INTRODUCTION

The Rub claims were staked in fall 2005 to expand the Burwash property, which is owned by Strategic Metals Ltd. and is under option to Golden Chalice Resources Inc. The Rub claims cover high platinum soil geochemical values that were outlined in the 1980s by reconnaissance soil sampling.

The 2006 exploration program was managed by Archer, Cathro & Associates (1981) Limited. Work consisted of prospecting, geological mapping, and grid soil sampling. The crew consisted of four people between July 11 and July 18 and two people from then until July 23. The author participated in the field program and her Statement of Qualifications appears in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Rub property consists of 29 mineral claims registered with the Whitehorse Mining Recorder in the name of Archer, Cathro which holds them in trust for Strategic. The property is situated in southwestern Yukon at latitude 61°28'N and longitude 133°25'W on NTS map sheet 115 G/06. The general location of the property is shown on Figure 1 while individual claims are illustrated on Figure 2. Claim registration data are listed below.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
Rub 1-29	YC40144-YC40172	February 23, 2011

*Expiry dates include 2006 work that has been filed for assessment credit but not yet accepted.

Access to the Rub claims is by foot from the Wellgreen Mine access road 8 km from its junction with the Alaska Highway. From the junction, it is 30 km to Burwash Landing, the closest community and airport, and 410 km to the year-round seaport of Haines, Alaska. In 2006 the crew stayed in a four-wheel drive accessible tent camp located on the Burwash property.

GEOMORPHOLOGY AND VEGETATION

The Rub claims lie along the northeastern edge of the Kluane Range immediately southwest of the broad, flat bottomed Shakwak Valley. Local elevations range from 1250 to 1980 m. The claims extend from the valley floor up the north side of an east-west trending ridge. Topography is characterized by long, steep (about 30°) talus slopes with outcrop exposure near ridge crests and along actively eroding creek cuts. Vegetation near the valley floor consists of mature black spruce, slide alder, and thick moss giving way to stunted spruce, birch, and moss with open slopes above 1500 m. Drainages on the Rub claims consist of small streams with seasonally dependent flow rates.

HISTORY AND ECONOMIC POTENTIAL OF NEARBY OCCURRENCES

The nearby Wellgreen Mine was discovered in 1952 by local prospectors who immediately optioned it to Hudson Bay Exploration and Development Company Limited through a

**GOLDEN CHALICE RESOURCES INC.
STRATEGIC METALS LTD.**

JANUARY 2007

subsidiary, Hudson Yukon Mining Co. Limited. Production was carried out in 1972 and 1973 but the operation failed due to falling metal prices, excess dilution from bad ground conditions and unexpected erratic distribution of massive sulphide ore lenses.

Kluane Joint Venture (Chevron Minerals Ltd. and All-North Resources Ltd.) optioned the Wellgreen property in 1986 with the intent of evaluating its platinum group elements (PGE) potential and establishing the viability of bulk surface mining. Over the next few years All-North acquired a 100% working interest in the property from Hudson Yukon and Chevron and conducted extensive programs of surface and underground exploration which culminated in 1990 with an open pit resource estimated at 49.9 million tonnes grading 0.36% nickel, 0.35% copper, 550 ppb platinum, and 340 ppb palladium. The mineralization occurs as sulphide minerals within a mafic-ultramafic sill of Triassic age. Although some massive sulphide lenses are included in the resource, most of the mineralization appears as disseminations in gabbro and pyroxenite that form the marginal facies of peridotite.

At the Wellgreen Mine exploration in 2004 and 2005 focussed on the Wellgreen North Zone where a new discovery of shear zone hosted mineralization was outlined by prospecting and hand trenching over a 700 m strike length. The mineralization is distinguished from other mineralization in the Wellgreen area by its exceptionally high PGE grades, including the discovery trench that exposed a 1.2 m wide zone returning assays of 35.8 g/t platinum, 64.3 g/t palladium, 1.37 g/t rhodium and 3.4 g/t gold with only 0.10% nickel and 0.14% copper.

