTM space the following steps were followed;

1. Add 6145 to the X and 0 to the Y station coordinates. This introduced a grid origin of 0,0 to a known UTM point.
2. The baseline azimuth of the Francois grid is 108°. The grid coordinates were rotated clockwise 18°.
3. The last step involved shifting the whole metric grid from the 0,0 origin to UTM Zone 8 by adding 508035mE to X and 6975000mN to Y.

The most straightforward method of locating the Lone Mountain grid was to tie it to the Francois Grid.

1. Field notes for the Lone Mountain grid record tieline 2000S as baseline 0. All stations were measured north and south of this line. The 0+00 station must be shifted to 2175.0S by subtracting 2175. Line 2000E must be shifted to 8465.0W by subtracting 10465.
2. After the coordinate shift is applied the same three steps used to translate the Francois grid into UTM Zone 8 were followed.

The following notes were supplied by Amerok Geosciences Ltd.:

The 1982 Anaconda ground magnetic survey used a reference datum of 58,000 gammas while the 1997 reference datum was set at 57,000 gammas. The 1982 results were adjusted to this year's survey.

Discrepancies in the chaining of the grid necessitated the following adjustments to the line numbering:

L6200W north of the baseline renumbered as L6300W
L6300W north of the baseline renumbered as L6400W
L6400W north of the baseline renumbered as L6500W
L6400W south of the baseline renumbered as L6350W
L6500W north of the baseline renumbered as L6550W
L6600W north of the baseline renumbered as L6650W
L6600W south of the baseline renumbered as L6650W

DATA REDUCTION

Magnetometer Surveys

In 1982 Anaconda used an EDA ppm 300 magnetometer, in conjunction with an EDA ppm 400 base station recording magnetometer. Readings were taken at 25m intervals with some 12.5m in-fill readings taken in areas of steep magnetic field gradients. The data was levelled to a datum of 58,000 gammas and corrected for diurnal variation. These EDA magnetometers represent the first generation of memory magnetometers. They were rugged and reliable instruments and produced good quality data.

In 1997 Amerok Geosciences conducted a one person Mag/VLF survey using EDA Omni plus field and base station magnetometers with an optional VLF receiver. These instruments represent the ultimate advance of EDA's magnetometer line. Shortly after these magnetometers appeared on the market EDA was absorbed by Scintrex Ltd. The data was downloaded to a laptop computer for final processing and plotting.

Despite the number of repeat readings it was not possible to successfully level certain parts of the magnetic compilation. The old readings were referenced to the new. These "herring bone" patterns and abrupt terminations of contours are most apparent on the coloured contour map.

VLF Survey

In 1997 Amerok Geosciences was asked to collect VLF test data on at least two lines (4100W and 4300W). The equipment was tested and was found to be in sound working order. After concluding that signal strengths were too weak to generate useful data this survey technique was abandoned.

Gravity Surveys

A Lacoste & Romberg gravimeter was used by Anaconda in 1982 along with a Topcon Guppy EDM to collect relative station elevations. The raw gravity was corrected for tidal and meter drifts and Bouguer gravity values were calculated for specific densities of 2.0, 2.2, 2.4, 2.6 and 2.8 g/cc. Despite the generally low relief inner terrain corrections were applied to all the plotted values. All terrain corrections were made using an average terrain density of 2.0 g/cc.

MWH Geo-Surveys also used a Lacoste & Romberg gravimeter (#371). The core of the Lacoste & Romberg has remained relatively unchanged for decades. All of the gravity readings were collected on closed loops to allow the operator to correct for instrument drift. All grid loops were tied to a base established at the Equity Engineering camp. The camp base was assigned a value and all subsequent survey loops were tied to this base.

The gravimeter readings were converted to milligals, using the appropriate meter variables and corrected for instrument height, earth tides, drift between base ties and adjusted to the base value. These calculations combine to produce the Observed Gravity. The formula used for the Bouguer Gravity corrections is;

$$Gb = Gobs + tc - Gl + (0.3086 * h) - (0.04192 * h) * d$$

where: Gb = Bouguer Gravity; tc = Terrain correction; Gobs = Observed Gravity; h = Station elevation; Gl = Latitude correction; d = specific density

Bouguer gravity data was calculated using densities of 2.3, 2.5 and 2.67 g/cc. Repeat stations totaled 104 with an average repeatability of 0.015 milligals.

INTERPRETATION

A total of 20 anomalous areas were identified. They are drawn on the accompanying interpretation map (Map 1) lettered A through T.

As previously mentioned Targets A through D are essentially the same as those identified by Alan Scott for Anaconda in 1983. The additional gravity data collected in the vicinity of Target D have reduced the odds that it is an artifact of more rugged topography.

Magnetic Interpretation

The merged and leveled ground magnetometer surveys from Anaconda (1982) and Amerok Geosciences (1997) are presented as a colour contoured plan (Map 2). The Francois and Lone Mountain grids are plotted. The data quality is far superior for the Francois grid.

The most striking feature is the sharp east-west gradient that slices through the middle of the grid. This is interpreted as the edge of a thrust contact. Equity Engineering's "1996 Exploration Program on the Dromedary Property" report describes the property geology as being dominated by Devono-Mississippian Earn Group sediments and Cambro-Ordovician Kechika group sediments that arranged in thrust panels, which result in repetitions of the stratigraphic sequence. The Dromedary Creek and the Francois grid areas consist of at least two thrust panels of Earn Group chert, argillite and limestone. These have been over thrust by limestone, siltstone and phyllite of the Kechika Group.

The magnetic map shows a pronounced regional magnetic high that stretches from line 8700.0W, 1200.0S to line 2900.0W, 200.0S. Within this trend there are four well defined magnetic anomalies with peak amplitudes in excess of 1000 gammas. The high and variable susceptibility indicates that the cause may be skarn units. The area south of the thrust contact with the intense magnetic variation correlates with the Kechika Group. The magnetically quiet area north of the thrust contact represents the over thrust Earn Group. The steep gradient to the north and the shallow gradient to the south imply a shallow dip to the south for these rocks. Figure 1 illustrates the change in magnetic profile shapes over a tabular magnetic body plotted for dips from 0 through 180 degrees.

A second, less pronounced thrust contact can be traced across the northeast corner of the Francois grid stretching from line 4700.0W, 800.0N to line 3200W, 1200.0N. The high susceptibility of this area indicates the presence of Kechika group rocks.

Gravity Interpretation

Anomalies A to C

These three anomalies all lie immediately to the south of the pronounced regional break in the magnetic survey. This would place them in the Kechika Group. The gravity anomalies are essentially coincident with strong magnetic highs that have amplitudes of several hundred gammas. The gravity anomalies are not as continuous as the magnetic feature but may represent the same stratigraphic horizon. The discontinuities may be caused by locally thicker pockets of overburden or by less obvious north-south trending structural breaks. The anomalies are quite distinct and occur in relatively flat ground. Topographic influences should therefore be minimal. Anomaly amplitudes rarely exceed ½ a milligal.

Anomaly A has had one hole (DDH 90-01) drilled to its south on line 6200.0W but is otherwise untested over its 800 metre strike length. This hole intersected Au-bearing, massive pyrrhotite, equivalent to the lower zone mineralization seen in holes FRN 96-02, and 04. The east end of Anomaly B was tested by two holes (DDH 90-02 & FRN 96-01) but is also largely untested over its 800 metre strike length.

Three holes (FRN's 96-02, 96-03 and 96-4) were drilled near Anomaly C. Hole 96-04 should have caught the southern edge of the coincident gravity and magnetic high. The other two holes may have been collared too far south to adequately test the target. Even so, holes FRN 96-02, and 04 intersected two massive sulphide zones. "The metal suite of the upper zone is similar to other Earn Group deposits, containing economic Pb-Zn-Ag grades with anomalous Hg ands As, while the lower zone contains lower Pb and Zn grades, but higher Au grades."[1] Anomaly C has a length of 500 to 600 metres.

Numerical modelling of a 10 million tonne tabular orebody (Fig. 2) illustrates how the shape of a gravity profile will change as the dip progresses from horizontal to vertical. The mirror images of the 30 to 60 degree profile shapes are similar to the actual field surveyed profiles for Anomalies A,B and C. Figures 3 and 4 illustrate how anomaly amplitudes and widths change with increasing depths. A thin tabular body of 5 million tonnes will respond as shown in figure 3. Note that at a depth of 50m the anomaly amplitude is ½ a milligal, roughly the same as we observe over Anomalies A,B and C. If the mineralization is more compact, as shown by the cube in figure 4, the amplitude of the gravity high will be more than double but the width will remain roughly the same.

Geological mapping notes four known types of mineralization on the property: syngenetic massive sulphides, bedded barite, skarn and quartz veining (Hall, 1983). The massive sulphides and bedded barite both have high enough specific densities to produce gravity highs.

Figure 4

Anomaly D

In 1983 Alan Scott described Anomaly D as "of higher amplitude than the others, but is somewhat less well defined as it is in an area of more rugged relief. Anomaly D has a strong, flanking HLEM response to both the north and south." The 1997 work shows that in addition to the flanking EM Anomaly D has a coincident magnetic signature of approximately 400 gammas. The local terrain is more rugged however the coincident gravity and magnetic highs lend credibility to this target. It cannot be dismissed as a topographic artifact. The gravity profiles show a maximum amplitude of approximately ½ milligal. The source appears to dip towards the south and has a strike length of 400m.

Anomalies E to L

These anomalies are rated as secondary targets. They were generally selected on the strength of a gravity high with a coincident or flanking magnetic expression. They all lie in the area interpreted as the northeast thrust sheet. They were not identified during the 1982 Anaconda work program. There is a strong likelihood that anomalies E,F,G constitute a single horizon and that anomalies H,I,J a second. These are not strong or broad anomalies, their amplitudes range between ¼ and ½ milligal.

Anomalies M to Q

These five targets lie within the area interpreted as Earn Group sediments. Targets N,O and P have small, weak, coincident magnetic responses. The gravity anomalies are generally less than ¼ of a milligal.

