SUMMARY AND RECOMMENDATIONS

The Aurex-Sinister property is comprised of four contiguous claim blocks (Aurex, Sin, Nis and Rex) totaling 315 mineral claims (6300 hectares) located 35 km northeast of Mayo in the central Yukon Territory. The property is owned by Expatriate Resources Ltd. and is under option to Newmont Mining Corporation. There is all-season road access from Whitehorse to the property and a system of 4-wheel drive trails on the claims.

The claims are situated in the northeastern part of the Tintina Gold Belt which encompasses several mines and advanced projects in Alaska and Yukon. Although the gold deposits are all genetically related to Cretaceous igneous activity, many occur some distance from the closest intrusion. The Aurex-Sinister property lies within a cluster of gold prospects, the most advanced of which is the Dublin Gulch Deposit which lies about 20 km to the north and contains an open pit resource of 3.5 million ounces of gold. Two of the other gold prospects (McQuesten and Snowdrift) adjoin the Aurex-Sinister property to the north and are hosted by the same metasedimentary sequence that underlies the claim block.

Topography on the property is subdued and bedrock exposure is poor. Elevations range from 670 to 1070 m never reaching treeline. Soil development is immature because most of the area was covered by Pleistocene glaciation.

Exploration on the Aurex claims in the early 1990's was directed toward intrusive hosted mineralization modelled after Fort Knox, a large tonnage, relatively low grade mine located in Alaska. This exploration included 12,099 m of shallow, reconnaissance and grid air track drilling plus four diamond drill holes. Although the program failed to locate an intrusion, it produced sixty-two, 3 m intersections exceeding 1 g/t gold from skarns and veins. The best intersection averaged 6.42 g/t gold across 6.1 m.

The program conducted by Expatriate on the Aurex-Sinister property in 1999 specifically targeted skarn and vein hosted gold mineralization. A 5 sq km soil geochemical survey conducted on the Aurex claim block outlined a 2700 by 350 m arcuate gold-arsenic-antimony anomaly with peak values of 710 ppb, 2460 ppm and 66 ppm, respectively. Two mineral showings discovered within the grid area reflect the same metal signature. Skarn mineralization yielded up to 8.87 g/t gold while samples of vein float returned values as high as 9.31 g/t gold. Specimens from a third showing discovered outside the grid returned up to 3.16 g/t gold.

Soil samples taken along the Nis claim lines, 1 to 2 km west of the Aurex grid, returned weakly and moderately anomalous arsenic values over intervals up to 1000 m long. Gold and antimony results are more erratic but anomalous values generally coincide with arsenic. Peak values for gold, arsenic and antimony were 395 ppb, 1750 ppm and 10 ppm, respectively.

The next stage of exploration should be done in two phases. Phase I should include: ground or detailed airborne magnetic surveys; additional grid soil sampling; systematic mapping and prospecting to define structural and stratigraphic controls associated with the skarn and vein mineralization; and, excavator trenching to test areas of strong geochemical response. Phase II should consist of diamond drilling on targets defined by the Phase I work.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

INTRODUCTION

The Aurex-Sinister property is owned by Expatriate Resources Ltd. and is under option to Newmont Mining Corporation. It consists of four claim blocks. The Sin, Nis and Rex claim blocks are wholly owned by Expatriate while the Aurex claims are under option to Expatriate from YKR International Resources Ltd. The Aurex option agreement allows Expatriate to earn a 100% interest in the claims by making cash payments totalling \$180,000 and work expenditures totalling \$350,000 by January 12, 2003. A cash payment of \$20,000 was made upon signing and a second payment of \$20,000 was made in December, 1999. Exploration in 1999 exceeded the \$50,000 work commitment for that year. The property is subject to a 4.5% NSR royalty, 1.5% of which is payable to YKR and 3% to J. McFaull, the original property owner. YKR's and McFaull's NSR royalties can be bought out at any time for cash payments of \$1 million each.

The claims are situated at the west end of the Keno Hill District which has produced over 200 million ounces of silver from veins cutting Mississippian quartzite and schist. More importantly, the claim block lies in the northeastern portion of the Tintina Gold Belt, a loosely defined 2100 km long zone of gold and silver deposits extending across central Alaska and Yukon. Nearby deposits include Brewery Creek and Dublin Gulch with estimated resources of 1.3 and 3.5 million ounces, respectively. The adjoining McQuesten property hosts gold bearing skarn and replacement style mineralization defined by excavator trenching over 10 to 120 m widths for a 2.5 km strike length. Samples from the excavator trenches reportedly produced an arithmetic average grade of 2.48 g/t gold across 18 m (Burke, 1998). Similar values were obtained in drill intercepts.

This report describes geological mapping and geochemical surveys conducted by Expatriate and Newmont on Expatriate's behalf during the 1999 field season. The work was done at various times from late May to early October. The program was managed by Archer, Cathro & Associates (1981) Limited and supervised by the author. Appendix I contains the Author's Statement of Qualifications.

PROPERTY, LOCATION AND ACCESS

The Aurex-Sinister property consists of 315 mineral claims within four contiguous blocks. The claims are located in the central Yukon at latitude 63°52' north and longitude 135°35' west on NTS map sheet 105M/13 & 14 (Figure 1). They are registered in the Mayo Mining District in the name of Archer, Cathro & Associates (1981) Limited, which holds them in trust for Expatriate Resources Ltd. Claim data are listed below while the location of individual claims is illustrated on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>

* Expiry dates include 1999 work filed for assessment credit but not yet accepted.