The northern part of the current Rub claims was staked in 1987 as the Swede claims while the southern part of the Rub claims was then included in a much larger claim block that comprised the Linda property. Reconnaissance scale soil sampling was performed in 1987 on the Swede claims as part of the Reed Creek Joint Venture (Carne, 1987). This sampling returned encouraging results including 340 ppm copper, 230 ppm nickel, 480 ppb platinum, 85 ppb palladium and 55 ppb gold from various soil samples. Work on the Linda property did not reach the area now covered by the Rub claims (Eaton, 1988).

REGIONAL GEOLOGY

The Burwash property is situated within Wrangellia Terrane about 5 km southwest of the Denali Fault (Figure 3). The property covers a steeply dipping package of Late Paleozoic and Early Mesozoic volcanic and sedimentary rocks defined by the Skolai and Nikolai Assemblages, which are intruded by plutons of the Kluane Mafic-Ultramafic Suite and the Maple Creek Gabbro (Figure 4).

Skolai Assemblage

The oldest rocks in the vicinity of the Burwash property belong to the 1000 m thick Pennsylvanian to Permian Station Creek Formation which forms the lower member of the Skolai Assemblage. The lower part of the formation consists of augite-phyric basalt and andesitic volcanic flows that are succeeded upwards by fine- to medium- grained tuff. Volcanic agglomerate and breccia are locally present and discontinuous beds of limestone occur

throughout. The upper 400 m of the formation is transitional with overlying Hasen Creek Formation, with the contact informally put at the cessation of pyroclastic deposition.

The Early Permian Hasen Creek Formation forms the upper part of the Skolai Assemblage, attaining a maximum thickness of approximately 800 m. Stratigraphy consists of a fine grained clastic lower member composed of grey to black phyllite, cherty argillite and siltstone that gives way gradationally upward to shaly limestone and buff coloured massive bioclastic limestone and calcarenite with discontinuous beds of reddish brown conglomerate, massive greywacke and sandstone. Thin basaltic flows, breccia and tuff are locally present.

Nikolai Assemblage

The Middle to Late Triassic Nikolai Assemblage occurs as a kilometre or more thick sequence of basalt flows with minor interbedded limestone that unconformably overlies the Skolai Assemblage rocks. Flows are thin (2 to 10 m), vesicular to amygdaloidal and locally hematitic.

Kluane Mafic-Ultramafic Suite

The Kluane Mafic-Ultramafic Suite is comprised of mafic and ultramafic intrusions commonly seen within the northeastern section of the Kluane Range. These sill-like bodies probably acted as subvolcanic feeders to the overlying oceanic plateau basalts of the Nikolai Assemblage. They are preferentially emplaced along the contact between the Station Creek and Hasen Creek Formations within a short stratigraphic distance above or below the contact. They vary from less than 10 to 1000 m in thickness and attain strike lengths up to 20 km. A significant number are ultramafic dominated and include thin or discontinuous marginal gabbro zones at the base of the sill or in areas of complex interdigitation with country rocks. The generally fine grained to phyrlic marginal gabbros can be overlain or flanked successively by melano-gabbro, clinopyroxenite, olivine clinopyroxenite, peridotite and dunite. Furthermore, gabbros are also locally present in wallrocks peripheral to the sills. Gabbro and pyroxenite phases often host magmatic sulphide concentrations either as massive sulphide lenses or heavy disseminations. These sulphide rich zones carry nickel, copper and PGE mineralization in a number of locations. A Lower to Middle Triassic age for the mafic-ultramafic intrusions is indicated by crosscutting relationships.

Maple Creek Gabbro

Texturally varied hypabyssal stocks, dykes, and sills of gabbroic composition are approximately coeval with the mafic-ultramafic intrusions. They are thought to have been feeders to the Nikolai Assemblage volcanic rocks and are reliably dated at 232 ± 1 Ma.

