SUMMARY

The Oki-Doki Project Area is located in west-central Yukon approximately 67 kilometres east of Dawson City. The project area consists of a main block and three peripheral claim groups comprising 3,553 claim units covering 74,257.7 hectares. The claims are owned and operated by International Kodiak Resources Incorporated.

Following the turn of the century discovery of placer gold in the Klondike, various lode gold properties, such as Dublin Gulch, Clear Creek, and Antimony Mountain were located in the Dawson-Mayo area in the early part of this century. In 1987, with the discovery of the Brewery Creek deposit new interest was developed in the area. Eight mineralized zones define the main reserve trend at Brewery Creek. Mineralization is hosted by sedimentary rock adjacent to and within intrusive sills of the Tombstone suite occupying thrust faults and normal listric faults. North of the main reserve trend mineralization identified on the North slope zone is entirely sediment hosted and has been termed 'Carlin-like'. Production commenced with reserves of 17.1 million tonnes grading 1.45 g/T gold, Viceroy's mine is the first heap leach-open pit gold mine in the Yukon.

Previous exploration of the main block, by earlier operators, focussed on two separate areas, the Bear and Ridgway prospects, identified for their coincident anomalous airborne magnetic geophysical and regional stream sediment response. The bulk of the claim area remained unexplored until reconnaissance exploration was conducted in 1996.

In 1997, International Kodiak conducted a program of exploration accompanied by further land acquisition. Exploration emphasized detailed stream sediment sampling on existing ground and reconnaissance silt sampling on newly added claims to the east. A total airborne geophysical survey was flown over the entire main block. This program succeeded in identifying six areas of anomalous geochemical and geophysical response on the existing claims and several areas of interest on newly acquired ground.

The project area lies within the Selwyn Basin, northeast of the Tintina Fault. Located between the Robert Service Thrust and the Tombstone Strain Boundary the claims are underlain by sedimentary rock of Cambrian through Devono-Mississippian age. West-northwest and east-southeast trending folds and associated thrusts have deformed these lithologies. Subsequently these rocks have been intruded by granitoid members of the Tombstone Plutonic Suite.

Tombstone intrusions define a belt that extends from Tungsten in the Northwest Territories to the Fairbanks District in Alaska and are noted for their potential to host intrusion related gold deposits. The Fort Knox, Brewery Creek, and Dublin Gulch deposits are currently being mined or developed. These significant deposits have been recently joined by the Pogo vein deposit where to date a geological resource of 5.2 million ounces of gold has been identified with potential for expansion.

The Oki-Doki project area partially encloses Brewery Creek to the north and east and extends to the southeast following the regionally documented trend of Tombstone Intrusions and gold prospects from Antimony Mountain in the west to Red Mountain – Clear Creek in the east. The area distribution of the project blocks has the potential for the discovery of additional gold prospects. Battle Mountain and more recently Kennecot, Homestake, and Newmont have acquired adjoining ground.

In 1998, a program consisting of gridded soil geochemistry, mapping, prospecting, magnetometer and induced polarization surveys explored several of the six targets on the west half of the block. Detailed stream sediment sampling and prospecting was completed over four targets on the east half of the main block and on the peripheral claims. Activity on the east block further defined three of the four targets as areas that merit continued interest. On the west block, sulphide vein material from Area 1 provided assays as high as 3.674 oz/ton Au over narrow widths and values approaching half a gram, averaged over 16 metres, from sheeted vein material. Grid work on Areas 3 and 4 identified a series of broad multielement Au, As, Sb, Hg geochemically anomalous zones. Induced polarization surveying of Area 3 defined favourable chargeability and resistivity features coincident with the elevated geochemical values over a potential strike length in excess of two kilometres. Expenditures to date total over $2 million.

Additional work in the form of expanded soil geochemistry and induced polarization, trenching, and subsequent drilling of enhanced targets on Areas 3, and 4; repel traversing and trenching of Area 1; concurrent with initial grid work on remaining targets is recommended at an estimated cost of $750,000.

1.0 INTRODUCTION

1.1 AREA HISTORY

In 1896, the discovery of placer gold in the Klondike near Dawson City sparked one of the last world famous gold rushes, which produced millions of recorded ounces. Today, in the Dawson City region, over 100,000 ounces of gold are still recorded every year from small placer mining operations (Burke, 1996). Placer activity ultimately led to regional exploration for lode sources of the gold.

The Index prospect is located sixty kilometres east of Dawson and twenty-five kilometres north of the Brewery Creek deposit. Gold bearing stibnite quartz veining was first discovered in 1916. The veining is hosted by sedimentary rock near the margin of the Antimony Mountain syenite intrusion. The prospect has seen intermittent exploration to the present day and has returned assays as high as 30g/t Au (Minfile 116B 001). The Index was the first of a number of intrusion related Au prospects to be identified in a belt of occurrences that extends from Antimony Mountain in the northwest to Red Mountain in the southeast.

In 1987, Noranda Exploration Ltd. staked a weak regional aeromagnetic anomaly coincident with regional stream sediment samples that were anomalous in gold and mercury. Between 1988 and 1995, exploration efforts led to the discovery of the Brewery Creek deposit, outlining reserves in eight zones over a strike length of 12 km. During this time property ownership transferred to Hemlo Gold and then to the Loki Gold Corporation which subsequently merged with Viceroy Resources. Mineralization occurs primarily in oxidized Tombstone Suite intrusive sills, hosted by thrust and steep faults developed in sedimentary rock of the Earn and Road River Groups (Diment,1996). The Brewery Creek Gold Mine began producing gold in the fall of 1996 with proven reserves of 17.1 million tonnes grading 1.45 grams gold per tonne, equivalent to 790,000 ounces (Robertson, 1997). Production costs for 1997, the first full year of operation, averaged $184 per ounce. Brewery Creek is the Yukon's first heap leach operation and the territory's largest open pit gold mine (Thorstad, 1997b).

1.2 CURRENT ACTIVITY

Activity in the Brewery Creek area is ongoing. In 1996, Orinoco Gold Inc through option agreement with Battle Mountain conducted a trenching and drilling program on the Panorama Ridge property that borders the Oki-Doki main block to the southeast and is due east of the Brewery Creek trend. Of eight holes drilled, one, Drill Hole #7, provided economic grades of 2.5g/T Au over a 30-foot interval between 40 and 70 feet of depth. Trenching near this drill hole yielded 8.4g/T Au over 10 feet (Neugebauer, 1996).

Late in 1997, to the northeast of the Oki-Doki main block, Homestake Canada acquired ground in the Mike Lake area to explore for Brewery Creek style Tombstone hosted mineralization. In 1998 Homestake optioned Tombstone Explorations adjoining ground and conducted an exploration program involving extensive blast trenching. Drilling is planned for the spring of 1999.

Kennecot, at Antimony Mountain, and Newmont near Clear Creek were also active on their claims.

In 1997, at Brewery Creek, Viceroy added 483,000 ounces, or 30 million tonnes grading 0.50 g/t, of gold to the geologic resource at the Lucky, Bohemian, Classic and North Slope zones with over half of this mineralization in oxide form. The North Slope zone, located one kilometre north of the main reserve trend and defined by sediment hosted mineralization, accounts for 30% of this new resource, or 2.2 million tonnes grading 2.01g of gold. Exploration in 1998 focussed on infill and step out drilling of the Bohemian and Schooner zones to establish reserve and resource status for the two respective zones.

MDRU/UBC, the Mineral Deposit Research Unit based at the University of British Columbia, completed a three year study of the metallogeny of Tombstone Suite hosted deposits, sponsored, in part, by 19 industry subscribers.

1.3 LOCATION AND ACCESS

The Oki-Doki Project area claims plot on NTS map sheets 115P/13,14,15, 116A/2,3,4,5, and 116B/1,2 and are within the Dawson and Mayo Mining Districts.

Bordering the Brewery Creek deposit to the north and east, the Oki-Doki project area main block claims are located approximately 67 kilometres east of Dawson City, Yukon Territory (Figure 1). The centre of the block is located at 64° 08' north latitude and 138° 12' west longitude on the Lee Creek, NTS map sheet 116B/1.

Access to the property boundary and old camp from Dawson City is by paved road east along the Klondike Highway #3 for approximately 45 kilometres then north along the Dempster Highway #5, a hard pack gravel road, for about 27 kilometres. An access road runs east 3 kilometres into property limits to a camp on the west bank of the North Klondike River. From this point, a helicopter is used to access the property. To date, no roads have been constructed on the Oki-Doki property but at the adjacent operating Brewery Creek Gold Mine numerous roads exist, several of which are close to the property boundary.

Dawson City is Yukon's second largest city, and most services are available for the mining sector. Whitehorse, the capital of Yukon, is about 536 km southeast of Dawson City via the Klondike Highway and approximately one hour away by air.

1.4 PHYSIOGRAPHY, AND CLIMATE

The Oki-Doki Project area is on the western slopes of the Ogilvie Mountains and adjacent to the Tintina Trench to the southwest. Topography on the claims is generally moderate, with steeper slopes locally. Elevation ranges from 2000 feet on East O'Brien Creek to 5500 feet in the northeast end of the main block. Outcrop exposure is generally limited and is most common along steep slopes, ridges and creeks. This part of the Yukon was subject to weak localized glaciation. On the property localized alpine glaciation was restricted to the northeast corner of the west block claims. Patches of permafrost, slump and scar features are common on north facing slopes. For much of the area there are weak to no glacial till sheets to mask geochemical responses. Broad river valleys and steep rolling hills are common topographic features. In the surrounding region deposits of loess (wind blown silt of glacial origin) are known to reach thicknesses of approximately 20 metres (Diment, 1996). Loess will mask geochemical responses where it is thick.

Vegetation changes depending on the elevation and direction of slope. At low elevations, near drainages, spruce and pine are most common with occasional birch and cottonwood. At higher elevations willow, poplars, stunted conifers, grasses and buck brush are prevalent generally on south facing slopes. North facing slopes generally consist of moss and scrub alder with buck-brush.

The climate in the project area is sub-arctic. Typically with short cool summers, with the warmer periods from July to August, and long cold winters. The summer season occurs between June and September with 24-hour daylight in the third week of June. Summer temperatures range from 20-30° Celsius. Winter temperatures range from 0°C to as low as -50°C. Precipitation is generally low in the region with dry summers and moderately wet falls. Snowfall is variable. Accumulation is greatest on north facing slopes and within drift filled draws and drainages but in general averages one metre.

1.5 OWNERSHIP

The Oki-Doki Project area comprises four separate property blocks. These blocks consist of two separate MLN claim groups, the Bo claims and the Main Block. The Main block consists of Oki, Doki, Smoki, Karl, Lokey, Ob, Axis, Eagle, Goshawk, Bald, Golden, Wow, Bulsi, Good News, Yes, On, Bonus, Loki, Pay, Lucky, Big Time, Luvnit, Pay Day, Bang On, Big One, Bang, OBI, Sure Thing, Pay Dirt, Strike and High Grade claims. Collectively, there are 3,553 claim units covering 74,257.7 hectares (Figure 2a, 2b·Sheets 1,2). These claims, acquired through purchase and staking in the fall of 1996, 1997 and the spring of 1998, are currently owned and operated by International Kodiak Resources with offices at 1950 – 400 Burrard Street West, in Vancouver, British Columbia.

