INTRODUCTION

The Hopper property covers a bulk tonnage copper prospect located in southwestern Yukon. It is owned 100% by Strategic Metals Ltd. The initial staking was done in February 2006 and the property was substantially expanded in June upon receiving favourable results.

The 2006 exploration program was managed by Archer, Cathro & Associates (1981) Limited. Work consisted of claim staking, prospecting, geological mapping and grid and contour soil sampling. A crew of two to six people performed the work between May 31 and June 20. The author participated in the field program and her Statement of Qualifications appears in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Hopper property totals 163 mineral claims, including 162 contiguous claims in the main block and one claim located about two kilometres to the southwest adjoining the corner of the bordering Guy property. The claims are situated in southwestern Yukon at latitude 61°18'N and longitude 137°52'W on NTS map sheet 115 H/07. The general location of the property is shown on Figure 1 while individual claims are illustrated on Figure 2. The claims were staked under the Yukon Quartz Mining Act and are registered with the Whitehorse Mining Recorder in the name of Archer Cathro, which holds them in trust for Strategic. The claims cover an area of approximately 3200 hectares. Claim registration data are listed below.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
Hopper 1-20	YC41091-YC41110	February 15, 2007
21-154	YC47017-YC47150	June 16, 2007
155-162	YC47151-YC47158	June 21, 2007
170	YC47159	June 21, 2007

*Expiry dates do not include 2006 work that has not yet been filed for assessment credit.

The Hopper property lies alongside the Ashihik Lake Road, 52 km north of Otter Falls cutoff at Km 1602 on the Alaska Highway. Otter Falls cutoff is 128 km northwest of Whitehorse. Access in 2006 was by way of the all-season, two-wheel drive Ashihik Lake Road. A system of bush roads and bulldozer trails extends onto the property via the Guy claims.

GEOMORPHOLOGY AND VEGETATION

The Hopper property is located in an unnamed mountain range within the Kluane Plateau physiographic region. It is in a subalpine setting with local elevations ranging from 1000 to 1645 m above sea level. The lowest areas are located near the Ashihik Lake Road and exhibit glacial features such as small eskers, kames, kettles and assorted till deposits. These areas are densely forested with stunted spruce, willow and birch. The uplands begin approximately 800 m east of the road and consist of a broad, buckbrush covered plateau featuring gently undulating

knolls, swamps and small lakes. The upland plateau is separated from the lowlands by a steep (30°) moderately vegetated hillside. Outcrop is most common on the steep hillside and atop glacially scoured knolls.

Although the Hopper area is arid and creeks only flow during seasonal runoff, the small lakes should provide sufficient water for camp and drilling purposes. All of the creeks drain into Hopkins Lake, which is part of the Yukon River watershed.

PREVIOUS WORK

Cursory exploration was done in the area currently occupied by the Hopper claims between 1907 and 1967.

In 1968 Mitsubishi Metal Mining Co. staked the area and conducted geological mapping, grid soil sampling and a small amount of bulldozer trenching (Kikuchi, 1968). The sampling was done in an area roughly 6000 by 3600 m. It outlined moderate to strong copper-in-soil geochemical anomalies, within a dioritic stock and adjoining metasediments. Copper values ranged up to 660 ppm. Although much of the anomalous area is poorly exposed, a number of showings were discovered. Most consist of finely disseminated pyrite, chalcopyrite, pyrrhotite, and lesser molybdenum in relatively unaltered diorite. Chip samples across bedrock exposures returned promising assays including 0.52% copper over 45.72 m, 0.25% copper over 60.96 m, 0.24% copper over 45.72 m and 0.18% copper over 60.96 m. No gold or silver assays were reported. In 1969 Mitsubishi performed bulldozer trenching but no results were documented, probably because little bedrock was exposed.

In 1977 Whitehorse Copper Mines Limited explored an area that is now on the Guy claims, which adjoin the Hopper property to the southwest. This work identified copper rich skarns (Hureau, 1978). The best results are from two diamond drill holes with one yielding 1.94% copper over 18.59 m (no reported gold) and the other returning 2.23% copper and 0.785 g/t gold over 6.48 m.