PROPERTY GEOLOGY

Geological mapping was conducted on the Burwash property in 2004 by Steve Isreal of the Yukon Geological Survey at 1:50,000 scale on the Rub claims during 2006 by the author at 1:10,000 scale. Property geology is illustrated on Figure 5 while Table I below outlines the unit descriptions assigned by 2006 mapping.

Table I - Unit Descriptions

Age	Unit	Member	Description
Upper Triassic	Nikolai Assemblage		vesicular to amygdaloidal, locally hematitic basalt flows with minor interbedded limestone
Late Triassic and older (?)	Kluane Mafic-Ultramafic Suite		fine grained to phyrlic marginal gabbros flanked by clinopyroxenite
Pennsylvanian to Lower Permian	Skolai Assemblage		
		Hasen Creek Formation	fine grained grey to black phyllite, cherty argillite and siltstone with minor tuff units
		Station Creek Formation	interbedded black phyllite, siltstone, argillaceous limestone and cherty argillites with minor tuff horizons

Most of the Rub claims are underlain by a conformable stratigraphic sequence comprised of black phyllite of the Station Creek Formation overlain by cherty argillite and siltstone of the Hasen Creek Formation. Both formations strike northeasterly and dip to the southeast. These metasedimentary units are capped with basalt belonging to the Nikolai Assemblage. Each component of this sequence is between 400 and 800 m thick.

The Triassic-aged Nikolai Assemblage forms a 1200 m long, up to 600 m thick band that tapers to 200 m at its southeastern end. An east-west trending, steeply dipping thrust (?) fault juxtaposes these rocks with Station Creek Formation sediments to the south. The fault's surface trace is not exposed but is inferred to coincide with a boulder-filled recessive linear.

On the southern side of the inferred fault are two amoeboid shaped plugs of the Kluane Mafic-Ultramafic Suite, which intrude the Station Creek Formation. Both plugs are roughly 300 by 200 m.

GEOCHEMISTRY

In 2006, a total of 429 soil, 19 rock and five stream sediment samples were collected from the Rub claims. Most of the soil samples were collected on a grid located in the central part of the claim block with the remainder being scattered samples collected during geological mapping traverses. The soil grid consisted of an east trending baseline with compass- and topofill-controlled sample lines oriented perpendicular to it (Figure 6). The soil samples were collected at 50 m intervals along lines spaced 100 m apart. Handheld Global Positioning Satellite (GPS) devices were used to provide outside survey control for the grid. All sample sites are marked by half metre wooden pickets with sample numbers written in permanent pen. The samples were collected with a mattock from B horizon soil found between 20 and 80 cm below surface. Soil sample material was placed in individually pre-numbered Kraft bags. Stream sediment samples were taken from two creeks and their locations are shown on Figure 6. Rock samples were collected during geological mapping and their locations are also shown on Figure 6.

All samples collected in 2006 were sent to ALS Chemex in North Vancouver. Soils and stream sediments were dried and screened to -180 microns. Rock samples were weighed, dried and crushed to 70% - 2 mm, before a 250 g split was taken and pulverized to better than 85% passing 75 microns. Splits of the fine fraction of the various samples were then dissolved in aqua regia and analyzed for 34 elements using inductively coupled plasma-atomic emission spectroscopy (ME-ICP 41). A second, 30 g split was fused with a mixture of lead oxide, sodium carbonate, borax, silica and other reagents as required, inquarted with six milligrams of gold-free silver and then coupled to yield a precious metal bead that was analyzed for platinum, palladium and gold (PGM-ICP 23). Certificates of Analysis are contained in Appendix II. Soil and stream sediment results for copper, nickel, platinum, palladium and gold are shown on Figures 7 to 11, respectively, and are discussed in the following paragraphs. Rock results are discussed in the Mineralization section. Rock sample descriptions appear in Appendix III.

In order to determine the significance of the soil and stream sediment results from the Rub claims, the values for key metals were compared to those from the main part of the Burwash property. Table II shows anomalous thresholds for the Burwash property.