Anomalies R, S and T

All three of these anomalies lie at the edge of the main thrust contact or south of it. Anomalies R and S do not exhibit any coincident or flanking magnetic highs. Anomaly R is a weak gravity high that was selected because of its proximity to the primary anomaly A. Unfortunately, anomaly S lies at the end of the grid lines and is open to the south. It appears to have an amplitude of close to ½ a milligal and therefore should not be overlooked. Anomaly T lies on the thrust contact. Although it is weak its proximity to primary target C lends it more credibility.

DISCUSSION AND RECOMMENDATIONS

The 1997 gravity and magnetic surveys have confirmed the validity of the 1982 Anaconda surveys. They have refined the four targets (A,B,C & D), interpreted by Alan Scott in 1983, and removed much of the doubt he expressed about anomaly D. Sixteen additional targets (E to T) have been added to the interpretation. Anomalies A to D remain the first priority targets. Anomalies E to L warrant second priority, followed by anomalies R, S and T. Lowest priority should be assigned to anomalies M to Q. The

magnetic survey has accurately located the edge of a major thrust contact. Three of the first priority geophysical targets all lie within 300 metres of this contact. These targets were identified as gravity highs. The magnetic survey indicates that this horizon is essentially continuous over the length of the Francois Grid (Line 8700.0W to 2900.0W), close to six kilometres. We know very little about variations in overburden thickness in this area. It is conceivable that areas of thicker, lower density, overburden are masking gravity highs caused by sulphides. If drilling locates substantial sulphides associated with Targets A, B and C the whole length of the contact edge should be closely scrutinized.

Logistical Summary
Gravity Survey at Dromedary Mountain, Yukon

for Equity Engineering Ltd.

MWH Geo-Surveys Ltd.
June - July, 1997

11509 Summit Drive, Vernon, British Columbia, Canada V1B 2B5 • (604) 542-9897 • Fax (604) 545-5899

OVERVIEW:

From June 28 to July 21, 1997, MWH Geo-Surveys Ltd. carried out a gravity survey at Dromedary Mountain, Yukon at the request of Equity Engineering Ltd. The location of the survey was at approximately 62° 54' N, 128° 48 ' W. All gravity stations were surveyed for vertical position by a total station transit.

PROJECT SCHEDULE:

The following is the project timeline.

Mobilization of gravity & survey crews	June 28
Start of Production	June 29
Completion of postional survey	July 11
Demobilization of survey crew	July 11, 12
Completion of gravity survey	July 19
Demobilization of gravity crew	July 20, 21

A total of 1253 unique gravity stations and 104 repeats were occupied during 21 production days.

FIELD OPERATIONS:

Survey Personnel:
The personnel involved on this project were:

Dan Pickett	Surveyor / Party Manager
Troy Gortat	Gravity Surveyor

Instrumentation:
Lacoste & Romberg gravity meter # 371 was utilized for the gravity measurements. In addition to the gravity instrumentation, the following survey, computer, radio and transportation equipment was used over the course of the project.

Survey equipment:
Sokkisha SET5 total station transit

Computers:
1 portable computer

Communication equipment:
3 VHF radios

Field Procedures, Gravity:
Station to station access was on foot. All gravity readings were taken within closed loops to allow for correction of instrument drift. All loops were tied to a base established at the Equity Engineering camp. The base value used at the camp base was assigned a value and all day loops were tied to this base.

The Lacoste & Romberg meters' sensitivity was set prior to the commencement of the survey and checked regularly as the survey progressed. All gravity readings were taken to the 1/100th of a milligal.

A total of 8 percent of the gravity stations were repeated as a data check.

Field Procedures; Surveying: All gravity stations were surveyed for vertical positions by a Sokkisha SET5 total station transit. The 0+000N baseline had previously been surveyed by Underhill Engineering and all the cross lines were tied into the baseline. The vertical and horizontal reference points were therefore derived from the Underhill survey.

DATA REDUCTION and INTEGRITY:

Gravity:
The gravity readings were converted to milligals using the appropriate meter variables and corrected for: the meter tripod height, earth tides, drift between base ties and adjusted to the base value. The results from these calculations are listed as Observed Gravity.

The Observed Gravity values were corrected to Bouguer Gravity using the following formula:

$$Gb = Gobs + tc - Gl + (.3086*h) - (.04192*h) * d$$

where:
Gb = Bouguer Gravity
Gobs = Observed Gravity
Gl = Latitude correction
tc = Terrain correction
h = Station elevation
d = density

The latitude correction was calculated as:

$$gl = g_0(1+\alpha \sin^2\phi - \beta \sin^2 2\phi)$$

where:

$\phi = latitude$

$g_0 = 978032.68$

$\alpha = .0053024$

$\beta = .0000058$

Bouguer gravity data was calculated using densities of 2.3, 2.5 and 2.67 gm/cc. A total of 104 field stations were repeated throughout the course the surveys, the average repeat difference was .015 milligals. A data listing is included as Appendix I.

SUMMARY:

There were no technical or logistical problems during the course of this survey. The high accuracy of the gravity measurements and positional co-ordinates will yield a reliable data set from which exploration decisions may be based.

Re: Dromedary mag/VLF Surveys

Dear Murray,

Enclosed please find the completed plots for the mag survey (3 of each plot), a field report, survey and our invoice. Also enclosed is a disk containing all data, both raw and processed. The old data for the Anaconda, levelled to the new data, is also on disk.

We have e-mailed the data to Ken Robertson.

We trust that the job was completed to your satisfaction, and we look forward to working with you and Equity on future projects.

Sincerely,
AMEROK GEOSCIENCES LTD.

Ruth B. Hall, M.Sc.
Vice-President

Re: **Field Report - Dromedary Project, Francois Grid**

This memorandum describes a Mag/VLF survey conducted on the Francois grid, Dromedary Project, from July 9 to 19, 1997.

a) **Personnel & Equipment:** Amerok crew chief, Dan Hall, conducted a one person Mag/VLF survey using EDA Omni plus field and base station magnetometers with VLF receiver. Data was downloaded to a 486 laptop computer for subsequent processing and plotting. The daily survey logs are enclosed.

b) **Grid and Survey specifications:** The survey grid consisted of lines spaced at 100 and 200 m with picketed flags every 25 m. The magnetometer survey covered a total of 68.7 line km with readings taken every 12.5 m. The 24 Hz VLF data was collected over 2.0 line km. Overall, there were 44 lines numbered from L2900W to 8700W. Approximately half the grid was clean and cut straight while the remainder was simple flagging. One battery cable was damaged due to snags from the dense bush resulting in the loss of a half a day.

c) **VLF results:** The signal received from Culter, Maine (24.0 Hz) was too weak to collect accurate data. Two test lines (L 4100W and L4300W) were surveyed, and all equipment was thoroughly tested and found to be in good working order. The polarity of the In-Phase and Quadrature was not reversing as it should upon changing facing direction. The readings appear to be simply noise. After consultation with Murray Jones, the VLF survey was abandoned.

d) **In-field data processing:** The 1982 Anaconda Mag survey data used a reference field of 58 000 Gammas while the 1997 survey reference field was 57 000 Gammas; the 11982 results were adjusted accordingly. The compiled results are in the files 'CMmmdd.OMI'. Discrepancies in the chaining of the grid led to the following adjustments to the line numbering:

L6200 W north of the baseline renumbered as L6300 W
L6300 W north of the baseline renumbered as L6400 W
L6400 W north of the baseline renumbered as L6450 W
L6400 W south of the baseline renumbered as L6350 W
L6500 W north of the baseline renumbered as L6550 W
L6600 W north of the baseline renumbered as L6650 W
L6600 W south of the baseline renumbered as L6650 W

From the data collected on July 14, 3.6 km needed to be diurnally corrected by linear interpolation with an apparent 25 Gamma shift in base levels and was verified on July 16. The affected lines are:

L7000 W 2000S to 1100S
L7200 W 1125 S to 450 N
L7400 W 1125 S - 0 N

An error in the base station readings of less than 0.2 Gammas was introduced on July 16. The data file 'CM0716.OMI' was used without alterations.

e) **Data Files:** The raw field data is stored in the files RMmmdd.OMI, base station readings in BSmmdd.OMI, and diurnally corrected data in CMmmdd.OMI where mmdd represents the month and day.The spreadsheet MAG.XLS contains the compilation of the 1997 and 1982 surveys and the compiled XYZ dat a is in ALLMAG.XYZ. The XYZ formatted data from 1997 is contained in MAG97.XYZ.

f) **Results:** The 1982 plots show a strong East-West structure which is reflected in the 1997 data. L8700 W overlaps the Old Lone Mountain grid and will permit amalgamation of that data set with the current results.

Respectfully submitted,
AMEROK GEOSCIENCES LTD.

Carmen Lee

EQUITY ENGINEERING - DROMEDARY PROJECT

MAG / VLF SURVEY - DAILY LOG

Wed 09 July

Packed & checked equipment.
Flew into camp with Summit Air & TNTA chopper.

Thurs 10 July

Hot & Sunny. Mag forecast quiet with active periods.
Base station established outside of camp at -4775 E -995 N
Party-pack batttery appears to have a bad cell.
Substituted spare belt pack, set cycling to 20 s.

Production :

L 2900 W	500 S - 0 N	flagged, not cut.
L 3000 W	500 S - 0 N	flagged, not cut.
L 3100 W	500 S - 1100 N	flagged, not cut.
L 3200 W	500 S - 0 N	flagged, not cut.
L 3300 W	1000 S - 1000N	
L 3500 W	0 N - 1000 N	flagged, not cut.
L 3700 W	1000 S - 1100 N	1100 m flagged, not cut.

Total Production : 8.2 line kms Mag

Fri 11 July

Hot & Sunny. Mag forecast quiet. Cycled base station at 20 s.
Base station Party-pack battery appeared normal this morning but died at 12:25 pm. Switched to belt pack, but lost 2 line kms.
Re-surveyed L 4300 W and L 4500 W
Rigged new Base Station battery pack with 2 spare OMNI Plus battery cells.