The property is situated 35 km northeast of Mayo and 7 km southwest of Elsa. Access is provided by all-weather paved and chip-sealed highway from Whitehorse to Mayo and government-maintained gravel highway (Silver Trail) from Mayo to the claim block. A pre-existing network of 4-wheel drive roads allows access to the central part of the Aurex claim block from the Silver Trail Highway.

PREVIOUS WORK

Exploration conducted on the property prior to 1992 is poorly documented. The first reported activity on the ground now covered by the Aurex claims was in 1935. Parts of the area were held at various times up until the early 1980's. Work consisted primarily of prospecting for vein hosted silver mineralization with shallow hand trenches, shafts and bulldozer trenches. There are no assessment reports describing this work.

In April 1992 J. McFaul staked the Aurex 1-72 claims covering a strong GSC stream sediment anomaly (4850 ppm arsenic, 16 ppm antimony and 94 ppm gold) obtained from Corkery Creek. Mapping and prospecting identified gold bearing skarn horizons, specimens of which reportedly assayed up to 5.4 g/t gold (DIAND, 1997).

In February 1993 the property was expanded to 157 claims and optioned by Yukon Revenue Mines Ltd. (later renamed YKR) which explored for a Fort Knox type lode gold deposit. Between 1993 and 1996 Yukon Revenue completed 12,099 m of shallow air track drilling in 442 holes, 608 m of diamond drilling in 4 holes and 430 line kms of airborne geophysics, which were flown by Aerodat Inc. and included magnetic and EM surveys. The first phase of drilling was done on widely spaced prospecting lines and positive results were later tested with five closely spaced drill grids. This work identified widespread gold mineralization and implied a direct correlation between gold grades and abundance of sulphides, specifically arsenopyrite, pyrite and pyrrhotite. The best intersection from the combined programs reportedly returned a weighted average of 6.42 g/t gold across 6.1 m (Davidson, 1995). Visible gold was also documented in cuttings from three holes. It was described as being very fine grained, crystalline and having some attached quartz vein material (McFaul, 1993).

In August 1998 Amerok Geosciences Ltd. conducted a 4.25 line km Induced Polarization survey on behalf of YKR. The survey was done in the northwest corner of the Aurex claims near the boundary with the adjoining Snowdrift property and outlined a 500 m long, east trending, coincident chargeability/resistivity anomaly (Davis, 1998). The anomaly lies along strike from a mineralized skarn horizon intersected in drill holes 600 m to the west on the Snowdrift property. The geophysical target has not been drill tested and is open along strike.

The first reported activity on ground now covered by the Sin and Nis claims occurred in 1962 when Silver Titan Mines Ltd. conducted geological mapping and an electromagnetic survey (McClintock, 1987). In 1970, Lacanex Mining Company Limited flew an aeromagnetic survey and the following year Canadian Reserve Oil and Gas Limited conducted a ground geophysical survey (Rockel, 1972). Two east-west conductors were located and drilling was recommended but there is no record of it being carried out.

In 1979 Archer Cathro staked the Sin, Is and Ter claims and optioned them to Canada Tungsten Mining Corporation Limited. Exploration later that year and in 1980 consisted of geological mapping, electromagnetic surveys, soil geochemical surveys and five overburden drill holes. In 1987 the property was returned to Archer Cathro which allowed the Is and Ter to lapse and sold

the Sin claims to Expatriate in 1993. A ground magnetic survey was conducted over the northern part of the Sin claim block by Expatriate in 1998 (Becker, 1999). This survey located areas of low amplitude, positive magnetic response.

Expatriate staked the Nis claims in fall 1998 and the Rex claims in fall 1999. There is no record of significant previous work on either claim block.

GEOMORPHOLOGY

The Aurex-Sinister property occupies part of the Haldane Creek valley and a series of broad knolls at the west end of Galena Hill, a low ridge in the northeastern part of the Gustavus Range. Elevations range from 670 to 1070 m at the crest of a small knob in the southern part of the property. Most slopes are gentle, averaging less than 15°. The steepest slopes are in the headwaters of Corkery Creek which bisects the central part of the Aurex claim block. Creeks draining the property are all part of the Yukon River watershed.

Outcrop is sparse on the property, rarely exceeding 3% in any area. Soil development is immature with Pleistocene glaciation having scoured some areas and deposited variable thicknesses of till in others.

Vegetation is predominantly black spruce with willow and alder understory. Lowlands and north facing slopes host a thick cover of organic matter, moss and labrador tea. Southern slopes are similarly vegetated but also include balsam and poplar groves. Permafrost is likely pervasive on north facing slopes but discontinuous on southern exposures. Much of the southern portion of the Aurex claim block lies within a recent forest fire burn.

REGIONAL GEOLOGY AND MINERALIZATION

The Aurex-Sinister property is located within stratigraphy of the Selwyn Basin and lies within the Tintina Gold Belt. Simplified regional geology is shown on Figure 3 which depicts Upper Proterozoic to Lower Cambrian Hyland Group stratigraphy thrust over Paleozoic metasedimentary units of the Keno Hill Quartzite, Lower Schist, Earn Group and Road River Group. All stratigraphic units have been intruded by Mid-Cretaceous age Tombstone Suite intrusions. The largest of these intrusions and their proximity to known gold deposits are illustrated on Figure 4.

Recent mapping in this region was done by D.C. Murphy who has integrated numerous geological publications dating from 1920 to 1995. This work is published at 1:50,000 scale (Murphy, 1996).

The area in the immediate vicinity of the property is underlain by Hyland Group and lesser Keno Hill Quartzite metasedimentary rocks. The dominant structural features are a series of thrust faults and the McQuesten Antiform, the axis of which coincides with the easterly trending McQuesten River Valley. The Robert Service Thrust is observed on both limbs of the antiform and has been offset in several locales by north and northeast trending high angle faults. The largest fault of this type is the Haldane Fault, the trace of which parallels Haldane Creek along the west side of the Aurex-Sinister property.