Application for an assessment for work completed as outlined in this report places all claims in good standing until the years 2001 and 2002.

Complete claim information and tenure status for all claims in all blocks is presented in Appendix 1.

1.6 PREVIOUS EXPLORATION

In 1989, Tombstone Explorations staked the Mik claim over the Ridgway prospect on a tributary to Lee Creek between Lee and Antimony Creeks. This ground covered a government airborne magnetic anomaly. In the following year the claim was prospected and silt sampled. One silt sample taken near the southeast edge of the magnetic anomaly was weakly anomalous in gold, copper, zinc and mercury. Placer Dome conducted a brief prospecting and silt sampling program in August of 1992 but their samples failed to return significant values (Yukon Minfile 116B 165).

In 1990, Noranda Exploration staked the Cub claims covering the Bear prospect. This area is located in the northeast corner of the main block between East O'Brien and O'Brien creeks. In 1991, the claims were explored through prospecting, mapping, geophysical and geochemical surveys and trenching. Seventy-five metres of veining over a half metre in width were identified hosted in calcareous siltstone at the margin of a syenite stock. Mineralization consists of arsenopyrite, chalcopyrite and scheelite. One specimen of massive arsenopyrite assayed 10g/T Au (Yukon Minfile 116A 033).

LUMINAI DRAFTING LTD. okiclm3

In 1996, Core Explorations contracted Nicholson and Associates to initiate a broad reconnaissance exploration program covering seventeen selected areas between Mayo and Clinton Creek. One area staked as a result of this program became the main block of the Oki-Doki project and was subsequently optioned to International Kodiak Resources. Within the block four areas of anomalous Au±As±Sb in soil and silt samples were identified. Two of these correspond with the location of the Bear and Ridgway prospects. A third occurs in the southeast corner of the block on a tributary to East O'Brien Creek. The fourth is in an area with two east flowing tributaries to O'Brien Creek (Nicholson, G., 1997).

In 1997 a property wide detailed stream sediment sampling program was conducted over the west block. Additional claims were staked to the east and sampled at a reconnaissance level. A total airborne geophysical survey covering both existing and new claims was flown at the end of the program. On the main block over 40 gold in silt and soil anomalies were identified. Of these, six are multi station multi drainage anomalies with accompanying pathfinder As, Sb, Hg values. These four element anomalous areas are coincident with geophysically interpreted structural and intrusive features. On the new claims to the east four areas with coincident geochemical and geophysical anomalies were identified.

1.7 OBJECTIVE

Gold occurrences associated with the Tombstone intrusions have been identified since the turn of the century, and are currently being mined or developed at Fort Knox, Dublin Gulch, and Brewery Creek.

The Oki-Doki project properties enclose Brewery Creek to the north and east and follow the regionally documented trend of Tombstone Intrusions and related gold prospects from Antimony Mountain in the west to Red Mountain in the east. The potential for locating additional deposits, of intrusion hosted hydrothermal vein 'Fort Knox', country rock hosted vein, or sediment hosted replacement vein 'Carlin' type signatures, of economic tenure is a realistic possibility.

To this end, Kodiak conducted a program of stream sediment sampling of east block targets and gridded soil geochemistry and ground geophysics over targets on the west half of the claims during August and September 1998.

2.0 REGIONAL GEOLOGY

2.1 INTRODUCTION

The Oki-Doki project area is central to the Dawson-Mayo area. This area lies in part within the Selwyn Basin. The Selwyn Basin forms part of ancestral North America. This region is characterized by deep water offshelf sedimentary strata that are transitional eastward and northward into shelf carbonate and clastic sedimentary rocks of the Mackenzie Platform. To the southwest, the Selwyn Basin is separated from volcanic stratigraphy of the exotic Yukon Tanana Terrane by the Tintina Fault Zone (Green, 1972: Poulson, 1997) (Figure 3).

2.2 STRATIGRAPHY

Lithologies within the Selwyn Basin are late Proterozoic to Mississippian in age. Stratigraphy of the Dawson-Mayo area is comprised, in order from oldest to youngest, of Hyland Group, Gull Lake Formation, Rabbit Kettle Formation, Road River Group, Earn Group and Keno Hill quartzite lithologies (Murphy et al, 1997).

Hyland Group

Proterozoic to lower Cambrian in age gritty metaclastic rocks of the Hyland Group can be divided into the Yuseyu and Narchilla Formations. The Yuseyu Formation is a succession of variably deformed fine to coarse grained rocks. Green gray phyllite is most common, followed by metasandstone and less common conglomerate and calcareous rock. Rocks of the Narchilla Formation differ only in that they are interbedded with variegated phyllite. A member of sandy white, gray and tan weathering occurs in the middle of the formation. Both formations are considered to be turbidite successions.

Gull Lake Formation

Overlying and in discontinuity with the Hyland Group, the Cambrian Gull Lake Formation consists of four members; a basal mafic volcanic and volcaniclastic member, a quartzite and phyllite member, a phyllite member and a calcareous clastic member. This suggests basinal sedimentation characterized by localized rifting progressing into marginal platformal outgrowth.

Rabbit Kettle Formation

Unconformably overlying older lithologies, the Cambro-Ordovician Rabbit Kettle Formation forms a prominent laterally continuous white weathering carbonate marker horizon. The limestone is primarily a platy thin to medium marble rock with lesser dolomitic phyllite deposited in a transitional setting.

Road River Group

Overlying the Rabbit Kettle Formation is the Silurian-Ordovician Road River Group. This group is further subdivided into the Duo Lake and Steel Formations. The Duo Lake Formation comprises gray to black to brown, brown weathering, phyllitic shale, cherty shale, chert and rare quartz augen phyllite. The Steel Formation consists of limey mudstone, phyllitic mudstone and siltstone with lesser fine grained calcareous quartz sandstone and thin sandy limestone. This rock is generally massive and has distinctive orange weathering. Deposition of both formations was in a deep basinal environment.

Earn Group

The Devono-Mississippian Earn group unconformably succeeds the Road River Group and is comprised of mostly dark gray to black shale with subordinate and variable amounts of chert, siltstone, sandstone, limestone, bedded barite, chlorite muscovite pyllite and chert pebble conglomerate. Deposition was likely deep marine basin in nature.

Keno Hill Quartzite

Overlying the Earn Group are massive to well foliated and lineated quartzite units of the Mississippian aged Keno Hill Quartzite.

Younger Rocks

All of the above formations are locally unconformably overlain by undifferentiated Upper Paleozoic to Triassic rocks and Jurassic clastic rocks in the north and northeast limits of the Dawson-Mayo area.

2.3 INTRUSIVE ROCKS

Stratigraphy of the area has been interrupted by volumetrically minor mafic sills which intruded Hyland group rocks in the Cambrian and Earn and Keno Hill group rocks during the Triassic. During the Cretaceous widespread locally large intrusive bodies of the felsic to intermediate Tombstone and McQueston Suites were emplaced (Murphy 1997).

Tombstone Suite

The Tombstone intrusions consist of two compositional and textural types. Quartz poor to quartz absent massive coarse grained hornblende-biotite syenite, quartz syenite, quartz monzonite, and granite defines one group. A second group is defined by quartz bearing, weakly porphyritic medium to coarse grained granite and granodiorite. The intrusions are variably magnetic with aeromagnetic signatures extending into hornfelsed contact aureoles. Tombstone intrusions occur at all stratigraphic levels in the area defining a southwest trending topographically prominent belt and were emplaced between 90-94 Ma.

McQueston Suite

McQueston intrusions occur in the southern limits of the area defining an east-northeast trending belt and are confined to the Hyland group. These intrusions comprise medium to coarse grained potassium feldspar megacrystic biotite muscovite granite and quartz monzonite. The McQueston intrusions were emplaced between 64-67 Ma.

2.4 STRUCTURE

Rocks of the Selwyn Basin occur in three tectonic sheets. These are separated by the Dawson, Tombstone and Robert Service low angle thrust faults. The rocks in each sheet are folded into upright to locally inclined, moderate to tight folds. The age of folding is constrained between the Jurassic age of the youngest strata present and the late Cretaceous age of the post deformation granitoid intrusion. This deformation is attributed to north-south shortening associated with terrane accretion.

Northeast trending folds and associated thrusts are associated with the Dawson and Tombstone sheets whereas west-northwest and east-southeast folds are most common in the Robert Service sheet. This regional pattern is disrupted in the south by the east-northeast trending McQueston anticline.

The youngest deformation is attributed to Eocene and younger dextral strike slip motion on the Tintina Fault (Poulson 1997).

2.5 DEPOSIT MODELS

The Tombstone-Tungsten belt, which extends from Tungsten in the Northwest Territories to the Fairbanks district in Alaska is noted for its potential to host intrusion related gold deposits such as Dublin Gulch, Fort Knox Brewery Creek and the recently discovered associated Pogo vein deposit(Murphy et al,1997) (Figures 5,6).

At Dublin Gulch, an inferred and potential resource of 98.6 MT at1.19 g/T Au has been calculated for the Eagle zone. The Eagle zone is a gold bearing, sheeted quartz vein porphyry deposit hosted by the Cretaceous Dublin Gulch biotite granodiorite stock. Mineralization consists of centimetre wide parallel quartz veins with accessory gold, arsenopyrite, pyrite, pyrrhotite, chalcopyrite, native bismuth, bismuthinite, and scheelite. These veins are not clustered or associated with distinct shear zones. Potassic and phyllic alteration is developed as vein selvages and becomes pervasive with vein density (Hitchins and Orssich 1996; Smit 1996)

The Fort Knox gold deposit is hosted within the Fort Knox Pluton, a Cretaceous multiphase granitic body. Gold occurs along the margins of stockwork veins and veinlets, quartz filled shear zones and along fractures within the granite. Mineralization is sulphide poor and closely associated with trace amounts of bismuth, tellurium and to a lesser extent with molybdenum and tungsten. Vein controlled weak phyllic, potassic, albitic and argillic alteration is present. Proven and probable reserves based on a cutoff of 0.39 g/T Au are 158.3million tonnes grading 0.83g/T Au (Bakke 1996).

Most, 85%, of the gold mineralization at Brewery Creek is hosted by altered and fractured high level Tombstone intrusions. These intrusions occur primarily as gently dipping sill like bodies emplaced in a series of imbricate east to east-southeast trending thrust faults. The remaining mineralization is primarily hosted by siliciclastic sediments. Brewery Creek is an example of a 'non carbonate hosted disseminated, stockwork, and replacement type' deposit . Elevated As, Sb, and Hg occur associated with fine grained arsenian pyrite, stibnite and arsenopyrite with quartz primarily in veinlet and breccia zones (Bremner, 1990; Saunders 1991; Diment 1996) (Figure 4)

Exploration at the Pogo deposit has to date identified a geological resource of 5.2 million ounces at an average grade of 0.52 ounces per ton at a cut off grade of 0.1 ounces. The Pogo deposit consists of at least two tabular quartz bodies hosted by Proterozoic – Paleozoic Tanana Terrain gneisses located along the southern margin of a mid Creataceous intrusive batholith suite. The zones are composed of 3% sulphides with pyrite, pyrrhotite, and arsenopyrite dominating accompanied by lesser bismuthinite and chalcopyrite.