Production :

L 3500 W	1000 S - 0 N	
L 3600 W	1000 S - 0 N	
L 3900 W	1000 S - 1100 N	1100 m flagged, not cut.
L 4100 W	1000 S - 1100 N	1000 m flagged, not cut (hit cut line at 175 N)
L 4300 W	1025 S - 0 N	
L 4500 W	1025 S - 0 N	
L 4700 W	1025 S - 0 N	
L 4900 W	1037 S - 0 N	

L 5100 W 1400 S - 1037 S
L 5200 W South of Tie line 1000 S, could not find line.

Total Production : 10.6 line kms Mag

Sat12 July

Overcast, threatening rain all day. Mag forecast quiet.
Base Station cycled at 20 s. Lyse changed batteries for me at 2:00 pm.

Production :

L 5900 W	1525 S - 1075 S	
L 6000 W	1500 S - 1125 S	
	900 S - 0 N	
L 6100 W	1500 S - 0 N	
L 6300 W	1625 S - 900 N	
L 6400 W	1600 S - 1075 S	
	0 N - 900 N	
L 500 W	1825 S - 900 N	
L 6600 W	0 N - 900 N	Thickest bush I've ever seen !

Total Production : 10.7 line kms Mag

Sun 13 July

Partly cloudy, hot. Mag forecast quiet.
Base station cycled at 20 s all day on new battery pack.
Attempted to read VLF Cutler Maine (NAA 24.0 Hz) on two lines. Signal is too weak to produce usable data. Readings were not repeatable while facing in opposite directions. Checked all gear, swapped receivers & cables. Seattle (24.8 Hz) produced proper readings, so the problem is not equipment related.
Aborted VLF survey. Carried on with half day of Mag only.
Lost 2.0 kms Mag data upon restarting survey without VLF.

Production :

L 5100 W	1025 S - 0 N	
L 5300 W	1400 S - 0 N	
L 5500 W	1425 S - 900 N	
L 5700 W	1400 S - 900 N	525 m flagged, not cut.

Total Production : 6.6 line kms Mag

Mon 14 July

Sunny & Hot again. Mag forecast quiet.
Base Station cycled at 20 s. STopped at 13:18 hrs for no obvious reason. The battery still showed a full 3-bar reading upon restarting at 18:15 hrs.
Diurnal variations from 8:00 to 13:18 ranged only about 15 gamma
Range from 13:18 to 18:18 of 25 gamma.
Lines affected indicated below.

Production :

L 5900 W	1075 S - 900 N	Cut line, all the rest flagged only.
L 6100 W	0 N - 900 N	
L 6800 W	1800 S - 450 N	
L 7000 W	2000 S - 1100 S	no base station readings
L 7200 W	1125 S - 450 N	no base station readings
L 7400 W	1125 S - 0 N	no base station readings

Total Production : 5.1 line kms Mag with base station on,
3.6 line kms Mag without base station readings

Will attempt to confirm interpolated diurnal corrections for these three lines with 15 repeated data points another day.

Tues 15 July

Overcast, muggy & buggy. Mag quiet with storm intervals.
Base Station cycled at 20 s in am, then 15 s in pm.
Base station battery switched to party pack at 14:00 , dead by 15:00 hrs !
Field unit belt pack cable shorted under strain from dense bush whacking. Forced to return 4.5 kms to camp after only 1.8 kms of surveying to change belt packs. Repaired this evening.
The afternoon data (4.2 kms) was lost due to base station failure.
All told, I covered 16 kms through uncut bush for only 1.8 kms data.
Lyse's (the cook) dog died this morning from injuries sustained fighting with the other dog in camp . A grim day.

Production :

L 8200 W	1190 S - 350 N	All lines flagged only, not cut.
L 8100 W	0 N - 375 N	

Total Production : 1.8 line kms Mag.

Weds 16 July

Overcast, cooler. Mag quiet. Base Station cycled 15 s.
Lyse changed battery belt packs at 13:00 hrs.
I used canister batteries in the field. One pack ran all day.
Attempts last night to operate the base station from the charger failed. The Omni wouldn't turn on, and when the battery was connected, the display and memory was scrambled.
The field unit lost the time and date at the start of surveying this morning. No apparent reason. Reset time arbitrarily at 09:30. The base station was 9 mins 27 secs out of sync.
The diurnal corrections were very quiet and an analysis of the base station file found that the error induced by being out of sync averaged 0.13 Gamma (Std Dev 1.6 G). Hence the data is acceptable for use.

This morning we used a helicopter set-out to the top of Lone Mtn and crashed bush downhill to Line 8700 W, on the old Lone Mtn grid.

Production :

L 8700 W	2175 S - 1165 S	All lines flagged only, not cut.
L 8400 W	1175 S - 2200 S	
L 8000 W	2262 S - 400 N	
L 7800 W	1137 S - 400 N	

Total Production : 6.1 line kms Mag

Thurs 17 July

Cloudy with some sun & showers. Very buggy.
Mag forecast quiet with active intervals. Base Station at 15 s.
No equipment problems today !

Production :

L 5000 W	0 N - 900 N
L 5100 W	0 N - 900 N
L 5300 W	0 N - 900 N
L 5200 W	1450 S - 1050 S
L 5600 W	1400 S - 1062 S
	0 N - 900 N
L 7200 W	2000 S -1125 S
L 7600 W	2175 S - 0 N

Total Production : 7.4 line kms Mag

Fri 18 July

Overcast, buggy.
Mag forecast quiet. Base Station at 20 s.
A good, quick day close to camp

Production :

L 4100 W	0 N - 850 N	resurveyed up cut line
L 4300 W	0 N -1200 N	
L 4400 W	0 N -1200 N	
L 4500 W	0 N - 950 N	
L 4600 W	0 N - 850 N	stations out by 50 m at baseline
L 4700 W	0 N - 900 N	
L 4800 W	0 N - 900 N	
L 4900 W	0 N - 900 N	

Total Production : 7.7 line kms Mag

Sat 19 July

Partly cloudy, cooler.
Mag forecast quiet. Base Station at 15 s.
Flagged one line of grid (L5200 W) for Equity, and surveyed it.
Final data processing, check & pack gear for 19:00 hrs demob.

Production :

L 5200 W	0 N - 900 N	Flagged line, then surveyed.

Total Production : 0.9 line kms Mag

Kalzas Formation
Unit 12 Fossiliferous limestone, laminated fossiliferous sandy limestone and silty shale and crinoidal quartz sandstone

Crystal Peak Formation
Unit 11 Chert pebble conglomerate, chert lithic sandstone, interbedded siltstone-shale

ROAD RIVER GROUP

Ordovician to Silurian
Unnamed
Unit 9 Graptolitic, siliceous and graphitic shale, siltstone

KECHIKA GROUP

Cambrian-Ordovician
Unnamed
Unit 4 Calcareous muscovite phyllite and wavy banded limestone, calcareous siltstone

Lower Cambrian or Earlier
Unnamed
Unit 1 Quartzite, interbedded sandstone and limestone

MAP SYMBOLS

- Lithological contact
- Bedding (inclined, vertical, overturned)
- High angle fault
- Thrust fault
- Anticline (upright, overturned)
- Syncline (upright, overturned)
- Barite

APPENDIX E

ROCK SAMPLE DESCRIPTIONS AND PETROGRAPHY

MINERAL ABBREVIATIONS

AK	ankerite	AS	arsenopyrite	BA	barite
BI	biotite	CA	calcite (or CC)	CL	chlorite
CP	chalcopyrite	CY	clay	EP	epidote
GE	goethite	GL	galena	HE	hematite
HS	specularite	JA	jarosite	KF	K-feldspar
MG	magnetite	MN	Mn-oxides	MS	sericite (or SE)
PO	pyrrhotite	PY	pyrite	QZ	quartz
SI	silica	SP	sphalerite	SM	smithsonite

ALTERATION INTENSITY

tr	trace	w	weak	m	moderate
		s	strong		

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: ?Sl	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010411	UTM	N	UTM	E	Strike Length Exp: 10	Metallics: 1.5%PO,trPY	5	1.8	70	62
	Elevation		Sample Width: 30 cm		True Width: 30 cm	Secondaries: GE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 093°/54° S		Bedding		Host : Siliceous sediment/chert		20	274		

Comments: Lensy pyrrhotite/trace pyrite in dark siliceous sediments - similar to rocks above massive sulphides in FRN96-02,04?

Sample Number:	Grid North:	N	Grid East:	E	Type: Chip	Alteration: ?Sl	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010412	UTM	N	UTM	E	Strike Length Exp: >100	Metallics: AS,CP,GL,PO,PY,SP?	<5	17.0	<10	864
	Elevation		Sample Width: 3.6 m		True Width: 3.6 m	Secondaries: GE,HE,JA,MN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 095°/70° S				Host : Relatively siliceous hornfels		4670	1.72%		

Comments: Test mineralization apparent on Main Zone - lense or pod or massive pyrrhotite - with streaks of galena, sphalenite?, chalcopyrite.

Sample Number:	Grid North:	N	Grid East:	E	Type: Chip	Alteration: wCA,mCB	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010413	UTM	N	UTM	E	Strike Length Exp: 5	Metallics: tr-2%GL,tr-1%SP	10	11.6	200	20
	Elevation 820 m		Sample Width: 1.6 m		True Width: 1.6 m	Secondaries: wGE,wCE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 120°/70° SW		Bedding		Host : Carbonatized shale?		5040	7180		

Comments: Looks like galena/sphalerite lenses and wisps along foliation, also in cross-cutting calcite veinlets. Tom's show - 180m south of camp.

Sample Number:	Grid North:	N	Grid East:	E	Type: Chip	Alteration: wCA,wCB	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010414	UTM	N	UTM	E	Strike Length Exp: 5	Metallics:	<5	0.6	250	30
	Elevation 810 m		Sample Width: 1.4 m		True Width: 1.4 m	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 120°/70° SW		Bedding		Host : Weakly carbonatized shale		136	396		

Comments:

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: w?CB	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010415	UTM	N	UTM	E	Strike Length Exp: 10	Metallics:	<5	1.2	80	13
	Elevation 920 m		Sample Width: 30 cm		True Width: 30 cm	Secondaries: sGE,wMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Earn Group? dark quartzite		238	860		

Comments: Strongly gossanous, limonitic quartzite - black, abundant quartz vein throughout.