The Keno Hill silver vein camp has produced over two hundred million ounces of silver since 1921. Productive veins occur in the Keno Hill Quartzite and underlying Lower Schist. Although the vein faults are believed to cut through the Robert Service Thrust and continue into the Hyland Group, no significant silver mineralization has been discovered above the thrust. Ore shoots within the veins typically consist of galena, sphalerite and tetrahedrite with siderite or quartz gangue. The vein faults trend northeast and dip steeply to the southeast with left lateral offsets ranging from a few metres to over a hundred metres (Boyle, 1965). Cross faults offsetting the vein faults trend perpendicular to them and dip 20 to 30° to the southwest.

Four major gold occurrences are located within 20 km of the Aurex-Sinister property. All are located in the upper plate of the Robert Service Thrust and are hosted by Hyland Group metasedimentary rocks. Vein and stockwork mineralization contains most of the gold at Dublin Gulch and Scheelite Dome while skarns and replacement style mineralization predominate at McQuesten and Snowdrift. The largest, most advanced project is Dublin Gulch which hosts an open pit resource containing 3.5 million ounces of gold.

DATE: FEBRUARY, 2000

PROPERTY GEOLOGY

Property geology is shown on Figure 5. The Aurex-Sinister property is situated on the southern limb of the McQuesten Antiform, immediately south of the Robert Service Thrust. Hyland Group metasedimentary rocks are exposed at surface and comprise the upper plate of the thrust fault while the lower plate consists of Keno Hill Quartzite. Most stratigraphy has bedding parallel to foliation which strikes eastward and dips to the south between 22 and 60°.

Stratigraphy

Keno Hill Quartzite (Mq) is characterized by a thick sequence of massive quartzite intercalated with minor carbonaceous phyllite and calcareous quartzite. This unit outcrops on the adjoining McQuesten property. It projects along strike onto the Sin claims and downdip onto the other claims comprising the Aurex-Sinister property.

Hyland Group (PY) is locally mapped as the Yusezyu Formation or Upper Schist and consists of strongly foliated and lineated muscovite-chlorite phyllite and quartzite with lesser limestone, marble and skarn. Most of the property is underlain by a sequence of phyllite dominant strata (PYy) but the southwestern portion of the Aurex claims are underlain by a sequence composed principally of quartzite and psammite (PYp). Mapping in the northern part of the property locally differentiated units within the phyllite dominant package as follows.

Phyllite (PY1) is generally grey to tan and shows moderate to strong crenulation cleavage. Stringers and boudins of quartz and carbonate are common. At some locales sericite, biotite and/or graphite are present along foliation planes. Downhill from Showing 1 in the northwestern part of the Aurex claim block this unit is tan to yellow and comprised dominantly of quartz augen in a quartz-sericite matrix suggesting a felsic volcanic protolith.

Quartzite (PY2) is pale grey and blocky weathering. Foliation planes are usually marked by muscovite or sericite and locally by weak diffuse colour banding. Some outcrops are quartz-feldspathic and gritty resembling psammite. Phyllite interbands are common ranging in thickness from 10 cm to 1 m. Pervasive secondary quartz flooding was observed in a few outcrops.

Limestone/marble (PY3) is blue-grey to white, fine grained and thinly bedded. It is variably silicified or dolomitized and sometimes contains thin phyllite partings. Sulphides are present in some dolomitized exposures.

Skarn (PY4) is rusty on weathered surfaces, grey to green on fresh surfaces, fine grained and blocky weathering. The green colour is most likely attributed to the presence of diopside. Disseminated sulphides occur in variable concentrations at several localities on the property.

Intrusions

Triassic metadiorite sills (TRd) are dark green, foliated, fine to medium grained and blocky weathering. The main mineral assemblage consists of amphibole, chlorite and plagioclase. Sills are commonly observed in the Keno Hill Quartzite and one small sill is exposed in a creekcut immediately north of the Aurex claim block within Hyland Group stratigraphy.

Cretaceous Tombstone Suite intrusions (KTg) are described as buff to grey weathering dykes, sills and small plugs with aplitic or granitic textures. Some of these bodies are locally quartz and feldspar phyric and mineralized with disseminated arsenopyrite. The only intrusions belonging to this suite that have been mapped in the immediate vicinity of the property are narrow sills within the Hyland Group that are exposed in trenches on the McQuesten property, about 1 km north of the Aurex claim block.

Structure

The Robert Service Thrust crosses the Sin claims and parallels the northern edge of the Aurex claims, marking the contact between the Hyland Group and Keno Hill Quartzite. This structure dips southward toward the property at approximately 30°. Local faults and shear zones dip steeply and are roughly north-northwest and east-northeast trending, respectively. Most of these structures appear to have small displacements; however, one fault, paralleling Thompson Creek, has produced approximately 700 m of apparent dextral offset on the Robert Service Thrust. Listwanite, quartz-carbonate and quartz are associated with faults on the Aurex claim block but this material is mostly seen as float.

Small scale isoclinal folds are seen in large float boulders and on the banks of some bulldozer trenches. The axis of these folds parallels foliation. Broad post-metamorphic folding is also present and is indicated by variable foliation dips. No large scale fold hinges have been mapped so the amplitude and frequency of the folds is not known.