Table II - Anomalous Thresholds-Burwash Property

	Weak	Moderate	Strong
Copper (ppm)	500	1000	2000
Nickel (ppm)	500	1000	2000
Platinum (ppb)	50	100	200
Palladium (ppb)	50	100	200
Gold (ppb)	50	100	200

Almost all soil values from the Rub claims are considered background level for the Burwash region. On the claims, there is a slight correlation between copper and nickel but no significant association between base and precious metal values.

Only four copper values exceeded the weakly anomalous threshold, with a maximum value of 1760 ppm. The anomalous copper values are all clustered downslope from the Nikolai Assemblage. None of the nickel values was even weakly anomalous.

Platinum, palladium and gold analyses returned mostly background values. Anomalous platinum and gold results are erratically distributed. The maximum platinum value was 43 ppb and the highest gold value was 186 ppb. Most palladium values were also erratically distributed; however, a series of high values were obtained along one soil line over a length of approximately 800 m. This string of anomalous values lies downslope from one of the Kluane Mafic-Ultramafic Suite plugs. Although proximity to the plug suggests these results may be valid, the absence of elevated values on adjacent lines suggests they could be due to lab error. The highest palladium value was 62 ppb.

MINERALIZATION

During the 2006 program, 19 rock samples were collected from the Rub claims, of which 10 were chip samples and nine were specimen samples. The samples include three basalt, nine gabbro, four altered andesite, and three quartz-carbonate vein specimens. Table III below summarizes the best assay results. Specific occurrences are discussed in their regional context in the following paragraphs.

Table III - Rock Sample Summary

<u>Sample</u>	<u>Rock Type</u>	<u>Sample Type</u>	<u>Width (m)</u>	<u>Cu (ppm)</u>	<u>Ni (ppm)</u>	<u>Au (ppb)</u>	<u>Pt (ppb)</u>	<u>Pd (ppb)</u>
B395980	Basalt	Chip	2.25	20200	40	13	5	20
B395988	Basalt	Specimen	0.28	6490	32	20	5	27
B395989	Leucocratic Gabbro	Specimen	0.30	661	376	24	186	215
B395995	Basalt	Chip	2.00	1270	32	14	5	21

The two most important styles of mineralization within the Kluane Range are the Flood Basalt associated nickel-copper-PGE and the Volcanic Redbed copper occurrences (Carne, 2003). There are two significant deposits of Volcanic Redbed style in the region: Johobo and White River. The Flood Basalt associated nickel-copper-PGE occurrences are evident at the nearby Wellgreen Mine and in the main part of the Burwash property. Although weakly developed, both types of mineralization are present on the Rub claims.

Of the nine gabbro samples collected from the Rub claims eight yielded background levels for copper, nickel, platinum, palladium and gold. One sample (B395989) returned near background copper and nickel values but had a surprisingly high ratio of precious to base metals. Mineralization in this sample consisted of finely disseminated and blebby pyrrhotite with lesser disseminated chalcopyrite.

The Volcanic Redbed copper occurrences are copper deposits that occur within Nikolai Assemblage (Carne, 2003). On the Rub claims elevated copper values are associated with basalt of the Nikolai Assemblage. Mineralization within the basalt occurs as disseminated chalcopyrite and malachite on fractures and weathered surfaces.

CONCLUSION AND RECOMMENDATIONS

The Rub claims cover a copper-nickel-PGE prospect associated with the Triassic age Kluane Mafic-Ultramafic Suite. Historical work outlined an area with high platinum-in-soil values. However, only scattered, slightly elevated copper and precious metals values were obtained from the work performed in 2006.

Future work should consist of a series of hand trenches across the fault separating the Nikolai Assemblage and Station Creek Formation to explore for a buried PGE rich zone similar to the recent high grade PGE discovery at the Wellgreen Mine. More sampling should also be done in

the vicinity of the PGE bearing rock sample collected in 2006 from one of the Kluane Mafic-Ultramafic Suite plugs.

Due to its small size, no further work is recommended at the copper showing in the Nikolai Assemblage.