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: mCB	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010416	UTM	N	UTM	E	Strike Length Exp:	Metallics: trHS	<5	<.2	200	8
	Elevation		Sample Width:		True Width:	Secondaries: wGE,sHE,mMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Hematite-Mn stained shaly phyl		104	426		

Comments: Weathered, vuggy rock - carbonate out?

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: wCB,?Sl	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010417	UTM	N	UTM	E	Strike Length Exp:	Metallics:	<5	0.4	220	17
	Elevation 1020	m	Sample Width:		True Width:	Secondaries: mHE,sMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite		214	4670		

Comments: Float is concentrated in colluvium over wide area.

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: mCB,wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010418	UTM	N	UTM	E	Strike Length Exp:	Metallics:	<5	2.0	160	21
	Elevation 865	m	Sample Width:		True Width:	Secondaries: sGE,sMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite/shale		636	510		

Comments: Float near base of slope - talus from zone up slope.

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: wCY,wSl	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010419	UTM	N	UTM	E	Strike Length Exp:	Metallics: trGL,trPO,trSP	<5	14.2	90	12
	Elevation 900	m	Sample Width:		True Width:	Secondaries:	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite/arkosite		9270	8750		

Comments: Light green alteration mineral, spots, layers similar to that observed in mineralized zone in TK-2, adjacent to 010457.

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: wCB	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010420	UTM	N	UTM	E	Strike Length Exp: 1	Metallics:	<5	0.2	390	7
	Elevation 875	m	Sample Width: 30	cm	True Width: 30 cm	Secondaries: mGE,wHE,mMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 135°/85° SW		Foliation		Host : Shaley quartzite		46	634		

Comments: Strong fossil content.

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: mCB,wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010421	UTM	N	UTM	E	Strike Length Exp:	Metallics:	<5	0.4	110	3
	Elevation 880	m	Sample Width:		True Width:	Secondaries: mGE,wHE,wJA,wMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite		274	466		

Comments:

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: wCB,wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010422	UTM	N	UTM	E	Strike Length Exp:	Metallics:	<5	2.6	80	5
	Elevation 970	m	Sample Width:		True Width:	Secondaries: wHE,wJA,wMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Black quartzite		1010	22		

Comments: Vuggy weathering in quartzite and vein.

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: wSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010423	UTM	N	UTM	E	Strike Length Exp: 2	Metallics: trPY	<5	0.2	100	12
	Elevation 860	m	Sample Width: 30	cm	True Width: 30 cm	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Siliceous shaley phyllite-qtzt		24	66		
Comments:										

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: wCA,wSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010424	UTM	N	UTM	E	Strike Length Exp:	Metallics:	<5	<.2	40	7
	Elevation 850	m	Sample Width:		True Width:	Secondaries: GE,JA	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite		16	422		
Comments:										

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: wCB,mQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010425	UTM	N	UTM	E	Strike Length Exp:	Metallics: tr?SP	<5	0.2	70	2
	Elevation 855	m	Sample Width:		True Width:	Secondaries: mGE,mMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite		86	410		
Comments: Angular float, abundant quartz veins.										

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: w?SI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010426	UTM	N	UTM	E	Strike Length Exp:	Metallics: 1-2%PO,1-2%PY,?SP	<5	0.6	50	29
	Elevation 925	m	Sample Width:		True Width:	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Siliceous siltstone?		<2	22		
Comments:										

Sample Number:	Grid North:	N	Grid East:	E	Type: Select	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010427	UTM	N	UTM	E	Strike Length Exp:	Metallics:	<5	1.8	120	9
	Elevation		Sample Width:		True Width:	Secondaries: sGE,mHE,sMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Shaley phyllite-quartzite		414	4030		
Comments: Mn-oxide-rich ferricrete from soil (Kennecott) which assayed 0.57% Pb.										

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010428	UTM	N	UTM	E	Strike Length Exp: .3	Metallics:	<5	1.4	80	7
	Elevation 980	m	Sample Width:		True Width:	Secondaries: wMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Dark shaley phyllite/siltstone		8	14		
Comments: Rock chips from bottom of pit 1.5m deep at 875N.										

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: mCA	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010429	UTM	N	UTM	E	Strike Length Exp: 5	Metallics:	<5	<.2	60	7
	Elevation		Sample Width: 30 cm		True Width: 30 cm	Secondaries: wMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Carbonate altered shaley phyll		16	180		
Comments:										

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: ?Sl	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010430	UTM	N	UTM	E	Strike Length Exp:	Metallics: 0.5%PY	5	0.6	100	55
	Elevation		Sample Width:		True Width:	Secondaries: wJA	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Cherty argillite		2	54		
Comments: Float in creek, only sign of rock from about 900S.										

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: wSl	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010432	UTM	N	UTM	E	Strike Length Exp: 5	Metallics: trPY	<5	0.8	110	25
	Elevation 1140 m		Sample Width: 50 cm		True Width: 50 cm	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 109°/55° SW		Bedding		Host : Chert, cherty argillite		18	16		
Comments:										

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: wCB,wSl	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010433	UTM	N	UTM	E	Strike Length Exp: 5	Metallics:	<5	0.6	380	3
	Elevation 795 m		Sample Width: 2 m		True Width: 2 m	Secondaries: wGE,wJA	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite to siliceous siltsto		386	88		
Comments: Associated with lead in soil anomaly.										

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010434	UTM	N	UTM	E	Strike Length Exp: 5	Metallics:	<5	0.4	70	4
	Elevation		Sample Width: 3 m		True Width: 3 m	Secondaries: wJA	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Massive black chert		46	<2		
Comments: Small outcrop of black chert - barely exposed, near anomalous overburden sample.										

Sample Number:	Grid North:	N	Grid East:	E	Type: Select	Alteration: mSl	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010451	UTM	N	UTM	E	Strike Length Exp: 100	Metallics: trAS,1%CP,>10%PO,PY,?	1510	4.6	<10	2570
	Elevation 1620 m		Sample Width: 30 cm		True Width: 30 cm	Secondaries: sGE,wJA,mMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 095°/45° SW				Host : Hornfels		2	2220		
Comments: Discovery, main showing area on Dromedary.										

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: wSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010452	UTM	N	UTM	E	Strike Length Exp: 50	Metallics: trPO,3-5%PY	<5	1.2	90	84
	Elevation 780	m	Sample Width: 50	cm	True Width: 50 cm	Secondaries: mGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 130°/90° SW				Host : Siliceous argillite		14	96		

Comments: Faulted right on creek approximately 50m east of line 2900.

Sample Number:	Grid North:	N	Grid East:	E	Type: Select	Alteration: CB	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010453	UTM	N	UTM	E	Strike Length Exp: 50	Metallics: trPY,1%SP	10	20.4	150	108
	Elevation 800	m	Sample Width: 15	cm	True Width: 15 cm	Secondaries: GE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 110°/70° SW		Bedding		Host : Phyllite, black argillite		8780	2.27%		

Comments: Just up hill approximately 30m from Tom's showing, small hole 80m west 5000E130N of baseline.

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: sQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010454	UTM	N	UTM	E	Strike Length Exp: 10	Metallics: ?GL	<5	2.2	330	6
	Elevation		Sample Width: 50	cm	True Width: 50 cm	Secondaries: wGE,sHE,mMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 090°/86° S		Bedding		Host : Quartzite		814	1.81%		

Comments:

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010455	UTM	N	UTM	E	Strike Length Exp: 20	Metallics:	<5	1.6	410	34
	Elevation 930	m	Sample Width: 4	m	True Width: 4 m	Secondaries:	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 108°/85° SW				Host : Possibly ferricrete		302	770		

Comments: Small fossils on downstream side, quartzite upstream. Lots of exposed rock, just down stream from grassy outcrop. Rock on westside of creek.

Sample Number:	Grid North:	N	Grid East:	E	Type:	Alteration: wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010456	UTM	N	UTM	E	Strike Length Exp: .5	Metallics:	<5	0.6	50	249
	Elevation 875	m	Sample Width: 30	cm	True Width: 30 cm	Secondaries: sGE,wHE,wJA	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 116°/76° SW		Bedding		Host : Shaley phyllite		56	3230		

Comments: On creek above camp approximately 500m. Outcrop right on creek below zone 010455.

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: wCA,sQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010457	UTM	N	UTM	E	Strike Length Exp: .5	Metallics: ?GL	<5	0.2	160	6
	Elevation 900	m	Sample Width: 30	cm	True Width: 30 cm	Secondaries: mGE,wHE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite		50	390		

Comments: Next to sample 010419. Just below small gully above quartzite zone.

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: mCA,sQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010458	UTM	N	UTM	E	Strike Length Exp: 20	Metallics: ?GL	<5	0.2	90	7
	Elevation 900	m	Sample Width: 30	cm	True Width: 30 cm	Secondaries: wHE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite		34	114		

Comments: Fossils top of first bench above gully.

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010459	UTM	N	UTM	E	Strike Length Exp: 2	Metallics:	<5	<.2	110	7
	Elevation 905	m	Sample Width: 50	cm	True Width: 50 cm	Secondaries: mGE,wHE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Black argillitic shale		16	2670		

Comments: Cleavage in rocks very close together from 010458 to 010460.

Sample Number:	Grid North:	N	Grid East:	E	Type:	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010460	UTM	N	UTM	E	Strike Length Exp: .5	Metallics:	<5	1.8	150	11
	Elevation 910	m	Sample Width: 50	cm	True Width: 50 cm	Secondaries: mGE,wJA	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Siliceous siltstone?		794	450		

Comments: Weathered out boxwork similar to rock in 010419. Similar to 010456 and host rock in 010469.

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010461	UTM	N	UTM	E	Strike Length Exp: .4	Metallics:	<5	1.8	180	16
	Elevation 940	m	Sample Width: 50	cm	True Width: 50 cm	Secondaries:	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite		472	424		

Comments: 40 m east of L2800 275N on break.

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010462	UTM	N	UTM	E	Strike Length Exp:	Metallics: 0.5%PO,trPY	<5	2.2	70	49
	Elevation 1075	m	Sample Width: 30	cm	True Width: 30 cm	Secondaries:	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite		12	116		

Comments: Pyrrhotite disseminated throughout rock. Rock very angular, close to geochem anomaly. 112m east of L2800E 500N.