REGIONAL GEOLOGY

The Hopper property is located between the Tintina Fault, 150 km to the northeast and the Denali-Shakwak Fault, 75 km to the southwest (Figure 3). Both faults are steeply dipping transcurrent structures that have seen hundreds of kilometres of dextral strike-slip offset. Tectonic interpretation places the property within the Yukon Tanana Terrane (Gordey and Makepeace, 1999). The local stratigraphy consists largely of Late Proterozoic to Paleozoic quartz-mica schist belonging to the Nisling Subterrane (Tempelman-Kluit, 1981). This package of strata form a northwest trending belt between 5 and 15 km wide that is bound along both sides by Mesozoic and Cenozoic intrusive rocks (Wheeler and McFeeley, 1991).

Early Jurassic intrusive rocks of the Long Lake and Aishihik Suites are found northeast of the Nisling Subterrane (Figure 4). They are primarily intermediate plutonic rocks but include felsic and mafic end members. Late Cretaceous to Early Tertiary intrusive rocks, primarily of the Ruby Range Plutonic Suite, form an extensive band southwest of the Nisling Subterrane and

appear as smaller stocks within it. Government airborne magnetic surveys (GSC, 1966) identify strong positive magnetic anomalies associated with the Late Cretaceous to Early Tertiary intrusions.

PROPERTY GEOLOGY

Geological mapping was conducted in the vicinity of the Hopper property at 1: 50,000 scale by S. Johnston and J. Timmerman of the Yukon Geological Survey in 1997 and by Strategic during the 2006 exploration program at 1:10,000 scale. This mapping identified two intrusive units and four metamorphic units that collectively comprise the Aishihik Metamorphic Suite (AMS). Lithologies are summarized in Table 1.

Table I - Property Lithological Units

Unit	Age	Description
Youngest Intrusive	Eocene	
Efp		north trending, olive to orange weathering, green feldspar porphyry dyke rocks; hornblende phenocrysts are common; includes buff weathering, tan to orange, leucocratic quartz-eye feldspar porphyry
Ruby Range Plutonic Suite	Late Cretaceous-Tertiary	
KTgRR		grey to light brown weathering, light to dark grey, medium to coarse grained, size range from equigranular to megacrystic, biotite-hornblende granodiorite, hornblende-biotite monzodiorite and quartz monzonite
Aishihik Metamorphic Suite	Late Proterozoic-Paleozoic	
PAMs		tan to brown to black quartzite; minor mica schist, marble, metabasite and felsic meta-igneous rocks
PAMc		bleached white weathering, white to grey, coarsely crystalline, flow banded, fetid marble; chert, and metabasite
PAMb		orange and green weathering, green to black hornblende metabasite; hornblende amphibolite, gneiss, and quartzite. Units adjacent to marble horizons may include significant amount of epidote-diopside calc-silicate.
PAM		pink-purple, red, and dark grey weathering, dark grey to brown, garnetiferous, muscovite-biotite feldspathic mica schist and quartz-mica schist; foliaform quartz and quartz-feldspar lenses are common

(After Johnston and Timmerman, 1997)

Most of the property is underlain by a 7 km long by 5 km wide stock that is flanked to the northeast and southwest by rocks of the AMS. This stock is a porphyritic, feldspar megacrystic, felsic to intermediate pluton of the Ruby Range Plutonic Suite. It is crudely zoned by texture and composition with a margin of aphanitic metabasite and a core of coarse grained quartz-biotite-hornblende diorite. Very fine grained magnetite is noted in both phases. The intrusion appears to be relatively unaltered, aside from a few small zones with weak clay alteration of feldspar on weathered surfaces.

The basement rocks belong to the AMS, which comprises a gently southeast dipping package of quartz-mica schist, phyllite and quartz grit with narrow interbands of thinly bedded, dirty limestone and calcareous metasediments. Weak to moderate pervasive calc-silicate alteration and skarn horizons are locally developed near the intrusive contact. The skarns are dark green to black with varying amounts of actinolite, diopside, anhydrite, garnet, and magnetite.