Respectfully submitted,

ARCHER, CATHRO & ASSOCIATES (1981) LIMITED

APPENDIX III
ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions

Project: Burwash Property: Burwash

Sample Number: B395979	Grid East: UTM: Elevation: 584531 E m	Grid North: UTM: N 6816206 N	Type: Rock Sample Width: 1 foot Dimension: Abundance: 3m by 4m
Comments: Rock is a brown-bronze rusty surface with minor black boxwork. Cpy blebs distinguishable, although fine. Host rock is black, fine grained gabbro			
Sample Number: B395980	Grid East: UTM: Elevation: 584372 E m	Grid North: UTM: N 6815458 N	Type: Rock Sample Width: 8 inches Dimension: 3m by 4m Abundance:
Comments: Rock sample from within amygdaloidal basalt. Area has intense manganese stained surface with minor cpy mineralization disseminated throughout.			
Sample Number: B395981	Grid East: UTM: Elevation: 584350 E m	Grid North: UTM: N 6815581 N	Type: Chip Sample Width: 2.25m Dimension: 3m by .75m Abundance:
Comments: Chip sample over malachite stained, cpy rich zone in a fine grained mafic rock, gabbro. Talus surrounds o/c, complete lateral extent not known at this time.			
Sample Number: B395982	Grid East: UTM: Elevation: 584657 E m	Grid North: UTM: N 6815644 N	Type: Rock Sample Width: 1 foot Dimension: Abundance:
Comments: Rock sample approximately 1 foot squared from rusty surfaced, fine grained andesite. Magnetic due to pods of pyrrhotite approximately two mm's in irregular blebby areas. Rusty zone is 4m by 2m.			
Sample Number: B395983	Grid East: UTM: Elevation: 584712 E m	Grid North: UTM: N 6815515 N	Type: Float Sample Width: Dimension: Abundance:
Comments: Float sample from large talus train of py and cpy mineralized green and black andesite with surface staining. No staining on outcrop directly above.			
Sample Number: B395984	Grid East: UTM: Elevation: 585174 E m	Grid North: UTM: N 6815646 N	Type: Grab Sample Width: 3m Dimension: Abundance: Very
Comments: Rock sample is a cumulative grab sample over 3m below a vertical rock outcrop that has abundant limonitic staining. Majority of outcrop is a compressed andesite tuff. Cpy mineralization and pyrrhotite are disseminated throughout finely.			

Sample Number: B395985 Grid East: 585396 E Grid North: 6815062 N Type: Rock Dimension: 1 foot Abundance:

Comments: Rock sample is exposed in a tarnished area directly below the outcrop of tuff above. The sample is of a pale grey siliceous rock with cryptic pyrrhotite mineralization.

Sample Number: B395986 Grid East: 585486 E Grid North: 6815485 N Type: Rock Dimension: 12" by 4" Abundance:

Comments: Rock sample of a 'pod' of rusty, mineralized basalt within a larger andesite outcrop. The main mineralization is cpy and there are minor pyrite grains. Whole outcrop doesn't have this mineralogy.

Sample Number: B395987 Grid East: 584448 E Grid North: 6816729 N Type: Rock Dimension: 1m by 1m Abundance:

Comments: Rock sample over eight inches. Wavy, laminated gneiss with augens of fsp and quartz. Blebby pyrrhotite mineralization present. Outcrop 'pokes' out from vegetation.

Sample Number: B395988 Grid East: 584616 E Grid North: 6815481 N Type: Rock Dimension: 8 inches Abundance:

Comments: Rock sample is from an outcrop of pyrrhotite and chalcopyrite mineralized gabbro. Some malachite on pieces (60%). Outer surface has a 'waxy' look.

Sample Number: B395989 Grid East: 584413 E Grid North: 6815221 N Type: Rock Dimension: 45 by 12m Abundance:

Comments: Rock sample is of rusty rock with blebs of pyrrhotite mineralization. Fine grained grey host, likely a basalt. Rock is definitely representative of the rocks in the area.