Sample Number:	Grid North:	N	Grid East:	E	Type: Chip	Alteration: sCA,wSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010463	UTM	N	UTM	E	Strike Length Exp: 2	Metallics: 0.2%PO,0.2%PY	<5	0.2	160	7
	Elevation 850	m	Sample Width: 2	m	True Width: 2 m	Secondaries:	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 097°/78° S				Host : Calcareous siliceous siltstone		8	102		

Comments: Calcareous siliceous siltstone. Warren did sample 5m west of sample 596758, same rock 50m west of L3200 75N.

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010464	UTM	N	UTM	E	Strike Length Exp:	Metallics:	<5	<.2	510	22
	Elevation 840	m	Sample Width: 1	m	True Width: 1 m	Secondaries: sGE,sHE,wMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Ferricrete		196	928		

Comments: Ferricrete runs along at this level across the slope all the way to L3200E, 25m east of line L2800E 150N.

Sample Number:	Grid North:	N	Grid East:	E	Type:	Alteration: sSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010465	UTM	N	UTM	E	Strike Length Exp: .5	Metallics:	<5	<.2	150	1
	Elevation 845	m	Sample Width: 2	m	True Width: 2 m	Secondaries: mGE,mMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation		Bedding		Host : Quartzite, black argillite?		14	238		

Comments: Some boxwork, possibly recessive mineral 200m west of L2800E 150N.

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: sSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010466	UTM	N	UTM	E	Strike Length Exp: 1	Metallics: ?PY	<5	7.2	30	51
	Elevation 1070	m	Sample Width: 20	cm	True Width: 20 cm	Secondaries: sGE,trMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Siliceous quartzite		1685	1660		

Comments: At TL 800N, 18+75E. Boxwork, weathered out mineral.

Sample Number:	Grid North:	N	Grid East:	E	Type:	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010467	UTM	N	UTM	E	Strike Length Exp: 2	Metallics:	<5	1.0	240	5
	Elevation 1070	m	Sample Width: 2	m	True Width: 2 m	Secondaries: wMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Siliceous siltstone		796	696		

Comments: Sampled to satisfy curiosity about soil anomaly L1800E 875N.

Sample Number:	Grid North:	N	Grid East:	E	Type: Grab	Alteration: wCK,mSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010468	UTM	N	UTM	E	Strike Length Exp: 1	Metallics: 0.5%PO,0.5%PY	<5	1.2	50	14
	Elevation 940	m	Sample Width: 1	m	True Width: 1 m	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Calcareous siliceous siltstone		22	30		

Comments: Right on top of argillitic shale, same as samples I took low on or in between L3200E and 2800E and same as float sample I took high on 28 (just below first summit coming up so called esker between 3600 and 4000).

Sample Number:	Grid North:	N	Grid East:	E	Type: Select	Alteration: CA,SI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010469	UTM	N	UTM	E	Strike Length Exp: 20	Metallics: 0.2%GL,0.1%PO,0.1%PY,	<5	17.8	280	7
	Elevation 945	m	Sample Width: 50	cm	True Width: 50 cm	Secondaries: GE,sZNO	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 110°/85° N				Host : Shaly phyllite-silic.siltstone		5.53%	5.83%		

Comments: South side of gully 50m east of line 4000E 550N. Sphalerite finely disseminated, lots of hydrozincite.

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North:	N	Grid East:	E	Type: Select	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010470	UTM	N	UTM	E	Strike Length Exp: 40	Metallics: 0.2%GL,0.1%PO,0.1%PY,	<5	2.8	280	3
	Elevation 945	m	Sample Width: 50	cm	True Width: 50 cm	Secondaries: GE,wZNO	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 110°/85° N		Bedding		Host : Calc.sil. siltstone/shaly phyl		6370	1855		

Comments: 4m from sample 010469.

Sample Number:	Grid North:	N	Grid East:	E	Type: Select	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010471	UTM	N	UTM	E	Strike Length Exp: 20	Metallics: 0.2%GL,0.1%PO,0.1%PY,	<5	2.0	230	3
	Elevation 945	m	Sample Width: 50	cm	True Width: 50 cm	Secondaries: mGE,wZNO	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 110°/85° N		Bedding		Host : Calc.sil. siltstone/shaly phyl		3250	2430		

Comments:

Sample Number:	Grid North:	N	Grid East:	E	Type:	Alteration: wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010472	UTM	N	UTM	E	Strike Length Exp: 5	Metallics: 0.5%PO,0.5%PY	<5	<.2	590	30
	Elevation 1140	m	Sample Width: 1	m	True Width: 4 m	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Cherty argillite		6	56		

Comments: 25m west of drill hole 81-10 helipad.

Sample Number:	Grid North:	N	Grid East:	E	Type:	Alteration: wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010473	UTM	N	UTM	E	Strike Length Exp: 5	Metallics: 0.5%PO,0.5%PY	<5	0.2	140	19
	Elevation 1140	m	Sample Width: 1	m	True Width: 4 m	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Cherty argillite		8	42		

Comments: Below drill hole 81-8 100m and west 50m.

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: mSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010474	UTM	N	UTM	E	Strike Length Exp:	Metallics: 1%CP,0.2%PO,0.3%PY	<5	1.8	80	79
	Elevation 1040	m	Sample Width: 50	cm	True Width: 50 cm	Secondaries: mGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Cherty argillite		20	138		

Comments: Right at drill hole 81-9.

Sample Number:	Grid North:	N	Grid East:	E	Type:	Alteration: sQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
010475	UTM	N	UTM	E	Strike Length Exp:	Metallics:	<5	0.2	180	15
	Elevation		Sample Width:		True Width:	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 097°/60° S				Host : Sooty quartzite		86	258		

Comments: In contact with shale right in creek above ferricrete sample approximately 350m.

Dromedary	Orientation 083°/85° N				Host : Shaly quartzite/siltstone		202	550		

Comments: Fissile outcrop just south of geochem projection.

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration: wCB,wSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596768	UTM	N	UTM	E	Strike Length Exp:	Metallics:	<5	0.2	70	3
	Elevation 790	m	Sample Width:		True Width:	Secondaries: mGE,wMN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Quartzite/siltstone		40	302		

Comments: Float from area of local subcrop - vuggy weathered rock - boxwork.

Sample Number:	Grid North:	N	Grid East:	E	Type: Float	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596769	UTM	N	UTM	E	Strike Length Exp: 100	Metallics:	<5	1.6	>10000	31
	Elevation 840	m	Sample Width:		True Width:	Secondaries:	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation		Bedding		Host : Quartzite		2	14		

Comments: Warren did rock sheet >1? Sample was taken from float 5m below top of ridge and outcrop.

Sample Number:	Grid North: 700	S	Grid East: 5475	W	Type: Chip	Alteration: ?CL,?MS,wSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596770	UTM	N	UTM	E	Strike Length Exp: 1	Metallics: tr?GL	20	0.6	300	23
	Elevation 690	m	Sample Width: 1.6 m		True Width: 1.6 m	Secondaries: mGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation				Host : Possibly shaly phyllite		6	232		

Comments: Trench in overburden - crumbly surface exposed, foliation attitude not possible, sulphide? very fine-grained, possibly more than trace in rock. Zinc zap did not detect zinc oxide.

Sample Number:	Grid North: 700	S	Grid East: 5425	W	Type: Chip	Alteration: wCA,mCB,wSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596771	UTM	N	UTM	E	Strike Length Exp: 1	Metallics: tr?GL	<5	0.2	270	19
	Elevation 690	m	Sample Width: 1.4 m		True Width: 1.2 m	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 090°/70° N		Foliation		Host : Shaly phyllite? to siltstone		20	78		

Comments: Dark grey well foliated rock, locally siliceous. Carbonate as small lenses - porphyroblasts? - calcite in veinlets. Galena is very fine-grained if present at all. Sample in south half of trench.

Sample Number:	Grid North:	N	Grid East:	E	Type: Chip	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596772	UTM	N	UTM	E	Strike Length Exp: 1	Metallics:	<5	0.4	220	30
	Elevation 690	m	Sample Width: 1 m		True Width: 0.9 m	Secondaries:	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 090°/70° N		Bedding		Host : Same as 596771		46	126		

Comments: North half of trench.

Sample Number:	Grid North: 738	S	Grid East: 5500	W	Type: Chip	Alteration: mCB,wSI	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596773	UTM	N	UTM	E	Strike Length Exp: 1	Metallics:	<5	0.2	160	19
	Elevation 1705	m	Sample Width: 1.35 m		True Width: 1.2 m	Secondaries: mGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 083°/79° N		Foliation		Host : Shaly phyllite to siltstone		14	408		

Comments: Locally strongly weathered - gossanous - after carbonate in lenses.

Rock Sample Descriptions

Project Name: Dromedary **Project:** BLK97-03 **NTS:** 105L/14,15

Sample Number:	Grid North: 725 S	Grid East: 5500 W	Type: Chip	Alteration: ?CB,wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596774	UTM N	UTM E	Strike Length Exp: 1	Metallics:	10	1.4	230	63
	Elevation 705 m	Sample Width: 1.9 m	True Width: 1.9 m	Secondaries: mGE,wJA,?MN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation		Host : Shaly phyllite		32	330		

Comments: Strongly weathered rock - saprolite? with deeply weathered gossan zone mid-trench - goethite-jarosite-15cm wide. Quartz veins common.

Sample Number:	Grid North: 730 S	Grid East: 5500 W	Type: Chip	Alteration: ?Bl,wCB,?MS	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596775	UTM N	UTM E	Strike Length Exp: 1	Metallics:	<5	0.2	170	21
	Elevation 705 m	Sample Width: 1.75 m	True Width: 1.6 m	Secondaries: wGE	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation		Host : Shaly phyllite		8	658		

Comments: Trench - 55cm deep to bedrock. Not particularly altered looking. Broken ground - foliation disrupted.