Structure is dominated by north trending steeply east- or west- dipping fault and fracture zones. These zones commonly contain felsic to mafic porphyry dykes and quartz-carbonate veinlets, veins and breccias. A secondary, roughly orthogonal, fracture set trends northeasterly and is healed with quartz and/or carbonate veinlets and veins.

GEOCHEMISTRY

In 1985 the GSC performed regional stream sediment sampling across the Aishihik Lake Map Sheet (Hornbrook, et al., 1985). Three samples were taken from creeks draining the Hopper property. They returned moderately anomalous copper and lead values to peaks of 51 ppm and 68 ppm, respectively which are above the 95th percentile for the survey area. Only background level values were documented for other elements in the Hopper area.

A total of 483 soils, 23 rocks and four stream sediment samples were collected by Strategic in 2006. The soil sampling was done on two grids within the upland plateau and along eight contour lines: four in the eastern part of the claims and four contouring the steep hillside on the western edge of the plateau (Figure 5). Each grid consists of a central, east trending baseline with compass- and topofill- controlled soil sample lines oriented perpendicular to the baseline. The grid samples were collected at 100 m intervals along lines spaced 100 m apart. The contour samples were collected at 50 m intervals along lines spaced between 100 and 200 m apart. Handheld Global Positioning Satellite (GPS) devices were used to determine contour sample locations and to provide outside survey control for the grids. All sample sites are marked by half metre wooden pickets affixed with aluminium tags inscribed with sample numbers. The samples were collected from B horizon soil typically found between 20 and 60 cm below surface using a mattock. Sample material was placed in individually pre-numbered Kraft bags. Rock samples were collected during geological mapping. Their locations are shown on Figure 6.

All of the samples were sent to ALS Chemex in North Vancouver. Soils and stream sediments were dried and screened to -180 microns. Rocks were crushed to better than 70% - 2 mm then a 250 g split was pulverized to better than 85% passing 75 microns. Splits were analyzed for gold using fire assay and inductively coupled plasma-atomic emission spectroscopy and for 34 other elements by aqua regia digestion followed by inductively coupled plasma-atomic emission spectroscopy. Copper, molybdenum, lead, zinc, gold and silver results are shown on Figures 7 to 12, respectively. Certificates of Analysis are contained in Appendix II. Rock results are discussed in the mineralization section. Rock sample descriptions appear in Appendix III.

The 2006 soil sampling on the western grid and adjacent contour lines outlined an area roughly 2300 m long by an average of 400 m wide, where values exceed the 200 ppm, moderately anomalous threshold for copper. This anomaly is cored by an 800 by 250 m area featuring values between 500 and 1275 ppm copper. The anomaly is open to the north, south and west and merges with a smaller lobe (400 by 400 m) to the east. This lobe contains the highest copper

value obtained during the 2006 program (2810 ppm). The lobe has not been closed off along its eastern edge.

Samples from the south end of the eastern grid outlined weakly to moderately anomalous copper values (up to 718 ppm) within a 400 by 200 m area. This anomalous area forms a crude east trending arc that projects toward the lobe containing the highest values on the western grid.

The contour sampling lines from the eastern side of the property returned only background values for copper.

Molybdenum response is well correlated with copper yielding a maximum value of 95 ppm. Lead (to 37 ppm) and zinc (to 296 ppm) exhibit coincident, weakly elevated point anomalies and clusters within the east-central part of the western grid. The highest gold value (465 ppb) was obtained from a contour sample collected from the central part of the property. Silver values did not exceed 2 ppm in soil samples.

MINERALIZATION

Three types of mineralization have been observed at the Hopper property. They are intrusive hosted disseminated sulphide, sulphide-oxide bearing skarn, and vein- or fracture- hosted sulphide.