GEOCHEMISTRY

Soil sampling was conducted on the property in two phases, first in July and then in September and early October. In July, Newmont established an east trending, flagged baseline on the Aurex claims, subparallel to Corkery Creek. One hundred and thirty soil samples were taken along four lines oriented perpendicular to the baseline. During fall Expatriate's crew established three cut baselines approximately 1 km apart in the north-central part of the Aurex claim block. The southernmost baseline is roughly coincident with the baseline Newmont established earlier. One thousand and thirty-nine soils were collected along lines run perpendicular to the baselines and along claim lines in the southern part of the claim block. An additional 252 soils were taken along the Sin and Nis claim lines. Grid soil samples were taken at 50 m intervals on lines spaced 100 m apart while claim line samples were collected at 100 m intervals. All sample sites are indicated by one-half metre lath marked with inscribed aluminum tags and felt pen showing grid coordinates and sample numbers.

Expatriate's samples were sent to Chemex Labs Ltd. in North Vancouver where they were dried and screened to -80 mesh, dissolved in standard aqua regia leach and geochemically analyzed for 32 elements by the Induced Coupled Plasma (ICP) technique and for gold using fire assay preparation with atomic absorption finish. Newmont's samples were sent to Chemex Labs in Nevada where they were analyzed for nine elements by the same procedures described above. Sample locations are shown on Figures 6 and 7 while geochemical results for gold, arsenic and antimony are illustrated at 1:20,000 on Figures 8 to 10 and 1:5000 scale on Figures 11 to 13. Certificates of Analysis are contained in Appendix II. Anomalous thresholds and peak values are summarized on the following table.

Anomalous Thresholds and Peak Values

<u>Element</u>	<u>Weak</u>	<u>Moderate</u>	<u>Strong</u>	<u>Extreme</u>	<u>Peak Value</u>
Gold (ppb)	25	50	100	200	710
Arsenic (ppm)	200	400	800	1600	2460
Antimony (ppm)	2	4	8	16	66

Claim Line Samples

Soils collected along the Aurex claim lines in the southern part of the property generally returned low values for most metals. Antimony gave the strongest response of the three main elements with the majority of the samples in a 1000 by 1000 m area immediately south of the grid returning weakly to extremely anomalous values. Gold and arsenic response in this area is more subdued but scattered anomalous values coincide with the best antimony results. The highest gold value (355 ppb) was an isolated result from a sample taken in the southeast part of the claim block.

Samples taken along the Sin and Nis claim lines returned weakly and moderately anomalous values for arsenic, gold and antimony within a 4 by 3 km area. Arsenic response is the most widespread including strings of anomalous values up to 1000 m long. Gold and antimony results are more erratic, forming shorter strings (up to 400 m long) and single point anomalies. Elevated gold and antimony values are positively correlated with arsenic. Peak values obtained for gold, arsenic and antimony were 395 ppb, 1750 ppm and 10 ppm, respectively.

Grid Samples

Contoured results define a gold-arsenic geochemical anomaly wrapping in a broad arc for a length of 2700 m around the west end of the main knoll in the west-central part of the grid. Antimony is closely correlated with the other elements in some parts of the anomaly but is absent in others. Peak values from the anomaly are 710 ppb gold, 2460 ppm arsenic and 66 ppm antimony. The arcuate shape of the anomaly may be attributed to down-ice glacial dispersion, downslope dispersion from multiple shallowly dipping zones, or a combination of the two. Smaller clusters of anomalous gold-arsenic-antimony response are located outside the main anomaly. These clusters have loosely defined north-northwest and east-northeast trends. The same trends are also observed within parts of the main arcuate anomaly. The geochemical trends parallel the strike of known faults and shears but the lack of bedrock exposure precludes definitive linkage between them.

One striking feature observed within the main geochemical anomaly is the abrupt termination of antimony values on the north facing slope. The anomalous values appear to truncate along an easterly trending line that may also correspond with some type of structure.

The most important aspect of the soil geochemical anomalies is that the majority occur in areas where there are no known mineral showings and where there has been no drilling (Figure 14).

MINERALIZATION

Prospecting in 1999 discovered three areas of sulphide-bearing float and outcrop on the Aurex claim block. Figure 14 shows the location of the showings along with trenches, drill collars and mineralized holes from earlier programs.

Thirty-eight rock samples were collected in 1999 and sent to Chemex Labs in North Vancouver where they were pulverized to 150 mesh, treated with a standard aqua regia leach and geochemically analyzed for 32 elements by the ICP technique plus gold using a fire assay preparation and atomic absorption finish. Rock sample locations and significant results are shown on Figure 14. Certificates of Analysis are contained in Appendix II while rock descriptions appear in Appendix III.

Two types of mineralization have been recognized on the property, stratabound sulphide bearing skarn horizons and crosscutting quartz-carbonate sulphide veins. Skarn mineralization is best exposed in the northwest and central parts of the grid while vein float is scattered over a larger area.

Skarn exposures are typically rusty weathering and contain moderately abundant limonitic fractures. The mineral assemblage consists mostly of quartz and diopside. Sulphides comprise trace to 20% of the rock and are dominantly pyrrhotite, pyrite and arsenopyrite occurring as disseminations roughly layered parallel to foliation. Mapping of old roads and trenches in the northwest corner of the grid suggests there are at least four sulphide bearing skarn horizons that are traceable along the slope. Surprisingly these horizons are located downhill from the main geochemical anomaly. Three of the horizons were sampled, yielding mixed results. A hand specimen (BB06407) from the lowermost horizon (Showing 1) returned 8.87 g/t gold, 2.0 g/t silver, >1% arsenic, 60 ppm antimony and 90 ppm bismuth while a series of random chips (N114798) taken from a 3 by 2 m area, 450 m northeast along the same horizon, yielded 200 ppb gold and 3790 ppm arsenic. Skarn specimens (N114784) from trench spill piles in the central part of the grid were again elevated in gold (670 ppb) and arsenic (4580 ppm) and in this case were also enriched in tungsten (90 ppm).