Sample Number: B395990 Grid East: 584639 E Grid North: 6815459 N Type: Chip Dimension: 8m long Abundance:

Comments: First chip sample from TR-06-01. Sample is 2m in width and has minimal rock content at the bottom of the 'rib'.

Sample Number: B395991 Grid East: E Grid North: N Type: Chip Dimension: Abundance: UTM: Sample Width: 2m Abundance: Elevation: m

Comments: Second 2m chip sample in TR-06-01, primarily gauge material with .75m of quartz carbonate vein bedrock. Black stringers 1-2mm thick in the vein material (sulphide?).

Sample Number: B395992 Grid East: E Grid North: N Type: Chip Dimension: Abundance: UTM: Sample Width: 2m Abundance: Elevation: m

Comments: Third 2m chip sample from TR-06-01. Sample is of gabbro bedrock with blebs of pentlandite mineralization (?)

Sample Number: B395993 Grid East: E Grid North: N Type: Chip Dimension: Abundance: UTM: Sample Width: 2m Abundance: Elevation: m

Comments: Final chip sample in TR-06-01, quartz veins 1.5mm thick within the gabbro. Blebbly mineralization within the host rock. Mineralization is fracture controlled.

Sample Number: B395994 Grid East: E Grid North: N Type: Chip Dimension: Abundance: UTM: Sample Width: 2m Abundance: Elevation: m

Comments: New trench, TR-06-02, first 2m chip sample is of gabbro rock with nil to sparse mineralization. Moderately gougy red soil material included in sample as well.

Sample Number: B395995 Grid East: E Grid North: N Type: Chip Dimension: Abundance: UTM: Sample Width: 2m Abundance: Elevation: m

Comments: Second 2m chip sample from TR-06-02. 2m chip of bedrock with malachite on 10-15% of the rocks. Cpy mineralization is sparse, no other sulphides visible.

Sample Number: B395996 Grid East: E Grid North: N Type: Chip Dimension: Abundance: UTM: Sample Width: 2m Abundance: Elevation: m

Comments: Third chip sample from TR-06-02, in bedrock, unmineralized gabbro.

Sample Number: B395997 Grid East: E Grid North: N Type: Chip Dimension: Abundance: UTM: E UTM: N Sample Width: 3m Abundance: Elevation: m

Comments: Final chip sample in TR-06-02. Quartz vein material with rusty red gougy soil, less than .5m of unmineralized gabbro.

Sample Number: Grid East: E Grid North: N Type: Dimension: Abundance: UTM: E UTM: N Sample Width: Abundance: Elevation: m

Comments:

Sample Number: Grid East: E Grid North: N Type: Dimension: Abundance: UTM: E UTM: N Sample Width: Abundance: Elevation: m

Comments:

Sample Number: Grid East: E Grid North: N Type: Dimension: Abundance: UTM: E UTM: N Sample Width: Abundance: Elevation: m

Comments:

AFFIDAVIT

I, Joan Mariacher, of Vancouver, B.C. make oath and say:

That to the best of my knowledge the attached Statement of
Expenditures for exploration work on the Rub 1-29 mineral
claim on Claim Sheet 115G/6 is accurate.

Joan Mariacher

Sworn before me at Vancouver, B.C.

this 30th day of August 2006.

Notary Public, Yukon Territory

Statement of Expenditures
 Rub 1-29 Mineral Claims
 August 29, 2006

Labour

H. Smith – geologist – July 11-13, 15-17, 19-20 – 8 days at \$400/day	\$ 3,392.00
A. Pare – field assistant – July 11-14, 17-20 – 8 days at \$304/day	2,577.92
F. Hodgins – field assistant – July 11, 14-20, 23-24 – 10 days at \$256/day	2,713.60
T. Gibbons – Jul 11-24 – 15 days at \$248/day	<u>3,943.20</u>
	12,626.72

Expenses

Field room and board – 41 days at \$125/day	5,434.50
ALS Chemex	<u>3,552.28</u>
	8,986.78

\$21,613.50