Sample Number:	Grid North: 800 S	Grid East: 6115 W	Type: Chip	Alteration: wCB,wMS	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596776	UTM N	UTM E	Strike Length Exp: 1	Metallics:	10	1.6	370	32
	Elevation	Sample Width: 1.4 m	True Width: 1.4 m	Secondaries: mGE,mJA	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation		Host : Shaly phyllite		68	80		

Comments: Ferricrete development both ends of trench. 1.25m deep trench on esker?

Sample Number:	Grid North: 205 N	Grid East: 2400 E	Type: Grab	Alteration:	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596777	UTM N	UTM E	Strike Length Exp: .4	Metallics:	<5	<.2	130	6
	Elevation 850 m	Sample Width: 15 cm	True Width: 15 cm	Secondaries:	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation 090°/23° N	Bedding	Host :		6	74		

Comments: Warren took sample so wasn't sure on rock composition, etc.

Sample Number:	Grid North: 800 S	Grid East: 6115 W	Type: Chip	Alteration: wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596778	UTM N	UTM E	Strike Length Exp: 1	Metallics:	<5	1.2	290	22
	Elevation 680 m	Sample Width: 1.05 m	True Width:	Secondaries: wGE,mJA	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation		Host : Shaly phyllite		18	42		

Comments: Friable weathered outcrop.

Sample Number:	Grid North: 825 S	Grid East: 6100 W	Type: Chip	Alteration: wQZ	Au (ppb)	Ag (ppm)	Ba (ppm)	Cu (ppm)
596779	UTM N	UTM E	Strike Length Exp: 1	Metallics:	<5	1.2	160	7
	Elevation	Sample Width: 2.25 m	True Width: 2.25 m	Secondaries: wJA,?MN	Pb (ppm)	Zn (ppm)		
Dromedary	Orientation		Host : Chert - black		112	24		

Comments: Quartz veinlets cut homogenous black chert - locally vuggy, with oxides after?

January 2, 1998

PETROGRAPHIC EXAMINATION OF ROCK SAMPLES FROM THE DROMEDARY PROJECT

Introduction:

5 rock samples, numbered as below, were submitted by Murray Jones. Typical portions of each sample were prepared as polished thin sections.

Sample	Slide No.
010419	97-27656
010451	97-27657
596765	97-27658
Dromedary Main	97-27659
KAL-1	97-27660

Summary:

Three of the rocks of this suite show features clearly indicative of their metasedimentary origin. Their mineralogy (in four cases out of five) suggests skarnic affinities - possibly in the sense of their being thermally recrystallized silty to quartzitic sediments with an original component of exhalative sulfides, chert and dolomite.

Samples 010419 and KAL-1 are of closely similar type, being layered quartzites showing a distinctive bimodal texture of sub-rounded sand grains with an interstitial cherty phase. Actinolite is a more or less abundant accessory, as fibrous/radiate, porphyroblastic clumps and (in KAL-1) also as monomineralic interbeds. Some of the actinolite clumps have cores of garnet. Both samples contain a little fine-grained pyrrhotite and traces of sphalerite, as disseminations in the cherty interstitial phase. Sample KAL-1 also includes substantial galena and sphalerite concentrated in a discrete 1 cm interval of the bedded sequence.

Samples 010451 and Dromedary Main differ from the previous two in that the principal accessory silicate is diopside rather than actinolite, and the contents of pyrrhotite are much higher. The silicate components are mosaic aggregates of anhedral quartz and intimately intergrown diopside - the latter occurring partly as tiny included granules in the quartz, and partly as vari-sized prismatic subhedra. Minor associated silicates are epidote and chlorite in 010451, and garnet in the Dromedary Main sample

Pyrrhotite (plus minor chalcopyrite) occurs evenly intergrown with the silicates, in apparent co-genetic relationship, in 010451; a few laminae of fine-grained plagioclase are also present. In the Dromedary Main sample, where sulfides (possible tuff intercalations?) are the dominant component (75% of the rock), the accessories are arsenopyrite, sphalerite and galena as well as a little chalcopyrite. The sectioned portion includes two textural variants: an intimate non-foliated intergrowth of pyrrhotite and diopside; and a foliated variant in which laminar segregations of monomineralic pyrrhotite alternate with bands composed of fine-grained intergrowths of pyrrhotite and sphalerite with quartz and garnet.

The remaining sample of the suite, 596765, is a quartzose sediment of similar style to the first two, but somewhat finer-grained overall. It has a dark appearance due to the presence of cryptocrystalline opaque material (of uncertain composition), which occurs as dispersed dust, as intergranular films and concentrated as anastomosing schlieren. This rock is essentially devoid of sulfides and of skarn-type minerals. The reported Pb and Zn contents must presumably be present in oxidized form, but are not readily apparent.

Individual petrographic descriptions are attached.

J.F. Harris Ph.D.

Actinolite	17
Garnet	1
Pyrrhotite	3
Sphalerite	0.5
Galena	trace
Chalcopyrite	trace
Limonite	1

This is a homogenous fine-grained rock of quartzose appearance. Macroscopic examination of the thin section shows a rudimentary foliation defined by the distribution of a brownish accessory as discontinuous parallel strings.

Petrographic examination confirms that the dominant component is quartz. This occurs as an aggregate of equant to slightly elongate, sub-rounded grains, 100 - 300 microns in size, tightly cemented by a network/interstitial phase of minutely microgranular quartz of grain size 10 - 50 microns. This assemblage has the aspect of a quartzite derived by partial recrystallization of a sandstone of bimodal granularity - consisting of sub-rounded sand grains with an interstitial phase of silt-sized material or chert. The fine intergranular phase has the appearance of a primary detrital component rather than an authigenic cement or a product of marginal granulation/recrystallization.

The principal accessory is found to be actinolite, as compact, rosette-like, radiate clusters of fibro-acicular habit (close-packed needles up to 100 microns or so in length and 10 microns in thickness). The individual actinolite clusters typically range from 0.3 - 1.0 mm in size, but often occur as coalescent clumps up to 2 or 3 mm in size. These commonly appear to develop along sub-parallel, stylolite-like, anastomosing partings of brownish sub-opaque material.

The actinolite needles penetrate the adjacent quartz grains and have clearly developed by porphyroblastic growth - perhaps by metamorphic recrystallization of original glauconitic material. Some of the actinolite clumps have cores of euhedral garnet. The preservation of primary granularity in the quartz suggests that the metamorphism was probably of a dominantly thermal character.

Very minor proportions of greenish biotite and/or chlorite are the remaining silicate accessories. These occur as sparsely scattered, tiny, irregular shreds in the fine interstitial quartz phase.

Sample 010419 cont.

The rock contains minor, very fine-grained, disseminated sulfides. These consist principally of pyrrhotite as grains 10 - 100 microns in size, commonly aggregated as small clusters of up to 0.5 mm. A little marmatitic sphalerite and rare traces of galena and chalcopyrite occur in like manner - typically independent of the pyrrhotite.

The sulfides occur randomly disseminated within the silt-sized interstitial quartz phase, often (but not consistently) at the peripheries of actinolite clusters. Examples were also seen of pyrrhotite intergrown with garnet.

The pyrrhotite at one side of the sectioned portion shows partial oxidation to limonite.

The skarnic silicates and sulfides in this rock have clearly developed syngenetically as products of the metamorphism of the host. The source elements for these constituents may have been present as original impurities in the sandstone, or could have been introduced from an external source prior to, or during, metamorphism.

SAMPLE 010451 (Slide 97-27657)

QUARTZ-DIOPSIDE-PYRRHOTITE ROCK

Estimated mode

Quartz	44
Plagioclase	6
Diopside	20
Epidote	1
Chlorite	1
Tremolite?	trace
Scheelite?	trace
Sphene	trace
Pyrrhotite	25
Chalcopyrite	1.5
Limonite	1

This is an incipiently banded rock of fine-grained quartzose appearance, containing abundant disseminated pyrrhotite.

A few thin laminar zones, distinguished by their white etch reaction in the off-cut, indicate the presence of a little plagioclase.

In thin section the rock is found to consist dominantly of quartz, as a mosaic of anhedral, locally interlocking grains, 0.1 - 1.0 mm or more in size.

The principal accessory is diopside. This occurs in disseminated form, ranging from tiny granules down to 10 microns or so in size, scattered through quartz grains, up to prismatic subhedra of 0.3 mm or more. The diopside occurs rather evenly distributed throughout the quartz matrix in a manner suggestive of formation by cogenetic recrystallization.

Minor epidote is occasionally associated with the diopside, and there is one zone which includes a colourless mineral of lower relief thought to be tremolite (or possibly prehnite?).

The diopside is typically fresh and well crystallized, but occasionally shows incipient alteration to chlorite and ferruginous secondary products.

Abundant pyrrhotite, sometimes with minor associated chalcopyrite, occurs rather evenly disseminated throughout. The sulfides occur in simple intergranular intergrowth with the quartz and diopside, as grains 50 - 500 microns in size. The pyrrhotite often coalesces to irregular networks and crudely elongate segregations up to several mm in size (sometimes with included small grains of diopside).

Traces of a high relief mineral tentatively identified as scheelite occur as randomly scattered, individual, rounded grains, 0.1 - 0.3 mm in size in pyrrhotite and in the silicate matrix.

Sample 010451 cont.

Accessory plagioclase occurs as occasional, thin, segregated, laminar zones, in the form of fine-grained aggregates of grain size 20 - 100 microns. Tiny euhedra of sphene are often associated.

SAMPLE 596765 (Slide 97-27658) SANDY SILTSTONE

Estimated mode

Quartz	87
Feldspars?	2
Sericite	3
Carbonate	trace
Tourmaline	trace
Cryptocrystalline opaques	7
Pyrite	trace
Sphalerite	trace

This sample is a fine-grained rock of siliceous aspect. The distribution of a black (carbonaceous?) accessory component defines an irregular streaky/lenticular fabric which has a bedded aspect. The rock locally shows small-scale vuggy porosity.

Thin section examination confirms the clastic character of this rock. It consists dominantly of quartz, as sub-angular grains 30 - 100 microns in size, intergrown with varied proportions of a minutely fine-grained, cherty variant (of grain size 5 - 30 microns).