Mineralized veins are comprised predominantly of quartz and lesser carbonate with muscovite and sericite commonly developed along selvages and fractures. Some veins occur as foliaform sweats while others are associated with steeply dipping, north-northwest trending faults.

Milky quartz veins are the most common type on the property. They often contain red to brown limonitic pits with rare pyrite and galena. A series of composite samples of this material was collected along a 1500 m section of the access road on the southern edge of the soil geochemical grid. Seven of the fifteen samples exceeded the detection limit for gold (up to 35 ppb) and all were slightly elevated in arsenic and antimony.

Arsenopyrite and stibnite bearing quartz vein float was discovered at two locations, one in the northwest corner of the grid and the other on the access road immediately south of the grid. Some of the vein material is strongly cross fractured and brecciated with the resulting open spaces filled with semi-massive stibnite. Arsenopyrite occurs as fine disseminations within the stibnite. A chip sample (BB06416) taken across a 100 by 40 by 30 cm float slab yielded 150 ppb gold, 2.4 g/t silver, 268 ppm arsenic and >1% antimony, while a hand specimen of similar material (BB06406) collected nearby (Showing 2) returned 9.31 g/t gold, 6.4 g/t silver, 1400 ppm arsenic and >1% antimony.

Abundant silicified quartz-carbonate float also occurs 800 m east of the soil geochemical grid. Specimens collected from waste piles beside several old hand pits (Showing 3) are rusty weathering, strongly pitted and mineralized with 5 to 40% coarse blebby arsenopyrite. The source of the float is not known but it exhibits a layered appearance which suggests it may be foliaform. A sample of this material (N114780) returned 3.16 g/t gold, >1% arsenic and 52 ppm antimony.

DISCUSSION AND CONCLUSIONS

The Aurex-Sinister property covers excellent skarn and vein hosted gold targets. Although previous drill results suggest there is a positive correlation between gold grade and total sulphide content, surface work in 1999 did not conclusively support the observation. The prospecting did show that all samples which returned greater than 1 g/t gold also contained arsenopyrite. This association is further supported by soil geochemical results which outlined large areas of coincident gold-arsenic response that were not tested by earlier programs.

Skarn mineralization is contained within stacked horizons that resemble similar zones hosting significant gold occurrences on the adjacent Snowdrift and McQuesten properties.

Although few vein exposures have been observed, exploration appears to have provided useful information concerning their orientation and mineralogy. Previous drilling suggests the vein faults are steeply dipping and that some contain native gold. Prospecting in 1999 indicates an association with antimony as well as arsenic. The soil geochemical data supports the prospecting results showing north-northwest and east-northeast trends which coincide with the orientation of faults and shears in the area.

The combined metal signature (gold-arsenic-antimony) of the skarn and vein mineralization at the Aurex-Sinister property is typical of a system distally situated from an intrusive body. Although skarns are generally associated with small tonnage deposits, some host very sizeable ore bodies. The location of the intrusion responsible for the thermal event which caused the skarnification is not known and it may not be unroofed.

Most of the earlier bulldozer trenching, air track drilling and diamond drilling was done in areas of near background soil geochemical response. The majority of the holes explored stratigraphy apparently overlying the strata causing the main soil geochemical anomalies. A comprehensive exploration program is definitely warranted to re-evaluate known showings and test soil geochemical targets.

APPENDIX I

AUTHOR'S STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, William A. Wengzynowski, geological engineer, with business addresses in Whitehorse, Yukon Territory and Vancouver, British Columbia and residential address in Vancouver, British Columbia, do hereby certify that:

1. I graduated from the University of British Columbia in 1993 with a B.A.Sc. in geological engineering, option 1, mineral and fuel exploration.
2. I became a Professional Engineer on December 12, 1998 registered in the Province of British Columbia.
3. From 1983 to present, I have been actively engaged in mineral exploration in the Yukon Territory and am presently employed with Archer, Cathro & Associates (1981) Limited.
4. I have personally participated in and supervised the field work reported herein.

W.A. Wengzynowski, P.Eng.

Project: AX23500

P.O.#:

Samples submitted to our lab in Fairbanks, AK

This report was printed on 12-AUG-1999.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
201	140	Dry, sieve to -80 mesh
202	140	save reject
214	2	Rcvd as pulp; mesh size checked
238	142	Nitric-aqua-regia digestion
287	142	Special dig'n with organic ext'n

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	142	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
6	142	Ag ppm: HNO3-aqua regia digest	AAS-BKGD CORR	0.2	100.0
13	142	As ppm: HNO3-aqua regia digest	AAS-HYDRIDE/EDL	1	10000
2	142	Cu ppm: HNO3-aqua regia digest	AAS	1	10000
3	142	Mo ppm: HNO3-aqua regia digest	AAS	1	1000
4	142	Pb ppm: HNO3-aqua regia digest	AAS-BKGD CORR	1	10000
22	142	Sb ppm: HCl-KClO3 digest, extrac	AAS-BKGD CORR	0.2	1000
5	142	Zn ppm: HNO3-aqua regia digest	AAS	1	10000
23	142	Bi ppm: HCl-KClO3 digest, extrac	AAS-BKGD CORR	0.1	1000

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him/her and based on an evaluation of all engineering data which is available concerning any proposed project

(PNX) - NEWMONT METALLURGICAL SERVICES

Project: AX23500

P.O.#:

Samples submitted to our lab in Fairbanks, AK
This report was printed on 12-AUG-1999.