The most common style of mineralization is disseminated sulphide within the intrusive rocks. Surface samples from the western part of the stock often exhibit chalcopyrite, pyrite, pyrrhotite, magnetite and molybdenite, which occur as fine interstitial disseminations and clots. Minor fracture hosted mineralization is also present consisting of chalcopyrite within hairline to one centimetre fractures that are often healed with clear to white quartz. Hydrothermal alteration along vein selvages is minimal. Intense surface oxidation and leaching commonly seen in some porphyry systems elsewhere in Yukon is not evident at the Hopper property.

Eight specimens of intrusive material collected during the 2006 program yielded between 0.11% and 1.53% copper with up to 11.6 g/t silver. The average of these samples was 0.65% copper. Four of these samples are classified as weakly magnetic diorite while the remainder are categorized as granodiorite. The results for individual samples are tabulated in Table II.

In 1968, Mitsubishi sampled 25 outcrop exposures. The location of the six most anomalous chip samples is shown on Figure 5. The sampled outcrops returned generally encouraging results including 0.10% copper over 30.48 m, 0.52% copper over 45.72 m, 0.25% copper over 60.96 m, 0.18% copper over 60.96 m, 0.24% copper over 45.72 m, and 0.21% copper over 30.48 m. At each site the bedrock samples produced higher values than nearby soil samples. Examination of Mitsubishi bulldozer trenches showed that although they failed to reach bedrock, mineralized float boulders are locally abundant in the overburden.

Skarn horizons and lenses are developed near the contact between the AMS and the intrusion in the western part of the property. Individual skarn horizons on the Hopper property range from 2 to 5 m thick. Strike lengths have not been determined. The skarns are composed of either

actinolite-diopside or magnetite-garnet. Sulphide mineralization consists of patchy chalcopyrite with lesser pyrite and molybdenite. The best of three skarn samples collected in 2006 was a 2 m chip sample that yielded 0.93% copper, 0.096 g/t gold, 15.1 g/t silver and 155 ppm molybdenum. Specimens of dark grey-green aphanitic to weakly banded metabasite collected in close proximity to the mineralized skarn returned copper values ranging from 0.14 to 1.75% and silver values to 12.2 g/t.

Epigenetic mineralization in the form of quartz-carbonate veining occurs mostly within the intrusion. Quartz-carbonate veins typically parallel the dominant north trending fracture orientation. The quartz is clear to white to smokey and sometimes exhibits weak banding, drusy cavities and brecciation. The veins are commonly mineralized with isolated coarse blebs and clots of chalcopyrite and molybdenite. The carbonate weathers orange-brown and consists of amorphous to white crystalline calcite. Assay results of vein material collected in 2006 were relatively low for copper and accessory metals.

DISCUSSION AND CONCLUSIONS

The Hopper property covers a copper prospect associated with one of several Late Cretaceous to Tertiary stocks in the Aishihik Lake area. Historically, the Hopper prospect was classified as a

porphyry target. However, work done in 2006 showed that many features that characterize porphyry deposits are absent or only weakly developed at the Hopper property. Preliminary work suggests the mineralization may be magmatic in nature.

Typical porphyry systems exhibit concentrically zoned alteration. The ore zone or shell containing chalcopyrite, pyrite and molybdenite is normally characterized by strong potassic alteration dominated by potassic feldspar and biotite. These secondary minerals are developed as a result of hydrothermal alteration of primary lithology. The majority of the intrusive rocks collected during 2006 at the Hopper property appear fresh and all compositional components (quartz, feldspar, hornblende, and biotite) are believed to be primary. The absence of epidote, chlorite or muscovite alteration is noteworthy. Acid etching and staining of 10 slabbed specimens shows relatively uniform distribution of potassic feldspar that likely reflects primary orthoclase content in the intrusion.

Hypogene sulphide mineralization in most porphyry systems is dominantly fracture controlled with lesser disseminations. Common sulphide minerals consist of pyrite, chalcopyrite, bornite, and molybdenite which zone out peripherally to base metal and precious metal veins and skarns. Sulphide mineralization within the intrusive rocks at the Hopper property follows the general zoning model but the copper primarily occurs as disseminations.