The cherty component sometimes occurs as diffuse interstitial networks to aggregates of the fine sand-sized grains; it sometimes forms a matrix through which the coarser grains are scattered; and it sometimes appears to constitute discrete clasts of comparable (or locally greater) size to the sand grains.

It is possible that a minor component of plagioclase is present, as sporadic sand-sized clasts and as a constituent of the cherty variant. Occasional small lenses of what appears to be minutely microgranular K-feldspar are also seen.

Sericite is another minor accessory, as minute dustings in the cherty component, as sparsely dispersed individual flakes, and as rare, small, segregated pockets.

A few tiny grains of tourmaline are recognizable.

The dark pigmentation is an optically indeterminate crypto-crystalline material occurring as zones of irregular/sinuous schlieren, diffuse impregnations of the cherty quartz component, and intergranular films outlining the sand-sized quartz grains. This material was initially presumed to be of carbonaceous (bituminous) character, but its appearance under high magnification in reflected light suggests rather that it may have a substantial content of rutile. The sporadic occurrence of traces of sphene in association with the black material is consistent with this observation.

Sample 596765 cont.

The sectioned portion of this sample contains only insignificant traces of sulfides, as a few, randomly disseminated, tiny, individual specks of pyrite and marmatitic sphalerite. Assays are reported to indicate the presence of significant levels of Pb and Zn. These must presumably, then, be present in non-sulfide (oxidized/secondary) form. The slide does contain a few sub-concordant hairline veinlets of a brown carbonate which could be smithsonite or cerussite, and it is possible that the crypto-crystalline opaque material could include a proportion of anglesite.

SAMPLE: DROMEDARY MAIN (Slide 97-27659) SEMI-MASSIVE SULFIDES

Estimated mode

Quartz	8.5
Diopside	12
Garnet	4
Chlorite	0.5
Pyrrhotite	65
Arsenopyrite	2
Sphalerite	4
Galena	2
Chalcopyrite	0.5
Limonite	1.5

This sample consists of fine-grained, semi-massive sulfides. Polished thin section examination reveals that the dominant component is pyrrhotite, with diopside, quartz and garnet as the principal accessories.

Macroscopic examination of the section shows two texturally distinct variants, each making up about half of the slide. One is a non-foliated, fine-grained intergrowth of sulfides and silicates showing patchy variations in relative proportions. In the other variant the sulfides show an irregular, small-scale, laminar texture, with occasional small sulfide-free intercalations.

The non-foliated portion consists essentially of an intimate, fine-grained intergrowth of sulfides and diopside, on a scale of 2 - 200 microns. The sulfides form a matrix to tiny included grains of diopside and/or occur as an interstitial phase to meshworks and sheafs of prismatic diopside grains - a relationship which suggests concomitant development under conditions of recrystallization. Minor quartz occurs as sporadic individual grains and as occasional segregations of minutely microgranular texture.

The sulfides consist dominantly of pyrrhotite, as individual, small, equant grains, more or less coalescent to irregular compact patches. Accessory sphalerite and galena occur within the pyrrhotite as sporadic irregular clumps of grains 2 - 200 microns in size, sometimes mutually. Minor chalcopyrite is present as scattered tiny flecks, and arsenopyrite and rare pyrite as occasional individual grains, 100 - 300 microns in size.

The other (foliated) half of the slide differs in that the silicate component consists of minutely cherty quartz and garnet - the latter partly of spongy porphyroblastic character.

The sulfide assemblage is similar to that in the other half except that arsenopyrite and chalcopyrite appear somewhat more abundant, and galena less so.

Sample Dromedary Main cont.

Part of the pyrrhotite and associated sphalerite is extremely fine-grained and forms intimate intergrowths with the silicates on a scale of 2 - 50 microns. The laminar fabric is defined by close-spaced, thin bands of compact, silicate-free pyrrhotite.

The contact of this variant with the diopside-rich one is marked by a thin zone of foliaceous chlorite.

The massive sulfides are cut by a few multi-directional fractures infilled by limonite.

SAMPLE: KAL-1 (Slide 97-27660) ACTINOLITE QUARTZITE WITH SULFIDES

Estimated mode

Quartz	40
Actinolite	38
Garnet	trace
Galena	12
Sphalerite	6
Chalcopyrite	trace
Pyrrhotite	1
Limonite	3

This sample shows sharply defined compositional banding on a scale of 5 - 10 mm.

Thin section examination shows that it consists dominantly of two silicate components - quartz and actinolite - plus local development of a Pb/Zn-rich sulfide assemblage. It is closely similar to Sample 010419, but with a higher ratio of actinolite and sulfides relative to quartz.

The light-coloured bands in the thin section show virtually identical features to those described in Sample 010419, consisting of aggregates of sub-angular to sub-rounded, equant to slightly elongate grains of quartz, 0.1 - 0.4 mm in size, with an interstitial silty or cherty phase of quartz of grain size 10 - 50 microns. Radiate clusters of fibro/acicular actinolite occur sporadically throughout this texturally bimodal quartzite matrix, locally coalescing as concordant streaks.

In this sample quartzitic bands (with widely varying ratios of cherty to sand-sized quartz) alternate with brownish bands which are composed of essentially monomineralic actinolite, as compact felted to radiate/acicular aggregates.

The sulfide assemblage in the present sample differs from that in 010419 in consisting dominantly of galena and sphalerite, with only minor pyrrhotite.

Sulfides are sparse over most of the sectioned area, being confined to very fine-grained disseminations - mainly of sphalerite and pyrrhotite - in some quartzitic bands. The grain size of the sulfides is typically in the range 5 - 100 microns, with the sphalerite locally aggregating as clumps and lenses up to 1 mm or so in thickness. Sulfides are rare in the actinolite bands.

The bulk of the sulfides occur within a zone about 1 cm in thickness at one end of the sectioned portion. Galena is strongly dominant in this zone. It forms fine disseminations and irregular clumpy segregations 0.5 - 2.0 mm or more in size in a chert-rich quartzite band, and minutely fine-grained intergranular impregnations (ranging

Sample KAL-1 cont.

down to low micron size) in some thin intercalated actinolite laminae.

The sulfides are more or less strongly oxidized (to limonite and secondary Pb and Zn minerals) at the extreme end of the slide and along a sub-concordant fracture in the centre.

(EIA) - EQUITY ENGINEERING LTD.

Project: BLK-97-3
P.O. # :

Samples submitted to our lab in Vancouver, BC.
This report was printed on 7-AUG-97.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
205	22	Geochem ring to approx 150 mesh
226	22	0-3 Kg crush and split
3202	22	Rock - save entire reject
229	22	ICP - AQ Digestion charge
* NOTE	1:	

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

CERTIFICATE A9734517

(EIA) - EQUITY ENGINEERING LTD.

Project: BLK97-03
P.O. # :

Samples submitted to our lab in Vancouver, BC.
This report was printed on 5-AUG-97.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
201	35	Dry, sieve to -80 mesh
202	35	save reject
229	35	ICP - AQ Digestion charge

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	35	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
2118	35	Ag ppm: 32 element, soil & rock	ICP-AES	0.2	100.0
2119	35	Al %: 32 element, soil & rock	ICP-AES	0.01	15.00
2120	35	As ppm: 32 element, soil & rock	ICP-AES	2	10000
2121	35	Ba ppm: 32 element, soil & rock	ICP-AES	10	10000
2122	35	Be ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2123	35	Bi ppm: 32 element, soil & rock	ICP-AES	2	10000
2124	35	Ca %: 32 element, soil & rock	ICP-AES	0.01	15.00
2125	35	Cd ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2126	35	Co ppm: 32 element, soil & rock	ICP-AES	1	10000
2127	35	Cr ppm: 32 element, soil & rock	ICP-AES	1	10000
2128	35	Cu ppm: 32 element, soil & rock	ICP-AES	1	10000
2150	35	Fe %: 32 element, soil & rock	ICP-AES	0.01	15.00
2130	35	Ga ppm: 32 element, soil & rock	ICP-AES	10	10000
2131	35	Hg ppm: 32 element, soil & rock	ICP-AES	1	10000
2132	35	K %: 32 element, soil & rock	ICP-AES	0.01	10.00
2151	35	La ppm: 32 element, soil & rock	ICP-AES	10	10000
2134	35	Mg %: 32 element, soil & rock	ICP-AES	0.01	15.00
2135	35	Mn ppm: 32 element, soil & rock	ICP-AES	5	10000
2136	35	Mo ppm: 32 element, soil & rock	ICP-AES	1	10000
2137	35	Na %: 32 element, soil & rock	ICP-AES	0.01	5.00
2138	35	Ni ppm: 32 element, soil & rock	ICP-AES	1	10000
2139	35	P ppm: 32 element, soil & rock	ICP-AES	10	10000
2140	35	Pb ppm: 32 element, soil & rock	ICP-AES	2	10000
2141	35	Sb ppm: 32 element, soil & rock	ICP-AES	2	10000
2142	35	Sc ppm: 32 elements, soil & rock	ICP-AES	1	10000
2143	35	Sr ppm: 32 element, soil & rock	ICP-AES	1	10000
2144	35	Ti %: 32 element, soil & rock	ICP-AES	0.01	5.00
2145	35	Tl ppm: 32 element, soil & rock	ICP-AES	10	10000
2146	35	U ppm: 32 element, soil & rock	ICP-AES	10	10000
2147	35	V ppm: 32 element, soil & rock	ICP-AES	1	10000
2148	35	W ppm: 32 element, soil & rock	ICP-AES	10	10000
2149	35	Zn ppm: 32 element, soil & rock	ICP-AES	2	10000

CERTIFICATE A9734509

(EIA) - EQUITY ENGINEERING LTD.