Sheeted vein and stockwork styles of mineralization dominate at Dublin Gulch and Fort Knox whereas non carbonate hosted disseminated stockwork and replacement accounts for much of the mineralization at Brewery Creek. In these examples, mineralization is hosted in or immediately adjacent to mid Cretaceous intrusions, whereas at Pogo, mineralization occurs proximal to the intrusive belt.

In the Dawson-Mayo area, in addition to the above styles of intrusion related gold mineralization examples of gold skarn, carbonate hosted disseminated and quartz sulphide vein deposits exist.

Gold skarn mineralization is present at the Marn deposit adjacent to a dioritic to monzonitic apophysis of the Mount Brenner stock. The occurrence is a scheelite bearing hedenbergitic skarn with pyrrhotite and chalcopyrite as the dominant sulphide phases. Gold and bismuth were emplaced during late stage alteration.

Carbonate replacement types include manto like prospects such as Lake Creek. Here disseminated to massive arsenopyrite replaces carbonate minerals well away from stocks of the Tombstone Suite but with volumetrically minor porphyry dikes present. Another example of carbonate replacement is the North Slope occurrence at Brewery Creek. This zone is located over a kilometre north of the main trend of mineralization Here gold occurs with stibnite in a siliceous breccia within a fault zone cutting calcareous siltstone of the Steel Formation and has been described as Carlin-like.

Quartz sulphide vein deposits are common and account for many of the early discoveries in the region. Antimony Mountain is just one example. On average the veins are one metre wide, dip steeply and trend east-northeast. Arsenopyrite, and pyrite are the most common sulphide minerals occurring in quartz rich or massive sulphide veins.

All of these styles of mineralization have a spatial association with intrusions of the Tombstone Plutonic Suite, carbonate members of the stratigraphic succession. Structural orientation is predominantly east-west. The suite As-Sb-Hg occurs both proximal and distal to intrusions whereas Bi is diagnostic of proximal deposits (Poulsen 1996).

Other styles of mineralization that occur within the Dawson-Mayo area are Pb-Zn-Ba sedimentary-exhalative deposits and Ag, Pb, Zn veins hosted by Neoproterozoic-paleozoic sedimentary strata (Figures 5,6)

2.6 AREA PROSPECTS

The Oki-Doki project area extends from Antimony Mountain in the northwest to Red Mountain in the southeast. Adjoining the Brewery Creek mine property to the north and east the Oki-Doki west block encompasses two areas of previous work. These are the Ridgway and Bear prospects. Immediately adjacent to the claims are the Index, Burr, Hamilton, Philip, Aussie and Ida prospects. Peripheral to the east block claims are the Syenite, Fiona, Mozi, Sprague, Weiz, Hobo, Zeta, and Omega prospects.

The bulk of these showings are east-west oriented Au bearing vein systems hosted at or near the interface between sedimentary rock and Cretaceous syenite intrusions. The exceptions are the Omega and Zeta prospects which are, respectively, bedded barite and argentiferous galena vein occurrences (Figure 7)

3.0 EXPLORATION PROGRAM

3.1 SCOPE OF PROGRAM

The 1998 Oki-Doki project exploration program was conducted by International Kodiak Resources in two phases between August 1st and September 28th.

This program consisted of initial exploration of east block targets and selective follow up of the more advanced west block targets.

AREA PROSPECTS
BY: V.V.D.
DATE: DEC. 1998
SCALE: 1 : 500,000
FIG: 7

Stream sediment sampling of secondary drainages, reconnaissance soil sampling traverses, prospecting of available outcrop, and reconnaissance mapping at 1:20,000 was carried out on four east block targets

On the west block, several of the anomalous drainages of Areas 2 and 3 were gridded, soil sampled, and prospected. Areas 1, 4 and portions of Area 6 were covered by contour soil sampling, and additional prospecting.

Phase two work commenced September 1st, consisted of gridding and soil sampling Area 4, infill soil lines on Area 3 grids and concluded with 10 kilometres of line cutting, magnetometer and induced polarization surveys over part of Area 3.

3.2 LOGISTICS

Work was carried out by a crew complement of ten. Operations were conducted out of the Klondike River Lodge located at the junction of the Dempster Highway and Highway #2. The program was helicopter supported from several staging points: the Dempster corner, the Axis claims at kilometre 27 on the Dempster Highway at the western limit of the project area claims, and from the Clear Creek Road near Barlow Dome south of the east block claims.

3.3 SURVEY CONTROL

Traverse line, start and end points were located by tie in to recognizable topographical features and GPS checked. Lines either followed water courses in the case of silt traverses or were compass oriented on reconnaissance and grid soil traverses. Distances along all traverse lines were measured by hip chain. Six grids totaling 70km of compass and hip lines were run over Areas 2, 3, and 4. The distribution over these areas is as follows: Area 2 - 14.1km, Area 3.1 - 30.2km, Area 3.2 - 7.35km, Area 3.3 – 8.05 km, Area 3.4 – 3.5km, and Area 4 - 6.8km (Figure 8). Two portions of Area 3.1 were subsequently line cut to facilitate a ground geophysical survey. Cut lines totaling 10km were tightchained and wing lines oriented by turning board. Coordinate tie ins between cut lines and underlying compass lines were found to be within 5 to 10 metres. All measurements unless otherwise noted were in metric.

3.4 SAMPLING

Silt samples were collected at suitable sites between 150 and 200 metre interval stations on stream traverses. Reconnaissance soil samples were collected at 50 or 100m intervals, and grid based soil sampling collected soils at 50m intervals on 200m spaced lines and 100m spaced infill lines. Grab, chip, float and talus fine rock samples were collected on mapping, prospecting, geochemical, tagging and follow-up traverses. Sample numbers assigned were designed to indicate sampler the type of sample, and the sampler's continuous series sample number. An example of the sample number system is as follows; 31R 0027, would have been taken by sampler '31' of rock (R=rock, S=silt, X=soil), and was his 27th sample taken. Sample locations were field plotted on NTS NAD '27 Zone 7 and 8 series maps.

3.5 ANALYTICAL PROCEDURES

A total of 2,733 samples were collected. Of these 2,064 were soil, 389 were stream sediment, and 280 were rock samples. Samples were shipped to Acme Analytical Labs in Vancouver. Geochemical samples collected were placed in kraft bags and dried prior to shipping then screened to –80 mesh. Rock samples were crushed to –10 mesh, split, and then pulverized to –150 mesh. All samples were subjected to standard 30 element ICP analysis. Hg values were determined by cold vapor/ atomic absorption. Au values were determined by atomic absorption with a fire assay finish.

3.6 GEOPHYSICAL SURVEY

S.J.V. Consultants was commissioned by Kodiak to conduct a geophysical survey of 8.6 kilometres of induced polarization-resistivity over 15 survey lines and a magnetic survey over the same lines and an additional 3 survey lines totalling10km.

Magnetic data was collected using a Gem Systems GSM-19 magnetometer at 12.5 metre stations. Diurnal variations were monitored using an EDA Omni IV magnetometer as a base station.

The IP survey utilized an Iris ELREC-6 receiver and 3kW Phoenix IPT-1transmitter configured in a pole-dipole array using an 'a' spacing of 25 metres and 'n' values of 1-6.

Magnetic data has been presented in plan contour and stacked profile forms. Plan contour maps, pseudosections and inverted IP depth sections were prepared for the resistivity and chargeability data (Appendix 5, Volume 4).

4.0 PROPERTY GEOLOGY

4.1 INTRODUCTION

The Oki-Doki project main block is underlain by rock of Earn, Road River and Hyland Group lithologies. Early to Late Cretaceous intrusive stocks, dykes and sills intrude fine to coarse grained sedimentary rocks (Figure 3,9).

4.2 LITHOLOGY

The west block of claims is underlain mostly by a thick succession of sedimentary rocks of the Road River Group. These sedimentary rocks can be subdivided into the Duo Lake Formation consisting of shale, argillite and chert; and the Steel formation consisting of siltstone and mudstone. The northeast and northwest parts of the main claim block are underlain by the Hyland Group consisting of quartzite, sandstone, quartz-pebble conglomerate and chert. Interbedded thin wavy limestone and thicker massive argillite of the Rabbit Kettle Formation are also exposed to the north east. Much of the Oki-Doki property north of Viceroy's Brewery Creek Mine is covered by overburden, however occasional black friable graphitic outcrops near the southern boundary are thought to be Earn Group sediments. East block lithologies are primarily argillite and shale of Road River and Earn Group lithologies.

4.3 INTRUSIVES

A number of intrusive plugs, dykes and sills were encountered on the property. The composition of these intrusives in decreasing order of incidence is granodiorite-monzonite, diorite, feldspar-quartz porphyry, and andesite.

Felsic Plutonic Rocks. These range from granodiorite to quartz monzonite and are typically medium to coarse grained, although fine grained textures have been observed in places. The main mafic mineral in these plutons is biotite, and commonly occurs as biotite porphyry. Hornblende is less common. These rocks occur as typical plutons, up to several hundreds of metres in extent, and are generally fresh, unaltered. Some dykes have been observed as well. These plugs are more common in the E block and adjacent to the newly staked Wow claims in the northern and eastern part of the main block of claims.

Medium to Coarse Grained Diorite. These rocks usually occur as dykes and sills up to 100 metres in width or more. The predominant mafic mineral is biotite, with minor hornblende. Unlike the more felsic intrusives, these dykes are more commonly equigranular. These rocks are also mostly unaltered. They locally contain up to 2% fine disseminated pyrite, which is sometimes oxidized, resulting in mild gossans. These dykes may coincide with magnetic anomalies from the airborne survey.

Feldspar ± Quartz porphyry. These intrusions occur as small plugs, dykes and sills up to 30 metres in width. Phenocrysts range to 15% coarse angular to sub-rounded or fragmented feldspar up to 4mm in size, and up to 5% rounded to sub-rounded quartz up to 2mm in size, in a fire grained to aphanitic tan to pale gray-brown matrix. These rocks generally contain up to 2% disseminated pyrite. One dyke or sill, located in the northeast end of the E block, had trace disseminated pyrrhotite, chalcopyrite and arsenopyrite. The feldspar phenocrysts and the pyrite are often leached out and replaced by limonite. Manganese oxide is common in fractures. This unit most closely resembles descriptions of intrusive rock observed at Brewery Creek

Numerous irregular andesitic dykes with various textures have been noted at various locations. They are generally narrow, less than one metre in width, limited in extent, and appear to be unmineralized and unaltered.

4.4 STRUCTURE

Topographic lineaments define a trellis pattern characteristic of fold and thrust terrane. Prominent lineaments occupied by major drainages trend east-west parallel to the orientation of regional fold axes and thrust faults, and north-northwest parallel to the orientation of regional strike slip faulting. From Landsat and SAR radar imaging additional northwest and northeast lineaments are apparent (Figure 10).