Soil sampling in the western part of the property identified three areas of anomalous copper response which are similar in size and intensity to anomalies associated with known porphyry deposits in Yukon and British Columbia. Limited rock sampling within these anomalous areas by Strategic and Mitsubishi has returned encouraging results that substantially exceed near soil values. Reconnaissance sampling to the eastern part of the property returned generally low values but much of the area was not sampled.

Although the Hopper property lacks many features commonly associated with porphyry deposits, it exhibits size and grade ranges that characterize bulk tonnage deposits. Further work is warranted to evaluate this prospect. The next stage of exploration should consist of additional soil sampling to fully delineate areas of anomalous copper response, coupled with detailed mapping, prospecting and excavator trenching to define the lateral extent of the surface mineralization.

Respectfully submitted,

CERTIFICATE VA06058475

Project: Hopper

P.O. No.:

This report is for 40 Soil samples submitted to our lab in Vancouver, BC, Canada on 20-JUN-2006.

The following have access to data associated with this certificate:

AL ARCHER
VANCOUVER OFFICE

DOUG EATON
BILL WENGZYNOWSKI

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	34 Element Aqua Regia ICP-AES	ICP-AES

To: STRATEGIC METALS LTD.

CERTIFICATE VA06058300

Project: Hopper

P.O. No.:

This report is for 6 Rock samples submitted to our lab in Vancouver, BC, Canada on 26-JUN-2006.

The following have access to data associated with this certificate:

AL ARCHER
VANCOUVER OFFICE

DOUG EATON
BILL WENGZYNOWSKI

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	34 Element Aqua Regia ICP-AES	ICP-AES
Au-AA23	Au 30g FA-AA finish	AAS

To: STRATEGIC METALS LTD.

CERTIFICATE VA06056133

Project: Hopper

P.O. No.:

This report is for 17 Rock samples submitted to our lab in Vancouver, BC, Canada on 20-JUN-2006.

The following have access to data associated with this certificate:

AL ARCHER
VANCOUVER OFFICE

DOUG EATON
BILL WENGZYNOWSKI

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	34 Element Aqua Regia ICP-AES	ICP-AES
Cu-AA46	Ore grade Cu - aqua regia/AA	AAS
Au-AA23	Au 30g FA-AA finish	AAS

To: STRATEGIC METALS LTD.

CERTIFICATE VA06056402

Project: Hopper

P.O. No.:

This report is for 228 Soil samples submitted to our lab in Vancouver, BC, Canada on 20-JUN-2006.

The following have access to data associated with this certificate:

AL ARCHER
VANCOUVER OFFICE

DOUG EATON
BILL WENGZYNOWSKI

JOAN MARIACHER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
SCR-41	Screen to -180um and save both
LOG-22	Sample login - Rcd w/o BarCode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	34 Element Aqua Regia ICP-AES	ICP-AES

To: STRATEGIC METALS LTD.