Project: BLK97-03
P.O. # :

Samples submitted to our lab in Vancouver, BC.
This report was printed on 6-AUG-97.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
201	66	Dry, sieve to -80 mesh
202	66	save reject
229	66	ICP - AQ Digestion charge
* NOTE	1:	

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	66	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
2118	66	Ag ppm: 32 element, soil & rock	ICP-AES	0.2	100.0
2119	66	Al %: 32 element, soil & rock	ICP-AES	0.01	15.00
2120	66	As ppm: 32 element, soil & rock	ICP-AES	2	10000
2121	66	Ba ppm: 32 element, soil & rock	ICP-AES	10	10000
2122	66	Be ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2123	66	Bi ppm: 32 element, soil & rock	ICP-AES	2	10000
2124	66	Ca %: 32 element, soil & rock	ICP-AES	0.01	15.00
2125	66	Cd ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2126	66	Co ppm: 32 element, soil & rock	ICP-AES	1	10000
2127	66	Cr ppm: 32 element, soil & rock	ICP-AES	1	10000
2128	66	Cu ppm: 32 element, soil & rock	ICP-AES	1	10000
2150	66	Fe %: 32 element, soil & rock	ICP-AES	0.01	15.00
2130	66	Ga ppm: 32 element, soil & rock	ICP-AES	10	10000
2131	66	Hg ppm: 32 element, soil & rock	ICP-AES	1	10000
2132	66	K %: 32 element, soil & rock	ICP-AES	0.01	10.00
2151	66	La ppm: 32 element, soil & rock	ICP-AES	10	10000
2134	66	Mg %: 32 element, soil & rock	ICP-AES	0.01	15.00
2135	66	Mn ppm: 32 element, soil & rock	ICP-AES	5	10000
2136	66	Mo ppm: 32 element, soil & rock	ICP-AES	1	10000
2137	66	Na %: 32 element, soil & rock	ICP-AES	0.01	5.00
2138	66	Ni ppm: 32 element, soil & rock	ICP-AES	1	10000
2139	66	P ppm: 32 element, soil & rock	ICP-AES	10	10000
2140	66	Pb ppm: 32 element, soil & rock	ICP-AES	2	10000
2141	66	Sb ppm: 32 element, soil & rock	ICP-AES	2	10000
2142	66	Sc ppm: 32 elements, soil & rock	ICP-AES	1	10000
2143	66	Sr ppm: 32 element, soil & rock	ICP-AES	1	10000
2144	66	Ti %: 32 element, soil & rock	ICP-AES	0.01	5.00
2145	66	Tl ppm: 32 element, soil & rock	ICP-AES	10	10000
2146	66	U ppm: 32 element, soil & rock	ICP-AES	10	10000
2147	66	V ppm: 32 element, soil & rock	ICP-AES	1	10000
2148	66	W ppm: 32 element, soil & rock	ICP-AES	10	10000
2149	66	Zn ppm: 32 element, soil & rock	ICP-AES	2	10000

KALZAS

CERTIFICATE A9734512

(EIA) - EQUITY ENGINEERING LTD.

Project: BLK97-03
P.O. # :

Samples submitted to our lab in Vancouver, BC.
This report was printed on 6-AUG-97.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
201	70	Dry, sieve to -80 mesh
202	70	save reject
229	70	ICP - AQ Digestion charge

* NOTE 1:

The 32 element ICP package is suitable for trace metals in soil and rock samples. Elements for which the nitric-aqua regia digestion is possibly incomplete are: Al, Ba, Be, Ca, Cr, Ga, K, La, Mg, Na, Sr, Ti, Tl, W.

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	69	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
2118	70	Ag ppm: 32 element, soil & rock	ICP-AES	0.2	100.0
2119	70	Al %: 32 element, soil & rock	ICP-AES	0.01	15.00
2120	70	As ppm: 32 element, soil & rock	ICP-AES	2	10000
2121	70	Ba ppm: 32 element, soil & rock	ICP-AES	10	10000
2122	70	Be ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2123	70	Bi ppm: 32 element, soil & rock	ICP-AES	2	10000
2124	70	Ca %: 32 element, soil & rock	ICP-AES	0.01	15.00
2125	70	Cd ppm: 32 element, soil & rock	ICP-AES	0.5	100.0
2126	70	Co ppm: 32 element, soil & rock	ICP-AES	1	10000
2127	70	Cr ppm: 32 element, soil & rock	ICP-AES	1	10000
2128	70	Cu ppm: 32 element, soil & rock	ICP-AES	1	10000
2150	70	Fe %: 32 element, soil & rock	ICP-AES	0.01	15.00
2130	70	Ga ppm: 32 element, soil & rock	ICP-AES	10	10000
2131	70	Hg ppm: 32 element, soil & rock	ICP-AES	1	10000
2132	70	K %: 32 element, soil & rock	ICP-AES	0.01	10.00
2151	70	La ppm: 32 element, soil & rock	ICP-AES	10	10000
2134	70	Mg %: 32 element, soil & rock	ICP-AES	0.01	15.00
2135	70	Mn ppm: 32 element, soil & rock	ICP-AES	5	10000
2136	70	Mo ppm: 32 element, soil & rock	ICP-AES	1	10000
2137	70	Na %: 32 element, soil & rock	ICP-AES	0.01	5.00
2138	70	Ni ppm: 32 element, soil & rock	ICP-AES	1	10000
2139	70	P ppm: 32 element, soil & rock	ICP-AES	10	10000
2140	70	Pb ppm: 32 element, soil & rock	ICP-AES	2	10000
2141	70	Sb ppm: 32 element, soil & rock	ICP-AES	2	10000
2142	70	Sc ppm: 32 elements, soil & rock	ICP-AES	1	10000
2143	70	Sr ppm: 32 element, soil & rock	ICP-AES	1	10000
2144	70	Ti %: 32 element, soil & rock	ICP-AES	0.01	5.00
2145	70	Tl ppm: 32 element, soil & rock	ICP-AES	10	10000
2146	70	U ppm: 32 element, soil & rock	ICP-AES	10	10000
2147	70	V ppm: 32 element, soil & rock	ICP-AES	1	10000
2148	70	W ppm: 32 element, soil & rock	ICP-AES	10	10000
2149	70	Zn ppm: 32 element, soil & rock	ICP-AES	2	10000

APPENDIX G

LEAD ISOTOPE ANALYSES

Lead Isotope Analysis Samples - Dromedary Project

Sample	Location	Description
263143	DDH FRN96-02, 146.4 m depth	massive sulphide, 30% pyrite, 15% pyrrhotite, 10% sphalerite, 3% galena, fine grained, banded.
2702	Kal Trenches	quartzite, with galena and specularite in laminae, minor quartz veinlets cross-cut foliation.
230772	Tom Showing	siltstone, well foliated, 2-3% galena, 1% pyrite, 1-2% sphalerite, in cross-cutting veinlets and along foliation.

Galena Lead Isotope Analyses from Samples submitted by Equity Engineering Ltd.

Janet E. Gabites, Geochronology Laboratory, U.B.C.

Six galena samples were analysed for lead isotopic composition. The data are plotted on a $^{207}Pb/^{204}Pb$ v. $^{206}Pb/^{204}Pb$ diagram in Figure 1 and $^{208}Pb/^{206}Pb$ v. $^{207}Pb/^{206}Pb$ diagram in Figure 2, and complete analytical data are given in Table 1.. The shale curve has been plotted in the figures to provide a reference. This curve was calculated from data from sediment-hosted stratiform deposits in the miogeocline of the Canadian Cordillera, and thus provides a reference curve for continental and upper crustal environments in this broad region (Godwin *et al.*, 1988). Isotopic studies of stratiform base metal occurrences in the Yukon-Tanana Terrane (Mortenson, unpublished data) indicate that the shale curve also closely approximates the isotopic evolution of lead in this terrane. Two samples were analysed in duplicate.

Three samples collected from the Dromedary deposit in the Selwyn Basin plot near the shale curve (Figure 1), which implies that the mineralization that they were collected from is of upper crustalorigin. These data support an early to mid Paleozoic age of formation for the mineralization. Previously analysed samples collected from Dromedary and nearby showings have also been plotted in the figures for comparison. These samples were not well located, and may be of dubious quality; however, the new analyses compare well with the main cluster The new analyses from Dromedary are somewhat less radiogenic than those from most Devono-Mississippian SEDEX-type occurrences in the Selwyn Basin, such as Tom or Jason, and are more similar to lead isotopic compositions from the Howards Pass deposit. This may suggest that the host rocks are Ordovician to Silurian Road River Formation. Other galena samples from the Dromedary give much more radiogenic compositions and probably represent younger and unrelated mineralization.

One sample from Argus has been analysed. Two other samples from the Finlayson Lake area plot above the shale curve, and form an array with Argus that intersects the curve around 350 Ma. Two previous analyses from Hoo also plot above the shale curve and lie along this line. All these data are consistent with an ag o mineralization of about 350Ma (early Mississippian) with metals derived from several different reservoirs. All the analyses cluster together in Figure 2, suggesting that the spread in $^{207}Pb/^{204}Pb$ v. $^{206}Pb/^{204}Pb$ space is due to variablity in ^{204}Pb.

Analytical Techniques

Small clean cubes of galena were handpicked, washed, and dissolved in dilute hydrochloric acid. Approximately 10-25ng of the lead in chloride form was loaded on a rhenium filament and isotopic compositions were determined using a modified VG54R thermal ionization mass spectrometer. The measured ratios were corrected for instrumental mass fractionation of 0.12% per mass unit based on repeated measurements of the N.B.S. SRM 981 Standard Isotopic Reference Material. Errors reported in Table 1 were obtained by propagating all mass fractionation and analytical errors through the calculation.

GEOLOGIST'S CERTIFICATE

GEOLOGIST'S CERTIFICATE

I, Murray I. Jones of 8606 144A St., Surrey, in the Province of British Columbia, DO HEREBY CERTIFY:

1. THAT I am a Consulting Geologist with offices at Suite 207, 675 West Hastings Street, Vancouver, British Columbia.

2. THAT I am a graduate of the University of British Columbia with a Bachelor of Science Honours degree in Geology (1982) and the University of Ottawa with a Master's of Science degree in Geology (1992).

3. THAT I am a Professional Geoscientist registered in good standing with the Association of Professional Engineers and Geoscientists of the Province of British Columbia (No. 20063).

4. THAT this report is based on property work I conducted and/or supervised during June and July, 1997, as well as government publications and assessment reports filed with the Yukon Territory.

DATED at Vancouver, British Columbia, this 31st day of December, 1997.

Murray I. Jones, M.Sc., P.Geo.