Bedding orientations observed across the property are east-west striking and moderate dipping consistently to the south. Lithologies overall young to the south. These two observations likely indicate the property lies on the broad limb of an antiform. Local reversals in dip direction reflect drag folding proximal to thrust faulting.

Orientations for veins bearing mineralization are east-west trending and steeply south dipping. This is in agreement with similar regionally documented occurrences.

4.5 MINERALIZATION

Sulphides observed on the claims occur as disseminated or interstitial filling mineralization, polymetallic mineralization associated with quartz calcite veining within shear zones, and polymetallic mineralization associated with quartz calcite veining within hornfelsed zones.

Disseminated mineralization is common in all rock types. Very fine grained to coarse euhedral pyrite, likely diagenetic in origin, ranges in abundance up to 5% and through weathering generates numerous gossans on exposed rock surfaces. Pyrrhotite up to 2%, trace chalcopyrite, and arsenopyrite occur as interstitial fillings likely haloing larger intrusive bodies.

Polymetallic mineralization, hosted in fault and shear controlled quartz ± calcite veins, occurs at several locations. Minerals include: pyrite up to 5% occurring as pods, blebs up to 5mm, and disseminations; pyrrhotite up to 3% occurring as small blebs up to 2mm; arsenopyrite up to 3% occurring as euhedral laths up to 1mm; chalcopyrite up to 2% occurring as blebs up to 3mm; trace chalcoate occurring as small specks; trace bismuthinite occurring as small specks. Sulphide veins occur as narrow massive arsenopyrite, stibnite veins and as pods of arsenopyrite, galena, sphalerite, jamesonite.

Quartz and carbonate veining occurs in all rock types found on the property as individual veins, stockworks, and vein breccias.

The most common form of veining is quartz stockwork. Veins range up to 5cm in width with vein densities up to 15%. These veins are generally unmineralized but can carry 1-2% fine pyrite and minor pyrrhotite.

Quartz-calcite-ankerite veining occurs in areas of faulting with developed carbonate alteration zones. The veins are commonly brecciated. Widths rarely exceed 30 cm and are generally barren of mineralization.

Quartz-calcite veins occur in fault and shear zones with associated silicification, bleaching and propylitic alteration. Quartz textures vary from milky to chalcedonic to saccharoidal to vuggy and drusy. Veins widths range up to one metre and can carry mineralization.

5.0 EXPLORATION RESULTS

5.1 PROPERTY GEOCHEMICAL SURVEYS

Over the Oki-Doki west and east blocks and MLN and Bo claims 2,454 geochemical samples were collected. Of these, 2,064 were soil and 389 were reconnaissance silt samples. Of the soil samples collected 1,566 were grid based the remaining 498 were collected from contour and reconnaissance traverse. Several distinct populations were recognized and grouped allowing for separate statistical parameters to be established. Soils from gridded areas define one population, soils from non gridded areas define a second population, and soils from the east block were treated as a third population. This division of the soils effectively distinguishes between areas primarily underlain by intrusive rock and areas primarily underlain by sedimentary rock and separates advanced targets of the west block from first phase targets of the east block claims. Silts were divided into two populations; those collected from drainages within intusive rock

dominated terrain, and those collected from drainages within sedimentary rock dominated terrain . This division also effectively split the population into a set from the west block and a set from the east block. For all populations element highs defining a second elevated population were excluded from calculations of statistical parameters.

Gridded Soils

Gridded soil geochemical descriptive statistics for Au, As, Sb, Hg are presented in the following table. Values for Au>46, As>116, Sb>63, Hg>1175 were excluded from computation.

TABLE 1	90th percentile	95thpercentile	X+σ	X+2σ
Au ppb	10	15	10	15
As ppm	22	29	23	33
Sb ppm	10	13	10	16
Hg ppm	455	650	390	602

Non gridded soils

Non gridded soil geochemical descriptive statistics for Au, As, Sb, Hg are presented in the following table. Values for Au>96, As>441, Sb>99, Hg>1455 were excluded from computation.

TABLE 2	90th percentile	95thpercentile	X+σ	X+2σ
Au ppb	32	52	28	55
As ppm	264	359	200	311
Sb ppm	33	46	28	43
Hg ppm	295	490	360	578

East Block

East block soil geochemical descriptive statistics for Au, As, Sb, Hg are presented in the following table. Values for As>64, Hg>440 were excluded from computation. All gold and antimony values were included.

TABLE 3	90th percentile	95thpercentile	X+σ	X+2σ
Au ppb	8	11	7	11
As ppm	19	28	20	27
Sb ppm	5	6	4	6
Hg ppm	173	222	155	234

Intrusive silts

Intrusive silt geochemical descriptive statistics for Au, As, Sb, Hg are presented in the following table. Values for Au>53, As>496, Sb>45, Hg>765 were excluded from computation.

TABLE 4	90th percentile	95th percentile	X+σ	X+2σ
Au ppb	20	27	17	26
As ppm	251	335	201	318
Sb ppm	24	30	18	27
Hg ppm	490	595	321	498

Non intrusive silts

Non intrusive silt geochemical descriptive statistics for Au, As, Sb, Hg are presented in the following table. Values for Au>41, As>56, Sb>18, Hg>510 were excluded from computation.

TABLE 5	90th percentile	95th percentile	X+σ	X+2σ
Au ppb	9	13	9	14
As ppm	15	21	17	25
Sb ppm	6	7	5	8
Hg ppm	303	372	251	361

5.2 Evaluation

Soil Geochemistry

Comparison of plots for the pathfinder elements indicate a close correlation between Au and Hg values and between As and Sb values in both soil and silt populations. In general, Au values are flanked by mercury and overlap with arsenic and antimony values. Contour and grid sampling on the west block provided anomalous results in all areas covered and detailed silt and soil traverses of the east block returned anomalies in three of the four areas focused on.

West Block
Area 1

Contour soil sampling returned elevated gold values as high as 356ppb, below Trenches 1and 2 and values up to 945ppb Au on strike to the northeast near the property boundary, likely at the Birdie/Bindie zones. Contour samples below Trenches 3 and 4, the Bear zone, were geochemicaly quiet. Arsenic and antimony values were uniformly high throughout all of the sample traverses reflecting the underlying intrusive body (Figure 11,12).

Area 2

Area 2 grid work was designed to follow-up both elevated '97stream sediment samples in the southwest and '96 reconnaissance soil anomalies in the northeast. Spotty single station anomalies occur in the north and a weak multi line multi station Au anomaly occurs in the very southwest limits of the grid. The latter anomaly is associated with weak arsenic and mercury values. No anomalous antimony values were returned (Figure 13.1-13.4).

Area 3
Area 3.1

Eight clusters of anomalous gold values are distributed over the grid area. The elevated gold values are partially overlapped by arsenic and antimony and are draped and flanked by mercury values. These anomalies effectively define two parallel potentially offset multielement trends running discontinuously over 2.4km (Figure 14.1-14.4).

Area 3.2

Coincident anomalous arsenic, antimony, mercury with low gold values were encountered along the southern and northeast limits of the gridded area. Discontinuous gold values occur over 600m in the south and over an open ended 200m in the north (Figure 15.1-15.4).

Area 3.3

In the southeastern portion of the grid gold values up to 157ppb occur discontinuously over 500m and are flanked to the south by more consistent, elevated arsenic, antimony, and mercury values (Figure 16.1-16.4).

Area 3.4

Grid coverage of Area 3.4 was extended from Area 3.1. A coincident gold, arsenic, antimony, mercury anomaly occurs in the northeast corner and a gold mercury anomaly extends along the southern limit of coverage discontinuously for 400 metres (Figure 14.1-14.4)

Area 4

Two areas of multiline, multistation gold response were identified. These areas are north central and southeast central to the Area 4 grid. In general, there is a poor correlation with the other pathfinder elements (Figure 17.1-17.4).

Area 6

Limited contour and ridgeline sampling was conducted on only a portion of Area 6. Several complementing elevated gold values were returned (Figure 11).

East Block

Stream sediment and contour soil traverses returned elevated gold values from the Lost Horses Creek area and from the west flank of the Hobo Creek stock on the Bonus claims. Stream sediment sampling on the On, Golden, Goshawk claims between Aussie Creek and the South Klondike River yielded widespread anomalous gold, arsenic and mercury values associated both with a buried intrusion near the centre of the claim and a N70W trending dyke or sill which separates the buried intrusion on the property and the Panorama Ridge intrusion to the north (Figure 18).

MLN, Bo Claims

Stream sediment samples from the Bo claims were consistently elevated in gold and arsenic values. Contour sampling returned background values indicating that the source of the stream anomalies is further upstream and off of the Bo claims. Contour soil sampling of the MLN claims returned a number of elevated gold and arsenic values. These values are localized on the southwest claims and scattered on the northeast claims (Figure 19).

5.3 ROCK ASSAYS

Although outcrop is limited to less than 10% of the property area, a total 280 rock samples were collected and submitted for analysis.

Of the rocks collected, twenty – two returned values greater than 100ppb Au. All of the samples are from Area 1 and correspond to the area of the Bear prospect. Twenty one of these were collected while resampling two sets of existing trenches. A lone sample assaying 1760ppb Au was collected from near the property boundary, corresponding to the Birdie/Bindie zone on strike with a structure running through Trench 1-2. This set of trenches returned 26m averaging 431ppb Au from very narrow sheeted vein material in relatively unaltered granodiorite. The second set of trenches Trench 3-4 exposed narrow sulphide veining with grades as high as 3.674 oz/ton Au and 120.7ppm Ag from sample 35R0111. Silver rich lead zinc pods and veining were located in the northeast limits of Area 1. These veins correspond to the south Rimrock showing. Samples bearing jamesonite assayed as high as 229ppm Ag. Gold values however were uniformly low (Figure 11,12,20,21).

5.4 GROUND GEOPHYSICS

Magnetic data from the ground survey over Area 3.1 is in general of low amplitude response. More elevated magnetic response occurs over portions of Line 34E and Line 45E potentially indicating alteration along inferred NNW trending structures.

Results from the induced polarization survey detail a consistent broad chargeability low/resistivity feature was observed over the entire induced polarization survey area. This feature is formational in nature. Flanking and overlapping this feature on several lines, L23, L28, L35, and L45, are areas of high resistivity up to and exceeding 100m in width. The high resistivity likely represents areas of silica flooding or veining along shallow thrust faults with the potential for accompanying mineralization (Sheldrake, Appendix 5). The geophysical anomalies are, in all instances, open ended and through inversion modeling at shallow depths of 50 – 100m.

6.0 DISCUSSION

Detailed follow–up geochemical, prospecting, mapping and geophysical surveys of west block targets and first phase exploration on east block geochemical and geophysical features succeeded in enhancing all of the exploration targets addressed and improved the focus for future work. Target areas were variably advanced as resources permitted with an emphasis on Area 3.1 which now stands, effectively, drill ready. The potential for these target areas to host intrusion hosted 'Fort Knox' type, intrusion related, 'Pogo' vein or sediment hosted Carlin like deposits remains high.