SAMPLE PREPARATION

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION
205	3	Geochem ring to approx 150 mesh
226	3	0-3 Kg crush and split
3202	3	Rock - save entire reject
238	3	Nitric-aqua-regia digestion
287	3	Special dig'n with organic ext'n

ANALYTICAL PROCEDURES

CHEMEX CODE	NUMBER SAMPLES	DESCRIPTION	METHOD	DETECTION LIMIT	UPPER LIMIT
983	3	Au ppb: Fuse 30 g sample	FA-AAS	5	10000
6	3	Ag ppm: HNO3-aqua regia digest	AAS-BKGD CORR	0.2	100.0
13	3	As ppm: HNO3-aqua regia digest	AAS-HYDRIDE/EDL	1	10000
2	3	Cu ppm: HNO3-aqua regia digest	AAS	1	10000
3	3	Mo ppm: HNO3-aqua regia digest	AAS	1	1000
4	3	Pb ppm: HNO3-aqua regia digest	AAS-BKGD CORR	1	10000
22	3	Sb ppm: HCl-KClO3 digest, extrac	AAS-BKGD CORR	0.2	1000
5	3	Zn ppm: HNO3-aqua regia digest	AAS	1	10000
23	3	Bi ppm: HCl-KClO3 digest, extrac	AAS-BKGD CORR	0.1	1000

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geologic materials collected by the prospective investor or by a qualified person selected by him/her and based on an evaluation of all engineering data which is available concerning any proposed project

APPENDIX III
ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions

Project: AUREX-SIN Property: AUREX

Page 1 of 2

Sample Number: Grid North: N Grid East: E Type: FLOAT Dimension: ROAD CUT Ag(ppm) Pb(ppm) Zn(ppm) Cu(ppm)
 BB06401- UTM: N UTM: E Sample Width: Abundance: COMMON

BB06405 Elevation: m

Comments: COMPOSITE VEIN FLOAT SAMPLES COLLECTED EVERY 100m ALONG ROAD CUT.
 QUARTZ CHIPS ARE MILKY WHITE AND CONTAIN LIMONITIC PITS PLUS RARE
 PYRITE AND GALENA.

Sample Number: Grid North: N Grid East: E Type: FLOAT Dimension: ROAD CUT Ag(ppm) Pb(ppm) Zn(ppm) Cu(ppm)
 BB06406 UTM: N UTM: SHOWING 2. E Sample Width: 10x7x5cm Abundance: 2 Pieces

Elevation: m

Comments: WHITE QUARTZ VEIN FLOAT ON SIDE OF ROAD CUT. STRONG YELLOW-GREEN
 SCORODITE ALTERATION ON WEATHERED SURFACE. MINERALIZED WITH BLOBBY STIBNITE AND
 DISSEMINATED ARSENOPYRITE (5-8%)

Sample Number: Grid North: N Grid East: E Type: FLOAT Dimension: Bulldozer Trench Ag(ppm) Pb(ppm) Zn(ppm) Cu(ppm)
 BB06407 UTM: N UTM: SHOWING 1 E Sample Width: 12x8x8cm Abundance: COMMON.

Elevation: m

Comments: SPECIMEN OF GREY-GREEN DIOPSIDE SKARN FLOAT. STRONG SURFACE
 RUSTY WEATHERING. MINERALIZED WITH DISSEMINATED PYRITE AND ARSENOPYRITE. (up to 15%).

Sample Number: Grid North: N Grid East: E Type: FLOAT Dimension: ROAD CUT Ag(ppm) Pb(ppm) Zn(ppm) Cu(ppm)
 BB06408- UTM: N UTM: E Sample Width: Abundance: COMMON

BB06415 Elevation: m

Comments: SAME AS BB06401 - 405.

Sample Number: Grid North: N Grid East: E Type: Dimension: ROAD CUT Ag(ppm) Pb(ppm) Zn(ppm) Cu(ppm)
 BB06416 UTM: N UTM: SHOWING 2. E Sample Width: Abundance: 4+ Pieces

Elevation: m

Comments: Pseudo CHIP SAMPLE ACROSS 100 x 40 x 30 cm FLOAT SLAB OF STRONGLY
 CROSS FRACTURED QUARTZ + CARBONATE VEIN MATERIAL. MINERALIZED WITH PODS AND BLOBS OF
 SEMI-MASSIVE STIBNITE AND DISSEMINATED ARSENOPYRITE.

Sample Number: Grid North: N Grid East: E Type: FLOAT Dimension: Near Creek Ag(ppm) Pb(ppm) Zn(ppm) Cu(ppm)
 BB06417 UTM: N UTM: E Sample Width: Abundance: 2 pieces

Elevation: m

Comments: WHITE to YELLOW SUCROSIC QUARTZ VEIN FLOAT WITH 1% BLOBBY
 ARSENOPYRITE.

Rock Sample Descriptions

Project: AUREX-SIN Property: AUREX

Page 2 of 2

Sample Number:	Grid North:	N	Grid East:	E	Type:	Chip	Dimension:		Ag(ppm)	Pb(ppm)	Zn(ppm)	Cu(ppm)
BB06418	UTM:	N	UTM:	E	Sample Width:	0.50m	Abundance:					
	Elevation:	m										

Comments: 0.50m chip sample across white foliaform vein exposed in old hand trench. NO SULPHIDES SEEN.

Sample Number:	Grid North:	N	Grid East:	E	Type:	Float	Dimension:	Bulldozer Trench	Ag(ppm)	Pb(ppm)	Zn(ppm)	Cu(ppm)
BB06419	UTM:	N	UTM:	E	Sample Width:	12x10x10	Abundance:	Common				
	Elevation:	m										

Comments: Grey skarn specimen mineralized with 5-10% fine grained pyrrhotite and 1-2% fine grained arsenopyrite.