APPENDIX III
ROCK SAMPLE DESCRIPTIONS

Rock Sample Descriptions			Project: HOPPER	Property: HOPPER	May 31-June 13, 2006
Sample Number: C103401	Grid East: E UTM: 396815 E Elevation: m	Grid North: N UTM: 6796441 N	Type: Chip	Dimension: 6m hor, 4 m vert	Abundance:
Comments: Sample of granodiorite, mostly unaltered, equigranular, hornblende and biotite rich. Malachite on fracture surfaces, cpy disseminated throughout in <2mm blebs. Granodiorite is heavily fractured with 6 per metre. Characteristic of porphyry.					
Sample Number: C1103402	Grid East: E UTM: 396815 E Elevation: m	Grid North: N UTM: 6796441 N	Type: Chip	Dimension: 6m hor, 4 m vert	Abundance:
Comments: Quartz rich rock (chalcedony-red/orange) with minor malachite on surface. No visible sulphides. The rock is a qtz vein and not brecciated but has country rock intertwined with the qtz. Massive py blebs <1 cm with variable thickness. Moly < 2mm blebs, lightly disseminated. Possibly sphalerite crystals. Malachite staining.					
Sample Number: C103403	Grid East: E UTM: 396815 E Elevation: m	Grid North: N UTM: 6796441 N	Type: Chip	Dimension: 6m hor, 4 m vert	Abundance:
Comments: Sample of granodiorite, mostly unaltered, equigranular, hornblende and biotite rich. Malachite on fracture surfaces, cpy disseminated throughout in <2mm blebs. Granodiorite is heavily fractured with 6 per metre.					
Sample Number: C103404	Grid East: E UTM: 396451 E Elevation: m	Grid North: N UTM: 6797435 N	Type: Grab	Dimension: 18 m strike, 4 m dip	Abundance:
Comments: A Ca-rich skarn (orange) is adjacent to a black, fine grained rock with heavy cpy disseminated throughout and malachite on most surfaces. There is no mineralization within the Ca-skarn and the black rock unit (dyke?) extends for >18metres until it comes in contact with a light grey porphyry.					
Sample Number: C103405	Grid East: E UTM: 396693 E Elevation: m	Grid North: N UTM: 6797587 N	Type: Chip	Dimension: 15m long * 4 m high	Abundance:
Comments: Diorite rock with cpy disseminated finely throughout.					
Sample Number: C103406	Grid East: E UTM: 396922 E Elevation: m	Grid North: N UTM: 6797488 N	Type: Float	Dimension:	Abundance: Very
Comments: Float collected below meta-sed o/c. It's an epidote-chlorite-magnetite (dyke) rock with cpy disseminated and minor py. Located dyke in o/c farther upslope and it's 1.5 m wide and runs conformably with sed units.					

Sample Number:	Grid East:	E	Grid North:	N	Type:	Chip	Dimension:
C103407	UTM:	396953	UTM:	6797450	N	Sample Width: 1m strike	Abundance:
	Elevation:	m					

Comments: The chip sample was taken over 1m dip width. It's a black, fine grained siliceous rock adjacent to a Ca-skarn on the west and a hornblende-biotite poor diorite (which would make it what kind of intrusive rock?)

Sample Number:	Grid East:	E	Grid North:	N	Type:	Chip	Dimension:	o/c:50m horiz and vertical to ridge
C103408	UTM:	396833 E	UTM:	6796988 N	Sample Width:	2m	Abundance:	
	Elevation:	m						

Comments: Sample of granodiorite with cpy mineralization disseminated throughout. Alteration zone definitely present, especially near the fractures-orange staining. The altered granodiorite sits next to a green, non-magnetic dyke that lacks mineralization. There is a large boulder train below outcrop.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Chip	Dimension:
C103409	UTM:	396823 E	UTM:	6796311 N	Sample Width:	1m	Abundance:
	Elevation:	m					

Comments: .

Sample Number:	Grid East:	E	Grid North:	N	Type:	Outcrop	Dimension:
C103410	UTM:	396506	UTM:	6797329	N	Sample Width:	8 inches
	Elevation:	m					Abundance:

Comments: Fine grained diorite in contact with mafic dyke << 1m in width. Cpy and py disseminated in diorite. Malachite on the odd piece. Tarnished pyrite.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Rock	Dimension:
C103411	UTM:	396909	UTM:	6796830 N	Sample Width:	1 foot	Abundance:
	Elevation:	m					

Comments: Limonitic drusy fractures with cpy disseminations. Malachite on qtz veinlet, stockwork fractures-secondary. 023/62 RHR and 140/83 RHR

Sample Number:	Grid East:	E	Grid North:	N	Type:	Float	Dimension:
C103412	UTM:	397160 E	UTM:	6797210 N	Sample Width:	Random	Abundance:
	Elevation:	m					

Comments: Bill took "lake sample" of this back as rep. Quartz carbonate vein scavenging cpy and moly.

Sample Number: C103413 Grid East: 397160 E Grid North: 6797210 N Type: Float Dimension:
UTM: E UTM: N Sample Width: Abundance: Relative
Elevation: m

Comments: Highly concentrated group of py, cpy and pyrrhotite in MATRIX of intrusive. Moly on weathered surface. Pyrrhotite seen in largest amount thus far on property. Bill took "lake sample" back to XY as a rep

Sample Number: C103414 Grid East: 397232 E Grid North: 6797342 N Type: Rock Dimension:
UTM: E UTM: N Sample Width: 2 feet Abundance:
Elevation: m

Comments: Hornblende with lots of sulphides, pyrite, and a bit of pyrrhotite.

Sample Number: C103415 Grid East: 396925 E Grid North: 6797509 N Type: Chip Dimension:
UTM: E UTM: N Sample Width: 2m Abundance: Very
Elevation: m

Comments: A 2m chip sample of epidote-actinolite skarn. Cpy, moly and minor amounts of py. Follow up chip sample of C103406. O/c exposed over 4m vertical thickness and for approximately 12-14 m horizontally before it tapers out.

Sample Number: C103416 Grid East: 396925 E Grid North: 6797509 N Type: Chip Dimension:
UTM: E UTM: N Sample Width: 2 m Abundance: Very
Elevation: m

Comments: Chip sample over 2m vertical distance. Stratigraphically below C103515. Abundant cpy with massive garnet and malachite. Rep of C103415 and C103416 are together.

Sample Number: C103417 Grid East: 396821 E Grid North: 6797805 N Type: Chip Dimension:
UTM: E UTM: N Sample Width: 3 m Abundance:
Elevation: m

Comments: Epidote, diopside skarn exposed over >4m malachite stained with chalcopyrite disseminated. CaCO3 ppt on surface

Sample Number: C103418 Grid East: 397415 E Grid North: 6798212 N Type: Grab Dimension:
UTM: E UTM: N Sample Width: 6m Abundance:
Elevation: m

Comments: Grab sample from old trench (trench is approx. 12 m long and 3m wide). Very felsic (young?) intrusive rock with lots of cpy. Fracture controlled and matrix supported.

Sample Number: C103419 Grid East: 396903 E Grid North: 6797887 N Type: Chip Dimension:
UTM: E UTM: N Sample Width: 2m Abundance:
Elevation: m
Comments: Chip sample over 2m vertical distance. Epidote skarn with moly, pyrrhotite and minimal cpy mineralization.

Sample Number: C103420 Grid East: 397649 E Grid North: 6797686 N Type: Chip Dimension:
UTM: E UTM: N Sample Width: 6m Abundance:
Elevation: m
Comments: Chip over exposed bedrock of very mafic quartz biotite diorite.

Sample Number: C103421 Grid East: 397542 E Grid North: 6797238 N Type: Chip/grab Dimension:
UTM: E UTM: N Sample Width: 2m Abundance:
Elevation: m
Comments: Chlorite altered hornblende-biotite intrusive with some feldspar, fracture controlled chalcopyrite

Sample Number: C103422 Grid East: 397598 E Grid North: 6797242 N Type: Grab Dimension:
UTM: E UTM: N Sample Width: 2m Abundance:
Elevation: m
Comments: Grab sample in old trench of unaltered hornblende-biotite diorite with cpy mqn in matrix and semi massive moly on some fracture surfaces

Sample Number: C103423 Grid East: 397690 E Grid North: 6797248 N Type: Grab Dimension:
UTM: E UTM: N Sample Width: 3m Abundance:
Elevation: m
Comments: Grab sample in old trench, abundant fracture controlled cpy mzn. Chips taken from bedrock and from float.

AFFIDAVIT

I, Joan Mariacher, of Vancouver, B.C. make oath and say:

That to the best of my knowledge the attached Statement of
Expenditures for exploration work on the Hopper 1-162 and 170
mineral claims on Claim Sheet 115H/7 is accurate.

Joan Mariacher

Sworn before me at Vancouver, B.C.

this 19th day of February 2007.

Notary, Yukon Territory

Statement of Expenditures
Hopper 1-162, 170 Mineral Claims
February 15, 2007