The Oki Doki project claims are underlain primarily by lithologies of the Ordovician – Silurian Road River Group and to a lesser extent by lithologies of the Devonian Mississippian Earn Group and Cambrian Gull Lake Formation. These sedimentary rocks are intruded by dikes or sills, plugs and stocks of the early to late Cretaceous Tombstone Intrusive suite. On Viceroy's property to the south, Tombstone sills, introduced along thrust faults, and hosted within Road River and Earn Group sedimentary rocks localize much of the mineralization.

Gridded and contour geochemical surveys of west block targets were successful in identifying source areas within previously identified anomalous catchment areas. Commonly the distribution of the pathfinder element anomalies are discontinuous. Many of the anomalies are on moderately steep north facing slopes which are prone to slumping potentially locally masking the anomalies with transported material. Discontinuous pathfinder anomalies are distributed, on either side of a NNW structural offset, over 2.4 kilometres in Area 3.1.

First phase stream sediment sampling and reconnaissance ridgeline and contour sampling of east block claims succeeded in identifying three areas of anomalous geochemical response. These areas of interest occur on the On Golden Goshawk claims and in the Lost Horses Creek and Hobo Creek area of the Bonus Claims. Areas of geochemical response correspond with inferred buried and surface intrusive features delineated by the 1997 airborne geophysical survey.

Induced polarization – resistivity surveying of two portions of Area 3.1 identified several areas of moderately high resistivity. These areas of resistivity flank a high chargeability–low resistivity formational feature. This feature is coincident with pathfinder element soil geochemical anomalies. The high resistivity could reflect quartz flooding or veining with the potential for attendant mineralization localized along structural contacts between Road River and Earn Group lithologies. The areas of high resistivity are open ended and require additional survey coverage. Inversion modeling indicates that targets are at a relatively shallow depth. A magnetometer survey provided high readings over one line likely identifying a previously inferred NNW structure that links the two areas of coverage (Figure 22).

Prospecting in Area 1 relocated the Bear, southern Rimrock, and Bindie zones and an additional undocumented showing. Sampling of narrow sulphide veining from trenches 3 and 4 at the Bear prospect returned values as high as 3.674 oz/t Au. Grab samples of sulphide pod material from the southern Rimrock zone returned high values for silver up to 229.5ppm with accompanying high lead, zinc, arsenic, and antimony but uniformly low gold. Quartz sulphide material from the Bindie zone assayed 1760ppb Au. This zone is on strike with undocumented trenching – Trenches 1 and 2 to the west which provided

26m averaging 431ppb Au from sheeted vein material. This structural lineament continues to the west and remains unexplored.

7.0 RECOMMENDATIONS

A Phase 3 program of exploration is recommended for the Oki Doki project claims for the 1999 field season. This program should be conducted in three stages with each successive stage contingent upon positive results of the previous stage.

Phase 3, Stage 1: To start on or about June 15, 1999 this work would be concentrated in Area 3.1 and would consist of linecutting and ground geophysics in the form of induced polarization/resistivity and magnetics to follow-up and expand upon anomalies generated from the 1998 work. Some mechanized trenching of advanced targets would run concurrently during the latter half of this stage.

Phase 3, Stage 2: Contingent upon positive results from Stage 1, Stage 2 work would consist of continued geophysical and geochemical surveys and trenching in Area 3. Concurrent activity on established targets in the Oki – Doki east block and west block claims would consist of gridded soil geochemistry and possibly ground geophysics in the form of induced polarization/resistivity and magnetics. Repel mapping and rock sampling traverses by qualified climbing personnel is recommended for Area 1. Blast trenching of targets generated from this work would be conducted toward the end of this stage. In addition a short diamond drill program of 500 metres to test targets generated in Area 3 would run concurrently during the latter half of this stage.

Phase 3, Stage 3: Contingent upon positive results from the Stage 2 work, a Stage 3 program of diamond drilling, totaling 1000 metres would tentatively be scheduled for early fall.

The estimated cost all-in, with Stage 1 totaling 100,000, Stage 2 totaling 420,000, and Stage 3 totaling 230,000, of the Phase 3 program would be $750,000. A cost breakdown of the individual stages is presented in the following table:

8.0 PROPOSED BUDGET

OKI -DOKI PROJECT
1999 Program
Phase 3, Stage 1
Geophysical Surveys and Trenching

Personnel						
Geologist	1	man	@	21 days	@ 350 /day	7350.00
Geological Technicians	2	men	@	21 days	@ 250 /day	10500.00
Camp Costs	8	men	@	21 days	@ 65 /day	10920.00
Analytical Fees	200	samples	@	15 /sample		3000.00
Geophysical Costs						
I.P. Survey/Magnetics	10	km	@	1,500 /km		15000.00
Linecutting	10	km	@	800 /km		8000.00
Trenching	10	days	@	1,500 /km		15000.00
Transportation						
Truck Rental	0.70	months	@	2,500 /month		1750.00
Helicopter (wet)	30	hrs	@	750 /hr		22500.00
Shipping						500.00
Fuel						500.00
Airfare						2500.00
Other						
Communication	Radios, telephone, etc.					480.00
Equipment/Consumables						2000.00
Stage 1 Subtotal						$100,000.00
TOTAL PHASE 3, STAGE 1						**$100,000.00**

Drafting							15000.00
Report Preparation							20000.00
TOTAL PHASE 2							**$407,136.00**

10.0 STATEMENTS OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, **Val Peter Van Damme,** of 2045 Holdom Avenue, Burnaby, British Columbia, hereby certify that:

I am a graduate of Lakehead University, Thunder Bay, Ontario, having received an Honours B.Sc. in Geology in 1988.

I have practiced my profession continuously since 1988.

I am a Consulting Geologist with offices at 2045 Holdom Avenue, Burnaby, British Columbia.

I am a registered member in good standing of the Association of Professional Engineers and Geoscientists of British Columbia (Reg. #22371).

The information in this report is based on an overview of published and unpublished reports on the property and the surrounding area.

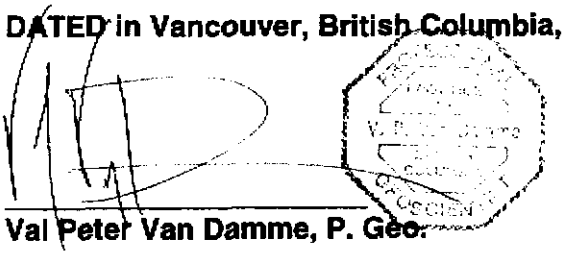
I conducted geological field work and personally supervised work conducted on the property during the periods August 1-31 and September 12-28.

I have no interest, direct or indirect, in the subject property or any within a 10 km radius, nor do I expect to receive such interest.

I have not received nor do I expect to receive, any interest, direct or indirect, in the properties and securities of International Kodiak Resources Inc.

International Kodiak Resources Inc. and its affiliates are hereby authorized to use this report in any prospectus, statement of material facts, or other public document.

DATED in Vancouver, British Columbia, this 22 day of December, 1998.



Val Peter Van Damme, P. Geo.

STATEMENT OF QUALIFICATIONS

I, **Brian D. Game,** of Vancouver, British Columbia, hereby certify that:

I am a graduate of the University of British Columbia with a Bachelor of Science Degree (1985) in Geology.

I have practiced my profession as a geologist in Canada, the United States and South America continually since graduation.

I am a Consulting Geologist with offices at 310 – 638 West 7th Avenue, Vancouver, British Columbia.

I am a registered member in good standing of the Association of Professional Engineers and Geoscientists of British Columbia (Reg. #19896).

The information in this report is based on an overview of published and unpublished reports on the property and the surrounding area.

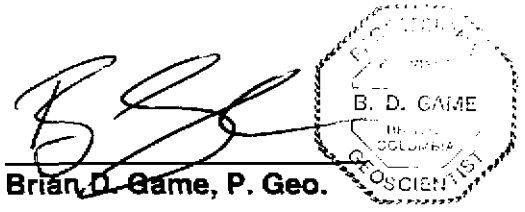
I conducted geological field work and personally supervised work conducted on the property between August 1st and September 12th, 1998.

I have no interest, direct or indirect, in the subject property or any within a 10 km radius, nor do I expect to receive such interest.

I have not received nor do I expect to receive, any interest, direct or indirect, in the properties and securities of International Kodiak Resources Inc.

International Kodiak Resources Inc. and its affiliates are hereby authorized to use this report in any prospectus, statement of material facts, or other public document.

DATED in Vancouver, British Columbia, this 22nd day of December, 1998.



Brian D. Game, P. Geo.

Kodiak Resources Oki Doki Project

Sample Number	Date Y/M/D	Area/Region	UTM Easting	UTM Northing	Sample Type	Description Lithology/Alteration/Structure/Mineralization
33R0001	98/09/9	Area #1	355615E	7123722N	Random Chip	Hornfelsed sediment, very siliceous; orange-brown on weathered surface. Tr - 2% py +- asp
33R0002	98/08/9	Area #1	355615E	7123722N	Random Chip	As above, abundant quartz-carbonate veining. 2-5% dissem. py +- asp.
33R0044	98/08/11	Area #4	645220E	7110280N	Grab	Bleached, weathered quartz monzonite dyke @ 260 - 270 degrees approx. 1-2 m. wide.
33R0045	98/08/11	Area #4	645750N	7109950N	Grab	Rusty, pyritic argillite, abundant erratic quartz-calcite stringers.
33R0046	98/08/11	Area #4	645793E	7109153N	Grab	Very weathered, orange-brown cherty argillite.
33R0063	98/08/12	Area #4	646292E	7108325N	Grab	Fine grained diorite dyke, medium green in colour, minor sericite, 2-3 metres wide @ aprx. 270 degrees.
33R0090	98/08/13	Area #4	353900E	7108980N	Grab	Grey-green argillite; abundant narrow swirling quartz-carbonate stringers.
33R0091	98/08/13	Area #4	645793E	7109153N	Grab	Extensively weathered (oxidized) cherty argillite, red-yellow (ferro magnesium)
33R0105	98/08/14	Area #4	645760E	7110150N	Grab	Black argillite, orange-yellow on oxidized surface tr py.
33R0106	98/08/14	Area #4	645900E	7110310N	Grab	Buff to pale orange-brown mod. weathered quartz monzonite dyke, 2 to 3 metres in width.
33R0107	98/08/14	Area #4	645900E	7110310N	Grab	Black, very weakly graphitic argillite, minor quartz-carbonate stringers, contract with R106.
33R0115	98/08/16	Area #3	637600E	7109680N	Grab	Black argillite; weakly graphitic, abundant swirling white quartz stringers.
33R0122	98/08/16	Area #3	637146E	7109830N	Grab	Green, cherty argillite; minor-quartz-filled fractures.
33R0135	98/08/16	Area #3	636980E	7109860N	Random Chip	Argillite, pyritic; rusty, orange-brown on weathered surface.
33R0136	98/08/16	Area #3	636980E	7109860N	Random Chip	As per R0135.
33R0137	98/08/17	Area #1	357798E	7124813N	Grab	Quartz-feldspar rich felsic dyke, minor silica alteration, blebs and clots of cpy tr-2% trend 310/?
33R0138	98/08/17	Area #1	358005E	7124605N	Grab	0.20 - 0.30 m wide milky white quartz vein @ 070/90; 10 metre strike extent Malachite, limonite.
33R0139	98/08/17	Area #1	358085E	7124497N	Grab	0.15-0.20 m wide quartz sweat, follows schistocity @ 340/20N tr cpy, mal.
33R0140	98/08/17	Area #1	358235E	7124379N	Grab	weak quartz stockwork in orange-brown diabase dyke.
33R0141	98/08/17	Area #1	358300E	7123468N	1 m chip	Hornblende-biotite-feldspar phyric dyke, 080/090; manganese stringers.
33R0142	98/08/17	Area #1	358448E	7122755N	1 m chip	Biotite-plagioclase phyric diorite, Tr py, po.
33R0143	98/08/18	Area #5	358011E	7111695N	Random Chip	cherty argillite; minor quartz-calcite stringers, weakly limonitic on fractures 110/80 N.
33R0144	98/08/18	Area #5	358097E	7111494N	1m chip	grey-black cherty argillite; tr pyrite.
33R0145	98/08/18	Area #5	358097E	7111494N	Grab	limonitic argillite, abundant 0.1 - 1 cm wide quartz stringers, vuggy, limonitic.
33R0146	98/08/19	Area #1	358180E	7122054N	Grab	quartz subcrop, 10-20 cm angular blocks of milky white quartz; limonitic.