Sample Number:	Grid North:	N	Grid East:	E	Type:	Float	Dimension:	Road cut	Ag(ppm)	Pb(ppm)	Zn(ppm)	Cu(ppm)
N112402	UTM:	N	UTM:	E	Sample Width:	17x15x15cm	Abundance:	1 piece				
	Elevation:	m										

Comments: Moderately oxidized quartz carbonate vein float with abundant grey fractures partially filled with very fine grained pyrite and possibly arsenopyrite.

Sample Number:	Grid North:	N	Grid East:	E	Type:	Specimen	Dimension:	Bulldozer Trench	Ag(ppm)	Pb(ppm)	Zn(ppm)	Cu(ppm)
N112403	UTM:	N	UTM:	E	Sample Width:	10cm	Abundance:					
	Elevation:	m										

Comments: 10 cm specimen of grey quartzite with diffuse color banding and secondary quartz flooding. Taken from 1m thick outcrop. NO SULPHIDES SEEN

Sample Number:	Grid North:	N	Grid East:	E	Type:	Float	Dimension:	Bulldozer Trench	Ag(ppm)	Pb(ppm)	Zn(ppm)	Cu(ppm)
N112404	UTM:	N	UTM:	E	Sample Width:	10x7x5cm	Abundance:	Common				
	Elevation:	m										

Comments: Pale green-grey skarn with thinly banded and disseminated foliaform pyrite, lesser pyrrhotite and trace arsenopyrite.

Sample Number:	Grid North:	N	Grid East:	E	Type:		Dimension:		Ag(ppm)	Pb(ppm)	Zn(ppm)	Cu(ppm)
	UTM:	N	UTM:	E	Sample Width:		Abundance:					
	Elevation:	m

Project: Aurex-Sinister Property: Aurex

Page 1 of

Sample Number: <u>N114780</u>	Grid North: <u>N</u>	Grid East: <u>E</u>	Type: <u>Float</u>	Dimension: <u>10m x 20m area</u>
UTM: <u>N</u>	UTM: <u>N</u>	E Sample Width: <u>-</u>	Abundance: <u>Common</u>	
Elevation: <u>m</u>				
Comments: <u>Quartz-arsenopyrite vein float found in the area of old hard pits at the head of Corkery Creek. Sample consists of weakly weathered Qz vein material with ~10% medium grained disseminated arsenopyrite. Limonite on fractures and only trace boxwork texture. See TB-4 and N114781 no pyrrhotite in sample</u>				
Sample Number: <u>N114781</u>	Grid North: <u>N</u>	Grid East: <u>E</u>	Type: <u>Float</u>	Dimension: <u>10 x 20m area</u>
UTM: <u>N</u>	UTM: <u>N</u>	E Sample Width: <u>-</u>	Abundance: <u>Common</u>	
Elevation: <u>m</u>				
Comments: <u>Strongly weathered quartz-arsenopyrite vein float from the same location as sample N114780. Same as above sample except with stronger weathering, a dark brown to black limonite rim coating a quartz vein with 10-40% fine to medium grained arsenopyrite. See TB-4 + N114780 no pyrrhotite in sample</u>				
Sample Number: <u>N114782</u>	Grid North: <u>N</u>	Grid East: <u>E</u>	Type: <u>Float</u>	Dimension: <u>bulldozer trench</u>
UTM: <u>N</u>	UTM: <u>N</u>	E Sample Width: <u>-</u>	Abundance: <u>Common</u>	
Elevation: <u>m</u>				
Comments: <u>Weakly mineralized quartz vein material in an old bulldozer trench. Vein material is weakly mineralized with fine grained pyrite and arsenopyrite. Sample material is coated with limonite, trace scorodite and weak boxwork texture. See TB-5 or 768m along bulldozer road on top of Aurex hill. no pyrrhotite in sample</u>				
Sample Number: <u>N114783</u>	Grid North: <u>N</u>	Grid East: <u>E</u>	Type: <u>Float</u>	Dimension: <u>bulldozer trench</u>
UTM: <u>N</u>	UTM: <u>N</u>	E Sample Width: <u>-</u>	Abundance: <u>Common</u>	
Elevation: <u>m</u>				
Comments: <u>Skarn horizon mineralized with arsenopyrite and pyrrhotite found as float in an old bulldozer trench. Light to medium grey, weakly banded, hard, weakly weathered skarn with strong carbonate, ~30% fine grained black minerals (diopside amphibolite) and mineralized with 3-5% arsenopyrite, minor pyrrhotite (slightly magnetic) and trace pyrite. 570m along bulldozer road on top of hill</u>				
Sample Number: <u>N114784</u>	Grid North: <u>N</u>	Grid East: <u>E</u>	Type: <u>float</u>	Dimension: <u>bulldozer trench</u>
UTM: <u>N</u>	UTM: <u>N</u>	E Sample Width: <u>-</u>	Abundance: <u>Common</u>	
Elevation: <u>m</u>				
Comments: <u>Skarn horizon mineralized with arsenopyrite and pyrrhotite found as float in an old bulldozer trench. Weakly weathered, light to medium grey, strongly banded with sulphides and dark skarn minerals alternating with quartz-carbonate rich bands. Mineralized with 3-5% arsenopyrite (up to 20% locally) and minor pyrrhotite (slightly magnetic). 930m along bulldozer road on top of hill</u>				
Sample Number: <u>N114785</u>	Grid North: <u>N</u>	Grid East: <u>E</u>	Type: <u>outcrop</u>	Dimension: <u>bulldozer trench</u>
UTM: <u>N</u>	UTM: <u>N</u>	E Sample Width: <u>-</u>	Abundance: <u>Common</u>	
Elevation: <u>m</u>				
Comments: <u>Random grab sample from a 3-4m wide skarn band mineralized with arsenopyrite and pyrrhotite. The band is weakly weathered, hard, blocky with 1 to 3% fine grained disseminated sulphides.</u>				