Kodiak Resources Oki Doki Project

Sample Number	Date Y/M/D	Area/Region	UTM Easting	UTM Northing	Sample Type	Description Lithology/Alteration/Structure/Mineralization
33R0147	98/08/19	Area #1	357905E	7121656N	Random Chip	green fine to medium grained mafic dyke (andesitic) @ 075/90, weakly silicified, 1-3% dissem. Py; minor sericite.
33R0148	98/08/19	Area #1	357933E	7121503N	Random Chip	black argillite; abundant swirling and semi-concordent white quartz stringers.
33R0149	98/08/19	Area #1	357893E	7121586N	1 m chip	< 5 m wide mafic (dioritic) dyke, E-W trend.
33R0150	98/08/19	Area #1	357674E	7121169N	Random Chip	grey limestone with abundant .2 - 3 cm wide swirling white quartz stringers (stockwork) 080/85N.
33R0151	98/08/19	Area #1	357324E	7120900N	Random Chip	grey-black cherty argillite; 10-15 cm chert beds, minor orange weathering 110/40N.
33R0207	98/08/26	Bonus			Grab	medium green, diorite dyke weakly to moderately feldspar phyric, fresh unaltered 090/?.
33R0221	98/08/26	Bonus	397580E	7097735N	float grab	15 x 20 cm subangular white quartz boulder, limonitic some brecciated black argilite fragments trace f.g. dissem. py.
33R0231	98/08/30	Area #6	639070E	7118942N		chert; rusty weathered (weakly pyritic)
33R0246	98/08/30	Area #6	639014E	7119303N	Talus grab	oxidized cherty argillite; minor quartz stringers.
33R0247	98/08/30	Area #6	638762E	7118901N	float grab	very rusty-weathered chert; banded trace pyrite, limonitic fractures.
33R0248	98/08/30	Area #6	638762E	7118901N	Grab	very rusty, limonitic cherty argilite, Abundant swirling quartz - calcite stringers, tr pyrite.
33R0251	98/08/30	Area #6	638778E	7118904N	float grab	chert; limonite and manganese-filled fractures tr py.
33R0252	98/08/30	Area #6	638774E	7119098N	Grab	Chert; very limonitic, minor clay alteration (pinkish - grey bloom)
31R0001	98/08/06	Grid Area 3.1	2200E	2850N	Grab	Granular, weakly clay altered sandstone.
31R0002	98/08/07	Grid Area 3.1	1600E	3500N	Grab	Argillite; some vuggy oxidized pockets tr py.
31R0003	98/08/08	Grid Area 3.1	2600E	2800N	Grab	Dark green andesite dyke.
31R0004	98/08/08	Grid Area 3.1	3800E	2800N	Grab	Grey, porphyritic dyke; tr py.
31R0005	98/08/08	Grid Area 3.1	3800E	2850N	Grab	Grey shale - quartzite with tr dissem py.
31R0006	98/08/08	Grid Area 3.1	3800E	3000N	Grab	Pyritic argillite/andesite slide material.
31R0007	98/08/11	Area 1			Grab	Chert; dissem py + asp.
31R0008	98/08/11	Area 1			Grab	Specular hematite in calcite in gouge zone along granodiorite contact.
31R0009	98/08/11	Area 1			Grab	Quartz-calcite with blebs of asp, py at above contact.
31R0010	98/08/11	Area 1			Grab	Chloritic chert with dissem. Asp, py, po plus minor cpy.
31R0011	98/08/11	Area 1			Grab	Quartz vein, minor dissem. Py + asp.
31R0012	98/08/11	Area 1			Grab	Porphyritic intrusive; dissem. py. asp, cpy.
31R0014	98/08/12	Area 1			Grab	Calcite-rich intrusive; dissem py +/- stibnite.
31R0015	98/08/12	Area 1			Grab	Granodiorite; tr py po
31R0016	98/08/12	Area 1			Grab	Granodiorite; tr py po
31R0017	98/08/12	Area 1			Grab	Hornfelsed sediment; tr py, po, cpy
31R0018	98/08/12	Area 1			Grab	Hornfelsed sediment; tr py po cpy
31R0019	98/08/13	Area 1			Grab	Altered granodiorite; pyrrhotite
31R0020	98/08/13	Area 1			Grab	Altered granodiorite; abundant pyrrhotite

Kodiak Resources Oki Doki Project

Sample Number	Date Y/M/D	Area/Region	UTM Easting	UTM Northing	Sample Type	Description Lithology/Alteration/Structure/Mineralization
31R0021	98/08/14	Area 1			Grab	Chlorite altered chert with po, py, asp.
31R0030	98/08/14	Area 1			Grab	Siliceous breccia zone at int/sed contact abundant gn, sph, py, po.
31R0036	98/08/14	Area 1			Grab	Somewhat rusty, leached out version of 0030
31R0040	98/08/15	Area 1			Grab	quartz-carbonate breccia with py, gn, sph.
31R0063	98/08/15	Area 1			Grab	as per R0040
31R0065	98/08/15	Area 1			Grab	Iron stained felsic dyke @ 080/76S, py, po
31R0067	98/08/16	Area 1			Grab	Felsic dyke; tr py, po
31R0069	98/08/16	Area 1			Grab	Intrusive with stockwork calcite veining; dissem py in country rock.
31R0075	98/08/16	Area 1			Grab	Quartz vein; mal, cpy.
31R0083	98/08/19	Oki Doki North			Grab	Chert; quartz stockwork with py, cpy.
31R0084	98/08/19	Oki Doki North			Grab	Quartz-carbonate stockwork in fine grained intrusive.
31R0085	98/08/19	Oki Doki North			Grab	Monzonite; pyritic.
31R0087	98/08/19	Oki Doki North			Grab	Carbonate vein stockwork in argillite/chert at contact with fine grained porphyritic intrusive.
31R0101	98/08/20	Oki Doki North			Grab	Grey, fine grained quarzite; py in fissures and blebs.
31R0162	98/08/22	Bonus			Grab	Porphyritic andesite; tr po.
31R0170	98/08/22	Bonus			Grab	Extensively altered monzonite (?).
31R0172	98/08/22	Bonus			Grab	Porphyritic and pyritic mafic intrusive.
31R0183	98/08/25	Big Time			Grab	Chloritic grit or wacke interbedded with carbonceous shale, dissem. py.
31R0188	98/08/25	Big Time			Grab	Graphitic argillite shot thru with quartz stockwork veining.
31R0194	98/08/30	Area 6			Grab	Argillite; stockwork quartz veining with some brecciation.
31R0197	98/08/30	Area 6			Grab	oxidized intrusive
31R0201	98/08/30	Area 6			Grab	oxidized intrusive
31R0206	98/08/30	Area 6			Grab	mafic intrusive (gabbro)
31R0218	98/08/30	Area 6			Grab	silicified grit; limonite-filled fractures
30R0050	98/08/20	Oki Doki North			Insitu	fine grained seds with aspy/sb in strain fabric.
30R0075	98/08/22	On, Golden, Goshawk			Float	blk argillite breccia
30R0077	98/08/22	On, Golden, Goshawk			Float	blk argillite breccia with hairline qtz-calcite stockwork
30R0084	98/08/22	On, Golden, Goshawk			Insitu	mafic dyke less than 1% po./aspy.
30R0114	98/08/26	Bonus			Float	qz rich intrusive/limonitic/mn stains/med. brown
30R0115	98/08/26	Bonus			Float	qz. Lim. filled voids - some fresh shards of chert
30R0116	98/08/26	Bonus			Float	heavily o_2 qz? - felsic? Rust throughout/s_2 powders + mn
30R0117	98/08/26	Bonus			Float	bleached out seds - some voids/rust & white fine texture
30R0119	98/08/26	Bonus			Float	fine grain beige - felsic?/bleached seds? mn & fe sworls
30R0120	98/08/26	Bonus			Float	granite - plag-phenochryts - 2 size of biotite fe_2 stains
30R0125	98/08/28	Big Time			Insitu	mafic - intrusive - dark brown - 2 size biotite 3 cm long plagio
30R0126	98/08/28	Big Time			Insitu	mafic - diorite trace olivine rare asyp? - po?
30R0142	98/08/31	Oki Doki North			Float	silicified light grey arg. fe o_2 + mn coatings - qz in voids
30R0143	98/08/31	Oki Doki North			Float	alt. argil. limonitic - goethite + mn o_2 in ductile shears

Kodiak Resources Oki Doki Project

Sample Number	Date Y/M/D	Area/Region	UTM Easting	UTM Northing	Sample Type	Description Lithology/Alteration/Structure/Mineralization
30R0144	98/08/31	Oki Doki North			Float	silicified lt. grey to white argil. fe o_2 + mn o_2 breccia?
30R0145	98/08/31	Oki Doki North			Float	alt - argil/chert cream to orange felsic? matrix & angular clasts
30R0147	98/09/01	Oki Doki North			Float	grey cherty argil. breccia - limonitic & mn stains
30R0148	98/09/01	Oki Doki North			Float	grey cherty argil qz stockwork limonitic - siliceous
30R0149	98/09/01	Oki Doki North			Float	lt. grey chert/argil very fractured & rusty
30R0150	98/09/01	Oki Doki North			Insitu	argil. - very o_2 crumbly texture - alt? weathered?
30R0151	98/09/01	Oki Doki North			Local Float	alt chert/argil breccia - goethite & hydrous mn_2
30R0152	98/09/01	Oki Doki North			Insitu	chert/argil. - extremely alt? weathered, rust crumble
30R0155	98/09/02	Oki Doki North			Insitu	mafic dyke - qz - olivine - hornblende - rare py.
30R0156	98/09/02	Oki Doki North			Local Float	mafic dyke - qz blebs - olivine - hornblende - rare py.
30R0157	98/09/03	Area 3.1			Channel	blk argil - carbonaceous - 1.5 m channel of fines in o/c
30R0158	98/09/03	Area 3.1			Local Float	limonitic & carbonaceous matrix - angular clasts grey chert & blk argil.
36R-001	98/08/09	Area # 1	3 57 189	71 24 225	Rock	dark coarse grained, gabbro, rusty weath surface trace py
36R-002	98/08/11	Area # 1	3 56 116	71 23 367	Rock	v. rusty fine grained mafic (gabbro) dike, tr. diss. py & po locally 1%, dark green, magnetic
36R-003	98/08/12	Area # 1	3 55 967	71 23 389	Grab	f.g. limonite veinlets, plag, hb, minor biot, px? gabbro? lamprophyre? generally iron rich
36R-004	98/08/12	Area # 1	3 54 553	71 23 828	Select Grab	Mafic dike, chill margin f.g., rusty, py, po, dissem. magnetic
36R-005	98/08/12	Area # 1	3 54 468	71 24 089	Select Grab	silic, l.s., ghosted green immedia. porphyroblasts int. intrusive dike
36R-006	98/08/12	Area # 1	3 54 467	71 24 141	Select Grab	brittle red brown brx'd sed. py relicts, hematite fract. veinlets, chert & argillite interbeds
36R-007	98/08/12	Area # 1	6 54 474	71 24 189	Select Grab	Silicous pyritic sed. rusty fract.
36R-008	98/08/13	Area # 1	3 54 444	71 24 234	Select Grab	silic sed. rusty lens, chl & silic alt'n tr. py
36R-009	98/08/15	Area # 1	3 55 674	71 26 155	Select Grab	brx'd thinly bedded sed., silic, rusty weath surf. tr. dissem py

35R-0130	98/08/15	Area #1	354960	7127000	Chip	3-4m 3% PbS in argillite with carb
35R-0131	98/08/15	Area #1	354960	7127000	Chip	4-5m 3% PbS in argillite with carb
35R-0143	98/08/15	Area #1			Rock	tr - 1% py 079/74 argillite beds
35R-0218	98/08/21	Oki-Doki North			Grab	Silicified sediment tr py, po
35R-0365	98/08/31	Oki-Doki North			Grab	biotite-rich, mafic intrusive tr py, asp
35R-0366	98/09/01	Area 3.1			Grab	clastic sediment tr -1% dissem py
35R-0367	98/09/01	Area 3.1			Grab	clastic sediment tr -1% dissem py
34R-0074	98/08/13	Area 4	644040	7112840	Grab	fine grained sedimentary rock, weak patchy limonitic and manganese staining, minor quartz veining
34R-0075	98/08/13	Area 4	644200	7112700	Grab	interbedded siltstone/argillite, limonitic, local manganese staining
34R-0076	98/08/13	Area 4	644247	7112780	Grab	green cherty argillite, limonitic staining
34R-0087	98/08/13	Area 4	644066	7113047	Grab	mottled grey white chert, minor Fe staining
34R-0101	98/08/14	Area 4	645520	7110750	Grab	banded chert, chert pebble conglomerate
34R-0112	98/08/15	Area 3.1	4670E	BL2500N	Grab	limonitic black to green interbedded argillite siltstone
34R-0113	98/08/17	Area 1	360653	7125707	Grab	green siltstone black argillite bedding parallel carbonate veining
34R-0114	98/08/17	Area 1	360720	7125450	Grab	diorite 1/2% pyrite
34R-0115	98/08/17	Area 1	360800	7125200	Grab	quartz monzonite
34R-0116	98/08/17	Area 1	360850	7125100	Grab	kspar megacrystic quartz monzonite
34R-0117	98/08/17	Area 1	361320	7124900	Grab	mafic dike
34R-0118	98/08/18	On Golden Goshawk	360087	7105614	Grab	friable green limonitic shale
34R-0119	98/08/18	On Golden Goshawk	360250	7105620	Grab	green flaggy siltstone trace pyrite
34R-0120	98/08/19	Area 1	361320	7124500	Grab	diorite
34R-0121	98/08/19	Area 1	361600	7124110	Grab	monzodiorite weak carbonate alteration
34R-0122	98/08/19	Area 1	361750	7123700	Grab	fine to medium grained quartz phyric granite

Kodiak Resources Oki Doki Project

Sample Number	Date Y/M/D	Area/Region	UTM Easting	UTM Northing	Sample Type	Description Lithology/Alteration/Structure/Mineralization
34R-0131	98/08/22	On Golden Goshawk	360450	7105720	Grab	fine grained mafic dike
34R-0132	98/08/22	On Golden Goshawk	360500	7105900	Grab	gray green black siltstone argillite weakly graphitic
34R-0134	98/08/22	On Golden Goshawk	360500	7106100	Grab	black argillite with cherty siltstone
34R-0136	98/08/22	On Golden Goshawk	360510	7106220	Grab	cherty black argillite
34R-0139	98/08/22	On Golden Goshawk	360500	7106600	Grab	black cherty argillite
34R-0200	98/08/26	Bonus	398600	7098940	Grab	quartz vein material float adjacent to shale subcrop
34R-0239	98/08/30	Area 6	639896	7118051	Grab	fine grained feldspar biotite bearing non magnetic intrusive
34R-0242	98/08/30	Area 6	640000	7117880	Grab	fine grained feldspar biotite bearing non magnetic intrusive
34R-0243	98/09/23	Area 3.1	3300E	BL3500N	Grab	partially healed argillite fault breccia
34R-0244	98/09/23	Area 3.1	3500E	BL3500N	Grab	black friable graphitic argillite

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: AUG 24 1998 DATE REPORT MAILED: Aug 28/98 SIGNED BY.....D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: AUG 25 1998 DATE REPORT MAILED: Aug 31/98 SIGNED BY ..... D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMTED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: AUG 26 1998 DATE REPORT MAILED: Sept 1/98 SIGNED BY: C. Leong .D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMTED FOR NA K AND AL.
ASSAY RECOMMENDED FOR ROCK AND CORE SAMPLES IF CU PB ZN AS > 1%, AG > 30 PPM & AU > 1000 PPB
- SAMPLE TYPE: ROCK AU* - IGNITED, AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: AUG 26 1998 DATE REPORT MAILED: Sept 1/98 SIGNED BY ..... D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMTED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: AUG 26 1998 DATE REPORT MAILED: Sept 1/98 SIGNED BY. C. Leong .D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
ASSAY RECOMMENDED FOR ROCK AND CORE SAMPLES IF CU PB ZN AS > 1%, AG > 30 PPM & AU > 1000 PPB
- SAMPLE TYPE: ROCK AU* - IGNITED, AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: AUG 31 1998 DATE REPORT MAILED: Sept 4/98 SIGNED BY..... D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML.WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: AUG 31 1998 DATE REPORT MAILED: Sept 4/98 SIGNED BY. .....D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SILT AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: AUG 31 1998 DATE REPORT MAILED: Sept 4/98 SIGNED BY..... C. Leong .D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND LIMITED FOR MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
ASSAY RECOMMENDED FOR ROCK AND CORE SAMPLES IF CU PB ZN AS > 1%, AG > 30 PPM & AU > 1000 PPB
- SAMPLE TYPE: ROCK AU* - IGNITED, AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: AUG 31 1998 DATE REPORT MAILED: Sept 8/98 SIGNED BY: D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: SEP 1 1998 DATE REPORT MAILED: Sept 4/98 SIGNED BY..... D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: P1-P4 SOIL P5 SILT AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: SEP 1 1998 DATE REPORT MAILED: Sept 4/98 SIGNED BY. C. Leong D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: SEP 8 1998 DATE REPORT MAILED: Sept 11/98 SIGNED BY: ..... D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: SEP 14 1998 DATE REPORT MAILED: Sept 17/98 SIGNED BY: C. Leong D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: SEP 14 1998 **DATE REPORT MAILED:** Sept 18/98 **SIGNED BY** .....D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SILT AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: SEP 14 1998 DATE REPORT MAILED: Sept 18/98 SIGNED BY: C. Leong .D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: SEP 18 1998 DATE REPORT MAILED: Sept 23/98 SIGNED BY: D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
ASSAY RECOMMENDED FOR ROCK AND CORE SAMPLES IF CU PB ZN AS > 1%, AG > 30 PPM & AU > 1000 PPB
- SAMPLE TYPE: ROCK AU* - IGNITED, AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: SEP 18 1998 DATE REPORT MAILED: Sept 23/98 SIGNED BY. . . . . D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

ICP - .500 GRAM SAMPLE IS DIGESTED WITH 3ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR AND IS DILUTED TO 10 ML WITH WATER.
THIS LEACH IS PARTIAL FOR MN FE SR CA P LA CR MG BA TI B W AND MASSIVE SULFIDE AND LIMITED FOR NA K AND AL.
- SAMPLE TYPE: SOIL AU* - AQUA-REGIA/MIBK EXTRACT, GF/AA FINISHED.(10 GM) HG ANALYSIS BY FLAMELESS AA.
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: OCT 5 1998 DATE REPORT MAILED: Oct 8/98 SIGNED BY. C. Leong .....D. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS

1. SUMMARY

Induced Polarization and Magnetometer measurements were made on 2 gridded portions of Area 3.1 that comprise part of the Oki-Doki project, Y.T.. The geophysical data indicate the presence of mineralization related to Tombstone Plutonic Intrusives. Recommended drill site locations are listed in Section 7, Conclusion and Recommendations.

2. INTRODUCTION

This report describes the results of a ground geophysical exploration program that was undertaken during the period September 14 to 27, 1998, on the "C Block" of the Oki-Doki Project. Previous work (Phase 1) consisted of a helicopter aeromagnetic and spectrometer survey, geological mapping, geochemical and stream sampling. The impetus for the present ground geophysical program was provided by positive geological and geochemical indications. Two geophysical methods, time domain IP/Resistivity and magnetometer measurements were used to evaluate a limited region of the Oki-Doki property.

The surveys were conducted under supervision of the Kodiak project geologist, Val Peter Van Damme and totalled 8.6 km of IP/Resistivity measurements and 10 km of magnetometer measurements.

The survey grids are located 2km north from the North Slope Deposit and 5 km from the Brewery Creek Deposit. The area is characterised by a thick sequence of thrusted sedimentary rocks of the Earn and Road River formations accompanied with intrusion of the Tombstone Plutonic Suite. Mineralization is expected to be within, or related to, the intrusive activity. The present survey grids were located on the basis of elevated Au, As, Sb and Hg geochemistry values that were detected during the phase 1 exploration program.

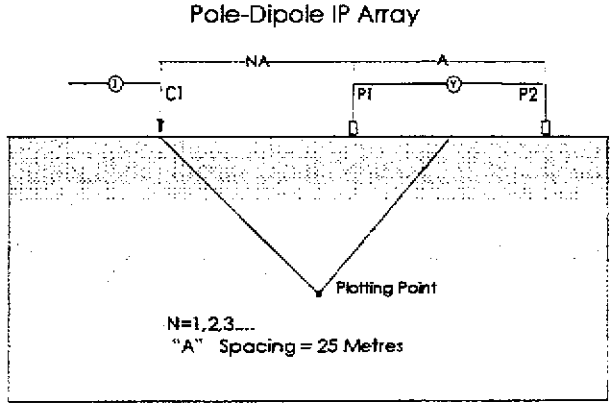
This report is meant to be an addendum to a more complete report, and thus location maps, comprehensive description of geology and previous exploration work are treated only briefly, or not included.

3. FIELD WORK AND INSTRUMENTATION

The geophysical surveys were conducted from September 14 to September 27, 1998, which included two mob-demob days, three stand-by days and nine production days. The geophysical crew consisted of Zoran Dujakovic (geophysicist), Chris Gooliaff (geologist) and Gary Smith (geologist), all employees of SJ Geophysics Ltd. International Kodiak Resources Inc. supplied two helpers to assist in the survey, Tim Woods and Sylvain Fleurant. A discussion of the geophysical methods used on this survey is included in Section 5."Geophysical Techniques."

The two survey grids were prepared by International Kodiak Resources Inc. and comprised of eighteen N-S traverses at 100 metre intervals.

For this survey the transmitter (Tx) used was a Phoenix IPT-1 with a 2 sec on, 2 sec off duty cycle (square wave on-time-off time). One of the current electrodes was used as an "infinity" (its effects are beyond detection at the measuring electrodes) and the other current electrode is used in conjunction with the measuring electrodes, as shown below.



The IP survey utilised an Iris ELREC-6 IP receiver (Rx). A pole-dipole array was used with an "A" spacing of 25 metres and "N" values of 1 - 6. The potential electrodes were consistently deployed to the north of the near current electrode and the data was collected at 25 metre station intervals. The receiver time delay was set at 80 msec with subsequent windows M1 through M10 at intervals of 80, 80, 80, 80, 160, 160, 160, 320, 320 and 320 msec respectively.

The IP data are typically downloaded from the IP receiver to a computer on a daily basis. They are then processed to produce pseudo-section plots of the apparent resistivity and selected chargeability channels, and if time permits, selected lines are "inverted" using

the UBC inversion software. See a more detailed discussion on inversion of IP data in Section 5., "Geophysical Techniques."

The magnetic data were collected, using a Gem Systems GSM-19 magnetometer, at 12.5 metre stations along the traverses. Magnetic diurnal variations were monitored using an EDA Omni IV magnetometer as a base station and at the end of each survey day diurnal corrections were applied to the field data.

4. DATA PRESENTATION

The geophysical data from this survey were collected on two grids and are displayed in three formats, as indicated below.

4.1 Contour Maps

Geophysical measurements were taken on Grid 1 and Grid 2. Contour maps of the apparent resistivity, chargeability and magnetic data were produced at a scale of 1:5,000. All data are positioned using UTM co-ordinates.

4.2 Stacked Profiles

Stacked profile maps of the magnetic data were also produced for both grids at a scale of 1:5,000. Pseudosections displaying the M3, M6 (3^{rd} and 6^{th} slices of the IP decay curve) and apparent resistivity data were made at 1:2,500 scale for individual survey lines. The IP and resistivity data were also "inverted" and presented as stacked profiles.

4.3 Compilation Plan Map

A Compilation Plan Map, based on the IP data and the ground magnetic data, was compiled to highlight the general trends and identify recommended drill targets.

5. GEOPHYSICAL TECHNIQUES

5.1 IP Method

The time domain IP technique energizes the ground surface with an alternating square wave pulse via a pair of current electrodes. On most surveys, such as this one, the IP/Resistivity measurements are made on a regular grid of stations along survey lines.

After the transmitter (Tx) pulse has been transmitted into the ground via the current electrodes, the IP effect is measured as a time diminishing voltage at the receiver electrodes. The IP effect is a measure of the amount of IP polarizable materials in the subsurface rock. Under ideal circumstances, IP chargeability responses are a measure of the amount of disseminated metallic sulfides in the subsurface rocks.

Unfortunately, there are other rock materials that give rise to IP effects, including some graphitic rocks, clays and some metamorphic rocks (serpentinite for example) so, that from a geological point of view, IP responses are almost never uniquely interpretable. Because of the non-uniqueness of geophysical measurements it is always prudent to incorporate other data sets to assist in interpretation.

Also, from the IP measurements the apparent (bulk) resistivity of the ground is calculated from the input current and the measured primary voltage.

With regard to precision, IP/Resistivity measurements are generally considered to be repeatable within about five percent. However, they will exceed that if field conditions change due to variable water content or variable electrode contact.

IP/Resistivity measurements are influenced, to a large degree, by the rock materials nearest the surface (or, more precisely, nearest the measuring electrodes), and the interpretation of the traditional pseudosection presentation of IP data in the past have often been uncertain. This is because stronger responses that are located near surface could mask a weaker one that is located at depth.

5.2 Inversion Programs

"Inversion" programs have recently become available that allow a more definitive interpretation, although the process remains subjective.

The purpose of the inversion process is to convert surface IP/Resistivity measurements into a realistic "Interpreted Depth Section." However, note that the term is left in

quotation marks. The use of the inversion routine is a subjective one because the input into the inversion routine calls for a number of user selectable variables whose adjustment can greatly influence the output. The output from the inversion routines do assist in providing a more reliable interpretation of IP/Resistivity data, however, they are relatively new to the exploration industry and are, to some degree, still in the experimental stage.

The inversion programs are generally applied iteratively to, 1) evaluate the output with regard to what is geologically known, 2) to estimate the depth of detection, and 3) to determine the viability of specific measurements.

The Inversion Program (DCINV2D) used by the SJ Geophysical Group was developed by a consortium of major mining companies under the auspices of the UBC-Geophysical Inversion Facility. It solves two inverse problems. The DC potentials are first inverted to recover the spatial distribution of electrical resistivities, and, secondly, the chargeability data (IP) are inverted to recover the spatial distribution of IP polarizable particles in the rocks.

The Interpreted Depth Section maps represent the cross sectional distribution of polarizable materials, in the case of IP effect, and the cross sectional distribution of the apparent resistivities, in the case of the resistivity parameter.

5.3 Magnetic Survey Method

Total Magnetic Intensity measurements are taken along survey traverses (normally on a regular grid) and are used to identify metallic mineralization that is related to magnetic materials (normally magnetite and/or pyrrhotite). Magnetic data are also used as a mapping tool to distinguish rock types, identify faults, bedding, structure and alteration zones.

6. INTERPRETATION

6.1 Interpretation of Geophysical Data – Grid 1

The IP chargeability and resistivity data on Grid 1 indicate formational responses that primarily express the sedimentary rocks in the area. The conductive (low resistivity) zones and the chargeability highs are thought to be generally due to graphitic rocks,

rather than metallic sulphide mineralization. In this regime, however, one ought not overlook the possibility of mineralization being masked in a transition zone.

According to the report "Brewery Creek Gold Deposit," (Diment 1995), it is noted that the gold mineralization is associated with the thrust faults and associated monzonite sills. Both the IP and resistivity data appear to confirm the anticipated thrusting that is characteristic of the Brewery Creek geological model. Further, on a number of traverses, the resistivity data indicates that quartz flooding occurs, perhaps as intrusions of sills, veins, or dikes. The quartz flooding is expected to be related to the thrust fault planes themselves, or, perhaps, other zones of rock weakness. It is in association with these silicified zones that mineralization is expected to occur on the Kodiak ground.

The magnetic data that was collected on this grid are of low amplitude but also suffers from aliasing (reading taken on traverses spaced too far apart). The data set is informative, however in that it identifies a more magnetic zone on the eastern part of Grid 1, which may indicate alteration in that region. Because of the nature of the magnetic data, no depth, or volumetric estimations can be made.

6.2 Interpretation of Geophysical Data – Grid 2

The IP data on Grid 2 also indicate the general formational nature of the rocks, and the same interpretational difficulties arise as they did on Grid 1. Three of the four traverses indicate a relatively resistive zone, indicating, they conform with the thrust faulting. The data imply silicification or intrusive activity along the interpreted fault planes.

The ground magnetic data on this grid do not provide detailed value to the interpretation. However, it is noted that the magnetically susceptible rocks are indicated on the eastern side of the grid, which may indicate the presence of increased alteration.

7. CONCLUSIONS & RECOMMENDATIONS

Most of the IP and resistivity responses were of formational character. However, five geophysical targets were picked as valid for drill testing.

The criteria for selection of the drill targets is as follows: 1) proximity to thrust faulting, 2) proximity to geochemical signature, 3) proximity to zones of silicification, and 4) associated with transitional IP chargeability responses.

It is recommended that as soon as core is available from the first drill hole, a geophysicist and geologist should be on site to adjust the targeting process. Please note that the resistivity data indicate that several of these zones may be outcropping, or very close to outcropping, and the area should be inspected before commencing drilling.

7.1 Grid 1 – Recommended Drill Testing

1. DDH#1 - Line 2300E Station 3800N, azimuth north, minus 45 degrees, drill 150 metres.

2. DDH#1 - Line 2800E Station 3700N, azimuth north, minus 45 degrees, drill 150 metres.

3. DDH#2 - Line 3500E Station 3600N, azimuth north, minus 45 degrees, drill 200 metres.

7.2 Grid 2 – Recommended Drill Testing

4. DDH#3 - Line 4500E Station 2500N, azimuth north, minus 45 degrees, drill 150 metres.

5. DDH#3 - Line 4300E Station 2500N, azimuth north, minus 45 degrees, drill 175 metres.

Respectfully submitted,

Date Signed: Dec 16, 1998

Appendix 1 – Statement of Qualifications - Zoran Dujakovic

I, Zoran Dujakovic, of 7056 Waverley Avenue, Burnaby in the Province of British Columbia, DO HEREBY CERTIFY:

1) THAT I am a graduate of the Belgrade University, Faculty of Mining and Geology - Geophysics Program with a Engineer of Geology (B.Sc.)degree in Geophysics.
2) THAT I have been engaged in mining and petroleum exploration since 1981.
3) THAT I am registered as an Engineer of Geology - Geophysics Program with the Chamber of Commerce of Serbia.
4) THAT I hold no direct or indirect interest in, nor expect to receive any benefits from the mineral property or properties described in this report.

Signed by: Z Dujakovic

Date: Dec 16 1998

Appendix 2 - Statement of Qualifications for Ron Sheldrake

I, Ronald Sheldrake of 2482 –148A Street, Surrey, in the Province of British Columbia, DO HEREBY CERTIFY:

1. THAT I am a graduate of the University of British Columbia, Faculty of Astronomy and Geophysics - degree (B.Sc.) in Geophysics.
2. THAT I have been engaged in mining and petroleum exploration since 1967.
3. That I am familiar with the use and interpretation of the airborne and ground geophysical methods that are discussed in this report.
4. THAT I hold no direct or indirect interest in, nor expect to receive any benefits from the mineral property or properties described in this report.