Rock Sample Descriptions

Project: Aurex-Sinister Property: Aurex

Page 4 of

Sample Number: <u>N114791</u>	Grid North: <u>UTM:</u>	N	Grid East: <u>UTM:</u>	E	Type: <u>Float</u>	Dimension: <u>bulldozer trench</u>	Abundance: <u>common</u>
	Elevation: <u>m</u>				Sample Width: <u>✓</u>		
Comments:	<u>Selective sample of arsenopyrite and pyrrhotite mineralized skarn float from an old bulldozer trench. Weakly weathered, hard, blocky material with strong limonite coating and 1-4% sulphides as fine-medium grained disseminations. See TB-15</u>						
Sample Number: <u>N114792</u>	Grid North: <u>UTM:</u>	N	Grid East: <u>UTM:</u>	E	Type: <u>Float</u>	Dimension: <u>hard trench</u>	Abundance: <u>common</u>
	Elevation: <u>m</u>				Sample Width: <u>✓</u>		
Comments:	<u>Selective sample of sulphide bearing skarn from the spill pile at an old hard trench. Hard, blocky, weakly weathered with limonite on all joints and 3-4% disseminated sulphides (arsenopyrite and pyrrhotite) see TB-17</u>						
Sample Number: <u>N114793</u>	Grid North: <u>UTM:</u>	N	Grid East: <u>UTM:</u>	E	Type: <u>chip</u>	Dimension: <u>2.5m true width</u>	Abundance: <u>common</u>
	Elevation: <u>m</u>				Sample Width: <u>2.5m</u>		
Comments:	<u>2.5m chip sample of mineralized skarn band exposed in an old bulldozer trench just along strike to the east of N114792. Hard, blocky, weakly weathered with limonite along all fractures and 1% fine grained disseminated arsenopyrite and pyrrhotite. TB-17</u>						
Sample Number: <u>N114794</u>	Grid North: <u>UTM:</u>	N	Grid East: <u>UTM:</u>	E	Type: <u>Float</u>	Dimension: <u>outcrop</u>	Abundance: <u>common</u>
	Elevation: <u>m</u>				Sample Width: <u>✓</u>		
Comments:	<u>Float sample taken below an outcrop and above Newmont soil sample 550. Sample is limonite coated quartzite which occurs as narrow bands in the Qz-Mu phyllite outcrop. No visible sulphides but some boxwork limonite. see TB-49</u>						
Sample Number: <u>N114795</u>	Grid North: <u>UTM:</u>	N	Grid East: <u>UTM:</u>	E	Type: <u>Float</u>	Dimension: <u>outcrop</u>	Abundance: <u>common</u>
	Elevation: <u>m</u>				Sample Width: <u>✓</u>		
Comments:	<u>Float sample taken below an outcrop and above Newmont soil sample 257. Sample is weakly limonite coated quartzite which occurs as narrow bands in a Qz-Mu phyllite outcrop. Rock is weakly carbonaceous, composed of 1-2 mm quartz band with no visible sulphides.</u>						
Sample Number: <u>N114796</u>	Grid North: <u>UTM:</u>	N	Grid East: <u>UTM:</u>	E	Type: <u>Float</u>	Dimension: <u>soil sample pit</u>	Abundance: <u>not common</u>
	Elevation: <u>m</u>				Sample Width: <u>✓</u>		
Comments:	<u>Sample of rusty quartzite with 1-2% pyrite cubes up to 1mm in size. Sample found at 11600E and 11350N. see TB-57</u>						

Rock Sample Descriptions

Project: Aurex-Sinister Property: Aurex

Page 4 of 3

Sample Number: Grid North: N Grid East: E Type: panel / chip Dimension: bulldozer trench
N114797 UTM: N UTM: E Sample Width: 5.5 x 4.0 m Abundance: outcrop
Elevation: m

Comments: Panel sample taken over a 5.5 by 4.0 m area which represents a true thickness of 4.5 m. The entire area was a calc-silicate skarn band mineralized with 1-3% fine grained disseminated arsenopyrite and pyrrhotite. See TB-8

Sample Number: Grid North: N Grid East: E Type: random chips Dimension: bulldozer trench
N114798 UTM: N UTM: E Sample Width: 3.0 x 2.0 m Abundance: outcrop
Elevation: m

Comments: Random chip samples taken from a 3.0 by 2.0 m area of mineralized skarn exposed in a bulldozer trench on the top of a ridge. Skarn is mineralized with fine grained disseminated arsenopyrite and less commonly pyrrhotite. See TB-21

Sample Number: Grid North: N Grid East: E Type: panel / chip Dimension: bulldozer trench
N114799 UTM: N UTM: E Sample Width: 7.0 m Abundance: outcrop
Elevation: m

Comments: 7.0 m panel sample which represents a ~3.0 m true thickness of skarn mineralized with minor arsenopyrite and pyrrhotite. Sample taken in conjunction with sample N114800 at TB-24

Sample Number: Grid North: N Grid East: E Type: panel / chip Dimension: bulldozer trench
N114800 UTM: N UTM: E Sample Width: 5.0 m Abundance: outcrop
Elevation: m

Comments: 5.0 m panel sample which represents ~2.0 m true thickness of skarn mineralized with trace sulphides, mainly arsenopyrite and pyrrhotite. Sample taken in conjunction with N114799 at TB-24

Sample Number: Grid North: N Grid East: E Type: Dimension:
