DUBLIN GULCH, ASSESSMENT REPORT 2005

Title: 2005 Dublin Gulch Exploration Program
LQ00090

Location: Mayo Mining District, Yukon, approximately 75 kilometers northeast of Mayo and 370 kilometers due north of Whitehorse

Dates of Work: January 1st - December 31st, 2005 (Project Planning, Management and Assessment)
May 7th - September 19th, 2005 (Drilling and Regional Program)

Prepared by: D Hladky B.Sc., P.Geol., Senior Project Geologist,
StrataGold Corporation (Canada) Ltd.

Supervised by: Jim Sparling, MBA, B.Sc., P.Geol., Exploration Manager
StrataGold Corporation (Canada) Ltd.

Appendix F - Dublin Gulch 2005 Diamond Drill Logs
Appendix G - ALS Chemex Assay Certificates - Drilling
Appendix H - Assay Certificates - Drilling QAQC
Includes Assay Certificates from:
- ACME Analytical
- ALS Chemex
- SGS Labs

Appendix I - Report: Review of the Dublin Gulch Quality Control Program, By Lynda Bloom of Analytical Solutions
Appendix J - Report: Report on Results of a Laboratory Audit of ALS Chemex Laboratory, North Vancouver, B.C., By Stephen Cook, Consulting Geochemist
Appendix K - Dublin Gulch Map with Regional Silt and Rock Sample Locations
Appendix L - List of Geochemical Rock Samples
Appendix M - ALS Chemex Assay Certificates - Rock Samples
Appendix N - List of Geochemical Silt Samples
Appendix O - ALS Chemex Assay Certificates - Silt Samples

1. INTRODUCTION AND LOCATION

The Dublin Gulch dispositions are located in the Mayo Mining District, Yukon Territory, approximately 75 kilometers northeast of Mayo and 370 kilometres due north of Whitehorse. The property outlined for assessment comprises 1856 contiguous quartz mining claims covering approximately 339.04 square kilometers of land.

The registered owner of the Len 1-32 and Jan 1-4 fractional claims is Janet Dickson, while the remaining claims are registered to StrataGold Corporation. The Len and Jan claims are subject to an option agreement wherein StrataGold may earn a 100% interest.

This report summarizes the Diamond Drilling activities and Regional Geochemical Sampling Program successfully completed in 2005.

A list of the Dublin Gulch Claims for Assessment is included in Appendix B of this report.

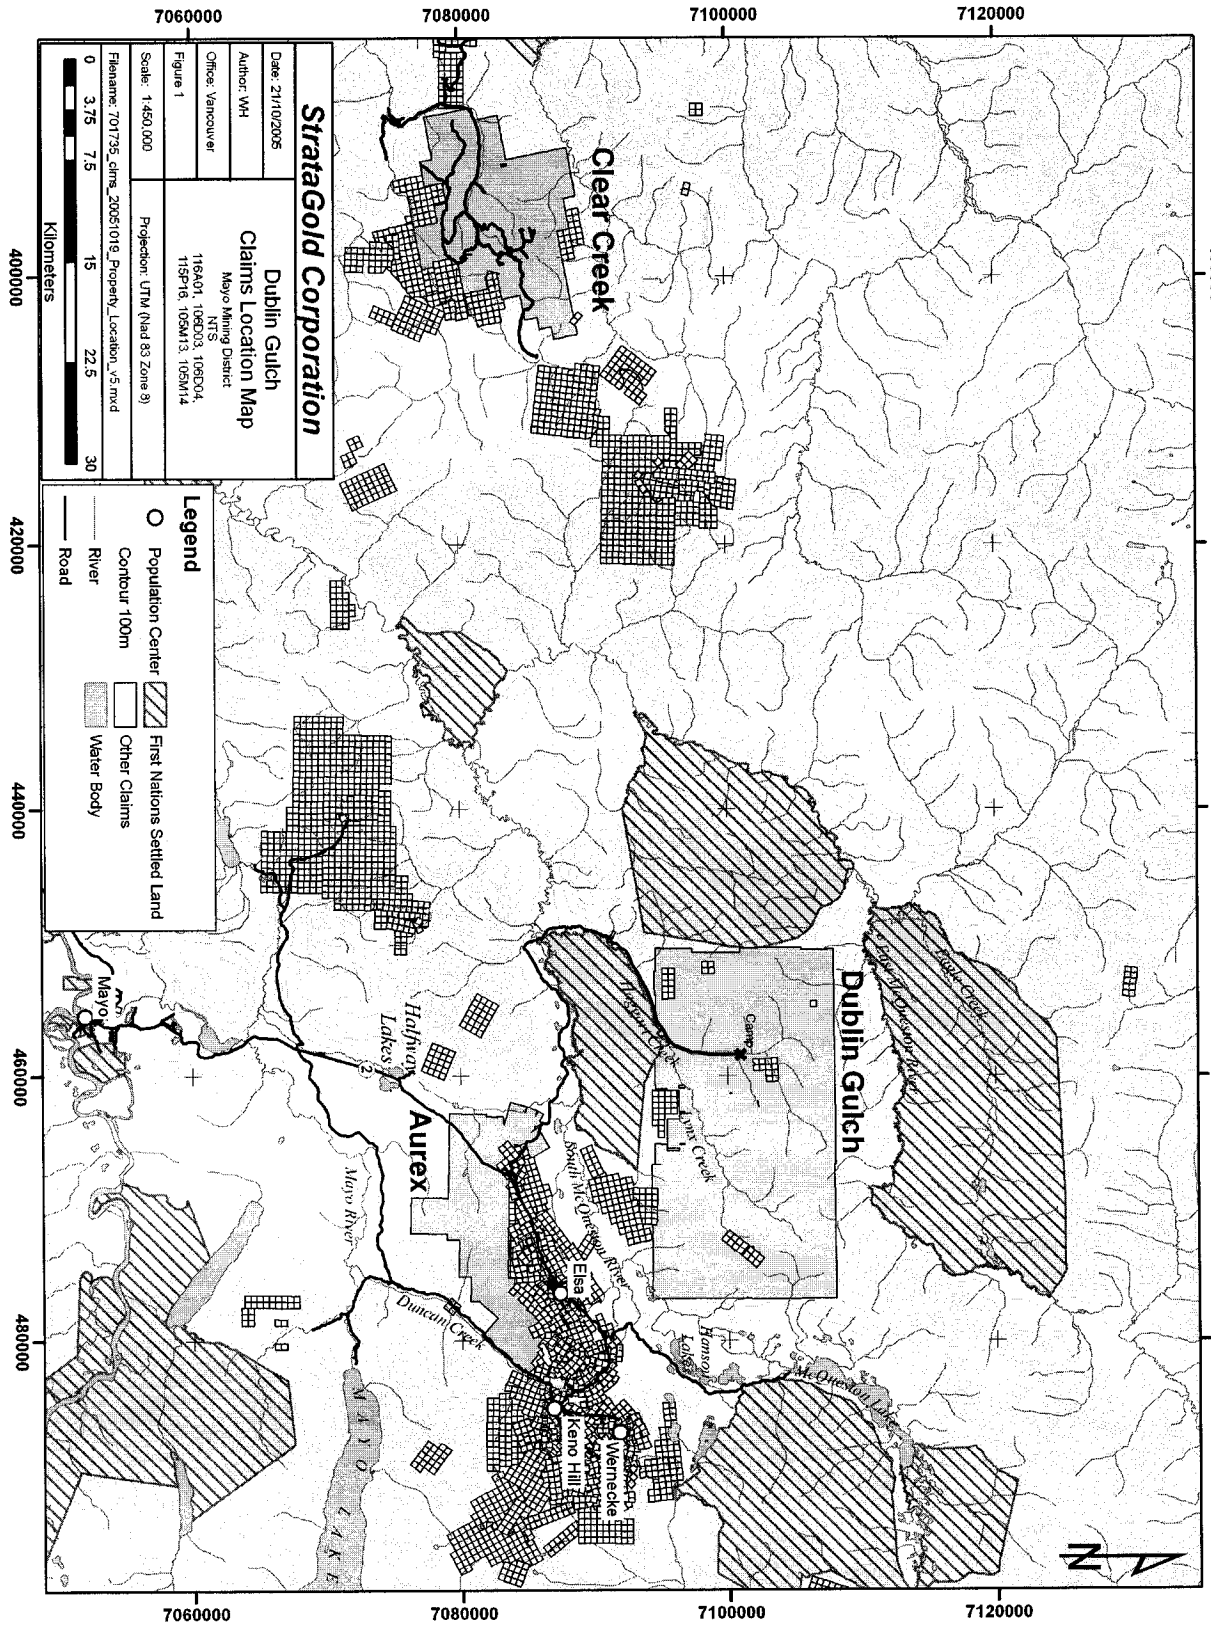

Figure 1: Dublin Gulch Claims Location Map

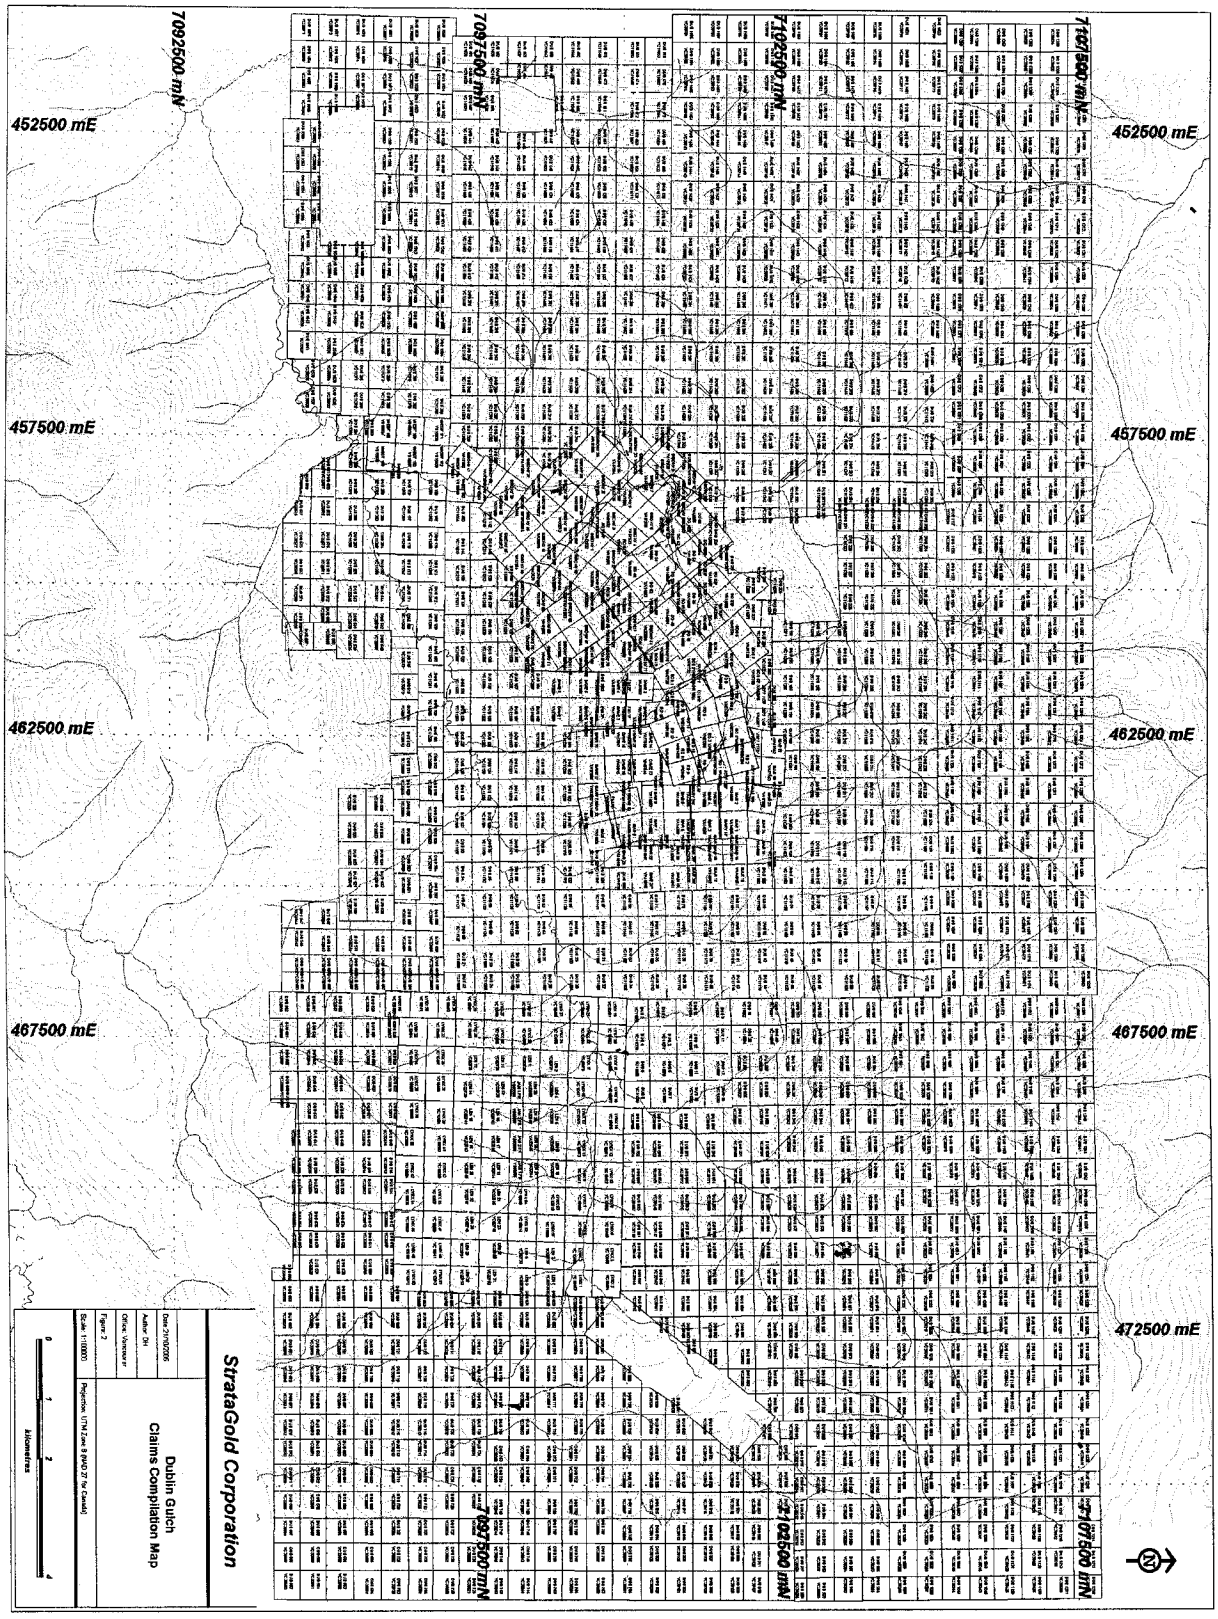

Figure 2: Dublin Gulch Claims Compilation Map (see Appendix A)

2. GENERAL INFORMATION

The Dublin Gulch Claims group for 2005 assessment consists of 1856 claims comprising a total of 399.04 square kilometers. Planning of the program began January 1st, 2005. The drill program was managed from May 7th to September 19th, 2005, when a total of 34 diamond drill holes were drilled. In the later part of this period a Regional Geochemical Exploration program concluded with 2418 stream sediment and 534 rock samples on the Dublin Gulch Property. Following this, assessment of the data continued through to December 31st, 2005, including a report on the Quality Control Program (Appendix I), as well as an ALS Chemex Laboratory Lab Audit (Appendix J). Appendices D through F contain Dublin Gulch Diamond Drill Sections and Logs, and Appendices K through O contain Rock and Silt Sample program details.

3. DESCRIPTION OF WORK – DIAMOND DRILLING

During the period May 7th to September 19th, 2005, 34 Diamond Drill holes were drilled on the Dublin Gulch claims. Two drills and a D6 Cat, owned by Britton Brothers Ltd., were contracted by StrataGold Corporation to complete the drill program intended to upgrade previous resource estimates, and explore new targets on the property. Where available, historical roads and pads were used, though commonly new access roads and drill pads were created to accommodate drilling. All drill holes were drilled for HQ size core, though occasionally the hole was reduced to NQ size core due to drilling complications. The core was drilled in 5 foot lengths and at shift change, transported down to the Dublin Gulch camp, located near the confluence of Dublin Gulch creek and Haggart Creek. Here the core was logged and split using two Diamond Bladed Saws, and sealed in plastic sample bags along with the sample tag. An extensive routine of Quality Assurance and Control (QA/QC) procedures were followed during sampling and subsequent assaying. These procedures are outlined in the following section.

TOTAL									8104.93				

Initially, return samples, or silt taken from the return mud while drilling, were collected at the drill every 5 feet (~1.53m) from the bottom of the casing to the depth that return was lost down the whole. In some cases, return was lost after only a few samples, in other cases, return lasted for the majority of the hole. The return samples were collected in large porous bags that allowed the water to slowly pass through or dry, while retaining the fine grained sample. These bags were then arranged in series and assigned a sample number. No Quality Control samples were included with the Return Samples. Return samples were collected for Holes DG05-276C to DG05-277C, and DG05-280C through DG05-284C. This exercise was stopped after Hole DG05-284C. A list of return samples is included in Appendix D, followed by the received assay certificates.

All Samples were shipped to ALS Chemex in Vancouver for analysis. Upon completion of a drill hole, collar coordinates were obtained using a Garmin GPS device, and a tripod with collar details was erected over the location.

4. METHODS OF ANALYSIS AND DATA PRESENTATION - DIAMOND DRILLING

Drill core was logged on site in the Dublin Gulch Camp, with sample tags placed by the logging geologist at the start of each sample interval. The core was then split using a Diamond Bladed Saw, with one half of the core remaining in the box and the other half being secured in plastic sample bags. The remaining core boxes were then cross-stacked and covered in the core storage area. The core samples for analysis were then sent via land to ALS Chemex in Vancouver for analysis. A total of 7263 core samples were submitted from the field, to be analyzed for Gold by Fire Assay, with 27 element ICP. The sample procedures are detailed below.

A map showing the highlighted locations of 2005 drill holes is in Appendix C, accompanied by 16 east-looking Gold assay and lithology cross sections in Appendix E.

Strict Quality Assurance and Control (QA/QC) protocols were maintained throughout the sampling process. The routine practice for a series of 20 samples is outlined in the following table.

Table 2: QAQC Sampling Procedures (as outlined in report by Stephen Cook)

Sample		Sample	
1	Field Duplicate 1	11	
2	Field Duplicate 2	12	
3		13	
4		14	
5		15	
6		16	Blank
7		17	
8		18	
	Preparation		
9	Duplicate/Check Assay	19	
10	Standard	20	

The Field Duplicate consisted of one quarter sample. In this case, "Sample 1" was split into two halves, and then one of these halves was quartered to create "Field Duplicate 1" & "Field Duplicate 2", and the other half of "Sample 1" was placed back in the box.

The Preparation Duplicate and Check Assays were prepared during milling in the ALS Chemex lab. The number 8 sample was crushed and sieved to 70 % passing 2mm mesh. From this sample, two 250 gram portions were measured out, with one of these being sent to ACME Analytical for processing as the Check Assay. The 250 gram sample remaining at ALS Chemex was then ring-milled to 85% passing 75 micron or better. From this sample, two 30 gram samples were measured out for testing. The first was tested for both Gold by Fire Assay as well as 27 element ICP by acid digestion, and the second only for Gold by Fire Assay.

Standards were also used by StrataGold to monitor analytical accuracy. A total of 7 different Standards were incorporated into the sampling protocol. Two of the Standards were obtained from the Canadian Certified Reference Materials Project (CANMET), and were measured out with an electric scale into 30.5 gram portions, double bagged in two plastic sample bags, and placed in the sample series to occur approximately once every 100 samples. The other five standards (OREAS Standards) were obtained as pre-measured 60 gram pouches from Analytical Solutions Ltd. One of these was chosen by the core logging geologist to occur in each of the remaining 4 out of 100 standard samples.

The Blank sample used consisted of barren Dolomite purchased in 30 lb bags. Approximately 1.5 to 2 kilograms of dolomite were placed in a plastic bag and submitted once every 20 samples. 12 samples, including one standard sample, were sent to each of 3 labs to test the consistency as a blank sample and to verify that no gold was

present. The results from these tests are included in the Drilling QAQC section in Appendix H.

The samples, once received by ALS Chemex, underwent the following procedure:

- The received sample was weighed and dried if necessary
- The sample was then crushed to 70% of the sample passing <2mm
- The sample was split using a riffle splitter
- The sample was then pulverized to 85% passing <75 um, with the crushers and pulverizers being washed at the beginning and end of the sample batch, and at the beginning of the technicians shift
- Followed by 30 gram Fire Assay and AAS with trace Hg via cold vapor/AAS
- Finally 27 element four acid ICP-AES

The analytical results were placed in an Access database as they were received. The original assay certificates received from ALS Chemex for the Drill Core and QAQC samples as well as the certificates from ACME Analytical Ltd. for the Check Assay samples, are presented in Appendix G for Drilling, and Appendix H for Drilling QAQC.

Due to the need to have the initial data reviewed, results from DG05-276C to DG05-302C were sent to Lynda Bloom of Analytical Solutions Ltd. for a review of the quality control program at Dublin Gulch. Based on the suggestions of this report, 373 samples were resubmitted to evaluate the consistency of the results of some of the original QAQC samples. It was also suggested to test the sampling procedures at ALS Chemex. For this, 10 samples with a variety of Au and Bi values, were submitted. For these, the remaining coarse fraction from the original sample was crushed such that the entire sample passed through a 2mm mesh. The sample was then riffle split into as many 500 gram portions as possible. Each of these samples was then pulverized, and from these new pulps three 50 gram samples were taken and analyzed for gold by Fire Assay.

The report received from Lynda Bloom is included in Appendix I. A lab audit of the ALS Chemex Ltd. North Vancouver lab was carried out by Stephen Cook on October 27th, 2005 and the report is included in Appendix J.

5. DESCRIPTION OF WORK - REGIONAL GEOCHEMICAL SAMPLING PROGRAM

The Regional Geochemical Exploration program consisted of a helicopter supported Stream Sediment (Silt) and Rock Sampling Program over much of the claim block. 2418 Stream sediment (silt) samples were collected at approximately 100 meter spacing along

current and seasonal drainages. 534 Rock samples were taken of quartz veins and mineralization in outcrop or sub-crop. Sample locations were flagged, with samples placed in stream sediment bags or plastic bags with sample tags, and shipped to ALS Chemex in Vancouver.

6. METHOD OF ANALYSIS AND DATA PRESENTATION – REGIONAL GEOCHEMICAL SAMPLING PROGRAM

Regional Samples, once collected, were sorted and placed into rice bags. Approximately 1 in 20 samples was a sample standard, the same as used for drill core sample quality control. In addition, approximately 1 in 20 samples was a sample duplicate, where the original and the following sample in the series were taken from the sample location. **Both the Rock and Stream Sediment (Silt) samples were processed the same as the Diamond Drilling core samples. For a list of the analytical procedures, refer to above.**

A map showing both the rock and silt sample locations is included in APPENDIX K. The list of Rock Samples is included in Appendix L with the ALS Assay Certificates included in Appendix M. The list of Stream Sediment (Silt) Samples is included in Appendix N, with the ALS Assay Certificates included in Appendix O.

7. STATEMENT OF EXPENDITURES

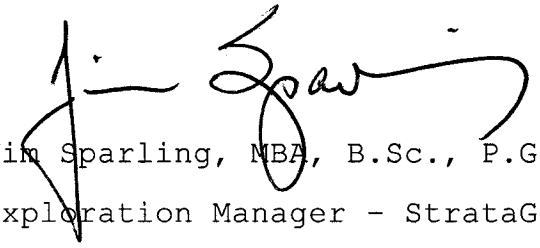

Table 2: Dublin Gulch Project Statement of Expenditures

	Through to 31/12/05
Accommodation and Meals	$79,464.53
Assays Geochem Analysis	$278,679.81
Camp Expense	$1,220.00
Helicopter	$96,671.85
Communication /Telephone	$22,267.23
Bulldoze & Equipment Contract	$202,257.69
DD Bulld & Equipment Contract	$22,520.00
Drilling	$757,375.42
DD Contractor - Direct	$40,762.20
DD Contractors Mob/Dem	$15,000.00
Drill Supplies	$72,389.00
Equipment Maintenance	$12,646.51
Equipment Rentals	$63,089.38
Expediting	$12,522.34
Fuel	$9,480.83
Fuel - Unleaded/100LL	$41.14
Fuel - Propane	$3,139.90
Fuel - Jet B	$13,696.03
Fuel - Diesel	$83,588.39
General Consultant	$46,223.99
Geophysical Consultants	$35,459.59
Geological Consultants	$475,706.49
Cook/First Aid Attendant	$51,088.31
Contract Labour	$276,740.24
Materials & Supplies	$249,755.68
Printing & Reproduction	$23,028.99
Truck Rental	$42,321.95
Delivery/Shipping	$73,277.26
Travel & Freight	$1,333.68
Travel Costs	$40,867.81
Worker's Compensation	$10,538.77
Warehouse	$14,639.16
Safety Supplies	$13,752.23
Totals	**$3,141,546.40**

8. RECOMMENDATIONS

It is recommended that the Dublin Gulch mineral dispositions described within this assessment report be held pending further geological and geochemical review, including the evaluation of the 43-101 report and updated resource estimate compiled by Wardrop Engineering Inc.

Respectfully submitted,

Jim Sparling, MBA, B.Sc., P.Geo.

Exploration Manager - StrataGold Corporation

7.0 CERTIFICATE OF QUALIFICATIONS

1. I **Jim Sparling**, of 839 Old Lillooet Rd, North Vancouver, British Columbia, Canada, hereby state - that I am the Exploration Manager with StrataGold Corporation, with offices at 701 Howe Street, Vancouver, British Columbia, V6C 2B3, and that:

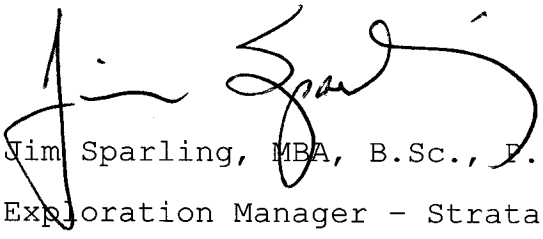
2. I hold a BA (Economics Major) from the University of Manitoba, Winnipeg, Manitoba (1978), a B.Sc. (Advanced Geology) from the University of Saskatchewan, Saskatoon, Saskatchewan (1984) and an MBA from Royal Roads University, Victoria, British Columbia (2003).

3. I have 19 years experience with various mining and oil and gas companies in Canada. My primary employment since 1992 has been in the field of mineral exploration.

2004	Exploration Manager, North and Central America, StrataGold Corporation
2003	Project Geologist, StrataGold Corporation
1994 - 2003	Project Geologist and Geophysical Crew Chief Hudson Bay Exploration & Development Co. Ltd.
1992 - 1994	Geophysical Crew Chief/ Technician, Brad Koop Exploration Ltd.
1989 - 1992	Geological Systems and Data Base Analyst, Petro Canada Resources Ltd.
1988 - 1989	Geological Consultant, Schindler Exploration, Indian and Northern Affairs (Minerals West)
1987 - 1988	Field Exploration Geologist, Hudson Bay Exploration & Development Co. Ltd.
1985 - 1987	Wellsite Geologist, Geotemp Consulting Ltd.
1984 - 1985	Field Exploration Geologist, Hudson Bay Exploration & Development Co. Ltd.

4. I am a practicing member in good standing with the Association of Professional Engineers and Geoscientists of Manitoba and Saskatchewan.

5. I have extensive exploration and development project experience with volcanic massive sulphide ore deposit geology and hydrothermal alteration, and experience with gold ore deposit geology. This experience has allowed me to become familiar with the evaluation of both regional and property geology, prospecting, geophysical surveys, diamond core drilling, underground exploration, development and production, and permitting processes



geophysical surveys, diamond core drilling, underground exploration, development and production, and permitting processes in Manitoba, Saskatchewan, Nunavut Territory and the Yukon Territory.

6. This report is based upon data collected during the 2005 Diamond Drilling and Geochemical sampling program in The Yukon Territory, Canada in 2004.

Dated at Vancouver, British Columbia; Friday, February 10, 2006

Respectfully submitted,

Jim Sparling

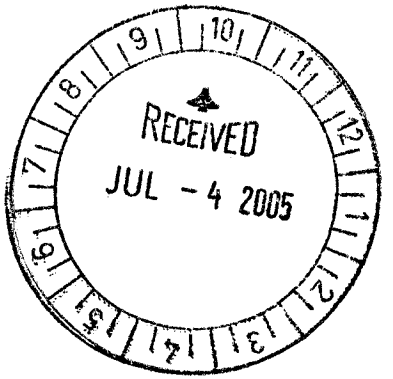
CERTIFICATE VA05047826

Project: Dublin Gulch-1735

P.O. No.:

This report is for 40 Stream Sediment samples submitted to our lab in Vancouver, BC, Canada on 17-JUN-2005.

The following have access to data associated with this certificate:



DAVID HLADKY	JIM SPARLING	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41d	Screen to -100um, save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP61	27 element four acid ICP-AES	ICP-AES

To: **STRATAGOLD CORPORATION**
ATTN: JIM SPARLING
701-475 HOWE ST
VANCOUVER BC V6C 2B3

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

Finalized D 1-JUL-2005
Account: STRGOL

CERTIFICATE VA05048596

Project: Dublin Gulch-1735

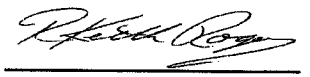
P.O. No.:

This report is for 127 Stream Sediment samples submitted to our lab in Vancouver, BC, Canada on 20-JUN-2005.

The following have access to data associated with this certificate:

DAVID HLADKY	JIM SPARLING	TERRY TUCKER

SAMPLE PREPARATION



ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41d	Screen to -100um, save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP61	27 element four acid ICP-AES	ICP-AES
Ag-AA62	Ore grade Ag - four acid /AAS	AAS

To: **STRATAGOLD CORPORATION**
ATTN: JIM SPARLING
701-475 HOWE ST
VANCOUVER BC V6C 2B3

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA05053955

Project: Dublin- Gulch-1735

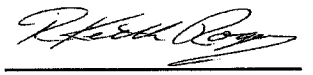
P.O. No.:

This report is for 45 Stream Sediment samples submitted to our lab in Vancouver, BC, Canada on 4-JUL-2005.

The following have access to data associated with this certificate:

DAVID HLADKY	JIM SPARLING	TERRY TUCKER

SAMPLE PREPARATION



ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41d	Screen to -100um, save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA23	Au 30g FA-AA finish	AAS
ME-ICP61	27 element four acid ICP-AES	ICP-AES
Ag-AA62	Ore grade Ag - four acid /AAS	AAS

DRILL LOG LEGEND P1	DATE: May 23 - 27th, 2005 PAGE 1 of 22
DRILL HOLE #: DG05-276C	FeOx: 0 = Unoxidized; 5 = Intensely Ox'd. Ser, Chl, etc: 0 = Unaltered; 5 = Intensely Altered. Carbonate: 0 = No Effervescence; 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:		Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-12.19			Casing - no core recovery						
10	12.19-258.00	12.19	14.59	GND (Main interval). GND is limonite stained. Core is extremely broken to grav/sand. Recovery is poor. GND has pervasive limonite in fracs and appears partially decomposed. Mineralogical characteristics include: 40% qtz, 30% hornblende, 20% biotite, 10% limonite & qtz veins				1		
10		14.59	15.24	Fault gouge unit. Limonite pervasive within grey gouge/crumbly brecciated GND with visible qtz eyes. Possible hydrothermally altered GND. Preferable interpretation is hyd. altered GND, within physically decomposed core.	1	1		3		1
10		15.24	17.49	Broken GND (gravel size to sandy clay). Note: poor core recovery, extensive limonite	2		1			4
10		17.49	17.70	Clay gouge fault zone. Core contains extensive predominant clay with visible quartz eyes, pieces of gravel-sized GND, essentially decomposed GND (hydrothermally alt'd) as from 14.59-15.24m.	1	1		4		1
10		18.29	20.88	Extremely poor core recovery (~20%). Round, gravel-sized GND.						
10		20.88	21.34	Core coherency is of sugary gravel; limonite coated pieces. Minor sericite, no visible sulphides.						
10		21.34	25.58	Qtz vn @ 22.63m; 30 degrees to CA, tr aspy dissem, ~0.5cm thick. Trace dissem pyrite @ ~23.26m w/in the GND, no obvious vns in area.						
10		25.58	25.91	GND becomes extremely broken to gravel/sand sizes. Pieces of qtz vns visible; no sulphides or structure observable. Heavy limonite staining.	1			1		1
10		25.91	30.48	Core is becoming more competent. Avg frac angles are ranging from 30-40° to CA. Limonite staining abundant & pervasive on frac srfc's; Qtz vn @ ~26.0m @ 70° to CA. qtz was cloudy grey w/ no visible dissem sulphides.	1					
10		30.48	32.35	Qtz vn @ ~30.60m @ 70° to CA, no visible sulphides, milky translucent color. Qtz vn @ ~30.82m @ 70° to CA, translucent milky qtz.						
10		32.35	33.03	V.broken core due to hydrothermal alt'n. Sugary core w/ minor clay (10%), abundant limonite staining. Minor qtz pc's indicate minor vning.	1			1		
10		34.02	34.90	Same as above only more abundant gravel sized pc's and less qtz vn chips.						
10		35.15	35.50	Milky & clear qtz vn @ 35.21m parallel to CA. No visible sulphides inclusive. A microvnlet @ ~45° to CA x-cutting the vn contained a few dissem aspy.	1					
10		36.56	36.58	Qtz vn @ 40-45° to CA. proximally w/in 5-8cm dissem aspy is present.						
10		37.55	39.62	Alt'd section of GND, extensively fractured. Abundant limonite pervasive & on fracs. Gravel/sand/clay consistency. Qtz pebbles observed indicating vning.	1			1		
10		39.62	41.10	Milky qtz vn @ 41.10m w/ dissem aspy @ 40° to CA. Surrounding 10cm on either side of vn have endured sericite alt'n & have pervasive limonite staining.	1					
10		41.10	42.55	Core is broken but displays qtz vning, which appears to have aided in decomposition of GND. Minor visible sericite (1-2%), pervasive limonite & on fracs. Minor dissem aspy & minor vugging w/in qtz vn pc's.	1	1		1		

DRILL LOG LEGEND P2

Selvages 0 = No Alteration 5 = Intense Alt'n

Ox. State 0 = No Oxidized Sulphides 5 = All Sulph Oxidized

Date: May 23 to 27th, 2005

LOGGED BY: T. Croteau/M. Stone/K. Whitehead

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar., 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:		Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		42.80	44.20	Extremely broken GND w/ heavy limonite staining. Some minor qtz pc's indicating vns present but no other info obtainable. Core varies from gravel size to sand to clay (predom sandy gravel).	1			1		5
10		44.20	44.93	25% qtz, 30% k-sp, 10% hbl, 30% bt & 5% other, incl. sulphides. Hydrothermal alt'n across numerous 1mm weathered vns throughout section. Granular limonite covers fractured srfc's. 97% core recovery; core broken into blocks up to 10cm long.	4			1	2	
10		44.93	45.72	1-2mm pyrite grains present w/ intense hydrothermal alt'n; ox'd to siderite on frac srfc's.	3	1		1	2	
10		45.72	46.22	Minor hematite noted, subhedral grains oxidized to bright red. Tiny carb vns, calc & siderite angles indistinguishable as vns are pervasive. Core is gouge to chunks ~6cm in diam.	4			2	2	
10		46.22	47.92	GND varies in degree of breakage from gouge to 15cm solid chunks. Fracs more reg @ 20° angle.	3			2	1	
10		47.92	48.77	Material shows remnants of GND (qtz eyes, bt) but is predom. gouged. Biotite alt'd to v. hard, black mineral. Minor (10%) calcite in frac dominated by limonite.	4			3	2	
10		48.77	49.50	Broken core into ~5cm diam chunks avg, w/ little alt'n except from 49.0-49.2m - gouge zone.	1			3	1	
10		49.50	49.80	Qtz vn seen surrounded by ~10cm pervasively alt'd GND. Ser, aspy noted dissem w/in, as well as limonite. Weakened GND.	1	1			1	
10		49.80	50.29	Broken core. Gouge section 50.7-50.8m. Limonite on fracs, 1mm diam w/ minor calc.	2			1	1	
10		50.29	51.82	GND: broken core; 10cm avg length, reg frac @ 70°.	1				1	
10		51.82	53.34	GND core quite competent; broken along limonitic veinlets. Hematite staining noted in 1-3cm lengths. @ 52.17m: <1cm qtz vn alters GND (limonitic), as well at 53.1m. Aspy seen.	1	1	1		1	
10		53.34	54.86	GND. Pervasive limonite vning, random orient., competent core from 53.5-54.6m, rest is limonized & broken into 5cm blocks max.	1	1		1	1	
10		54.86	56.39	GND: small gouge section @ 55m, otherwise broken into ~5cm diam avg blocks w/ extensive 1mm vns of limonite. 2 qtz vns.	2	2		3	1	
10		56.39	57.91	Fewer mafics in GND where qtz is more smeared out (silicified zone). Aspy appears dissem @ 56.7m & 57.3m . These areas contain more competent core chunks up to 15cm long.	1		1	1		
10		57.91	58.80	Highly broken GND. Qtz vns (3) <2cm wide w/ no sulphides btwn 58.3-58.5m.	2	1		1	1	
10		58.80	59.44	Aspy appears in close proximity to qtz vn. 2 more qtz vns w/ dissem sulphides. Gouge @ 59.1m (adjacent to 2nd qtz vn).	2	1		2	1	
10		59.44	60.96	Competent section (low mafics) to 59.6m followed by limonite-pervasive gouge to fault breccia to 60.96m. Qtz found at 60.5m in centre of gouge material. No sulphides visible.	3	2		2	2	
10		60.96	62.48	Broken GND core. Qtz vns w/in most competent sections; no sulphides noted, no selvages.	2	1		2	2	
10		62.48	64.01	Extremely broken GND. Pc's 11cm long to gouge-sized particles. One thin (0.5cm) qtz vn at 62.5m w/ tiny alt'n ring.	3	2		3	2	
10		64.01	65.00	Gouge and remnant grains of GND to 64.5m. Rock is more competent @ 64.5m to 65.0m; blocks 10cm max.	4	3	2	2	2	
10		65.00	66.40	Pure qtz section to 65.3m. GND to 65.53m for 15cm, then GND to 66.4m. Dissem bt (1%) on frac faces. 5-sided rust print on one qtz sect (~4cm), no rxn rims visible.	1	1			1	
10		66.40	66.86	Angular gravel sized GND, some whole core.	1			1		5
10		66.86	68.02	Good recovery. 2cm qtz vn w/ dissem py & aspy. Near selvage, limonite stained frac perpendicular to vn.	1					5
10		68.02	68.58	Gouge contains remnant GND, qtz eyes, minor clay. Hydrothermal alt'n of GND.	2			1		4
10		68.58	69.98	Good recovery. White qtz vns at 65° & 35°. Minor dissem py & aspy, limonitic fracs.	1					5
10		69.98	70.46	Good recovery. <1cm qtz vns present. Minor dissem py & aspy.	1					5
10		70.46	71.24	White qtz vns at 40°, limonized fracs.	1					5
10		71.24	71.63	Broken GND, up to 10cm long. Limonized fracs, white qtz vn (1.5cm). Broken pc's qtz ~2cm, GND decomposed, hydrothermally alt'd.	2	1		2		3
10		71.63	72.92	Gravel-sized GND, rounded. Some clay present, qtz eyes, white qtz vn.	1

UNIT CODE	GEOLOGICAL DESCRIPTION: From → To:	From	To:		ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		72.92	73.15	Qtz vns at top, in competent core, changes to gougy GND; hydrothermal alt'n related to qtz vning.	1			1		
10		73.15	74.02	Gravel-sized GND & qtz, rounded, limonized.	1					
10		74.02	74.49	Gouge, partially alt'd GND, clays w/ qtz eyes & gravel-sized GND, hydrothermal alt'n, limonitic.	2	1		2		
10		74.49	78.12	Broken core, limonized fracs. Qtz vn @ 45°, 8cm qtz lens at 77.72m, minor aspy in some vns.	1	1				
10		78.12	79.08	Good recovery. GND w/ qtz vns at 30°, minor aspy. Fracs show limonite. Py and strong sulphur smell present.						
10		79.08	80.37	GND w/ qtz vns at 30°, fracs are limonitic, dissem aspy btwn 80.19-80.37m, highly oxidized.	2					
10		80.37	80.70	2 massive sulphide vns ~3cm, aspy & scorodite & py present, GND highly alt'd, vuggy.	2					
10		80.70	82.30	Small qtz vns <1cm, limonized frac. Alt'd at 82.0-82.10m, gravel-sized GND w/ clay--hydrothermal.	2	1			1	
10		82.30	83.82	Good recovery. Limonized fracs, 7 qtz vns ~1cm thick, in conjugate sets, 2 series of vn emplacement. Gouge at 83.72-83.82m, qtz eyes present w/ remnant GND w/ hydrothermal alt'n.	1				1	
10		83.82	85.34	<1cm qtz vns in GND, limonized fracs alter rock from 83.22-83.42m. Qtz eyes & hydrothermally alt'd GND present. Preceded & followed by qtz vns at 45°.						
10		85.34	86.87	Good recovery. Limonized fracs, qtz vns <1cm, dissem aspy.	1	1		1		
10		86.87	87.35	Good recovery. Limonized fracs, 2 series of vn emplacement, 1st qtz at 45°, 2nd qtz & calc at 30°, minor aspy present in margins of both vns.	1					
10		87.35	87.93	Highly oxidized GND containing qtz & calc vns. Alt'd to clay w/ GND frags & qtz eyes from 87.65-87.75m. Hydrothermal continues after as oxidation w/ vns. Aspy present in qtz vn margin.	4	2				
10		87.93	88.39	Slightly oxidized GND hosting several small qtz vns. Vns are oxidized at margins. Aspy present in margins.	1					
10		88.39	89.38	Gravel-sized GND mixed w/ clay shows more intense alt'n after 88.8m; higher clay content & becoming crumbly. Qtz eyes present in the clay; possible fault or hydrothermal alt'n. Remnant GND in clay indicates hydrothermal more likely. Gravel size pc's of qtz, possible vns weathered.	2	1		2		
10		89.38	90.74	Slightly alt'd GND w/ limonized fracs grades to gravel sized GND btwn 89.92-90.06m. Qtz vns <1cm present, minor aspy in rim.	1	1		1		
10		90.74	90.99	Alt'd & oxidized GND. Brownish red in color, alt'd to sericite & clays. Qtz eyes present--hydrothermal.	3	1		2		
10		90.99	91.24	Highly oxidized & alt'd GND. Zone of intense clay alt'n; fault gouge at 91.09m, qtz vn <1cm.	3	2		3		
10		91.24	92.11	Mod ox'n & alt'n. Brownish red color. Mushy texture w/ qtz eyes & pebble sized GND; hydrothermal alt'n.	3	1		2		
10		92.11	92.96	Less ox'd & alt'd. Milky qtz vns <1cm. Small zones (1-2cm) of intense alt'n above & below vns. Qtz eyes present in zones; likely hydrothermal. Milky white qtz vns at 92.44m @ indeterminate angle w/ trace aspy at margin. Vn @ 92.70m: 0.5cm, grey, @ indeterminate angle due to alt'n, tr. aspy at margin.	2	1		1		
10		92.96	93.97	High alt'n btwn 92.96-93.14m. Mod alt'n (1) until 93.79-93.90m, which shows high alt'n to clays. Qtz vns at 70° to CA at 93.11m, 1cm diam. Vn @ 93.14m: 3.5cm @ 65° to CA, grey.	2	1		1		
10		93.97	94.49	Mod alt'n (2) until 94.03m where alt'n becomes higher (3). Qtz eyes present throughout clays & GND, likely hydrothermal alt'n. Minor sericite present.	2	1		2		
10		94.49	95.48	Slightly alt'd (1) but mod ox'n in GND. Highly alt'd (4) at 94.90-94.95m & at 95.32-95.38m to clay w/ qtz eyes & GND frags. Broken qtz vn @ 95.4m, grey.	3	1				
10		95.48	96.51	Good recovery. Mod ox'n in GND w/ limonitic fracs. Sericite in fracs & alt'n halos. Qtz vns @ 96.23m, ox'd vn w/ 3% ox'd py & 1% ox'd aspy in vn margin & halo.	2	1

10		103.63	105.16	Slightly oxidized GND. V. little limonite in fracs. Veins run near parallel to CA w/ ox'd margins; py & aspy in margins						
10		105.16	106.68	Relatively unaltered GND. Limonite in fracs. Veins run parallel to CA. Aspy & py in margins. Py slightly oxidized						
10		106.68	108.20	Unaltered GND w/ minor limonite in fracs. Vein at 106.68-106.86m, 0.1cm, ox'd, white qtz at 45° to CA . Vn @ 106.90m: 1cm, grey, @40° to CA, 5% ox'd po, 1% ox'd py. Vein at 107.95m. 0.1cm white qtz with carbonate, at 70°, trace aspy.	1					
10		108.20	109.73	Core is fractured. Lim on few surfaces, qtz & carb veinlets					1	
10		109.73	110.34	Unaltered GND. Minor limonite on fractures. Vn @ 109.77: 0.5cm, at 50°, trace aspy, milky white qtz, offset by micro-fault. Veins at 109.97m and 110.19m, milky white qtz, at 40° to CA, minor po and trace cpy in veins.						
10		110.34	111.25	Unaltered GND. Minor limonite on fractures.						
10		111.25	112.05	Good recovery. Minor ox'n. Stain in fracs. GND is lightly bleached. Dissem po (5%) & aspy (tr.) & py (1%) through entire length.						
10		112.05	113.66	~30% ser alt'n around narrow veins. 13 veins noted. Angles are complimentary (45° & 145°)	1	3	1		1	
10		113.66	114.60	Section is entirely altered w/ sericite + ox'n w/ lim covering fracture planes	3	3	2	1		
10		114.30	115.09	GND same as above unit, but veins/fractures more randomly oriented (20-90°)	3	3	2	1		
10		115.09	116.05	1mm carb/ser. Veins fractured at reg angle: 125°/65°; these tiny veins overprint larger qtz veins w/ sulphides at 145°/35°	1	2	1		1	
10		116.05	116.80	4 qtz. vns. Have clear centres(1cm, max) w/ margins of milky qtz (1cm thick). Py & aspy are in granular clumps on margins and w/l clear qtz centres. Ser/qtz/carb veins: <1mm thick, ox'd. More frequent w/ fractures	1	1	2		1	
10		116.80	117.80	Zone of high alteration but rock is still coherent, except at 117.25 where clay alteration is ~5cm thick. Med. grade, low-angle fracturing has slickensides shown in sericite, perpendicular to breaking plane's long axis. Sulphides appear at margins of fault breccia section (117.05 - 117.13m). Massive sulphides w/ aspy @ exterior edges. py clumped into masses >8cm long and 1cm wide. At 117.5m, v. high chlorite alt'n; only indistinct qtz. grains left. Some are in lines, denoting overprinted veins between 117.45 to 117.80m. Trace po located w/in these lines.	1	3	3	1	1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:		Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		117.80	118.24	Relatively unaltered. Pervasive lens of sericite appears associated w/ qtz lens. Small, partially ox'd carb veins overprinting ser & qtz.	1	2	1	1	1	
10		118.24	118.97	Altered around 3 qtz veins.	0	2	1	1	1	
10		118.97	119.40	Angle at which altered zone turns to unaltered GND is 45°. Sample is unaltered GND. Lenses of po < 4cm long & 0.3cm wide seen adjacent to qtz vein at 119.30m						
10		119.40	119.59	2cm wide milky qtz vn has po & py concentrated in 0.5cm wide section in centre						
10		119.59	121.10	2cm^2 section of po (uneven cluster). @119.90m, a section of randomly-oriented veinlets of calcite plus one 0.5cm vein of massive sulphides (po, py & cpy) rimmed w/ calcite, to 30°. Qtz vein at 120.11m to 140° not much alt'n assoc. Rest of section relatively unalt'd GND. Qtz veins: @120.16m, 120.47m, 120.76m, 120.86m, 121.02m & 121.20m. All @45-50° to CA. These veins have inner sections of clear qtz, a few mm thick, and outer sections of milky qtz. Po and py seen inside clear qtz.						
10		121.10	122.20	Six qtz veins noted, to 121.43m, after which, there is a zone of highly alt'd (chl+ser) GND. Bleached zone at 121.5m, at 55° to CA, with 0.5cm qtz vein in centre. Qtz vein also at 55°, at 121.6m begins chl alt'n zone to 121.85m. 3cm sericite zone btwn 2 qtz veins 1cm thick; alt'd zone to 122.2m.		1	1		1	
10		122.20	123.50	Silicified sections 3cm wide w/ 3cm alteration halos at 122.27m, 122.4m, 122.63m & 123.2m. Orientation is always 45°. 1-2% py & po w/in bleached sections. 3 qtz veins @ 122.5m, 122.9m and 123.4m @50° to CA.						
10		123.50	125.00	GND w/ altered/bleached sections: 123.65-123.90m (gouge, last 4cm); 124.10-124.14m; 124.50-124.53m; 124.64-124.68m; 124.78-124.83m. Two of these sections have small qtz veins at centre.	0	3	2	2	1	
10		125.00	125.90	GND w/ altered sections: 125.65-125.66m; 125.79-125.80m; 126.40-126.60m.	0	3	1	1	1	
10		125.90	127.39	Sericitized & chloritized GND assoc. w/ 10 1-2cm qtz vns w/ sulphides. Vn locations: 125.9m (70°), 126.17m (60°), 126.23m (40°), 126.4m (70°), 126.44m (70°), 126.64m (70°), 126.74m (50°), 126.90m (40°), 127.26m (50°), & 127.35m (40°). Aspy concentrated @ margins of veins, py w/in vein and at margins	0	3	3	0	1	
10		127.39	128.66	Continued zone of alteration except from 127.39 → 127.5 where veins are <1mm and selvages <2cm Larger qtz veins w/ sulphides @ 127.88, 128.16, 128.21, 128.44 & 128.63m; sulphides situated similar to above.	0	3	3	1	1	
10		128.66	129.64	Sericite & chlorite GND. Qtz veins: @128.89m (60°); @129.42m (60°), trace aspy; @129.95m (90°), trace po; @129.45m (40°).						
10		129.64	131.10	Qtz veins contain trace po & as, lots of py, located: @129.89m (70°), @130.50m (70°), @130.68m (65°). Massive sulphide lens at 129.8-129.85m, 3cm wide. Tr po, py, aspy. Section is mostly s/chl alt'd w/ <10cm wide unalt'd sections.		3	3	1	1	
10		131.10	132.04	Qtz vein at 131.15m at low angle and contains no sulphides. Others, at high angle, contain po. Veinlet network of carbs surrounded by selvages of silicified GND (bleached)					1	
10		132.04	134.23	Unaltered GND w/ carb veinlets randomly oriented w/in. Bleached sections @132.34m (70°), 4cm wide; @132.84m (45°), 12cm wide; and @132.92m (45°), 2cm wide. These may be silicified veins; aspy and py in moderate amounts. Late calcite veinlets offset qtz vein offshoots to 20°. Qtz veins: @133.80m, to 35°, 3.5cm thick; @134.0m, to 35°, 0.3cm thick; and @134.08m, 35°, 1cm thick.		2	1			
10		134.23	134.70	Unaltered GND. Silicified qtz vein at 134.35m, to 45° w/ no sulphides. Vn at 134.52m, 60°, w/ assc po. Qtz/carb vein at 134.62m, at 45° to CA, w/ high percentage of po.		1

10		134.70	135.64	At 134.70m, turns to alt'd at an angle of 40°. Qtz veins: @135.01m (50°); @135.22m (25°); @135.27 (50°) - intersects with previous, same generation; @135.54 (45°). At 135.34m, alt'd turns to unalt'd at a 40° angle.	1	4	3	2	2	
10		135.64	137.16	Unaltered GND except from 136.18→136.26m where chl zone surrounds 0.5cm qtz vein at 50°, and from 136.59 to 137.12m around 1cm qtz vein at 70° to CA. Also in this interval at similar angles are veinlets of 'pure' sulphides surrounded by bleached sections, 2cm wide, within alt zone			1			
10		137.16	137.59	GND has multiple 1-2cm thick qtz veins @ an average angle of 40-60° to C.A., ~1-2% dissem py and aspy present within milky white qtz veins. Core is devoid of limonite staining. GND is still of consistent mineralogical nature, however, episodes of bleaching/leaching of minerals out have reduced sections to extremely sericitic/bleached and occasionally silicified veins @ 137.20m (@ 50°), 137.34 (@40°), w/ dissem py, po, aspy. Sericite on margins						
10		137.59	140.03	GND is extremely bleached. Feldspars have completely reduced with rare to minor (<2%) mafics within GND Clear qtz vns @: 137.69, 137.76, 137.87, 137.95, 138.05, 138.07. 0.25-0.50cm, @50° to CA, w/ tr. euhedral po. and trace aspy. Milky to clear qtz veins after 138.83m contain po.						
10		140.05	140.45	Unaltered GND. Minor sericite on margin of bleached GND		1				
				@ 140.35: milky qtz w/ dissem po						
10		140.45	140.80	Bleached GND w/ trace mafics. Contact w/ unaltered GND @ 45°. Tr. dissem. aspy & po appear to be vein-like in orientation, @~50° to CA, however no clear vn materials present						
10		140.80	142.49	Unaltered GND predominant w/ veining (qtz) and sericite sections as well as on fractures (from 141.85 - 142.49m pervasive). 0.5 to 1.0cm milky qtz vns w/ clear qtz centres contain trace po and aspy. Ser minor, present on margins. Vns ave at 50° to CA.						
10		142.49	143.33	Extremely bleached, sericite-rich, grey white GND. Tr. indiscernible sulphides. Core is easily scratched w/ a nail		1				
10		143.33	143.63	Both qtz veins contact CA at 35°. Disseminated aspy 2-4%. disseminated py 1-2%						
10		143.63	145.30	Extremely bleached, sericite rich, grey white GND. Tr. indiscernible sulphs. Core is easily scratched w/ a nail. At 144.10m, 0.5cm qtz vein w/ 10% disseminated po.						
10		145.30	145.56	Extremely bleached GND w/ abundant sericite adjacent to 9cm thick massive sulphide vn; 90% aspy, 10% py.						
10		145.56	147.60	Slightly green sericitic GND w/ extensive bleaching. Soft core, yet coherent. Minor 0.5-1cm qtz veining		1				
10		147.60	147.83	Fault gouge. Greenish grey clay with sulphide-looking oxidized material. No visible fresh sulphides	2					
10		147.83	148.33	Bleached and sericite rich, broken GND. Core has green sericite hue						
10		148.33	150.53	GND w/ minor sericitic partings marked by soft, green hued core. Minor carbonate veinlets. Veins: @149.37m, 149.48m, 149.52m & 149.59m, 0.25-0.5cm qtz veins with trace euhedral-subhedral po. Vns @ 40-50° to CA. At 150.16m, 150.32m, 150.38m and 150.43m, 0.5-1cm qtz veins @ 50° to CA, trace aspy.						
10		150.53	150.88	Bleached GND w/ 3 1cm qtz vns @50° to CA w/ trace disseminated aspy & po.						
10		150.88	151.20	Fault gouge, uniform light grey clay w/ minor visible qtz eyes. Appears to have ox'd sulphides mixed in, but inconclusive	1	2		5		
10		151.20	152.66	Broken GND w/ sericite-coated fracs and minor sericite partings -- Semi-decomposed GND. One 2cm qtz vein w/ no visible sulphides		3		1		
10		152.66	153.35	Highly bleached, altered GND. Abundant sericite both pervasive and on fracs. Minor sericite/clay partings		3		1

UNIT CODE	GEOLOGICAL DESCRIPTION: From → To:	From	To:		ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		153.35	157.25	Mostly unaltered GND w/ qtz vns containing trace to 1% dissem sulphides, minor sericite on vn margins. At 153.34m, 153.40m, 153.60m, 153.63 and 153.71m, qtz veins 0.25-1.0cm thick, @ 35°-50° to CA contain tr-1% disseminated py, aspy. At 154.07m, a 1.5cm qtz/sulphide vein at 50° to CA contains 5% aspy and 1-2% py. At 154.12, 154.23, 154.31, 154.41, 154.43, 154.53, 153.62, 154.65, 154.70, 154.76, 154.85, 154.97 and 155.00m, 0.25-1cm thick qtz veins with trace-1% disseminated po and trace to no arsenopyrite. Average range of vn angles is 25-50° to CA. @155.42, 0.5cm thick qtz vn @50° to CA, w/ tr diss po. One 0.25cm carbonate (dolomite) vein at 156.06m, at 60° to CA contains trace py and ~1% aspy.		2		1		
10		157.25	158.01	GND becomes highly sericitized: soft, has green hue. Multiple qtz veinlets: @157.07, 157.27, 157.38, 157.42, 157.50 and 157.56m, 40-50° to CA, up to 0.5cm, max; most w/ tr. po and tr aspy.						
10		158.01	158.22	Qtz/sulphide veins and veinlet stringers within qtz veins and x-cutting throughout GND. Within the sulphide veins the py seems to always be central w/ the aspy on the margins. Dissem sulphides throughout GND section. At 158.08m, two 1-2cm thick sulphide veins at 50° to CA, contain 60% py and 40% aspy.						
10		158.22	158.50	Broken sericite abundant pervasive. Hydro-alt'd GND appears to be a fault zone. Plenty of bleached clay and qtz eyes.		3	1	3		
10		158.50	160.02	Altered, bleached GND with pervasive sericite alteration, soft core. Minor disseminations/ veinlets/ blebs of sulphides. Commonly, py~1%, as~tr.-1%						
10		160.02	160.15	Semi-massive to massive py ~99% and aspy~1%, @55-60° to CA. Some qtz veining immediately adjacent on margins.						
10		160.15	162.47	Extremely altered/sericitic. Decomposed yet coherent GND. Core has yellow/green bleached hue. Minor qtz veinlets @ 50-60° w/ tr. dissem aspy/py in half of them.		4	1	1		
10		162.47	163.50	Unaltered GND w/ veinlets of disseminated aspy (~50% of qtz vein) @40-50° to CA.						
10		163.50	165.15	Mod sericite alt'd GND. Core is mod. broken w/ occasional veinlets of qtz/dissem. sulphs. Core is v. soft and is bleached. Typical veinlets @ 50° w/ disseminated blebs of subhedral po.		4	1	1	1	
10		165.15	167.42	From 165.15-165.84m, highly altered/bleached clay. GND core is retained but pure white/grey clay veins		5		5		
10		167.42	168.13	Unaltered GND w/ sericite on fractures. Couple of qtz veins @50° to CA, w/ tr-1% po within centre of vein		1		1		
10		168.13	168.58	45cm wide milky qtz vein. Tr sulphs (indistinguishable). Contact angle is 30° to CA						
10		168.58	171.33	Moderately bleached/altered GND w/ sericite abundant on fracs. Minor sulphide/qtz veinlets. Core is moderately coherent. 3 notable veins @: 168.77, 170.10, 171.06m. Qtz veins w/ tr. dissem po and aspy, 2.5, 1, 0.5cm thick respectively. Two at 55°, last one at 80° to CA.						
10		171.33	172.21	GND is extremely bleached, but peppered w/ disseminated sulphs. Predominantly aspy (5-8%) w/ tr. py						
10		172.21	173.85	GND is moderately altered in partings and bleached white/grey. Core is mod-very broken, can't obtain angles from vein frags. Appears to be a few >1cm thick veins in section. Sericite on fracs and occasionally pervasive		2				
10		173.85	180.00	An extremely altered section of GND. Core appears as qtz/sericite and moderate chlorite. Core is silicified and all mafics are essentially altered. Some qtz veins can be seen w/ dissem. po (tr.)		3	3			
				@175.95: a clay faulted unit w/ a decomposed vn of aspy adjacent, poor core recovery. However the clay is of the graphite texture/colour w/ aspy observable. The aspy vn that remains is 1cm thick at 70° to CA. chl + ser abundant at 185.0 onward.		4	2	5		
				From 178.31 to 178.51m, qtz boudins and stringers of aspy and py. py~10%, aspy 20%. remainder of interval is of sericite and minor chl. Interpreted contact angles are 75-80° to CA.		3	1

UNIT CODE	GEOLOGICAL DESCRIPTION: From → To:	From	To:		ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		180.00	181.57	V. minor altered GND. Sheeted qtz veins/veinlets @ ave 40° to CA w/ occasional dissem. sulphides (inconclusive type, tr po)		1	1	1		
10		181.57	182.88	Mod. altered GND. Core appears as bleached greenish hue colour, chlorite is clearly present. Core is soft. Sericite is pervasive and abundant		4	3			
10		182.88	188.98	GND broken although core recovery is 90%. Minor sericite on fracs. Predominant dissem sulph. w/in the vns is po w/ lesser amounts of aspy. Veins are sheeted and relatively constant in thickness ranging from 0.5-1cm. Qtz veins milky to clear.		1	1	1	1	
10		188.98	189.23	GND as above						
10		189.23	191.09	Fault gouge. Light, bleached remnant of former GND due to visible brecciated pieces. Core is broken adjacent to fault and then retains its former competency 20cm distally. no visible sulphides. only qtz eyes and breccia. fault angle: 40-45°						
				At 190.56m, a 5cm wide qtz vein @ 50-55° to CA w/ minor biotite inclusive, very siliceous w/ tr. po.						
				Sulphide vein @ 191.00m, 0.5cm thick, w/ 96% po and 4% aspy, @ 60° to CA.						
10		191.09	191.29	Fault zone, focussed @ 191.19m. Core increases toward fault marked by aspy and grey, ox'd aspy. Also present are slickenside surfaces in sericitized/chloritized GND. interval appears green/cream-coloured w/ mafics absent		3	3			
10		191.35	194.24	Same as above unit, however centrally the core is competent but has two 2cm qtz veins w/ dissem sulphides, at 50° to CA						
10		195.01	195.58	Silicified, bleached/altered GND. Core has white/green hue, devoid of mafics. Chlorite and sericite dominant with qtz veinlets at 50-60° to CA, w/ rare diss sulphides (po).		2	1			
10		195.58	195.64	Fault gouge w/ bleached GND. Breccia. Fault @ 50-55° to CA.		3	1	4		2
10		197.48	197.81	GND is alt'd to soft, sericite-rich and chlorite. Core is bleached and has a green hue. @197.59m, a graphite grey slickenside surface indicating faulting thus hydro fluids interpreted to alter GND to observed state, mafics almost non-existent						
				At 198.79m, a 2.5cm qtz vein @50-55° w/ tr. po. At 199.03m, 4.5cm qtz vein @40-45° w/ dissem. tr. po. At 199.91, 201.52 & 201.73m, qtz veins 2cm wide, @50° to CA with trace po.						
10		203.10	207.26	GND has abundant sheeted veins @45-50° to CA, typically 0.5-1.0cm wide, carrying ~1% po as disseminations. GND is mostly unaltered w/ v. minor sericite locals. veins spaced 5-10cm apart						
10		207.26	208.56	GND; Good recovery. Veins at 207.56m, milky white qtz, @60°, 1% cpy in vein, 30% ox'd, 0.2% aspy in margin. At 207.66m, a 3cm milky white qtz vein @70° to CA, 2% cpy, 50% ox'd. Veins at 207.74, 207.77 & 207.82m, 0.5cm, milky white @60° to CA - 1-3% cpy in vein, 30-50% ox'd, 0.2% aspy in margins. Veins at 208.48, 208.55, 208.56 & 208.61m, 0.2cm milky white qtz sheeted veins - 1% cpy in veins, trace aspy in margins.						
10		208.56	208.79	GND is bleached, grey-green colour. Sheeted vein set: at 208.60, 208.67 & 208.71m, 0.2cm, light grey qtz @ 35° to CA. Vein at 208.60m has 4cm selvage containing 3-5% po, 0.2% aspy.			2			
10		208.79	208.92	GND is brecciated, qtz frags present. 3% py (50% ox'd) present in broken qtz piece. Possible hydrothermal alt'n.						
10		208.92	209.69	GND altered to green-chlorite. Vein @ 209.09m, 2cm grey qtz @ 30° to CA, 1%py in vein, 10% ox'd. Vein @ 209.71m, milky white qtz @ 30° to CA, 15% py, 10% ox'd. Vein @ 209.42m, 1cm grey qtz @ 60° to CA, crosscut by 2cm qtz vein @ 40° to CA; 5% py in margin of crosscutting vein.			4			
10		209.69	210.39	GND altered to sugary texture. Whitish green colour. Qtz eyes present. Veins @ 209.86 @ 45° to CA, 2cm qtz vein, highly fractured, milky to grey in colour.		4				
10		210.39	211.13	mod. alt. GND, chloritic. Veins @ 210.49 & 210.80m. Milky white qtz @ 45° to CA; 0.2% aspy in vein. Core becomes highly fractured at end.			3			
10		211.13	212.14	Broken GND. Minor clay on fractures. Vein @ 211.33m, 1cm milky white qtz @ 45°						
10		212.14	212.90	GND altered to green-grey colour - chloritized. Disseminated aspy (70% ox'd) present throughout interval		1	4	1

UNIT CODE	GEOLOGICAL DESCRIPTION: From → To:	From	To:		ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		212.90	213.36	More clay alteration, broken up core		1	3	2		
10		213.36	213.76	Slightly altered GND contains dissem. py. and cpy			1			
10		213.76	213.99	15cm altered zone. bleached, possible silicified. Abundant po ~5%						3
10		213.99	214.88	Unalt'd GND w/ disseminated aspy. Vein @ 214.06m, 1cm milky white qtz vein @ 50° to CA, 0.2% aspy in vein. Vein at 214.16m, 1cm milky white qtz vein @ 50° to CA, 3% po in vein.						
10		214.88	216.41	Unaltered GND. Vein@ 215.01m, 1cm, white qtz @ 60° , 5% sulphides. Vein @ 215.08m, 3cm, white qtz, @ 50°, 1% aspy in margins, 3% po and 1% cpy in vein. Veinlets at 215.47, 215.68 & 215.69m, 1% po in margins. Vein @ 216.21m, 1.5cm, white qtz, @45° to CA, 3% po in vein.						
10		216.41	217.30	GND w/ chlorite alteration around veins. Veins @ 216.56, 216.68 and 216.69m: 1cm white qtz, @60° to CA, sheeted set. 10-15% po in veins. Vein @ 217.03m, 0.2cm grey qtz at 30° to CA, 2cm selvage, 3%po, 1%cpy in vein.			2			
10		217.30	218.02	GND is fractured and altered to clay within. Minor chlorite alteration also present. Vein @ 217.39m, 1cm white qtz, @50° , 3% aspy in vein, 2cm chl selvage. Broken vein @ 217.70m, ~1cm white-milky qtz.		1	1	1		
10		218.02	218.48	Unaltered GND. Veinlets @ 217.42, 217.53 & 217.63m, 0.2cm white qtz, 5-10% po in chloritic selvages						
10		218.48	219.46	Slightly chloritized GND (1), more pronounced in vein selvages. Carbonate veins intrude fractures and qtz vein throughout interval. Vein @218.58m, 0.5cm milky calcitic qtz, @50° to CA, 2cm chloritized selvage, 1% aspy in vein. Calcite-filled fracture @218.72-218.85m.			1			
10		219.46	220.20	Weak chl alt'n in GND. Veins have strong (4) chl alt in selvages. vein @ 219.63m, 1cm milky white qtz @50° to CA, 2cm chloritic selvage, 1% py in vein, 0.2% aspy in selvage. Vein @219.67m, 0.5cm, @50° to CA, 3% po in vein. Vein @ 219.87m, 1cm qtz with carbonate filled fractures at 50°, 3% py in vein and margin. Vein @ 220.11m, 1cm milky white qtz @ 50° to CA, 3% py.			1			
10		220.20	221.08	Weak to mod (2-3) chl alteration. Veins at 220.30, 220.32 & 220.36m, 0.5cm milky white qtz @ 55° to CA, 1% aspy in veins, 1cm chl selvages. Calcite-filled fractures present.			3			
10		221.08	221.40	Unaltered GND. Vein @221.35m, 0.5cm milky white qtz, @45° to CA, 5% aspy and 6% po in vein.						
10		221.40	222.50	Strong chl alteration and carb replacement/ intrusions. Carbonate shows no preferred orientation. Dissem aspy. Vein @ 331.49m, 1cm milky white qtz @ 75° to CA, no visible sulphides.			4			
10		222.50	223.28	Same as above. Aspy present in veinlets. Fractures showing no preferred orientation and are filled with aspy (90% ox'd). Disseminated aspy also present.						
10		223.28	224.03	Unaltered GND. Vein @223.32m & 223.33m, 1cm grey qtz @ 55°, 15% po in veins. Vein @ 223.84m, 0.5cm grey qtz @ 50°, 20% po in vein. Vein @223.93m, 0.5cm, grey qtz @ 50°, 1% py in vein.						
10		224.03	225.55	Unaltered GND. Vein @ 224.30m, 0.5cm grey qtz at 110°, 1% py, 20% ox'd. Vein @224.73m, 0.5cm grey qtz w/ calcite, @ 60°, 1% po in vein. Vein @ 225.09m, 1cm milky white qtz with carbonate, 3% po. Vein @225.29m, 0.5cm milky white, 5% po in vein. Broken grey qtz vein @ 225.50m. broken qtz vein @ 225.50						
10		225.55	227.08	Unaltered GND. Veinlets @ 225.70 & 225.83m, 0.2cm, milky white qtz @65° to CA, 1% po. Vein @ 225.91m, 1cm, grey qtz, @ 65° to CA, 1cm chloritic selvage, 1% aspy in vein selvage. Vein @ 226.17m, 1cm grey qtz @ 55° to CA, 1% aspy in vein selvage, 20% ox'd. Vein @ 226.45m, 0.5cm, grey qtz, @55° to CA, 3% po in vein.						
10		227.08	228.60	Unaltered GND. Vein selvages are chloritic. Vein @227.20m, 0.5cm, grey qtz @ 55° to CA, 0-2% po. Veinlets from 227.28-227.48m, 6 milky white qtz with 1-3% po. Vein @ 227.78m, 2cm grey qtz, @55°, 2% aspy in vein. Veins @ 228.01 & 228.05m, 0.5cm grey qtz @ 65° to CA, 5-10% po in vein. Vein @ 228.46m, 1cm, grey qtz @ 60° to CA, 1% aspy in selvage. Vein @ 228.54m, 0.2cm, qtz and carbonate, @55°, 5% py in vein.						
10		228.60	229.45	Unaltered GND. Veinlets present throughout. Vein @ 229.30m, 1.5cm milky white qtz @ 60°, broken, with 3% po.						
10		229.45	230.12	Weakly chloritized GND. Core is broken up. Disseminated aspy throughout core and veinlets. Vein @229.98m, 1cm, grey qtz @ 60° to CA, 1% aspy in vein.			1			
10		230.12	230.76	Unaltered GND. Sheeted vein set: Veins @ 230.18, 230.32, 230.45, 230.50 & 230.66m. 0.2cm, grey qtz, @50°, 2% aspy in margins, 1% py in veins

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:		Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		230.76	232.10	GND relatively unaltered except for ~1cm selvages around 0.2cm clear qtz veins, at: 231.01, 231.05 (40°), 231.22 (40°), 231.25 (50°), 231.29 (115°), 231.33 (70°), 231.56 (70°), 231.60 (55°), 231.86 (55°), and 231.91 (60°). Surrounding the clear qtz is milky white siliceous material. There are also planes of siliceous (bleached) GND. Sulphides conc. within clear qtz or silicified areas. Conc of po @ 231.78m (10% of 1cm silicified zone).	1	2	1	1		
10		232.10	233.61	Same rock as above. Qtz veins @ 232.15 (130°), 232.29 (60°), 232.39 (60°), *232.51 (60°), *232.67 (60°), *232.86 (60°), 233.02 (45°), 233.11 (45°). Veins with * contain ~5% po. Also present in this interval are low-angle milky qtz/ ser veins.	1	2	1	1		
10		233.61	234.05	Zone of chl/ser GND. Vein at 233.82m, only 0.2cm qtz clearly visible. Surrounding rock is silicified. Po and aspy disseminated w/in 1cm of qtz. 1cm gouge zone @ 233.94m (has <2% carbonate). Silicified zone at 233.88 has po & aspy.		3	2	1	1	
10		234.05	234.15	Zone of shear and high percentage of sulphides. Highly sericitized to show good slickenside lineation on broken face - approx. perpendicular to CA, also slickens in py. Zone is v. fine-grained ox'd py in thin laminations.	3	4	2	1	1	
10		234.15	234.56	GND altered intensely - ser/chl. Only qtz grains barely visible with no real structure. Clay alteration results in break at 234.30m. At 234.56m, one small qtz vein w/ ~15% aspy ends alteration zone.	1	4	3	1	1	
10		234.56	235.70	Unaltered GND except around 0.5-1.5cm wide qtz veins, at: 234.75 (45°), 234.84 (130°), 235.05 (20°), 235.10 (70°), 235.30 (45°). Sulphides concentrated at edges of veins throughout section in random orientations, but close to 90° to CA.		1	1		1	
10		235.70	236.90	First 20cm altered ser/chl between 2 qtz veins; then unalt'd GND btwn 0.5-1.0cm qtz veins @70° to CA, at: 236.0, 236.08, 236.28, 236.46, 236.74, and 236.91m. Also: regular fracturing @ 45° approx. every 15cm.	1	2	2			
10		236.90	237.35	Moderately chl/ser alt'd GND grades to gouge/ completely sericitized section 17cm long. Two qtz veins: at 237.06 & 237.16m, 1cm and 0.5cm thick, run at 50° to CA. Po + aspy (trace) seen at margins.	1	3	2	2		
10		237.35	238.92	Unaltered GND in between milky qtz veins. Vein @ 237.42m, 45°, 1cm, w/ cpy and po. Vein @237.45m, at 45°, 0.5cm, with aspy. Vein @ 238.6m, to 45°, 3.5cm, with po.	1	1	1			
10		238.92	239.44	Unaltered GND in between milky qtz veins. Bleached (silicified) section @ 239.35m, at 30° to CA, 2.5cm thick, 3% po. Carbonate veinlets to 25° have 0.5cm selvages.	1	1			1	
10		239.44	240.85	Ser/chl altered GND. More broken rock, crumbly, sericitic (clay) pervasive to 240.0m. Qtz veins: @239.5m, 40°, 0.4cm; @239.9m, 45°, 0.3cm; @240.1m, 70°, 0.2cm; @240.23m, 45°, 1.5cm (po, trace); @240.59m, 70°, 0.5cm (aspy, trace). Gouge section 1.5cm wide at 239.5m, to 130°. Unalt'd GND after 240.0m, except veins.	2	3	1		2	
10		240.85	242.35	More altered GND due to increase in carb veinlets in random orientations and calcite veinlet to veins at low angle (20°) to CA. One 2cm wide calcite vein @ 241.63m has geode-like quality (calcite crystallized into open space), 2cm wide, at 20° to CA, reaching to 241.85m. Qtz veins also present, overprinted by and fractured at calcite veins. Qtz veins: @241.24m, 45°, 1.5cm, 2% po; @241.64m, 2° (parallel to CA), 1.2cm, tr aspy; @241.90m, 40°, 1.2cm, 5% aspy; @242.0m, 45°, 0.5cm, 10% po.	1	2			4	
10		242.35	243.84	Chl/ser/cab altered GND; no linear features can be distinguished because of alteration. Some sections of bleached rock were likely sites of qtz veins and have disseminated aspy & po surrounding them, at 242.6m, 242.85m & 243.5m. At 243.78m, a 0.5cm vein of oxidized py denotes a shear plane w/ slickenside lineations in clay minerals. Alteration halo is 6cm wide on either side.	1	4	3	1	3	
10		243.84	244.53	Barely altered GND with 5 qtz veins: @ 243.97m, 25°, 0.5cm, tr ox'd po; @ 244.08m, 70°-20°, 1cm, 5% po, tr cpy; @ 244.14m, 30°, 0.5cm, no sulphs, @ 244.18m, 20°, 1.5cm, trace py; @ 244.28m, 20°, 1.2cm, no sulphs. Slickenside sericite on frac faces. Reg fracture angles are 55° and 145°.		2	1		1	
10		244.53	244.71	Zone of greater alteration. Remnant of qtz vein 2cm long visible. Fracture to 30° shows slicken lineation of sericite + py (5%); ser is powdery (clay alt'n). High conc of carbonate veinlets (random orientations)	1	4	2	1	3	
10		244.71	246.37	Unaltered GND w/ qtz veins (3mm, clear w/ milky edge). Veins: @244.77m, 15°, 0.5cm, 2% diss po; @245.48m, 30°, 1cm, tr po, 2% aspy; @245.82m, 40°, 1cm, 5% diss po. Bleached zone @246.26m contains ~10% po and 2% aspy. Xenolith 1cm by 4.5cm long at 245.76m parallel to C.A. Monazite; has conc of bt outside its rim in GND.	1	2	1		1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:		Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		246.37	247.76	GND unaltered except zone of carb+ser weathering at 246.89-246.96m. Qtz veins: @246.76m, 45°, 1cm; @247.07m, 25°, 1cm; @247.29m, 40°, 2cm, tr aspy; @247.60m, 45°, 1.5cm. No sulphides except as noted.		2	2	1	1	
10		247.76	249.08	Unaltered GND w/ qtz veins & silicified zones containing sulphides. Siliceous planes: @247.80m, 50°, 1cm, tr po; @248.18m, 50°, 1cm, tr po+aspy; @248.56m, 45°, 0.5cm, tr aspy; @248.66m, 45°, -.5cm, 20% po; @248.81m, 50°, 1.5cm, tr po. Qtz vein: @248.38m, 50°, 3cm, tr po.		1	1			
10		249.08	251.04	Unalt'd GND except qtz veins: @249.51m, 50°, 1cm, 10% aspy; @249.56m, 40°, 0.5cm, 5% po; @249.78m, 40°, 1cm, 5% po; @249.93m, 45°, 1.5cm, 10% po; @250.08m, 40°, 2cm, 5% po, tr aspy; @250.28m, 60°, 0.5cm, 5% po; @250.51m, 45°, 0.3cm, 5% po; @250.73m, 45°, 1cm, tr cpy.		1	1			
10		251.46	252.13	Altered/bleached GND, 3 large (3-4cm) qtz veins with diss sulphides, @251.90m, 252.10m, & 252.84m. Both chl and sericite pervasive and on fracs. Core has bleached/green hue and is soft. Core is interpreted as being hydrothermally altered		2	1			
10		252.13	255.79							
10		255.79	255.93	Unit of bleached sericitic GND. Core has green hue. Within middle (255.86m), a 2cm thick qtz vein @70° to CA, with 1-2% aspy, subhedral crystals; indicative of hydrothermal alteration of GND during qtz/sulphide emplacement.		2	1			
10		255.98	258.00	GND has become more mafic w/ increased amounts of biotite and qtz has become more cloudy/milky grey. Perhaps chlorite is having an effect at a microscopic level? Aspy is the predominant sulphide w/in the last several meters prior to E.O.H.						
				E.O.H.

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-18.29			Casing						
10	18.29 - 258 (EOH)									
10		18.75	18.86	Fault gouge, clay is heavily stained by limonite, gouge contains red oxidized material, possibly hematite. Core is extremely broken and recovery is poor. Only one contact on fault can be seen. Interpreted angle of fault is @ 30° to CA.	4					
10		19.81	21.34	Within section, 2 vns, 0.75-1 cm thick of qtz @ 30-35 deg to CA can be seen. However, exact location imperceptible due to broken /poorly recovered core						
10		22.99	23.50	Core becomes sugary sand w/ heavy limonite staining, some red/brown clay (10%). no visible sulphides (difficult to constrain location due to poor core recovery). Some qtz eyes/chips are visible indicating possible veining with in section	4			1		
10		28.26	28.76	Hydrothermally altered to clay/sand. Remnant pieces of GND, sugar texture, heavy limonite staining, qtz eyes, etc. Core is severely broken, high core loss	4	2		5		1
10		28.76	35.20	no descriptions (KW)						
10		35.20	35.30	Lim stained clay zone. Zone of hydrothermal alteration as demonstrated by qtz eyes/gravel/pea-sized pieces of GND which looks to be in situ. Heavy lim, minor hematite and possible ox py.	1	2		4		1
10		36.50	37.65	Broken core; fracs w/ deep red powder (hem staining?), w/ limonite	2					
10		40.32	40.51	Clay gouge, and GND sand, qtz eyes present and clay was orange/red limonite/hematite stained indicating hydrothermal alteration either along fault surface or frac surface	2			2		
10		41.44	48.50	Possible sheeted vein system. Difficult to ascertain in areas due to core recovery and broken core, but veins appear ~ every 5 - 15cm apart and are @ 40-60 deg to CA with widths ranging from (1.5-0.5 cm) many w/ dissem aspy and po						
10		44.20	45.72	V. broken core, v. heavily encrusted by limonitic clay. Broken to sandy grvl texture.	2			3		3
10		46.05	47.00	Core appears to be silicified w/ uneven alteration of the mafics within the GND. There are sheeted clear qtz vns @ 40-45 deg to CA w/ minor diss aspy and po. Lim staining is pervasive.	3					
10		49.10	50.33	Core is extremely fractured to rubbly grvl. Heavy lim. coating. Abundant qtz pieces, possibly continuation of sheeted vn system. Section weathered to clay with some qtz eyes + mafics visible, no noticeable sulphs present.	2	1		1		5
10		50.33	51.82	Mod-Highly alt'd GND with pc's 0.1-8cm well ox'd. Relict grey qtz vn at 51.58m, 2cm wide. Totally ox'd sulphs (pyrite~5%) & hem (5%). Orientation not available (just a loose chunk).	4			1	2	
10		51.82	53.27	Increased competency, core pc's to 24cm in length. Lines of ox'd sulphs define relict qtz vns: @52.0m, 0.5cm, 35°, 15%aspy, 10%py; @52.2m, 0.4cm, 65°, 10%aspy, 5%py; @52.5m, 1.0cm, 40°, 20%aspy, 10%py; @52.6m, 0.3cm, 50°, 20%aspy, 10%py; @52.6m, 0.5cm, 50°, 5%py.	2				1	
10		53.27	53.51	Same material as 50.33m interval. No veins visible.	4			1	2	
10		53.51	54.86	Same material. One relict qtz pc. w/ ox'd py, 1cm wide, no orientation, @54.3m. Grey qtz, 1.5cm wide, 10% ox'd py @54.5m.	4			2	2	
10		54.50	54.86	Zone of extreme weathering to sand-sized particles.						
10		54.86	56.39	Same highly ox'd GND. Trace py, 90% ox'd. No veins visible.	3			1	1	
10		56.39	57.91	Red staining due to ox'd hematite on fracs. Surfaces moderately-alt'd GND. Qtz vn on 4cm$^{2\ block}$ @ 57.22m, 1.5cm wide, tr ox'd py.	3				1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		57.91	59.44	Mod'ly alt'd GND. Disseminated ox'd py (2%) throughout section. Broken into avg 5cm chunks. Qtz vn relict @ 59.43m, 1cm wide, tr ox'd py. Carb (siderite/calcite) minor on weathered vnlet srfc's.	2				1	
10		59.44	60.96	Poor recovery (28%). Mod alt.	2					
10		60.96	62.48	Mod-highly alt'd GND	3			1	1	
10		62.48	64.01	Silicified zone (relict qtz vns): @ 62.69m, 1cm wide, 2% ox'd py, @62.50m, 40°, 1.5cm; @63.20m, 30°, 1cm, tr aspy.	2				1	
10		64.01	64.20	Zone of predominant qtz. Very broken up but vn appears to be >5cm wide. Ox'd py ~10%.	1				1	
10		64.20	65.53	Highly alt'd GND. 'Pure' gry qtz ~1cm thick seen @ 64.25m and 64.30m. Few low angle to CA vnlets of ox'd carb material.	3			1	1	
10		65.53	67.06	Qtz vns @ 65.57m, 0.5cm, 55°, 1-3cm selvage; @65.82m, 1cm, 50°, tr ox'd py; and @67.0m, 45°, 0.3cm, tr ox'd py. Fracture here has movement-induced orientation, shown in calcite. Highly alt'd zone follows, 2.5cm wide.	2			1	1	
10		67.06	67.25	Minor altered GND except on veinlet fractures, where aspy is 95% oxidized to black (scorodite). One qtz vn @67.15m w/ ox'd py (10%) concentrated at centre. Total width 0.5cm with 1cm selvage, at 60° to CA.	1				1	
10		67.25	68.58	Moderate to highly altered GND	2			1	1	
10		68.58	69.63	Competent core. Unaltered to minor ox'n alteration at 10cm alternating sections. Grey qtz veins @ 68.62, 68.65, 68.84, 68.91, 69.10 & 69.15m. Ox'd py (10%), and ox'd aspy - scorodite (~10%).	1	0	0	1	1	
10		69.63	70.10	Highly altered section. One piece clear quartz <1 cm in diameter amongst rubble	3			2	1	
10		70.10	71.00	Relatively competent core with quartz veinlets surrounded by oxidation (1cm selvage). Veinlets @ 70.15, 70.26, 70.42, 70.55 & 70.67m - width 0.2cm @ 40° to CA, contain 3% ox'd py and up to 20% aspy.	1			1	1	
10		71.00	71.63	Zone of intense alteration. Rubble; few subrounded, cloudy grey quartz pebbles.	3			3	1	
10		71.63	72.90	Poor recovery (50%). Moderately altered GND; broken up core. Oxidized on vein fractures. Internal structure lost to ox'n weathering	3				1	
10		72.90	73.60	Extremely weathered section. Clay texture with few quartz/GND chunks, up to 5 cm. Altered sericitically and oxidized to 71.25m where rock becomes more competent, to 15 cm lengths. Overall colour is light orange-brown.	4	2		2		
10		73.60	74.52	Orange-brown colour continues on relatively competent rock (20cm lengths max). Diss aspy 1% and ox py 15%. No relicts	5			1	2	
10		74.52	74.80	Extremely altered section, as at 72.9m. Intense scorodite in latter half (red brown to black). Core yellow, soft and granular.	5			2	1	
10		74.80	76.22	Highly altered section. Overall color is pale yellowish brown. ~15 rusty veinlets @ 90° to CA (0.1 to 0.5 cm) run through entire section and rusty patches up to 1cm in diameter speckle it. Py ~8%, diss aspy throughout, 2%. Scorodite on fractures + carbonate (siderite?). Clay minerals as well on fractures (powdery white).	5			1	2	
10		76.22	76.92	Extreme alteration in GND. Whole section is thick clay texture, pale yellowish brown to mustard yellow. Some remnants of GND: quartz eyes and powdery white clay alteration of feldspars. Carbonic alteration is not in clay, but in sandy areas. Patches of sericite with pearly lustre, ~2 cm, irregular shape.	5	2		4	1	
10		76.92	77.45	GND is broken to gravel size rubble. No visible qtz pieces to infer veining, but core recovery is poor.				5	1	1
10		77.45	78.10	Clay seem: rusty yellow, uniform, w/ qtz eyes. This indicates hydrothermal alt'n or faulting, poor recovery so interpretation is inconclusive. No visible sulphides however limonite is pervasive and coats broken core.						
10		78.10	81.33	Core is very broken. Few qtz vein pieces noted, carbonate veinlets are fracture-filling and are x-cutting each other but do not appear as pervasive. Lim coating on fractures continues to be abundant.				1	1	5
10		82.45	84.77	Sheeted vein unit. Vn's are increasing from 0.25cm to 2-4cm. Thick, milky vn's w/ dissem aspy (tr-1%) in half of vn's. Qtz vn's @ 40-50° to CA. Qtz vn's typically spaced ~10-15cm apart. Veins @ 82.91, 82.98, 83.15, 83.19, 83.24, 83.96, 84.16, 84.44, 84.47, 84.56 & 84.77m. Veins are 1-2cm thick, @40-50° to CA.

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		85.68	86.45	At 85.68m, a 2cm thick qtz/sulphide (aspy ~1%), @40-50° to CA. At 85.85m, a 1cm thick qtz vein (milky to clear) w/ trace dissem euhedral and subhedral aspy @35° to CA. At 86.13m, a 1cm thick qtz vein @40° to CA, w/ trace diss aspy (subhedral grains) along vein margins.						
10		86.45	91.55	Brkn, rubbly, gravel sized GND, no structure visible but qtz vn pieces visible w/ tr dissem aspy						
10		89.92	91.44	V. poor recovery (22%). Broken up core, ~2cm blocks, on average. Mod alt'd GND. Two qtz vein floats 1-2cm w/ ~5% ox'd py. One coherent qtz vein w/ tr aspy on margins, trace ox'd py throughout.	1				1	
10		91.44	92.96	Mod alt'd GND. Monazite xenolith. @ 91.52m. Unalt'd patches of GND show on fresh faces, shapes irregular approx 3cm in diameter. Surrounded by brown-tinted (ox'd) GND. Regular fracture angle @75° to CA. Lim staining on fract faces. Qtz veins: @92.40m, @45°, 1cm, 5% aspy throughout, tr ox'd py; @92.60m, 50°, 0.5cm, tr aspy, tr ox'd py; @93.22m, 40°, 1cm, tr aspy, tr py; @93.32m, 45°, 1.3cm, 5% aspy (margins), tr py (ox'd).	2				1	
10		92.96	93.85	Mod→high alt'd GND. Overall colour is yellowish brown except unalt'd patches ~3cm in diameter, w/ irregular boundaries. Qtz veins: @93.30m, 35°, 0.6cm, tr aspy; @93.38, 30°, 1.5cm, 5% ox'd py; @93.42, float, 1cm, 2%py; @93.58m, 120°, 1cm, 10%aspy (50% to scor), tr py (50% ox'd).	2				1	
10		93.85	94.49	Moderately alt'd GND w/ patches of unaltered, irregular edges. Section infused w/ randomly-oriented veinlets of carbonate, oxidized to limonite. Veinlet @94.15m, to 30° is >30% sulphides (ox'd py - 90%, aspy - 10%), surrounded by unalt'd GND. Qtz vein @94.45m, 50°, w/ 10% ox'd py, 0.5cm wide. Some scor w/ lim on frac faces.	2				1	
10		94.49	96.01	Seven regular fractures throughout section @30°. Qtz veins: @95.50m, 2cm, 20°, tr ox'd py, tr aspy; @95.59m, 1cm, 45°, 10% ox'd py, diss ox'd py throughout rock from 95.59-95.85m; @95.8m, 1cm, 45°, tr po, aspy; @98.85m, 0.5cm, 45°, 5% aspy.	2				1	
10		96.01	97.54	Section mod alt'd GND. Qtz vein @ 96.11m, limonite stained, to 40°, 0.5cm, w/ 5% ox'd py. More qtz veins: @96.27m, 40°, 1cm; @96.33m, 40°, 1cm; These two veins have 1cm2 patches of aspy and surface ox'n ~7% of vein. More qtz veins: @96.60m, 1cm, 30°, tr aspy, tr ox'd py; and @96.62m, 1.5cm, 55°, tr ox'd py, tr scor'd aspy.						
10		97.54	99.15	Continuation of sheeted vn unit. Veins are typically at 40-45°, spaced10-15cm apart w/ widths ranging from 0.25-1cm thick. Veins are milky white qtz, w/ trace aspy or py sulphide disseminations. Some selvages seen but do not typically indicate ox'd sulphides, perhaps vugs. Veins: @98.16m, 0.5cm veins, @40°, tr aspy; @98.53m, 0.5cm wide, @40°, tr aspy.	1	1			0	
10		99.94	100.78	Clay alt'd GND (possible fault acting as fluid conduit). Core is severely alt'd w/ "bb sized" qtz eyes, and small sand-sized pieces of unalt'd GND, all of which are heavily lim-stained, both on surface and pervasively. Some indication of quartz veining from pieces. Clay is yellow/rust-coloured. No visible sulphides.	2	1		5		1
10		100.78	103.00	At 102.49m, a 1cm vein @35° to CA; qtz/carb vein - carb on margins, qtz 0.25-0.3cm thick within center, carrying dissem aspy (trace).		1			2	
10		103.00	109.21	From 103.0m onward, core demonstrates an obvious reduction in limonite (but still on fractures), increased competency, recovery notably higher. At 105.10m, **possible gold location**: a 2cm thick qtz vein @40° to CA, with minor pervasive limonite staining has a very faint grey qtz vein w/ py x-cutting @15-20° to CA. Sulphides noted are within the 20° vein, not in the 40° one. The 20° and 50° dip of hole makes 70° to surface which may be the gold source. The vein @ 20° was v. subtle. At 105.24m, first appearance of ox'd po dissems w/in qtz vns @50° to CA. @108.14m, a 7.5cm qtz vein at 35° to CA.	2

GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
UNIT CODE	From → To:	From	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		109.21	109.94	Alt'd GND. Brown/tan/rust colour. Mafics absent and replaced abundantly, with sericite and chlorite. Limonite is pervasive and on fractures, sulphides partially ox'd, where visible.	2	2	1		1	
10		109.60	110.80	Same as above, however several 1.5cm qtz veins are running within beginning and end of unit. @ 109.79, 109.90, 109.99, 110.14 & 110.24m, 0.5-1cm thick milky qtz vns, @35° to CA, w/ tr dissem aspy. @110.78, a 7cm milky qtz vein @35° to CA.						
10		110.80	111.94	no descriptions (KW)						
10		111.94	112.06	V. fine, uniform, brown clay seam, looks like chocolate ice cream. 100% clay.				5		
10		112.06	119.91	no description (KW)						
10		119.91	120.40	Slightly alt'd GND, pervasive limonite on fractures. Good recovery. Veinlets @120.08m, to 55°, 20%py.	1	1				
10		120.40	121.92	Unaltered GND with limonite in fractures. Qtz vein @ 120.51m, 3cm, milky white, 35°, 20%po. Vein @121.46m, 1cm, milky white, @45°, 20%po, 5%aspy in vein						
10		121.92	123.44	Lim pervasive in fractures. Qtz veins: @121.98m, 50°, 1cm, grey qtz, 5%po in veins; @122.39m, 50°, 1cm grey qtz, 10%po in vein; @122.46m, 50°, 1cm grey qtz, 5%po in vein; @122.92m, 45°, 1cm grey qtz, 5%po in vein; @123.44m, 50°, 1cm grey qtz, 10%po. Veinlets throughout section w/ 10%po and 5%aspy.	0					
10		123.44	124.20	Pervasive lim in fract. Moderately ox'd around veins. Veins: @123.61m, 1cm at 35°, milky white qtz, 1%aspy in margin; @123.73m, 2cm at 55°, grey qtz, 10%py in vein; @123.78m, 3cm at 55°, grey qtz, 5%py; @123.95m, 2cm at 55°, grey qtz, 20%po; @124.05m, 1cm at 55°, grey qtz, 10%po in vein, 5%aspy in margin.	0					
10		124.20	124.46	10cm qtz vein at 50°, 0.1% moly in vein. 10%py in smaller veins at 60°, cut by larger or may be offshoots.	0					
10		124.46	124.97	Mod'ly alt'd GND, pervasive lim in fractures, core is broken up. Vein @124.22m, 4cm grey qtz, at 35°, 1%aspy in margins. @120.66m and 120.83m, 1cm grey qtz at 35°.	3	2				
10		124.97	125.77	Mod alt'd GND. Vein @125.49m, 1cm milky white at 30°. No sulphides.	3	2				
10		125.77	126.98	Slightly alt'd GND. Veinlets common at 55°, 5%py. Vein @125.97m, 2cm grey qtz at 55°, 1% aspy in margins, 5% py in vein.	1	1				
10		126.98	127.57	Mod alt'd around fractures and veinlets at 60°, 5% aspy in veinlet selvage.	3	2				
10		127.57	128.02	3cm qtz vein at 55°. Grey, with 1%aspy in margin. Trends to zone of high alt'n. Clay rich with qtz eyes and GND fragments. Possibly hydrothermal alt'n or shear zone. Qtz vein near zone is fractured and offset in multiple locations - microfaults. @127.80m, 3cm zone of gouge, at 40° to CA, contains fragments of qtz vein, possible fault.	2	2	1			
10		128.02	128.45	Broken, altered GND. @128.27m, broken qtz veins in sugary GND; possible fault. @128.18m, GND alters to clay. Qtz eyes present with GND fragments - possibly hydrothermal. Vein @128.38m, 2cm grey qtz at 45°. No visible sulphides.	3	1				
10		128.45	129.54	Fractured GND w/ lim on fracts. Vein @129.05m, 1cm grey qtz at 50°, 3%aspy in vein, 80%oxidized.	1					
10		129.54	130.08	Slightly to mod'ly alt'd GND w/ disseminated aspy. Vein @129.79m, 2cm grey qtz at 35°, 3%py in vein, 1%aspy in margins.	1

10		131.06	132.59	Slightly alt'd GND, limonitic fractures. Veins: @131.38m, 0.5cm grey qtz at 60°; @131.88m, 0.3cm grey qtz @50°, 10%py, @131.95m, 0.5cm grey qtz at 50°, 5%aspy; @132.00m, 2cm grey qtz @50°, 10%aspy, 3%cpy, @132.06, 0.3cm grey qtz, 5%aspy, at 50°.	1	2				
10		132.59	134.11	Unalt'd GND; lim on fractures, veinlets running at 40°.						
10		134.11	134.81	Slightly alt'd GND. Fractures at 55°.	2	2				
10		134.81	135.64	GND is bleached; <1%bt present; disseminated aspy present		2	1			
10		135.64	136.88	Lim on fractures. GND alt'd to grey-green.		1	2			
10		136.88	138.02	Core is highly fractured and broken. Clayey gouge present @ 136.91m, 137.62m, 137.91m @ 45deg to CA. Qtz eyes and broken GND in clay - possible hydrothermal or shear	2	2		4		
10		138.02	139.52	Oxidized GND @ 138.68m becomes gouge ± GND frags. Decomposed GND: qtz eyes and frags present in clay - hydrothermal or shear	2	1		2		
10		139.52	139.98	10cm qtz vein @ 30°. Vein is fractured and shows slickensides on a 30° fracture @139.60m. 5cm qtz vein @ 30° at 139.76m.				3		
10		139.98	141.05	Unalt'd GND, oxidized @139.98m to 141.05m. At 140.75m, core is altered to rust brown, minor sericite, core is weaker, yet competent, but more easily broken	2	1	1			
10		141.05	141.73	Vein @141.37m, 1cm white qtz @30°, 5% aspy, crosscut by 0.3cm grey qtz vein at 60° to CA						
10		141.73	143.26	Unaltered GND. Veins appear to be sheeted set. Minor lim on fractures. Moly found in veining at 143.06m	0					
10		143.26	144.69	Minor lim on fractures						
10		144.69	150.78	At 148.86 a 2 cm x 5cm bleb of diorite as a xenolith within GND, no chilled margin						
10		150.78	150.88	Altered zone with 3 cm qtz vein adjacent. Contact angles at 40° to CA. Core is brown with qtz eyes as breccia within brown sericite matrix. Core is soft yet competent	1	2	1			
10		150.88	159.40	no descriptions (KW)						
10		159.40	163.50	Sheeted vn system. Veins are spaced about every 5-10cm @ 35-50° to CA, with avg thickness 1cm+ . Only recognized sulphide present is diss po, trace to 1%.						
10		163.44	164.59	Altered GND Core is stained heavily (pervasively with lim) and on fractures. Core is mod'ly broken to large gravel sizes. Chlorite prevalent in section, several 3cm veins within unit which may have been conduits of hydrothermal fluids. No visible sulphides. Contact at 163.44m is marked by a 3cm vein @ 40° to CA. The 164.59m contact is less abrupt but @40° to CA, with a marked decrease of pervasive limonite easily recognized by color change and core competency.	3	1	2	0	0	
10		164.59	166.33	GND has a noticeable decrease in veins per m, core is more broken, with lim heavy on fractures, and mod to low pervasively within GND	2	1	1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		170.69	171.15	Chloritized, altered GND. Core is green/brown with sericite, mod soft. @170.69m, core abruptly alters with initial pervasive lim progressing to chloritization. Contact occurs parallel to central vein in unit @45° to CA. Diss aspy with vein and surrounding 10-15cm of GND (~1%).	3	2	2	0	0	
10		171.15	172.20	Lim stained core decreasing with lim only on fractures @172.20m.	1	1	0			
10		172.21	173.74	Zone of high alteration, colour orangey brown. Reg. fractures at 35° (8), limonite pervasive. Tonalite xenolith at 172.6m, approx. 2 by 5cm.	2			1	1	
10		173.74	175.26	Mod'ly alt'd GND. 1cm^2 xeno of tonalite within largest quartz vein at 174.56m.	2			1		
10		175.26	176.26	Highly alt'd GND. Fractured, colour orangey brown.	2	1		1		
10		176.26	176.78	Wide zone of qtz - 24cm. Crosscut by veinlets filled with lim (176.26m to 176.50m).	1	1				
10		176.78	177.44	Unaltered GND	0	1	1			
10		177.44	178.31	Unaltered GND w/ qtz veins	0	2	1			
10		178.31	179.83	Unaltered GND	0					
10		179.83	180.81	Altered patch, 5 by 8cm, green coloured, irregular edges, 2%po						
10		180.81	181.55	One large, branching qtz vein. Tonalite xeno 3cm by 6cm, rounded edges w/ 2mm reaction rim.		1			1	
10		181.55	183.00	Broken up GND (max length of core 20cm). Unaltered.	2	1			1	
10		183.00	184.40	Extremely altered GND. One branching qtz vein. Colour is yellowish-white. Rock is crumbly and clay-rich. Weak slickenside lineation shows on sericite/limonite fracture faces - shear zone.	4	3		2	2	
10		184.40	185.10	Fractures near parallel to CA infilled with limonite and sericite.	3	2		1	1	
10		185.10	185.50	Silt layer, med brown mud with ~5cm blocks of GND.	1					
10		185.50	186.68	Unaltered GND.						
10		186.68	188.80	Unaltered GND.	1	1				
10		188.08	189.31		2	2			1	
10		189.31	190.50	Unaltered to lightly altered GND	2	1			1	
10		190.50	192.02	Mod alt'd GND. Lim on fractures. Overall colour is whitish green w/ 0.5cm selvages	1	4	2		1	
10		192.02	192.88	GND as above. One qtz vein running nearly parallel to CA goes through core for 34cm, but is only 1cm wide. Shear/gouge section at 192.54m is approx. 2cm wide; altered to white clay texture.	1	4	2	1	1	
10		192.88	193.56	Extremely altered zone to 193.20m, where alt'n becomes moderate. Colour whitish-pale brown. Regular breaks parallel to CA (4).	4	3	0	1	1	
10		193.56	194.47	Mod'ly alt'd GND, as at 190.5m.	3	3	1	1	1	
10		194.47	195.51	Mod'ly alt'd GND, as at 190.5m	1	3			1	
10		195.51	196.60	Mod'ly alt'd GND, as at 190.5m	1	2				
10		196.60	198.12	Mod'ly alt'd GND, as at 190.5m; random fracture orientation	1	2

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-278C

PROJECT: Dublin Gulch - 1735

GROUND ELEVATION: 1037m

BEARING: 000 | DIP: -50°

COORD SYSTEM: NAD 27: 459713E | EASTING: 459713 NORTHING: 7099325

COORD SYSTEM: NAD 83: 459593E | EASTING: 459593 NORTHING: 7099509

NAD 27 (CORRECTED for historic grid): | EASTING: 459783 NORTHING: 7099335

SECTION LINE 459675 (historic grid)

DATE STARTED: June 1 2005

DATE COMPLETED: June 4 2005

LOGGED BY: Melodie Stone, Terry Croteau, Kristian Whitehead

CONTRACTOR: Britton Brothers

DRILLING DETAILS

Hole Diameter: HQ

Overburden: 19.81m

Deviation:

Casing: 19.81m

Core Size: HQ

Cement (# Bags): 0

Plug Depth: N/A

Notes: No plug necessary.

SAMPLING DETAILS

Sample Sequence: B291480 to B291499 and B291500 to B291609

Requisition #: MASP44855STRGOL.05Q | Date Shipped: 8-June-05

Lab Record #: VA05045519 and VA05044876 | Date Received: 13-June-05

Sample Sequence: B291610 - B291631

Requisition #: MASP44855STRGOL.05Q | Date Shipped: 8-June-05

Lab Record #: VA05046431 | Date Received: 13-June-05

	GEOLOGICAL DESCRIPTION				ROCK (Alteration)							
UNIT CODE	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other		
-1		0.00	19.81	Casing (no core recovery)								
10	19.81-20.25	19.81	20.25	GND / qtz and shale-like metasediments (argillite), gravel sized pieces. Unable to discern whether metaseds due to abundant qtz and granodiorite pieces, however contact / lithology change is proximal. The drill set-up appeared that collar was in metaseds (?). (poor core recovery / and v. broken core). I would interpret this to be the MSED/GND contact.	1							
80	**20.25-26.05**	20.25	23.60	MSED, core is v. broken w/ limonite staining on fracs and pervasive within foliations. Metaseds appear as dark brown to black, fine-grained, less than 1mm thick foliations which have suffered moderate silicification determined by the inability to scratch core with a nail. Foliations are, within the first few feet, at 45° - 55° to CA, with the appearance of foliation angles changing due to folding episodes at a local level. No visible sulphides present however minor hematite staining is observed on some pieces of core. Qtz pieces indicate that veins are both x-cutting and are on foliation. No visible sulphides within the qtz pieces noted. Core recovery is approx 40%. At ~20.50m, silicification diminishes and core becomes essentially argillite (core can now be scratched by a nail).	1							
80		23.60	25.00	From 23.60-23.74m, core becomes qtz eyed; clay gouge with yellow /brown coloring. Appears as hydrothermally altered, possible fault zone.	2	1		3				
80		25.00	26.05	From 25.00-25.91m, argillite has multiple vn sets within it and has thickness of veins ranging from 0.25 - 1cm thick, milky coloured. At 25.60m, 2 vns x-cut each other at 35° and 155-160° to CA. No visible dissem sulphides present. Limonite on fractures but less pervasive on foliation. Core section was poor core recovery but competent core pieces were available for logging.	1							
10	**26.05-65.53**	26.05	30.48	Granodiorite/argillite contact, GND continues on. Core is broken to rubbly gravel; few structural bits intact for logging, lots of qtz pieces.	1			1				
10		30.48	32.00	GND altered to sand-sized pieces. Core is not bleached, heavy limonite staining. Visible qtz pieces indicating veins present. Minor clay mostly sand, mafics easily visible. Core essentially looks weathered to rotten.	2			1				
10		32.00	33.53	Core recovery is poor and core is extremely broken, however it appears as though there is a sheeted qtz vein system occurring, due to the abundance of qtz pieces in the rubble. No visible sulphides noticed w/ in the qtz pieces. Heavy limonite on fracs and pervasive.	2			1				
10		33.53	35.20	Core recovery is very low however several episodes between gravel pieces to clay sections w/ qtz eyes w/ heavy limonite straining on fracs and pervasive. Hydrothermal alteration is evident throughout this particular section, no sulphides noted. Clay is rusty brown and uniform. Remaining core is of sandy gravel consistency.	2			2				
10		35.20	38.10									
10		38.10	39.62	Core has same characteristics as above (33.53-35.20m). Possible hematite staining on fracs.	2			1				
10		39.62	41.15									
10		41.15	44.20	Highly digested GND, mafics intact but core is abundant w/ sericite. Core is salt/pepper in appearance & crumbles when touched. No coherency. Limonite is extremely pervasive & on fracs. Minor 10-15cm units of rusty coloured clay seems very indicative of hydrothermal alt'n.	3	1		1				
10		44.20	45.72	Core becomes much more competent, but limonite on frac/selvages & is pervasive. Ox'd py w/in some vns/vnlets pieces show red rust blebs (may be well-ox'd pyrite).	1							
10		45.72	47.24	Core is extremely broken w/ poor core recovery. Core is sandy gravel in texture w/ v. abundant limonite & bits of ox'd py. Some clay seems relict.	3	1		1				
10		47.24	48.77	Core is essentially a clay gouge. Alt'n zone - Core in places is somewhat preserved, mafics are intact w/ limonite & sericite on fracs & pervasively. Qtz eyes visibly intact. Some indications of veins. Minor hematite staining & ox'd py pieces w/in qtz pieces.	3	1		3				
10		48.77	53.61	Core is extremely broken to sandy gravel or to clay seams. Core recovery is ~50-65%. Limonite is pervasive & abundant, sericite is on fracs & w/in selvages. Mafics are still intact & highly ox'd py can be seen as relict orangey-red blebs on qtz pieces & in broken pieces of core.	4	3		2				
10		53.61	55.53									
10		55.53	55.58	Clay seam w/ qtz eyes, clay is of rusty uniform color. Minor reddish staining on 55.58m contact surface indicating ox'd py (essentially an alt zone).	3	1		4				
10		55.58	55.80									
10		55.80	59.44	Core is very uniformly hydrothermally alt'd to soft, mushy, sandy clay w/ heavy pervasive limonite. Sericite is observed in relict selvages & fracs. Qtz eyes 'bb'-sized abundant. Core looks like it has been digested by meteoric waters. Some reddish blebs & stains reminiscent of former py, not a lot of visible vns. Mafics are preserved where clay is less abundant. Core loss is @ ~80%, thus good representation of actual unit.	5	3		4				
10		59.44	60.96	GND altered to clay/crumbly texture. Colour is orangey-pale brown. Aligned qtz pebbles denote old veins. Carbonate is siderite >calcite.	3	1		3	2			
10		60.96	62.48	Qtz eyes and relict feldspars left in crumbly mess. Ox'd hematite present. Sericite aligned at ~15° to CA	4	2		2	2			
10		62.48	64.01	Colour whitish yellow to orangey brown. Qtz vein at ~62.9m, grey qtz.	3	2		3	2			
10		64.01	65.41	Colour a more medium-dark brown. Crumbly-clay gouge GND. Clear-milky qtz veins	4			3	2			
10		65.41	65.53	Large qtz vein w/ lim on fractures. Diss ox'd py throughout. Ox'd hematite present ~3%	1				1			
90	**65.53-66.00**	65.53	66.00	Qtz vein at 65.53m. Section is argillite (MSED); fine mafic laminations define meta-beds. Felsic section at 65.7m (QZZ) with diss ox'd py, muscovite (15%). Microfolds visible on the cm/mm scale. Ox'd hematite (10%) in mafic sections.	4	1		4	1			
10	**66.00-179.83**	66.00	67.06	Clay to crumbly GND. Largest pieces ~2cm square. Clear qtz pebbles noted at 3 depths	4	1		3	2			
10		67.06	68.58	Highly to extremely altered GND. First 20cm is somewhat coherent core (10cm chunks). After that gouge-clay texture. More competent GND below qtz vein relict, for ~10cm. Gouge to end.	4	3		3	2			

DRILL LOG LEGEND P2

Selvages
0 = No Alteration
5 = Intense Alt'n

Ox. State

	GEOLOGICAL DESCRIPTION				ROCK (Alteration)							
UNIT CODE	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other		
10		68.58	70.10	Mod. to highly altered GND. Core coherent from 69.15m with only minor clay alt'n. Oxidation throughout. Colour pale brown.	4	3		2	2			
10		70.10	71.63	Grades from competent (but mod. altered) to highly altered GND. Diss ox'd py throughout section (one patch 1cm^2 near qtz vein)	4	4		2	2			
10		71.63	73.15	Colour orangey pale brown. Core fairly competent, recovery good (89%).	2	1		2	1			
10		73.15	79.25	Mod - highly-altered GND. Colour white-pale brown. Qtz, feldspars, and most bt still in situ with some (30%) alt'n of feldspars to clay (opaque, white) minerals. Matrix material all altered. Qtz veins overprinted by alteration, so they are broken and little to no selvage present. Qtz veins broken and selvage overprinted by alt'n.	3	2		3	1			
10		79.25	80.77	Moderately to highly altered GND trending to gouge @ 79.33-79.67m. Gouge contains decomposed GND frags and a possible remnant quartz vein. 5cm broken qtz vein @ 79.92m	2	1		2				
10		80.77	81.52	Core broken into fragments up to 6 cm, becoming more altered to sericite @81.13 -81.37m. 4cm fractured and oxidized grey qtz with carb vein @81.30m.	1	3		2				
10		81.52	82.55	Clayey gouge dominant with 9cm section of moderately altered GND @82.30m	1	2		3				
10		82.55	83.82	Slightly altered GND with lim on fracs. Core is highly fractured and broken. Fractures predominantly @ 80-85° to CA	1							
10		83.82	85.34	Moderately altered, less fractured and broken. Lim on frac. @83.71m, 2cm clayey gouge @ 45° to CA - shear.	2	1		1				
10		85.34	86.87	Less altered, becoming broken and clay rich @85.94m. Broken qtz veins present in clays, appear offset --possible small scale fault/shear.	1			3				
10		86.87	87.40	Slightly altered GND, more competent	1							1
10		87.40	87.77	Zone of fractured and offset qtz veins. Offset sinistrally @50°.	1							
10		87.77	88.24	Unaltered GND trending to carb alt'n after 87.98m	0	1			3			
10		88.24	88.92	Ox'd GND. Qtz veins offset @50°, appears sinistral. Lim on fractures.	2			1				
10		88.92	91.44	Core fractured at 50°, same as the offset angle of the quartz veins								
10		91.44	94.49	Moderately altered GND with lim on fractures. GND has sugary, mushy texture with higher clay content towards end of interval. Qtz veins are fractured or broken.	2			3				
10		94.49	96.01	Intensely altered to clay from 94.49-94.79m. @94.79 ~1m shear zone. Lineation @130°. Winged porphyroblast @96.46m, parallel to lineation direction and shows a sinistral rotation, indicating shear sense. Qtz vns present are broken and sheared. Shear zone is grey-green.	2			1				
10		96.01	96.14	Clay gouge, qtz eyes present - possible hydrothermal alteration, likely related to shear zone above.	1			3				
10		96.14	96.68	Moderately altered GND	1	1		3				
10		96.68	98.28	Broken GND, lim staining, sugary texture. Qtz veins are broken.	2			3				
10		98.28	99.06	Moderately altered GND								
10		99.06	99.68	At 99.06m is a 4cm clay gouge - fault/shear zone. Then, moderately altered GND, lim on frac, more competent than above. Fractured @ 99.48m.								
10		96.68	100.58	Broken GND. Lim on frac								
10		100.58	101.58	Unaltered GND. Fragmented @ 101.46m. Vein @ 100.96m.								
10		101.58	102.11	GND fragmented until 100.68m, becomes fractured w/ lim on fracs								
10		102.11	102.73	Mod'ly alt'd GND. Pervasive lim	2	1		2				
10		102.73	103.63	Broken GND frags (max 6cm). Lim on frac.	1							
10		103.63	103.94	Mod alt GND. Reddish brown colour	3							
10		103.94	104.43	Less altered	1							
10		104.43	105.36	Intensely altered GND. Sugary texture, qtz eyes present w/ GND frags. Qtz veins fractured and offset	3	2		2				
10		105.36	110.51	Intensely altered GND. Core is yellow-beige w/ rusty patches. Qtz eyes, bt and GND frags present in clay. Veins are fractured or broken. Hydrothermal alt'n on shear zne. No obvious lineation or orientation indicators	2	2		3				
10		110.51	111.88	Slight to mod alt'n in GND. Core is fractured w/ pervasive lim as well as on fracs	2	2		1				
10		111.88	113.08	Core is fractured and broken. Qtz veins present, but broken	2	1		1				
10		113.08	114.44	Mod'ly alt'd GND. Sugary texture; becomes more altered to clay @114.12m	1	1		2				
10		114.44	115.52	Fractured GND. Lim on fracs	1							
10		115.52	115.82									
10		115.82	116.83	Mod'ly alt'd GND. Overall colour is med brown w/ alignments of yellow clay minerals (w/ sulphur?). Limonite, including siderite, on fracs	4	1		2	1			
10		116.83	117.90	Minor alt'n in GND. Veinlets noted here because they're different in appearance - straight w/ large selvages; Set of 2 veinlets @117.45 to 117.50m	1	1			1			
10		117.90	119.06	Minor alt'n in GND. Qtz/carb veins have large selvages. Shear sense indicator (drawn), sinistral movement.	1	1	1		3			

DRILL LOG LEGEND P2

Selvages
0 = No Alteration

	GEOLOGICAL DESCRIPTION				ROCK (Alteration)						
UNIT CODE	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other	
10		119.06	120.24	Unaltered GND where selvage from large qtz veins not affecting	1	1	1		1		
10		120.24	120.67	Mod'ly alt'd GND	1	2	1	1			
10		120.67	122.09	Unaltered GND. Lim on fracs	1	1					
10		122.09	123.63	Unaltered GND. Lim on fracs; sericite weathered to clay minerals on fracs	1	1		1			
10		123.63	124.97	Minor to unaltered GND. Po. Is pale bronzy silver coloured. Highly altered section (ser=1, chl=3, carb=3), from 123.80 to 124.00m.	1	2			1		
10		124.97	126.49	Unaltered section of GND w/ 7 congruent qtz veins. Aspy/scor concentrated at margins of straight, narrow veins. Some calcite along veins as well (~10%). 5cm x 3cm bleb of alt'd GND, to dark grey. Bt crystals still visible, few small (2mm) qtz crystals as well. Weakly magnetic; Hematite/magnetite(?) @125.18m.					1		
10		126.49	128.02	Unaltered GND except selvages					1		
10		128.02	128.68	GND dominated by silicified selvages of qtz veins. ~10cm gaps between selvages are unaltered. Selvage contains lots of dissem aspy and po.							
10		128.68	128.97	Silicified zone abuts unaltered GND @ 10° to CA. Diss aspy/scor and po. If qtz vein *was* here, it's not visible (possibly just outside core range).							
10		128.97	130.55	Unaltered GND. Qtz veins begin at 129.92m.							
10		130.55	131.44	Unaltered GND. Narrow silicified vein branches w/ scorodite/aspy and minor py. Minor lim on fractures.							
10		131.44	132.36	Unaltered GND							
		132.26	133.10								
10		133.10	133.85	Chlorite alteration zone. Core is bleached to white and green "speckled" core w/ a 3cm qtz vein @35-40° to CA. V. tr aspy disseminated w/in vein material. Mafics are completely depleted		3	3				
10		133.85	142.95								
10		142.95	144.49	Core is altered to a limonite/rusty brown; core is soft yet coherent, sericite and limonite are pervasive. Some clay ~1 3%	2	1		1			
10		144.49	148.38	White, soft carbonates are fracture filling into competent GND. Essentially x-cutting/carbonate stringer veinlets					1		
10		148.38	149.35	GND is fractured / healed w/ carbonate veinlets. Veinlets are gouge - soft and pure flour white.					1		
10		149.35	152.40								
10		152.40	154.40	GND as previous unit (148.38-149.35m), except that some carbonate vns are thicker (~0.25cm) and are running parallel to C.A. No visible sulphides disseminated within the calcite / carbonate vns/vnlets.					1		
10		154.40	158.50								
10		158.50	160.02	GND is oxidized slightly w/ pervasive limonite, minor sericite (both as fracture filling and somewhat pervasive). Core is rusty yellow/brown yet competent.	2	1			1		
10		160.02	163.70	Sheeted vn system appears. Vns are regular and similar. Vns are ave. 0.5-3.75cm in width. They have regular spacings of ~ 5-15cm apart @ an ave angles of 35-40°. Predominant noted sulphide is pyrrhotite @ tr-2%, as disseminations within the vns.		1	1				
10		163.70	164.59								
10		164.59	165.60	Mod'ly alt'd GND. Overall colour is pale whitish green with uneven patches, up to 10cm long of less altered GND, which is pale grey. One straight fracture face (25° to CA) is covered with powdery black alt'n product with various diss. sulphides (aspy, cpy and chalcocite (?) - striated dull gold colour + black granular aggregates), 0.5cm wide, at 165.18m.		3	3	1			
10		165.60	166.86	Unaltered except for wide selvages around qtz veins at beginning of sample. At least minor sericite throughout entire sample.		2	2		1		
10		166.86	167.14	14cm qtz vein: translucent milky white. Selvage also included in sample (total: 28cm).							
10		167.14	168.22	Alt'n is minor but rock is very broken up; fractures near parallel to CA and at ~80° to CA.		2	1		1		
10		168.22	169.43	Minor to mod alt'n in GND. Near-parallel fractures still prevalent but rock is more competent (less high-angle fractures).		3	2		1		
10		169.43	170.96	Minor to mod alt'n in GND. Massive sulphides (vein) beside qtz vein at 170.75m - noted on sample ticket. Minor diss sulphides throughout section (aspy, po).		3	3				
10		170.96	172.56	Extreme alt'n here. Whole sample is gouged out clay material with ~40% remnant GND material: qtz eyes, hb crystals (~2mm), etc.	2	2		4	2		
10		172.56	173.74	Mod'ly alt'd GND. Colinear fractures at 50° to CA (?).		3	1	2	1		

DRILL LOG LEGEND P2

Selvages
0 = No Alteration
5 = Intense Alt'n

Ox. State
0 = No Oxidized Sulphides
5 = All Sulph Oxidized

Date: June 1 - 4, 2005

LOGGED BY: T. Croteau/M. Stone/ K. Whitehead

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar., 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-9.14m			CASING (no recovery)						
10	9.14-201.17	9.14	15.24	V. broken and heavily oxidized GND. Alteration from minor to moderate. Veinlets grey qtz. V. poor recovery from 12.19 to 13.72m (19%). Rock is pebble-cobble size.	4	2				
10		15.24	18.29	Mod. to highly alt'd GND. One qtz vein has bands of alternating siderite and qtz. Adjacent to this is a zone of dark grey-black, grainy alt'n (old xeno?), ~6x4cm.	4	1			1	
10		18.29	24.38	Mod to highly alt'd GND. V. broken core: max 10cm long (1), most <5cm. From 21.34 to 24.38m recovery is poor (34% and 16%). Fewer small pebbles but core is still v. broken.	4	1			1	
10		24.38	25.91	V. broken core w/ one 20cm gouge zone, med. brown.	4	1		2		
10		25.91	27.43	Highly alt'd and broken core - one 10cm length. Colour pale brown.	4	2	1	1		
10		27.43	28.96	Highly to extremely alt'd GND.	4	2	1	1		
10		28.96	30.46	13% core recovery. Gouge to highly alt'd GND.	4	1		3		
10		30.46	32.00	Extremely alt'd to clay texture (90%), with qtz eyes and small GND pebbles	4	2		4	1	
10		32.00	33.56	Poor core recovery (14%). Pebbles.	4	1		2		
10		33.56	34.90	Extremely alt'd GND. Sand-sized, medium brown.	4			3	1	
10		34.90	36.40	Highly alt'd GND. Cobbles no bigger than 5cm. Veinlet at 34.05m w/ 1cm selvage (ox. 100%)	4	1		1	1	
10		36.40	39.37	Highly alt'd GND. Hematite oxidized near qtz veins (2mm subhedral grains).	4	1	1	2	1	
10		39.37	40.50	Highly alt'd GND. More competent, however, with pieces up to 15cm. Black ox'n product on uneven fracture faces. Limonite on microfractures. Gouge zone (5cm) between 2 competent, 6cm GND pieces. No slickensides.	5	2	1	1	1	
10		40.50	42.67	Extremely alt'd GND. Clay to sand-size (90%). Medium brown.	4	2	1	3	2	
10		42.67	43.76							
10		43.76	46.80	GND is v. broken and altered to gouge/sandy gravel with v. minor competent pieces. Core is v. limonite stained on fracs / pervasively and within clay yielding a rusty/yellow-brown color. Sulphides have undergone significant weathering (po + aspy). Qtz pieces in the core are visible indicating vning however thickness / amount and angle to CA are impossible to obtain. Sulphides are within veining or immediately adjacent.	4	2		2		
10		46.80	47.57							
10		47.57	48.90	GND becomes sandy, predominantly, w/ pieces of gravel and clay. Core is heavy limonite-stained and fracs are occasionally hematite-stained as thin skin on surface (black).	2	1		1		
10		48.90	49.03	Fault gouge with heavy limonite staining. Qtz vns w/ slickensides indicating fault movement, angle on surface is ~ 50° to CA.	3	1		2		
10		49.03	49.15							
10		49.15	50.01	At 49.15m is a 0.25cm wide oxidized pyrite vn, pure black, @~ 50° to CA.	5					
10		50.01	50.29	Fault gouge with a slickenside surface on contact at 35° to CA.	2	2		3		
10		50.29	50.41							
10		50.41	53.34	Core is altered to crumbly gouge w/ pervasive limonite and sericite. Core is v. soft yet recovery is good. Some vning can be seen but highly oxidized pyrite is interpretation.	2	4		2	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other	
10		53.34	54.86	Chloritized GND core, bleached, green-hued w/ little to no mafics. Minor calcite stringers (frac-filling mostly). Limonite on fracs, looks to be oxidized py on fracs.	2	2	2		1		
10		54.86	55.44								
10		55.44	55.84	Clay gouge alteration zone. Qtz eyes, looks like digested, rotten GND. Limonite abundant, making core / clay yellow-gold color.	2	1		4			
10		55.84	59.31								
10		59.31	59.91	Hydrothermal alteration zone, core becomes sandy to clay w/ some broken pieces. Heavy limonite staining. Qtz eyes present. Some red rusty bits (perhaps weathered sulphides).	3	1		2			
10		59.91	60.96	GND, same as previous unit	3	1		3	2		
10		60.96	64.01	Core has what looks to be a sheeted vn system. Veins are spaced ~ 5-10cm apart w/ similar core axis foliation of 45-50°. Minor dissem sulphides in vns.							
10		64.01	64.66	GND becomes etched and filled w/ limonite and sericite. Some bleaching through mafics. Intact core is easily broken w/ v. minor clay seems. Core is yellow-gold stained in color	3	2		1			
10		64.66	65.13	Large qtz vn. Some limonite and GND inclusive					1		
		65.13	66.78								
10		66.78	67.06	Gouge clay alteration seam, core reduced to sandy clay w/ small qtz eyes, heavy limonite staining. Qtz pieces indicating vning but too small to be certain.	2	1		4	1		
10		67.06	67.40								
10		67.40	67.78	Same GND as above, but w/ no qtz veining visible	2	1		4			
10		67.78	68.17								
10		68.17	69.15	GND becomes altered to bleached, sericite, grey-brown dull color. Minor green (chlorite hue) but not intense. Pervasive limonite, yet core is coherent. Abundant selvages w/ minor sulphides (aspy). Very little to no mafics, qtz vns visible @45-50° to CA, ~0.25-0.5cm thick, and continues to 96.68m.	3	1	2				
10		69.15	70.10								
10		70.10	72.23	Core is extremely broken to gravel and clay. Clay seams have reddish colours, possibly indicating py oxidation. Core is yellow-gold/rusty colour. Core has lost mafics in places, and has slight bleached/chloritic nature. Evidence of hydrothermal/faulting.	4	1	1	1			
10		72.23	75.38	GND is altered to a predominantly mafic-'free' state w/ only minor units of visible mafics. Core has a dull brown colour with visible sericite and minor chlorite. Some siderite w/in selvages. @74.34m pyrite vein oxidized to red/black and minor unoxidized crystals. Vein is ~0.75-1.5cm thick, at 50° to CA.	3	1	1				
10		75.38	76.02	Altered clay seam, hydrothermal alteration is evident from visible qtz eyes and some preserved gravel sized pieces of altered GND. Clay is yellow/gold and consistent in texture. No contacts preserved.	3			4			
10		76.02	77.50	Core remains altered as described in previous section (72.23-75.38m)	3	1	1.0				
10		77.50	83.82	Core remains altered as above description w/ what appears as a sheeted vein system. Veining/selvages are somewhat regular w/ spacing @5-20cm apart w/ a regular angle of 45-50° to CA.	2	1	1				
10		83.82	84.08	Clay seam at hydro alteration zone w/ a 5cm adjacent sulphide (aspy stringer) and veining zone. @84.08-84.13m, clay is gold yellow colour w/ qtz eyes	2	1		4			
10		84.08	89.37	Same as above unit, altered GND. description from 72.23-75.38m interval.	3	1	1

10		91.40	92.67							
10		92.67	92.80	Core becomes v. altered with dissems / vnlets of py and aspy (~2-5%). Somewhat oxidized at the contact @ 92.80m @ 60° to CA.	3	1				
10		92.80	93.13	Yellow to reddish-gold clay seam w/ GND rubble + qtz eyes. At 90.07m, a 1cm thick qtz vn @50-55° to CA (trace dissem py). At 93.13m, contact angle is 35° to CA.	3	1		5		
10		93.13	93.38	Core is v. decomposed but not to clay as yet. Qtz eyes are visible, core is soft but original altered brown core is still easily transparent. 93.38m: contact @~35° to CA, with some slickensides observed on adjacent GND. At 93.41, 93.53, and ~93.70m, 1-3cm thick qtz vns with py and aspy. Special Note: 68.17 to 96.68m, GND is of the same altered type best described in section: 72.23-75.38m	4	1		1		
10		93.38	94.80	Zone of high to extreme alt'n. One block competent core at 93.29 to 93.67m, with 2 qtz veins. Rest of sample is gouge/extremely alt'd to clay texture w/ alignment of sericite/chlorite @~90° to CA. Colour from bluish green to light yellowish brown. 3rd qtz vein has been folded w/in competent alt'n zone.	5	4	3	2		
10		94.80	95.75	Highly alt'd but competent core. V. broken. Colour med. brown.	4	2	1	1		
10		95.75	96.01	Strong slickensides along qtz vein margin. Tourmaline (?striated, v. hard, transparent to translucent, colourless to brownish black), + qtz + sericite: fault zone. Sample is one qtz vein; broken up.						
10		96.01	97.54	Strong to moderate alt'n. 2 large qtz veins in first 30cm. Fault gouge at 96.30m for ~10cm w/ 80% sericite, aligned. Qtz vein offset (brittle), on fracture @35° to CA. Slickensides aligned with long axis.	3	3	1	1	1	
10		97.54	98.52	Mod'ly alt'd GND. Limonite on microfractures is pervasive. Xeno at 98.8m: fine-grained diorite.	3	1			1	
10		98.54	99.06	Highly alt'd zone. Competent core w/ regular fractures to 50°. Med brown. Almost no GND texture left (just rounded qtz grains).	3		1			
10		99.06	100.58	Mod'ly alt'd GND with two vein sets. High angle offsets low angle.	2	1				
10		100.58	102.11	Mod'ly alt'd GND. Regular fracture set (6) to 45° and 135°. One has fault gouge material (clay) w/ slickensides. Also slickensides noted on low angle fractures.	3	1		1	1	
10		102.11	103.30	V. broken core. Fracture sets @45°/135° and low angle (0-15°). Gouge material in two low angle fractures. No slickens obvious but calcite smeared out.	3	2	1	1	1	
10		103.30	104.81	Minor to moderate alteration - slow gradation through sample, due to increasing number of veins and veinlets (selvages account for alteration)	3	1	2			
10		104.81	106.97	Mod'ly alt'd GND, w/ >2cm qtz veins @45°. Limonite on irregular fractures. At 105.86m, 2cm fault gouge-clay shows slickensides. Colour brownish grey.	3	1	1	2	1	
10		106.97	107.90	High to extreme alt'n. Limonite and calcite up to 1cm wide. Colour medium to pale yellowish brown. Boundary to less alt'd GND (grey, coarse texture) is at 30° to CA. Patches of orange rust (siderite?) speckle qtz vein and surrounding rock (20cm).	4	2	2	2	1	
10		107.90	109.33	Minor alt'n around veins and veinlets. Two noticeable xenoliths at 108.9m and 109.3m	1	1				
10		109.33	120.40	Minor alt'd GND w/ qtz veins. Regular breaking at 45° and 135°. Calcite on fract faces (<1mm thick). Diss aspy near fract w/in unalt'd GND. At 116.43m rock fract at 50° to CA (3) and some clay alt'n occurred (5cm wide).	1

UNIT CODE	From → To:	GEOLOGICAL DESCRIPTION			ROCK (Alteration)					
		From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		120.40	121.92	V. minor alt'n where qtz veins have dissipated into silicified zones (no clear vein boundaries) at 45° to CA w/ sulphides - included in the vein count, page 2.		1	1			
10		121.92	124.81	Qtz/aspy vein @ 45° to CA; 0.5cm. Aspy ~5-8%. GND adjacent on either side is bleached for ~3cm on either contact removing almost all mafics.	1					
10		124.81	130.03	AT 124.81m, a qtz/carb/sulphide aspy vein, @ 45-50°; width ranges from 0.5-0.75cm. Aspy is ~5% of vein components. No bleaching/alteration adjacent to vein	1	1			2	
10		130.03	130.50	Two 1cm qtz veins w/ 5cm chloritized margins.	2	1	2			
10		130.50	131.20	Chloritized/altered GND. Pervasively intruded w/ carbonate/qtz veining and sulphides (including ~1-10% py and ~5-15% aspy). Mafics are scarce in core. Core has a predominant grey colour. Zone ends w/ a slickensided surface @ 131.02m, 40° to CA.	2	1	1		2	
10		131.20	134.11							
10		134.11	135.64	GND altered throughout with calcite to crumbly texture. Approximately half the qtz veins are heavily silicified such that original vein is no longer seen as such, but more of a linear qtz-rich zone at the same angle as the real veins	1	1	1	1	3	
10		135.64	136.70	Minor alt'd. GND w/ pervasive veinlets of calcite overprinted by qtz veins.	1	2	1	1	2	
10		136.70	140.21	Highly alt'd GND. Colour is whitish green, only rounded patches of qtz grains remaining of original texture of GND. Qtz veins still visible as well but selvage is altered into main zone.	2	2	3	1	1	
10		140.21	140.61	Large qtz vein (23cm of core). Relatively low sulphide content						
10		140.61	142.04	GND as at 134.11m. Broken and calcitized.	1	2	1	1	3	
10		142.04	142.53	Less calcite zone w/ 4 large qtz veins. One xeno: fine-grained diorite, long axis parallel to nearby vein (4x2cm)		1	1		1	
10		142.53	143.26	GND as at 134.11m. Broken and calcitized		1	1		1	
10		143.26	145.56	More competent core; v. little calcite		1	1			
10		145.56	146.67	GND as at 134.11m; 50% broken and calcitic	1	2	2		1	
10		146.67	147.15	V. large qtz vein (37cm of core is 'pure' qtz); milky veinlets of calcite are incorporated.					1	
10		147.15	151.54	GND as at 134.11m; 50% broken and calcitic	1	2	1		2

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BOAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	GEOLOGICAL DESCRIPTION			ROCK (Alteration)					
		From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		151.54	153.04	Sheeted vein system w/in calcitic GND.	1	2	1		2	
10		153.04	153.77	More sheeted veins, slightly more rust on microfractures at 30° to CA	2	2	1		1	
10		153.77	154.70	Highly alt'd section (chl) follows 1cm qtz vein (included in last sample). GND texture erased to whitish green homogeneous rock. Veinlets (0.1cm) of pure pyrite. Fractured on one to shiny plate w/ black ox'n product on surface (wipes away easily).	1	3	4		1	
10		154.70	155.45	Minor alt'd GND hits alt'd section from above at 80° to CA. Qtz veins silicified so appears as all selvage		1	2		1	
10		155.45	156.48	Minor alt'd GND. Calcite veinlets pervade and weaken rock, generally at 30°-50°.		1	1	1	2	
10		156.48	159.56	Minor to mod'ly alt'd GND (selvages produce mod alt'n). Calcite vnlets still pervasive & cause breakage generally at 40-60° to CA.	1	2	2		2	
10		159.56	160.57	Carb & sericite alt'd GND. Color is light grey, texture alt'd to more planar (pseudo-foliation), defined by tabular sericite & calcite. One fracture (to 20°) has smeared out pyrite (gold, platey, striated) at 20° to CA w/ calcite/sericite elongate to 25° from the other side (2 episodes movement?). Sample <1% py.		3			3	
10		160.57	161.54	Limonite appears on frac faces, at 20° & 45° to CA; still v. broken.	1	3			2	
10		161.54	163.07	Limonite increases w/in carb/ser alt'd rock so very crumbly. Color is light grey w/ rust-brown along fracs.	2	3			2	
10		163.07	164.59	Cont'd limonite as irregular fracs every few cm to 163.84m. After this, fewer limonized fractures, but calcite still present on them. Xeno 3x2cm f-grained (and foliated) diorite.	1	3			2	
10		164.59	166.12	V. minor alt'n in qtz-rich GND. Diss po & py throughout sample (<2%). Regular fractures @ 50°, lim no longer. 2x1cm xeno 3cm from qtz vn.		3			2	
10		166.12	167.64	Carb/sericite still present along numerous veinlets in random & irregular fractures.		3			2	
10		167.64	169.16	Minor alt'd GND. Two gouge sections @167.85m (4cm) & 168.21m (1.5cm). Alt'd to clay/sand size; no notable slickensides.	1	3		1	2	
10		169.16	171.40	V. minor alt'd GND. Only alt'n is w/in selvages of numerous qtz vns.	1	2	1		2	
10		171.40	172.26	Large qtz vn w/ lenses of massive sulphides. Selvage from 171.4-171.55m. Vein from 171.55-171.87m, selvage from 171.87-172.00m. Vein (3cm) after that w/ 3cm selvage.						
10		172.26	172.78	Alt'd GND w/ 4 veins of massive sulphides.	1	3	3	1	1	
10		172.78	173.62	Mod'ly alt'd GND		2	2		1	
10		173.62	174.29	Mod-highly alt'd GND. Selvages dominate the sample.		3	3			
10		174.29	175.06	Highly alt'd GND. Competent core. Color whitish green to pale grey.		3	3		1	
10		175.06	175.66	Carb/qtz alt'd GND. Crumbly texture, white to light grey in color.						
10		175.66	175.91	Gouge zone. Clay to gravel sized pieces of GND.						
10		175.91	176.15	Chloritized zone w/ 4 qtz veins. Massive pyrite forms in 0.5cm wide lenses adjacent to qtz; Rock effervesces in acid along these lenses - siderite (oxidized pyrite + carbonates)						
10		176.15	177.76	Unaltered GND						
10		177.76	184.40	Alt'd selvages around numerous qtz veins make up bulk of section.

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-280C

PROJECT: Dublin Gulch - 1735

DATE STARTED:	DATE COMPLETED:
06-Jun-05	10-Jun-05
LOGGED BY:	
Kristian Whitehead & Terry Croteau	
CONTRACTOR:	
Britton Brothers	

DRILLING DETAILS

Hole Diameter: HQ
Overburden: 6.10m
Deviation:
Casing: 6.10m
Core Size: HQ
Cement (# Bags): 0
Plug Depth: N/A
Notes: No plug necessary.

FROM	TO	LITHOLOGY
6.10	202.78	Granodiorite

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-6.10			Overburden - Drill Casing; no recovery						
10	6.10-202.78			GND 40% qtz, 20% kspar, 15% bt, 10% Hal	3			1		
10		6.10	10.67	Broken GND: Core is extremely weathered and broken. Most pieces are angular, but some subangular - rounded. Sugary textured GND also present throughout. Lim is pervasive, and recovery is poor						
10		10.67	12.19	GND alterations trends to more clay rich gouge. Qtz eyes present with GND frags. Lim is pervasive.	3			2		
10		12.19	13.72	GND becomes slightly altered, lim is pervasive. @12.39m, GND becomes more fractured and sugary textured, lim staining becomes more intense. Veinlets present in fractured core; angles are indeterminate.	2			1		
10		13.72	14.02	Core is fractured and broken. Lim is pervasive. Clay alteration is less intense. Veinlets in section appear to be running at 35° to CA	2			1		
10		14.02	15.34							
10		15.34	16.50	Gouge, clay and sand w/ minor gravel pieces. Limonite is heavy on fracs. Zone of hydrothermal alteration. Limonite abruptly ends @ 16.90m	3	1		3		
10		16.50	16.76							
10		16.76	18.29	Core is extremely broken w/ poor core recovery. Aspy can be seen as thin coating on what looks like fractured surfaces	2					
10		18.29	19.29							
10		19.29	21.50	At ~19.20m: a fault/alteration zone. Evident from sandy and clay residue on core. Looks like aspy is remnant, but oxidized	2	1		1		
10		21.50	26.63	GND has bleached intervals, core has suffered some decay from sericite of fracs as evidence, broken core is demonstrating aspy oxidation and crystals	2	2	1	1	0	
10		26.63	31.37	Core becomes intensely oxidized to a dull brown colour, limonite is on fracs and moderately pervasive. Sericite is abundant on fracs and is pervasive. Chlorite is weak to moderate. Core is soft w/ oxidized aspy on fracture surfaces. Veins are essentially relict w/ oxidized aspy. Mafics are scarce and core crumbles when scratched in sections	4	3	2	1		
				From 28.63m to 28.60m, an orangey-gold coloured clay seam w/ oxidized aspy & possibly py. Contact @ 28.69m preserved @ 42° to C.A.	3	2		4		
				Another clay seam from 29.05 to 29.19m. Clay is uniform, light dull brown, w/ minor orangey-gold colours on contact. Uncertain if contact @ 29.19 is preserved but @ 35° to C.A.	3	2		5		
				Clay seam from 29.62 to 29.84m; core is orangey tiger colour. Oxidized and intact aspy and py	3	2		4		
				Clay seam from 30.48 to 30.91m; vein is relict by aspy veining, @~50°. Core is abundant w/ limonite	5	1	1	3	1	
10		31.37	31.50							
10		31.50	33.46	At 31.50m limonite completely and abruptly ends. GND is altered to a grey sericite rich, soft core. Mafics are still present, yet less in abundance than in unaltered GND. Sericite is pervasive and abundant on fracs and vein contacts. Qtz veins are somewhat intact w/ diss oxidized/unaltered aspy predominant. Core is essentially light grey in colour and uniform	4	4	1	2	1	
10		33.46	34.69							
10		34.69	35.08	Grey-white clay gouge alteration zone. No contacts preserved, some minor dissem ox'd aspy	4	3	1	4	1	
10		35.08	36.36							
10		36.36	38.95	At 36.36m, fault/slickensides @ 30° to CA, aspy/qtz vein, aspy ~25%, fault appeared to cut through vein, not activate along vein						
10		38.95	39.43	GND loses its mafics, core is dull greenish grey w/ sericite and chlorite present	3	2	2			
10		39.43	39.70	Semi massive aspy + py qtz vein. Sulphides are somewhat concentrated @ centre of vein w/ stringers/blebs running outwards. Py content ~3-5%, aspy ~40-45%. Qtz remainder w/ qtz being an opaque white						
10		39.70	40.49	GND is essentially digested to qtz eyes and sericite clay (good recovery). Core has a light green chlorite hue and has relict aspy and py vein/veinlets. 39.70 contact @ 30°, 40.49 contact has slicken lineations indicating a fault @ 40°	5	5	2	5		
10		40.49	40.63							
10		40.63	40.65	One 2.25cm thick qtz vein w/ disseminated aspy + py. angle 35-40°. Photo of area included.						
10		40.65	41.03							
10		41.03	43.54	GND continues to be devoid of mafics; sericite and chlorite to a minor state dominate, core is bleached with powdery, light grey colour.	3	3	1			
				From 42.14-42.35m, core is altered to white-grey clay and qtz eyes. Slickensided surface @~50° to CA. Surface had minor aspy 'slickened'.	3	4	1	4		
10		43.54	44.20	GND alteration zone, begins with clay predominant and then progresses to clay/ qtz eyes and broken core. All core is bleached with little to no mafics. Aspy is dissem w/ py. Sericite abundant on fracs and mod'ly pervasive	3	3	1	2		
10		44.20	46.50							
10		46.50	47.42	Hydrothermal alt'n zone (gouge). Sericite/qtz eyes/ grey-white clay w/ dissem aspy.	3	3		3		
10		47.42	48.15	Alt'd / bleached core as progressing from above. Gouge unit @47.85-47.93m. Sulphides (semi-massive) pyrite (30%), aspy (5-10%).	3	3	2	1		
10		48.15	50.09							
10		50.09	50.20	Clay gouge unit. Clay is light grey with aspy ox'd within (~5%)	3	3	1	5		
10		50.20	53.23							
10		53.23	53.38	Gouge, broken core, alteration zone. Core is light grey abundant w/ sericite, bleached	3	3	1	3	2	
10		55.38	55.59	Chlorite alteration zone. Core is light grey white w/ green hue. Sericite abundant	3	3	2			
10		55.59	56.39	Gouge/qtz eyes w/in semi-competent hydrothermal alteration zone. Core is light grey w/ pervasive sericite and on frac. Minor carbonates. Trace chlorite	3	3		2	1	
10		56.39	56.61	Medium grey uniform clay, looks like aspy clay. Directly adjacent @ 56.53-56.61m a qtz vein w/ aspy stringers	3			5		
10		56.61	57.09	Gouge alteration zone, core is white grey w/ minor green hue (chlorite). Qtz eyes, sericite dominant	3	4	1	4		

DRILL LOG LEGEND P2

Selvages: 0 = No Alteration; 5 = Intense Alt'n
Ox. State: 0 = No Oxidized Sulphides; 5 = All Sulph Oxidized

10		57.09	57.91	Core continues to be bleached, devoid of mafics, sericite rich, yet competent area caught between 2 hydrothermal alt'n zones. Dissem aspy (1%) and py (tr.)	3	3		1		
10		57.91	58.91	Gouge alteration zone, core is white grey w/ minor green hue (chlorite). Qtz eyes, sericite dominant	3	3	1	3		
10		58.91	61.00	Core is altered/bleached, yet competent. Core is light grey w/ green (chl) hue. Core is easily scratched, little to no mafics. Sericite on fracs, and moderately pervasive	3	3	1	3.0		
10		61.00	61.32							
10		61.32	61.71	Core has been etched and bleached, however, mafics are still intact. Salt/pepper appearance		2	1	1		
10		61.71	62.16							
10		62.16	62.48	Grey white clay seam perhaps fault gouge due to abundant slickensides throughout immediate section		3		5		
10		62.48	62.59	Core has been etched and bleached, however, mafics are still intact. Salt/pepper appearance		2	2	1		
10		62.59	63.60							
10		63.60	66.89	At 63.60m is a slickenside surface w/ aspy and ox aspy on contact @ 45° to CA. Another, at 63.92m, slickenside surface @40° to CA.						
10		66.89	68.48	Altered GND, core is bleached to light grey, greenish hue. Minor aspy dissem bits probable that a vein was proximal only lost in recovery. Core becomes gouge/med grey clay. Core is v. broken w/ poor core recovery. Carb in form of veinlets. At 68.63m, a slickenside surface @40° to CA		2	2	1	1	
10		68.48	70.41	Chloritized, altered, bleached GND. Core has slight green hue (chlorite). Core is sericite rich, core can easily be scratched, contains several qtz/carb veins/veinlets @ 68.78: slickenside, 60° @ 69.76: slickenside, 30°		4	2			
10		70.41	72.60							
10		72.60	75.26	Altered GND. Bleached to light grey, green; essentially the selvage around a qtz/carb and sulphide vein/stringers @ 72.68-72.69m, @ 40° to CA. @ 72.60m: slickenside, 35-40° to CA. At 74.73m, slickensides @ 25°-30° to CA.						
10		75.26	75.37	Altered chloritized GND. Selvage around a 0.5cm wide calcite vein		4	2			
10		75.37	76.00							
10		76.00	77.46	Clay gouge w/ qtz eyes, occasional pieces (some w/ slickenside surfaces). Clay is med grey w/ minor sulphide oxidation mixed in	4	3	1	5	1	
10		77.46	81.03	At 77.72m, a slickenside surface, @40° to CA. At 80.60m, slickenside surface @60° to CA, noted that area is altered w/in 2-3cm away		2	2		1	
10		81.03	81.70	Alteration selvage leading to fault gouge @ 81.70 - 81.87m, alteration selvage is light grey-green (chlorite) abundant w/ sericite and devoid of mafics		4	2	0		
10		81.70	82.30	Carbonate stringers w/ aspy and carb veins running ~50° to CA w/in other side of above mentioned alteration selvage from gouge focal point		4	2		5	
10		82.30	82.32	A 2.5cm wide carbonate qtz vein @ 25° to CA w/ ~5% aspy.						
10		82.32	82.56	Alteration selvage continues. @82.56 - slickenside @ 60° to C.A., aspy. on contact surface		4	2		1	
10		82.56	82.74	Clay gouge, light grey clay w/ qtz eyes, aspy disseminated (~5%); contact @ 82.74m is slickensided @ 20° to CA w/ selvage alteration continuing to ~82.94m		4	1	5		
10		82.74	82.83	A qtz/carb vein (1.25cm thick w/ py and aspy) @ 30° to CA is on a site of a fault indicated by slickensides (@ same 30° angle)						
10		82.83	85.69	@85.07: a slickenside, 65°-70° to CA.@85.07: a 1.5cm thick qtz/aspy vein, 65°-70° to CA. Aspy ~20% w/ 10cm wide (either side) chlorite bleached sericite prevalent alteration selvage. Trace py.						
10		85.69	88.94	Core is very broken, yet unaltered. Abundant 'vein like' selvages which are typically @ 40-50° to CA. Broken core is occurring commonly on these vein like selvages, which demonstrate aspy. Core would have an estimate of ~1-3% aspy. Some minor chlorite staining on frac surfaces and occasional slickenside pieces						
10		88.94	89.22	Altered GND. Core is bleached, sericite rich, chloritic stained. Minor mafics visible. Qtz eyes beginning to appear. Aspy stringer/veinlet x-cutting core @ 40-55° to CA, yet sulphides are oxidized mostly	3	3	1	1		
10		89.22	89.95	Core is v. broken, but pieces are demonstrating slickensides on veneers of aspy/calcite. @ 89.92m, slickenside surface of aspy coating. Possible py, 50° to CA.						
10		89.95	90.21	@89.95m: slickenside surface of aspy coating. Possible py, 50° to C.A. Altered selvage GND. Core is light grey-white w/ green (chl) hue. Soft core, abundant sericite w/ trace dissem aspy.		3	1	1		
10		90.21	90.28	White to light grey clay gouge. Qtz eyes		4	1	5		
10		90.28	90.68	Core is v. broken with slickensides on pieces w/ aspy & py & chl on contact surfaces						
10		90.68	91.85	Core is v. broken and is breaking down selvages/veinlets @ 40-60° to CA w/ py and aspy on frac surfaces w/ a lesser extent qtz and carb (sheeted veinlet system may be interpreted)						
10		91.85	92.96							
10		92.96	96.01	GND continues to retain sheeted vein like system. Typical vein/selvage spacing ~ 5cm, and ~55°-60° to CA.						
				From 94.25 to 94.53m, GND becomes slightly bleached and mafics reduce to half regular percentage, w/ a 1cm thick qtz vein, 40° to CA.		1	1			
10		96.01	96.54							
10		96.54	96.80	Core is altered to v. soft. 50% clay, 50% core, core is bleached, yet 5% mafics remain. Chlorite presence gives green hue to colour @ 96.70m: slickensides @ 40-45° to CA.		4	1	3		
10		96.80	97.54	Py and aspy thin frac coating on frac which is along core axis						
10		97.54	98.62

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		98.62	102.11	Core is abundant w/ fracs (45°-50° to C.A.), common w/ slickensides of aspy/py thus adding to the amount of sheeted veins accounted for.						
10		102.11	117.06	Sheeted veins continue through entire unit, save for bleached altered zone (103.63 - 104.19). Angles typically 40-55° to CA w/ widths ranging from <0.25cm to 0.50cm. Dissem aspy as the predominant sulphide w/ tr po, tr-2% py. Slickensides are common on frac surfaces w/ sulphides on those contacts. Occasional chlorite staining on fracture surface						
				From 103.63 to 104.19m, GND is bleached ,altered zone w/ clay gouge @ ~ 103.74 - 103.89. gouge/pieces of core shows aspy on qtz surfaces, clay is light grey-white	1	2	1	3		
				At 113.53, a 2cm carbonate vein w/ trace aspy (30° to CA) is cross-cut by an aspy veinlet, @45° to CA.						
				From 115.82 to 115.92m, core is altered and bleached, with oxidized aspy, core is easily scratched, sericite is minor to moderate, oxidized aspy veinlets (~5-8%)	2	2	1	1		
10		117.06	117.20	Continued alteration unit as above, core is bleached, however mafics remain, sericite is moderate and grey-looking ox'd aspy is ~5%. Core is easily scratched by a nail, minor clay, some carb veinlets present. Sheeted veining continues at 5-10cm spacing w/ veins/selvages typically 35-50° to CA and <0.75cm wide. Slickensided frac surfaces remain common w/ aspy on surfaces	2	2	1	1	2	
10		117.20	121.42							
10		121.42	121.63	Alteration zone, core is bleached to little or no mafics, sericite and chlorite are prevalent.						
10		121.63	123.44							
10		123.44	129.00	GND begins to bleach out and carbonates begin to pervade the core by coating and veinlets. Core progressively bleaches to ~123.70m where it remains constant until ~129.00m. Core can easily be scratched, qtz veins tough to see because digested; core displays mafics only. Salt and pepper appearance due to bleaching/sericite clay w/ minor chlorite hue. Aspy is present as med-dark grey oxidized veinlets. Core appears as "acid etched"		2	1		2	
10		129.00	130.19							
10		130.19	130.55	Gouge/clay seam, digested bleached core, although some mafic-retained zones. Sericite/chlorite present. Core is v. soft. Contact @130.19m, @20° to CA, cutting veins that are @~ 50°-60° to CA, carbonates present as stringers/veinlets	3	1	1	2		
10		130.55	131.30							
10		131.30	132.02	V. broken bleached/alt'd core. Core reduced to sandy sericite clay w/ some gravel sized pieces. **Note:** still remains a sheeted vn system, vning intensity ebbs & flows. From ~132.0-137.0m: core has a high amount of sheeted vns/meter (~1 per 5cm).		3	2	2	2	
10		132.02	137.09							
10		137.09	137.15	A chlorite/sericite/altered/stained core w/ almost rectangular carbs pass through the core @ ~40-45° to CA. Core immediately surrounding is mafic devoid. No visible sulphides associated.		2	2		2	
10		137.15	138.75	Core is bleached & alt'd to a mafic free, chlorite/sericite prevalent core. Core has greenish hue. Dissem py & aspy around relict selvages/vns/vnlets.		3	2			
10		138.75	139.05							
10		139.05	140.12	Core becomes alt'd grey w/ no visible mafics, sericite & chlorite prevalent. Calcite stringer initially present although they somewhat follow ~50° to CA w/ larger veins.		2	2		2	
10		140.12	140.33	Semi-massive to massive py (85%), aspy (15%) vein. Contact angle @140.33m is @~70° to CA.						
10		140.33	140.60	Grey clay gouge is rich w/ dissem sulphides, although they have been mostly oxidized & thus difficult to discern concentration or percentages of py & aspy. Looks like aspy is prevalent based on grey color & sparkles. Contact @ 140.60m is @30° to CA.						
10		140.60	144.27	Continues to be alt'd & sheeted vn system remains continuous onwards. GND alteration is notably increasing in chlorite, and core is displaying more prominent green color w/ biotite fading.						
10		144.27	144.54	Alt'd GND core is bleached w/ little to no mafics. Core has green hue speckled w/ carb spots (2-5%). Sericite & chlorite present; Core is easily scratched, and is essentially the selvage of py & aspy & sphalerite. Qtz vein @144.53m @40° to CA. Sheet vn system continues.		2	2	1	2

DRILL LOG LEGEND P1	DATE: June 6 - 10, 2005	PAGE 7 of 10		
DRILL HOLE # : DG05-280C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence	

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMQN = 20; DIOR = 25; MQD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		144.54	158.50							
10		158.50	162.04	Bleached/alt'd zone. Core is light green to light grey-white. Carbs are spotted w/in core like 'olive loaf'. Carb vns & stringer are present. sheeted vning continues, vns are ranging from 0.25-1.5cm thick and angle to CA has increased to ~70-75° to CA.		4	3	1	2	
10		162.04	163.65							
10		163.65	164.12	Sulphide qtz vn contacts @~65-70° to CA. 20-25% py & 20-25% aspy, sulphides are dissem throughout, but are somewhat oriented ~70° to CA (see photo). Surrounding core is alt'd to sericite/chlorite, yet coherent core.		2	2	1	1	
10		164.12	164.55							
10		164.55	165.03	Qtz sulphide vn w/ 2% aspy & ~2% py. Sulphide vnlets in vn are @~60-70° to CA.						
10		165.03	168.42	At 167.52m a slickenside @20° to CA, aspy on surface sheared & partially oxidized.						
10		168.42	168.64	Qtz/carb semi-massive py/aspy vn @~65-70° to CA. Alt'd selvage is continuous to 169.55m. Alt'n is abundant w/ sericite, minor chlorite (5%), little to no mafics, core is bleach & scratchable w/ a nail. Sheeted vning continues w/ spacing of vns/vnlets @~2-5cm apart w/in selvage.	1	3	2		2	
10		168.64	170.06							
10		170.06	170.69	Highly alt'd selvage leading to fault gouge clay @170.69-170.76m. Selvage is sericite abundant (25-30%), chlorite is ~5-8%. No mafics visible, minor relict qtz vns highlighted by aspy dissems or stringer @ typical 60-70° to CA.		4	2		2	
10		170.76	172.21	Core is mod alt'd, little to no mafics, essentially all selvage.		4	2	1	2	
10		172.21	172.49							
10		172.49	174.71	Core is mod alt, little to no mafics, essentially all selvage.		4	2	1	2	
10		174.71	175.26							
10		175.26	175.43	Core is extremely bleached & etched yet v. coherent (looks sand blasted & acidified). Stringers of py & aspy run w/ some minor direction ~70-80° to CA. Sericite & chlorite present.		3	2	2	1	
10		175.43	177.60							
10		177.60	177.64	A 4cm wide qtz/aspy (15%) vn @80° to CA. Alt'd selvage large & alt'n is significant.	1	4	2			
10		177.64	178.56							
10		178.56	181.36	Sheeted vning continues @70-80° to CA w/ spacing ~@5-8cm at most. From 181.36-182.66m, core is too alt'd to see vning system, yet continues from next box over.						
10		181.36	184.24							
10		184.24	185.93	Alt'd selvage that appears to be focused from a qtz/carb vn that's 6cm wide @45° to CA w/ 5-8% py & 3-5% aspy. @~185.29-185.93m. Alt'n intensifies to a category 4-5. Core is v. bleached, mafic free, w/ only sulphide stringers of ox'd py & aspy w/ abundant sericite & less chlorite. Dissems w/ GND perhaps not related to vning may be occurring but not observable enough to conclude for certain.		4	2	1	3	
10		185.93	190.50							
10		190.50	197.62	Sulphides, predominantly aspy, is being deposited via vnlets & stringers <0.1cm or mm sizes of qtz & carbs x-cutting larger vns, etc. Core would be estimated to contain ~2-3% sulphides total as a result. Sheeted vns appear to have disappeared but perhaps they haven't but the alt'n relicted the vns & discerning vns is no longer possible.		2	2		1	

DRILL LOG LEGEND P2

Selvages: 0 = No Alteration; 5 = Intense Alt'n

Ox. State: 0 = No Oxidized Sulphides; 5 = All Sulph Oxidized

Date: June 6 - 10, 2005

LOGGED BY: Kristian Whitehead, Terry Croteau

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar, 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
				At 195.58, the core becomes extremely alt'd to sericite & chlorite. The core is mafic-devoid & sulphides are ox'd almost completely. Some carb vnlets are preserved. Qtz eyes are small yet give core texture. Core almost is pure white in places yet core is competent, not clay. Appears as core has undergone acid etching from hot hydrofluids. At 195.95m a slickenside @ 40° to CA w/ a black graphitic looking ox'n product forming a thick coating (1-2mm) w/ slickensides on it		4	2		1	
10		197.62	198.35	The core is riddled w/ sulphide vnlets of py/aspy & ox'd sulphides. There is an abundance concentrated from 197.86-198.20m @~50% sulphides, ox'n is either high causing thick black graphite-like build up or it bismuthinite (unsure). Sulphides has relative angle of orientation @~40-55° to CA (see photos).						
10		198.35	202.78	Core becomes v. salt and pepper bleached w/ stringers & vnlets of predominantly aspy or ox'd grey sulphides throughout. Typical angle on discernable vns/vnlets @60-70°. To end of hole continued w/ unalt'd GND w/ fracs typical @60-85° to CA w/ some fracs occurring on vnlets of sulphides.		1	0	0	2	
10		202.78	206.65

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-24.38	0.00	24.38	Casing						
80	24.38-43.65	24.38	25.91	10cm GND section (24.38-24.48m); followed by metaseds w/ v. finely-laminated (<1mm) bedding, well-preserved w/ subtle compositional variation (i.e. more mafic/more felsic) btwn layers. Pure qtz pebbles make up 20% of total pebbles, have metaseds on margins so veining exists w/in metaseds. Ox'n through whole core.	3			1		
80		25.91	27.73	Metaseds as described above. One qtz vein offset by microfracture. Microfrac has same strike as bedding but cuts across w/in core. Strike 40° to CA.	2		1	1		
80		27.73	32.22	Gouge. Gravel to clay texture. V. few relicts of metaseds, pieces up to 6cm (qtz eyes or coherent mafic beds). Purple hue to some sections - high hematite content. Other zones have euhedral hematite grains ~2mm diameter. Color light yellowish brown w/ lenses ~1cm wide of pale whitish blue, dark brown, mustard yellow.	4	1		4		
80		32.22	33.74	Back to competent, moderately oxidized argillite as described above. Bedding @ 30° to CA. Beds have been moved along micro-fractures.	3	1		1		
80		33.74	36.45	Gouge as above (27.73-32.22m). Remnant hematitic bedding @ 34.4m, @ 25° to CA. Hematite crystals w/in qtz vns (2%).	4	1		4		
80		36.45	37.50	Gouge w/ qtz section 15cm wide.	3	1		3		
80		37.50	39.62	Clay to sandy-textured alt'd metaseds, 20% pebbles 1cm-4cm.	4	1		4		
80		39.62	43.65	GND infiltrates metaseds in 40cm, 30cm & 10cm sections. Carb (calcite) on frac faces.	3	1		1	1	
10	43.65-222.50	43.65	44.20	Unalt'd GND w/ carb/qtz veins & qtz veins w/ ~1cm selvages.	1				1	
10		44.20	45.62	Unalt'd GND except on fractures & micro-fractures where limonite is, and around qtz vns w/ tiny selvages.	1				1	
10		45.62	47.14	Calc & lim throughout GND veinlets & matrix. Crumbly texture.	2			1	2	
10		47.14	49.29	More competent GND w/ lim & calcite on fractures	1				1	
10		49.29	53.34	Crumbly GND w/ lim on micro-fractures & through matrix.	3	1		2	2	
10		53.34	54.86	8cm competent GND & gouge material in 10cm length.	3			2	2	
10		54.86	57.60	Competent but crumbly core, lim & calcite pervasive.	3			1	2	
10		57.60	61.34	1mm-2mm thick encrustations of lim on frac surfaces; calcite inside that layer, and through cracks in qtz vns.	2		1		1	
10		61.34	62.66	22cm gouge zone surrounded by 50cm selvage of alt'd GND. Color of alt'd material (selvage) is light brown. Gouge is whitish orange w/ pale blue/white clayey material w/ gravel-size qtz eyes/oxidized GND.	3	2	1	3	1	
10		62.66	64.01	Limonite stained, v. broken GND.	2	2	1	1	1	
10		64.01	65.53	Mod'ly alt'd GND. Few unalt'd sections (5cm long); rest pervaded w/ limonite.						
10		65.53	66.14	Minor alt'd GND. Ox'd selvages around qtz vns; calcite 1mm vnlets w/in veins & GND.	1	1	1		1	
10		66.14	67.06	Highly alt'd GND, limonite throughout matrix & veinlets. Color is pale greenish-yellowish brown & texture is clay to gravel. Common veinlet direction 10° to CA.	2	2	1	1	1	
10		67.06	67.47	Gouge to clay to sand texture. Slickensides defined in limonite/calcite fracture @ 25° to CA.	3	2	2	2	1

DRILL HOLE #: DG05-281C

FeOx: 0 = Unoxidized; 5 = Intensely Ox'd
Ser, Chl, etc: 0 = Unaltered; 5 = Intensely Altered
Carbonate: 0 = No Effervescence; 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION — Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		67.47	69.03	Limonite 90% pervasive in section, 10% unalt'd GND. Randomly-oriented calcite veinlets throughout.	3	2	2	1	1	
10		69.03	69.41	GND stained brown w/ little original texture remaining.	3	2	1	1	1	
10		69.41	70.31	Unalt'd GND & vns of qtz w/ moderate selvages. Lim & carb in less frequent veinlets.	1	1	1		1	
10		70.31	70.65	Limonite and carbonate staining pervasive. Overall, colour is light brown. 40% clay weathering makes rock weak but competent except 4cm gouge (clay)	3	3	1	2	1	
10		70.65	72.11	Limonite and carb less prevalent, but seen on ragged veinlets, generally trending ~10° to CA. Unaltered GND where not affected by sheeted vein set: 50% veins broken up (just linear qtz chunks)	1	1			1	
10		72.11	73.60	Limonite and carbonate pervading GND to weaker, but coherent core as at 70.31-72.11m. Early in sample, low angle fracture face shows lineated calcite (drawn - 40° to CA)	3	3	1	1	2	
10		73.60	74.46	Very weak rock due to pervasive limonite and calcite in < 0.2cm widths	3	2	1	2	1	
10		74.46	75.56	Sample is ~35% massive qtz, probably broken up and compacted old veins. GND weakened by pervasive lim and calcite.	3	2			2	
10		75.56	76.65	V. crumbly and clay-rich GND altered through pervasive limonite and calcite	3	4	1	2	2	
10		76.65	78.07	Sand-size material to GND chunks up to ~5cm.	4	3	1	2	1	
10		78.07	79.25	Extremely altered to white/brown clay-rich matrix. Calcite notable throughout.	3	3	1	1	2	
10		79.25	83.82	Gouge to crumbly, sericitized GND. Slickenside in muddy black clay on fract @10° to CA.	4	4	2	3	2	
10		83.82	84.60	Competent unaltered to moderate altered GND	1	2	1		1	
10		84.60	85.96	Old qtz/carb veins(@55°) overprinted by veinlets of limonite and calcite to 10°/110°. Veinlets have 2mm selvages. Very broken core, poor recovery here as well	2	2	1		2	
10		85.96	86.16	Sand. Pure. Medium brown	2					
10		86.16	87.51	Same as 85.60-85.96m, but more frequent carb/qtz veins. Lim covers fracture faces, at regular angles of 50/140°	1	1	1		1	
10		87.51	88.08	Unaltered GND w/ qtz veins and few lim veinlets. Ragged orientations, lim on straight fract too	1	1	1		1	
10		88.08	88.49	Calcitic and silica alteration more prevalent. Low angle fracture (10° to CA) w/ slickensides of ser and chl	1	1	1		2	
10		88.49	89.92	Lim/calc veinlets (1mm) weaken rock to v. broken. Texture of GND appears silicified, crystalline	2	2			1	
10		89.92	91.44	Few preserved sections of unalterd GND. 80% limonite stained, so pervasively that GND texture is erased	3	3	2		1	
10		91.44	92.96	30% unaltered GND w/ >2cm qtz veins w/ wide selvages	2	3	1		1	
10		92.96	93.61	Coherent, unaltered GND to 93.5m, where GND is limonized and brown coloured	1	1	1		1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		93.61	94.49	Heavily broken and limonized GND. Calcite and chlorite on fracture faces w/ no lineation	2	2	1		1	
10		94.49	95.59	Unaltered GND except selvages, around qtz veins and 1-2mm around veinlets/fractures covered w/ limonite and calcite	1	1	1			
10		95.59	96.01	Limonized and broken GND; weak and crumbly grey qtz vein	2	2	1		1	
10		96.01	97.54	Unaltered GND except carb + lim veinlet/fract w/ 1-2mm selvage. Larger qtz veins have weak silica-defined selvage	1	1			1	
10		97.54	99.06	Extremely altered GND. Chlorite, sericite, limonite throughout (colourful - yellow, orange speckles, greenish greyish brown). Original GND texture completely overprinted by alteration. Carbonate throughout as well (yellow part)	3	4	3	2		
10		99.06	100.58	Unaltered GND w/ qtz and qtz/carb veins w/ selvages (increased chlorite)	2	1	2		1	
10		100.58	103.26	Unaltered GND w/ qtz and qtz/carb veins w/ selvages (increased chlorite)	2	1	2		1	
10		103.26	104.12	Limonized and silicified GND gouge (yellowish brown) to competent (yellowish grey). Gouge section from 104.0 - 104.2m.	2	3	3	2	2	
10		104.12	104.64	Mod. Altered GND. Low angle (near parallel to CA.) veinlets (1-2mm) covered in lim and calcite. Also in random orientations	1	1	1		1	
10		104.64	105.80	Alt'd GND. Lim pervasive through 90%, rest is silicified. One small lens of ox'd sulphides @ 105.7m, 1mm wide, 3cm long, black	3	3		4	2	
10		105.80	106.43	Pale bluish white clay altered w/ veinlets, limonized (random) Hematite oxidized in qtz vein colours it pink	1	4	1	4	1	
10		106.43	107.32	V. mafic GND (qtz preferentially dragged to vein?) Separated by lim/q/cb alteration around qtz veins	1	3	1		1	
10		107.32	108.20	Extremely alt'd GND, colourful, as at 97.54- 99.06m. Lim fractures parallel to CA. Ser and chl on fract to 25° to C.A. Lim staining for 10cm (pervasive)	3	3	3	2	2	
10		108.20	109.73	Unaltered GND separated by selvages around qtz and carb veins. One qtz vein offset on 1mm fracture. Sericite lineation on fract face (10° to CA).	2	2		1	2	
10		109.73	110.35	Mod'ly alt'd GND; selvages oxidized	2	2	1		2	
10		110.35	111.05	Extremely altered GND, pale bluish white. Carb appears pervasive, stemming from randomly oriented veinlets throughout	1	4	2	3	4	
10		111.05	112.13	Extremely altered GND stained black, soft, flakey mineral	1	4	2	3	2	
10		112.13	125.51	Chloritized, clay-altered GND w/ <20cm blackened sections. Only slight variation in composition throughout. Overall colour is pale bluish green, and either white or black. Soft, clay to crumbly texture. @120.40m, a lens of grey clay w/ lineation, drawn, face is at 50° to CA.	1	4	3	3	3

DRILL LOG LEGEND - P1 | DATE: 8 to 11-June-05 | PAGE 13 of 14

DRILL HOLE #: DG05-281C

FeOx: 0 = Unoxidized; 5 = Intensely Ox'd

Ser, Chl, etc: 0 = Unaltered; 5 = Intensely Altered

Carbonate: 0 = No Effervescence; 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		194.40	199.17	Unalt'd GND and qtz veins w/ selvages. At 194.7m, a xenolith of amphibolite, 5x4cm. Slickensides shown in chl/ser on fracture face 20° to CA. Qtz veins are mostly milky qtz on margins and selvage with cloudy grey qtz in centre.	1	2	1		1	
10		199.17	200.85	Carbonate-infused GND. Breaks along veins at 25°-35°. Regular fractures (no carb) at 65° to CA. Veins (noted), are somewhat silicified and difficult to see. Slickensides on 60° fract face, perpendicular (drawn) to CA.		2			2	
10		200.85	202.09	Unalt'd GND except selvage around qtz veins and sulphide vein. 3cm gouge zone at 201.61m		2		1	1	
10		202.09	204.72	V. fine grained GND. Colour is dark grey. Aphanitic, competent texture.			1			
10		204.72	222.50	Unalt'd GND. From 214.88 to 216.35m. Rich in carbonate veining on fractures. GND is 35% qtz, 25% bt, 20% feldsp, 20% hb. (E.O.H)		1			1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		0.00	6.10	Casing (recovered 5.73-6.10m), GND description below.						
10	6.10-191.80	6.10	14.30	GND description as previous 2005 holes. sheeted vning essentially begins @ collar depth, vns are regularly @ ~40-45° to CA w/ avg widths of 0.25-1cm w/ dissem aspy (~trace to 3%) common. Vn spacing is currently @ 5-40cm apart. Fractures have limonite staining, lim is not pervasive.						
10		14.30	30.79	Core recovery is poor & core is severely broken, vning w/in coherent, larger pieces is not striking but subtle in appearance. Broken pieces don't have qtz pieces w/in, indicating veining. Thus conclusion remains @ modest vning system.						
10		30.79	35.05	Core remains the same GND mineralogy as from casing. Vning abundance is up to ~10-15/metre, but broken core makes precision of #'s difficult. Primary angle is 40° to CA w/ aspy the predominant sulphide w/in qtz vns.						
10		35.05	36.73							
10		36.73	37.17	Core is alt to light grey, mafic free, qtz eyes, sericite & chlorite present a soft, essentially a selvage for a vn, defined by ox'd sulphides & unox'd aspy ~5% & py ~1-2%. the interpreted angle to CA is @ 40° to CA. Some carb vnlets & clay.	2	3	2	2	1	
10		37.17	39.78							
10		39.78	39.86	Sandy/clay seam (unit). Core appears mildly bleached some (trace) aspy flecks.		1		2		
10		39.86	44.00	At ~42.43m is an area of GND pc's w/ a large amount of aspy & py. Orientation imperceptible but core pc's appear somewhat alt'd. Sulphides mildly ox'd: py @ ~3-5%, aspy @ 3%, difficult to be sure.		2	1	1	2	
10		44.00	44.20	Med alt'n zone due to two 1 & 1.5cm qtz & qtz/carb vns w/ ~5-10% sulphides (aspy & py). Chlorite hue on core. Core mafic devoid. Dull green/grey.	1	2	2		1	
10		44.20	53.34

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		53.34	53.81	Intense alt'n zone, core is extremely bleached & reduced almost to clay ox'd py & aspy. Focus appears to be @ 53.42-53.47m where there's a digested carb/qtz vn @ 55-60° to CA. Sulphides are all concentrated w/in or predominantly adjacent, thus a large selvage from 53.34-53.81m.	2	4	2	3	3	
10		53.81	56.23	Core is salt & pepper textured; feldspars are reduced to white sericite & hornblendes remain as mafics. Core is like a strong clay.	1	4	1	3	1	
10		56.23	56.55							
10		56.55	57.34	Slickenside @ 10° to CA w/ gouge on one of slickenside surfaces. Srfc had ox'd aspy, perhaps py w/ slickened srfc.						
10		57.34	57.73							
10		57.73	57.91	Core becomes severely hydro alt'n etched yet mafics remain as salt/pepper texture. Qtz/carbs are broken to chalk-like hardness. Ox'd aspy & py present as graphite grey stringers/vns.		3	1	2	3	
10		57.91	58.79							
10		58.79	59.44	Slightly chlorite/sericite alt zone, essentially a continuous selvage section due to sheeted vning closeness.		2	2		1	
10		59.44	61.79							
10		61.79	63.40	Extreme hydrothermal alt'n window, core is v. bleached, yet some mafic zones exist. sericite & chlorite abundant, ox sulphides are visible abundant in zones, mostly looks aspy. v. broken core makes interpretation difficult. carbs abundant due to acid testing response. sulphides may be ~2-4% of core.		4	2	2	3	
10		63.40	66.50							
10		66.50	67.30	Selvage alt'd around gouge zone @ 67.06-67.14m. Gouge has ~1% py & >1% aspy. Gouge fizzes on acid, and is grey & white. Contact of gouge @ ~60-65° to CA.		4	2	5	2	
10		67.30	71.63	Core is v. broken but long shards along carb vnlets & stringers. Core is abundant on fracs w/ calcite & dolomite. Opinion is the predominant sulphides are coming in w/ carbs w/ py being the most noticed associated w/ carb vning. Carbs are often sheared w/ frac rock @ lower angles to CA.						
10		70.05	82.69	Core is v. broken, v. high amount of pc's w/ slickensides of polished aspy & py, which is mostly ox'd. Frac angles include 30° & 55° to CA.						
10		73.43	73.54	Faulted gouge/sand sized gravel w/ pure qtz pc's/slickensided pc's. Angle looks to be @ 20° to CA w/ ox'd aspy & py. Carb pc's also involved.		1		2	2	
10		74.18	75.48	Alteration zone, core is essentially a connected set of selvages. The focus of the selvages would be an 11cm thick carb dominant sulphide & minor qtz vn @ 35-40° to CA. Py continues to be dominant sulphide running w/ carb vns.		2	2		1	
				At 77.10m: the qtz vns have increased in size to 1cm or greater, and the first appearance of po (0.1%).

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		82.94	83.24	Highly alt'd clay ream, sericite prevalent. White-grey clay, contact @ 82.94m @ 40° to CA, contact @ 83.24m @ 60°, slickenside srfc on either contact w/ competent core. Visible ox'd sulphide vnlets @ ~60° to CA.						
				At 83.24m: salt & pepper bleached/alt'd GND begins from this point. Core appears as acid bleached. Core is coherent, can be mushed by pushing heavy on it, indicating substantial sericite/clay content. Frac srfc's are commonly coated w/ slickensided ox'd sulphides.	2	4	1	2	4	
10		85.34	85.90	Core is very broken yet ox'd sulphides are abundant on fracs & fracs are abundantly slickensided. Py & aspy are discernable in some places.						
10		85.90	86.87	Alt'n selvage w/ slickensides on fracs w/ ox'd sulphide staining on srfc @ ~50° to CA.	2	3	2	1	0	
10		87.67	88.00	Same as above.	2	3	2	1	1	
10		91.44	93.19	Same as above w/ carb stringers on occasion. ~1% of core.	2	3	2	1	1	
10		93.52	94.01	Alt'n selvages contiguous due to qtz & carb vns @ ~60° to CA.	2	3	2	1	1	
10		95.63	96.01	Same as above.	2	3	2	1	1	
10		96.01	99.06	GND; mod to strong ser+ arg alt'n, locally wkly sheared to fault gg		3		4	2	
				At 97.86 - 97.87m = 0.5 cm py + aspy vn + qtz + cb						
				A few 1-2 cm dark mafic "xenos", commonly biotite (70%) + feld (+/- chl)						
				Tr aspy in selvages, disseminated						
				Local graphitic-pyritic slip surfaces at 60 deg						
10		99.06	100.58	Similar to above; slightly more sulphide veining		3		4	2	
				99.06 - 99.07m; qtz-cb vn @ 10 deg with 4% aspy + 0.3 cm qtz aspy vnlt (+/-cb) at 55 deg						
				At 99.2 m - graphic slip at 10 deg						
				At 99.53 - 99.57m, gougy zone (flt'd) at 30 deg to CA						
				Includes a 1 cm (99.54 - 99.55m) py-aspy +/- qtz vn						
				Commonly sheared to fract'd at 10-20 deg; highly alt'd, minor less alt'd GND zone						
				At 99.96 - 99.98m; similar py+/- py-aspy+/- qtz cb vn as abv; also with flt gg at 90 deg and at 20 deg to vn (at 70 deg)						
				At 100m fractured/sheared foliation at 60 deg and 20 deg						
10		100.58	102.11	As above; weakly sheared at 10-20 deg		2		3	2	
				At 105.73 - 105.74m = py + aspy + qtz/cb vn at 70 deg with a graphitic slip surface; possibly syngenetic/fracture filling; dominantly py on one side and aspy on other						
				At 101.2m fracture foliation at 10 deg to CA						
				At 101.96 to 101.97m = 1 cm fault gouge at 10 deg						
10		102.11	103.63	At 102.25m = fracture foliation at 20 deg and 120 deg		3		4	2	
				At 102.75m gougy surface (possibly shear - wk faulting) at 20 deg						
				At 102.75m slip surfaces (10cm spacing commonly) at 160 deg (relative to previous slip)						
				At 103.5m = fracture foliation at 5 deg; cb coated						
10		103.63	104.37	Moderate to strong alteration with shear in upper 20 cm		2		2	1	
				At 103.9m shear fractures at 20 degrees						
				At 103.95m fracture foliation at 60 deg (150 deg)						
				At 104.2m pyritic slip surface at 60 deg (150 deg)

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other	
10		104.37	105.60	GND; less alt'd; less shr; common 1-2mm qtz-py-aspy-cb vnlts at 60 deg		2		1	1		4
10		105.60	106.68	Highly alt'd GND; possibly shear/fault zone at 105.65 to 105.7m; 105.7 to 105.8m highly altered with moderate shear at 45 deg; At 105.6 -105.65m py+aspy+qtz/cb veins (2 to 3) up to 1cm in hanging wall of high alteration/ shear zone; lower contact to this zone at 106.2m at 45 deg		3		5	2		
10		106.68	107.20	As above		3		5	2		
10		107.20	108.20	Moderately altered GND; trace disseminated py in selvages; At 107.6m = slip face at 60 deg to core axis		2		2	1		
				At 107.9 - 108.0m gougy zone, possibly a flt; high argillite alt'n with tr-1% diss py; upper contact at 70 deg; common slip faces at 60 deg							
10		108.20	109.72	Moderately alt'd GND; wk shr fracturing; at 108.25m shear foliation at 60 deg; increasingly alt'd towards the base; more rubbly		2		2	2		
10		109.72	114.80	Very poor recovery; only small to 10 cm pieces; qtz + aspy + py stringers		3		1	2		
				At 114.66 - 114.8m gouge zone sheared to moderately faulted at 60 deg; 1-3mm stringers throughout							
10		114.80	114.97	Sulphide - Quartz vein at 60 deg; bottom contact of gougy shear and highly alt'd zone at 60 deg; v f g to 3mm grains; shear/fault related?		2		2	1	1	
10		114.97	121.92	Moderately to weakly alt'd; At 115.5m slip face with minor gouge at 30 deg to CA		3		2	1		
				Sheared to gougy sections; moderately fractured with gouge in btw pieces of broken GND							
				At 117.3m = pyritic slip at 40 deg							
				At 117.6m = fracture foliation at 30 deg; 118.6m - 118.87m = broken core with cb on fracture surfaces; At 118.95m fracture foliation at 10 deg and 160 deg							
				At 119.5 - 119.7m, 4 X 0.2 - 0.3 cm py +/- aspy vnlts at 60							
				At 119.8 - 119.9m = minor gouge to shr at 20 deg to CA							
				At 120.45 - 121.4m = multiple <1cm qtz (sheeted?) vnlts at 30 to 25 deg							
				At 120.65m slip at 150 deg relative to vnlts; planar with sericite							
				At 121.18m - pyrite vnlt at 70 deg at 90 deg to quartz veinlets (py + aspy + aspy + qtz)							
				At 121.65 - 122m = broken core							
10		121.92	123.02	GND, moderately altered due to quartz veinlets' local pyritic fracture filling (1mm)		4		3	2		
				At 122.6m at 130 deg (relative to qtz vnlts) is qtz-carb vnlt (o.3mm) with tr py							
10		123.02	123.99	Shear GND; light green; sheared to gg (irregular); quartz-py _ aspy vns at upper and lower contacts; minor gouge at upper and lower contacts as well		4		3	2		
				At 123.99m pyritic slip at 43 deg to CA parallel to pyrite vein							
10		123.99	126.49	Slightly less alt'd than prev; multiple quartz (+/- cb) vnlts with aspy-py; at increasingly low angle to CA		3		3	2		
				At 124.57m sericitic slip face at 15 deg, parallel to veinlets							
				Core moderately broken; mnr veining; at 125.05m slip at 60 deg							
10		125.47	126.49	increased alteration of GND; common low angle slip/shr faces and some veining; At 125.47 - 125.49m = gougy shear at 45 deg to CA; At 125.98m slip at 10 deg to CA with stria at 60 deg		4		3	2		
10		126.49	128.40	Less alt'd GND; low angle veins moderate alteration; qtz +/- py and aspy		2		1	1		
10		128.40	129.35	Increasingly altered GND due to qtz vn, 1 cm with py on margins		4		3	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		129.35	131.70	Slightly less altered GND than prev; At 129.85m = low angle quartz vns (20 deg)		4		2	2	
				At 131.1m quartz-cb vnlts at 35 deg; At 131.2m low angle qtz/cb fracture filling with ser slip faces at 15 deg; At 131.25m at 140 deg, quartz open space filling; euhedral quartz xtls in 1 cm vug						
10		131.70	132.05	Mnr faulting with associated veining		4		3	3	
				At 131.7 - 131.76m = Quartz vein with high sulphides (py gen; at lower margin)						
10		132.05	133.10	Less alt'd than prev; less shr; carb-qtz vn with trace sulphides at low angle (15 deg) to CA		3		2	2	
10		133.10	144.45	Less alt'd than prev; still dk bt, occasional alt'n adj to vein sets; relatively less fractured and sheared than prev		1		1	1	
				At 135.1 - 135.14m = FLT GG at 40 deg to CA; ser-arg-carb alt'd; no vis min; At 135.63m = graphitic slip with striae at 30 deg; face at 15 deg						
				Sheeted veins of qtz +/- coarse grained aspy/py; spacing btw 5 and 20cm; <1cm diam; At 136.58m graphitic slip face at 25 deg with straie at 20 deg; tr py; At 136.6 - 136.75m 0.2 mm fracture filling by carb-arg (clay) at 150 deg relative to the previous slip face						
				Generally uniform; weakly alt'd GND with mnr alteration associated with thin qtz vns (+/- tr py-aspy); at 138.38m slip shr face @ 25 deg; mnr carb coatings						
				Sim to abv						
				Mnr veining wi a "xenolith" of dk mafic (perhaps pot alt'd?) (78% bt + qtz + feld)						
				Similar to abv; slightly more vnlts; (qtz +/- py/aspy) gen at 30 deg to CA						
				Similar to abv; slightly more aspy in strings and local disseminations; irregularly fractured and slightly more alt'd from 143.76m						
				At 144.45 - 144.66m, moderate ser-cb-arg alt'n assoc'd with qtz-aspy-py vn at 40 deg to CA		3		2	2	
10		144.66	147.35	144.66 - 147.35 Weakly to locally alt'd GND; 145.4 - 145.75m = multiple qtz +/- py vnlts, vein to blotchy aspy selvages (0.7%)		1		1	1	
10		147.35	148.42	Increased alteration due to mnr shearing; mnr - tr qtz +/- py veining		3		3	3	
10		148.42	150.55	Locally wkly alt'd GND; generally unalt'd; mnr qtz +/- py/aspy vnlts		1		1	1	
10		150.55	153.00	Generally wkly to mod'ly ser-cb-arg alt'd; local mnr zones of relatively unalt'd GND		2		2	2	
				151.3 - 151.32 = Shr to gouge; high argillic alteration at 20 deg to CA					4	
				151.6 Slip/Shr plane at 30 deg to CA; slightly pyritic and gougy						
10		153.00	153.92	Moderately alt'd GND due to qtz - py/aspy vn (grey qtz); At 153.63 - 153.68m; 153.72 - Shr/slip at 30 deg parallel to vn		3		4	2	
				Locally blotch aspy/py in selvages (<2%)						
10		153.92	156.40	Weakly to locally relatively unaltered (grey) GND		2		2	1	
				At 154.15m - black (pyritic) slip at 40 deg						
10		156.40	156.97	Sericite altered GND; increasingly altered towards base of interval		3		2	1	
				At 156.76 - 156.78m = Qtz cb vn wi 1-3% py/aspy						
10		156.97	157.50	Weakly alt'd GND		2		1	1	
				At 157.5m = slip (pyritic face) at 40 deg						
10		157.50	159.40	Moderately to strongly alt'd GND; wkly sheared; shr fracts commonly filled with cb/qtz; some qtz +/- py veining; core soft		3		4	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		159.40	161.90	Higher Cb alt'n; core more competent (hard); increased veining		2		2	4	
				Increased silica; local pyrite stringers/fracture filling						
				161.35 - 161.41m = 2 X 0.5 cm zones of high pyrite mineralization in highly altered GND; irreg, though generally at 30-40 deg						
10		161.90	164.45	Non to locally weakly unaltered GND		1		1	1	
				From 162.75 to 162.76m: Qtz vein (gy clr qtz) with 2% aspy ± py. Noted alt'n is local.		2		3	1	
10		164.45	170.80	Highly argillic altered GND; common unaltered biotite; generally soft; rare veining; not a fault		3		5	2	
				gouge; rare veins						
				Core slightly more competent; less alt'd than previous and slightly less veining						
10		170.80	171.22	Sericite +/- argillic altered GND adjacent to 2-3cm qtz vn (with up to 3-4% aspy); no mineralization visible in the selvage		2		1		
10		171.22	173.12	Weakly to locally strongly alt'd GND		2		3	2	
				GND more competent adj to qtz vnlts, becoming more argillic alt'd within 10cm of vein; commonly cb +/- qtz on fracture surfaces; sampled relative to larger veins/veinlets		3		4	3	
				At 172.38m aspy-py coated (slip?) surface at 35 deg						
				Qtz vein at 35 deg (172.84 - 172.87m) with dk py; blebs of aspy and py-aspy coated lower contact; dominantly arg-ser-cb alt'n on either side						
10		173.12	175.00	Sericite alteration dominant with locally increased argillic alteration;		3		3	2	
				Nice py-aspy bearing vn (with shear?) at 173.2 - 173.25; slip/shr surfaces at 50 deg; py-aspy coated; dominantly se alt'n						
				Qtz-aspy-py vein; grey to white qtz, sulphides dominantly on margins with 2-3 mm and of spy through middle; black py (possibly due to shr) on margins						
10		175.00	175.86	Weakly ser-chl-arg alt'd GND with multiple thin qtz vnlts; increasing argillic alt'n towards the base		1	2	1	1	
10		175.86	177.40	High argillic alteration; moderately - highly gougy, some quartz veining		3	1	4	2	
10		177.40	177.53	White to grey qtz vn, 3% aspy wi 1-2% py at margins						
10		177.53	178.65	Argillic + sericitic alt'd GND (Lt gn to white)		3		3	2	
10		178.65	179.44	Relatively unaltered GND		1		1		
10		179.44	180.60	Intensely arg/ser alt'd GND due to white quartz veining, poor mineralization		4		5	2

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0 - 21.34			Casing (no recovery)						
10	21.34-205.76m	21.34	22.86	Extremely altered GND. Competent chunks up to 3cm diameter, oxidized through. sencite clay and argillic clay make up 80% of sample	5	4	2	4		
10		22.86	25.91	Extremely altered but coherent rock. purple hue suggests hematite content (up to 40%) Carbonate on veinlets close to parallel w/ C.A. Qtz eyes visible, remnant GND texture barely. sand size gouge section @ 23.6m (10cm wide)	5	4	2	1	1	
10		25.91	28.00	Oxidized GND. Colour light to med brown. 3cm gouge (clay) section with slickensides (mod strength) at 26.5m. Yellowish brown clay	5	3	2	1		
10		28.00	28.96	Same rock, but more clay alteration (30%). Highly altered and broken up GND. Breakage at parallel to CA - 10°	5	4	2	1	1	
10		28.96	31.29	Same as 25.91 to 28.00m, except gouge @ 29.85 (cm wide)	5	4	2	1	1	
10		31.29	32.00	May have once been one large qtz vein, chunky qtz pieces up to 4cm wide dominate the section. Gouge (clay to sand) section from 31.8 - 32.00	5	4	1	2		
10		32.00	34.05	Med to light brown GND. Original texture 90% overprinted and aphanitic	5	4	3	2		
10		34.05	35.05	Poor recovery here. Deep brown sandy alteration product makes rock very crumbly	4	2	3	1	1	
10		35.05	36.20	Extremely altered, but coherent rock. Veinlets show lim/calcite. Overall colour greyish dark brown w/ green (CHL) and orange (LIM) on veinlets w/ wide, pervasive selvages	4	2	3	1	1	
10		36.20	37.00	Poor recovery, same rock. Veinlets are everywhere, approach 20 per $10cm^2$	5	2	1	2		
10		37.00	38.10	Oxidized (limonized) selvage around qtz veins and lim veinlets separated by unaltered GND (up to 8cm across, uneven patches).	3	1	1			
10		38.10	42.67	Extremely altered GND. Gouge to crumbly gravel section. Competent zones (still highly oxidized), up to 8cm long	4	2	3	3	1	
10		42.67	44.25	Brown, coherent GND (as at 35.05 - 36.20m but w/ less chl) vein full of hematite, red, concretionary texture	4	2	1	2	1	
10		44.25	47.24	Altered to clay (appears as gouge, but no slickensides). and minor brecciated GND	4		1	4	1	
10		47.24	49.54	V. broken up core. Pieces avg 4cm. Lim staining pervasive. hematite w/in qtz veins and at margins to 15%	4	1	1	1	1	
10		49.54	50.44	Broken up, limonized rock, w/ minor clay	4		1	2	1

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41 BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93												
UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other		
10		50.44	53.34	V broken up core w/ limonite and calcite on fracture faces and limonite pervasive. Slickensides (med grade) on fracture face to 40° to CA, shown in sericite	4	1	1	1	2			
10		53.34	54.44	Area of granular GND w/ alt'n zones separated by unaltered zones up to 8cm in diameter. Massive aspy vein w/in qtz vein	2	1	1	1	1			
10		54.44	54.74	Clay zone. No evidence of fault or shear here, but upper and lower to it has slickensides. Limonite and carbonate clay.	5	1	1	4	3			
10		54.74	55.97	Lim/carb rich altered GND. Coherent, relict GND texture easily visible in qtz/bt, but overall, colour is yellowish brown. Qtz vein broken but still in situ in coherent core.	3		1	1	3			
10		55.97	57.91	Less alt'd here. Unaltered GND between selvages around veinlets of limonite	3		1		3			
10		57.91	60.96	Slickensides in oxidized py and sericite. Strong on fracture faces @ 45° and 30°. Moderate altered GND								
10		60.96	65.53	Unaltered GND (20%) separated by selvages of veinlets of lim/calcite (mod slickensides) and sulphide veins. Slickensides in ox. py. on fracture faces @ 45° and 30°, sand size and crumbly texture for 20% of section								
10		65.53	70.10	Lim-alt'd GND w/ calcite. Color is pale brown. Relict texture of GND (90%). Vnlets w/ lim/calc are random & irregular.	3	0	1	1	2			
10		70.10	71.20	Grades from lim-stained GND relict texture to completely alt'd & unrecognizable w/ qtz, chunky w/ vnlets of ox'd py, ~5% of sample.	4	1	1	1	2			
10		71.20	71.63	Clay/gravel texture. Lenses of black, alt'd bt.								
10		71.63	83.13	GND, highly alt'd to crumbly, mostly (80%) incompetent rocks. Lim & calc vnlets pervade the rock & weaken it. Overall color white, orange & brown. Black bt speckles. Vns exist as alt'd/broken lines of qtz chunks: rounded; associated w/ clay-like black lenses of ox'd py.	4	1	1	3	4			
10		83.13	87.80	Clean, unalt'd GND except for selvages around grey qtz vns & minor sericite throughout GND for part.	1	2	0	0	1			
10		87.80	100.58	Rock dominated by lim staining & calcitic selvage. GND texture relict beneath brown staining. Small unalt'd sections (<10cm) where vnlets are less frequent (only 8 per 10cm of core). Most sections vnlets >20/cm. Crumbly/sandy texture (50%), broken up core to pc's <10cm (50%). at 93-93.1m: a qtz-carb vn.	3	2	1	2	3

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		100.58	102.65	V. broken, unalt'd GND broken on lim microfracs at reg angles to CA: 40°/120°. Carbonitized section from 102.01-102.11m, w/ slickensides & a sheared-out appearance, trending to 60° to CA. V. white (sericite, carb) w/ slickensides defined in vnlet of mafics (alt bt?).	1	1	0	1	1	
10		102.65	103.63	V. broken core, lim near pervasive but ~2-5cm pc's, unalt'd in the centre.	2	2	0	1	1	
10		103.63	109.73	Carbonitized/sericitized GND. Selvages noted are in immediate proximity, if available. Carbonate appears in vns as well as throughout matrix of GND.	0	4	0	1	3	
10		109.73	112.78	Carb-ser alt'n to pervasive crumbly clay rich rock. Light grey-white shear zone. Slickensides (ser & alt bt) & aligned planar sericite throughout. Mafic lenses are dark grey clay & make up 50% of section; does not include py - too soft; none visible shear zone hits competent rock @ 50° to CA. No limonite.	0	4	0	4	3	
10		112.78	121.92	Minor alt'd GND. Slightly silicified & sericitized & carbonitized. GND texture for 90% of section where alt'n is, rock is more crumbly & white. V. minor limonite on 5% of section (end 1m). 4x3cm xenolith (mafic) f. grained diorite @ 115.70m few more ~1cm diameter throughout section (3). 2cm shear section combining pale beige gouge sand. Evidence of shear in mafic (dark grey clay) bands, movement appears to 90° to CA.	0	2	0	0	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		121.92	135.64	V. minor alt'd GND. Slightly more mafic in appearance. Vnlets, infrequent, of calcite infrequent 1 or 2/m of qtz w/ po. no (<1%) limonite. small xeno @ 124.5m, long axis parallel to qtz vn (40° to CA). 3x1cm. Reg breakage @ 30 & 80° to CA. Mod mineral slickensides on 30° faces, bt or dark sericite (soft, micaceous). 90% of qtz vns are grey qtz in the centre, w/ silicified zones surrounding. @ 133.6-135.64m: parallel to CA fracs break core lengthwise (2, mainly).	0	1	0	0	1	
10		135.64	139.59	Minor alt'd GND. Selvages around fracs & xenoliths account for alt'n. Slickensides in sericite/chlorite on frac faces @60° to CA.	0	1	1	0	0	
10		139.59	147.51	V. minor alt'd GND (carb), w/ large qtz vns (8cm max), small selvages. Xeno's up to 15x8cm (@142.2m) in size.	0	1	1	0	1	
				Cube (1cm^2) of qtz surrounded by 4mm selvage of chlorite @141.9m.						
				At 144.38m, nice, 1-2mm cpy. Slickensides on fractures @20-40° to CA increase in strength toward end of sample						
10		147.51	148.20	Fault zone. Crumbly gouge to gravel (brecciated GND). Contacts unalt'd GND at 20° (upper) & 35° (lower) w/ nice sericite slickensides.	1	3	2	3	3	
10		148.20	151.69	Carbonitized GND. Calcite in vnlets & through matrix of GND, making its texture crumbly & granular. Overall, color is whitish pale grey.	1	2	1	0	3

Lith Code: -1 = No Code; QVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		151.69	154.68	Mod'ly alt'd GND. Calcite-infused from vnlets & through matrix.	0	3	2	0	2	
10		154.58	156.74	Carb & chl & ser-alt'd GND. Crumbly gravel to sandy texture. GND texture 90% erased. Weak slickensides on irregular frac faces, in alt'd bt & ox'd py. General trend to these black lenses is 45° to CA. Color is minty green w/ grey & white patches.	0	4	3	1	3	
10		156.74	157.32	Sample is 75% pure qtz & carb (vn) & 30% carbonitized GND selvage, all quite crumbly.	0	1	0	1	4	
10		157.32	158.82	One huge (150cm) qtz/carb vn. 5% sulphides (half oxidized) disseminated throughout. Quite soft (5) & crumbly, opaque white.	0	0	0	0	4	
10		158.82	166.82	Mod'ly alt'd GND. Broken up to ~10cm chunks avg. Grey qtz vns w/ irregular edges & no real orientation. From 162-162.5m: low angle grey qtz vn appears folded. Lack of selvage also suggests post-vn mmphsm/ 2nd intrusion/ degree of heat to reset GND as unalt'd. Selvages relation to vn size is cryptic. Next small vn has large selvage (diff comp - may be part of later vein episode).	0	2	1	0	2	
10		166.82	169.99	Section dominated by large qtz/carb vns (1.03m & 1.46m wide). 3.17m total, 2.49m vn at 168.35m, (40cm section btwn >1m vns), one small selvage has ox'd py smeared onto frac face; treated as vn even though it has obviously been sheared.	0	1	1	0	3

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		169.99	183.82	Minor carb alt'n around qtz/carb vns & through vnlets. Otherwise v. minorly alt'd GND.	0	1	1	0	2	
10		183.82	184.80	Beginning gradation to heavily chloritized GND. Half of sample is v. alt'd w/ ser & chl. Unalt'd GND appears v. mafic (qtz <20%) w/ milky qtz vns.	0	3	3	0	1	
10		184.80	185.93	70% alt'd GND here. Appears in bands, selvage around qtz/carb vns.	0	2	4	0	2	
10		185.93	187.45	Crumbly, carb-rich, highly chloritized rock. No evidence of shear.	0	2	4	2	3	
10		187.45	205.26	GND chl'd. Color medium teal green to deep greenish grey. Reg fracs at 60-70° to CA. Smooth appearance, aphanitic. Med-sized qtz vns (~2-3/m) run through entire section. Vnlets of calcite are also frequent (~20/m), at 60° & 0° to CA. Qtz vns have a varying amount of calcite w/in them, from 0-90% - noted per sample on 2nd page: if calcite <50%, it is considered a "1", if >50%, "3"-type vein. @ 202.00-202.69m: a banded section w/ ox'd py in chunks to vnlets surrounds broken & rounded qtz vns.	0	2	5	0	2

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-284C

PROJECT: Dublin Gulch - 1735

GROUND ELEVATION: 865m

BEARING: 000 | DIP: -50°

DATE STARTED: 15-Jun-05 | DATE COMPLETED: 17-Jun-05

LOGGED BY: Terry Croteau & Kristian Whitehead

CONTRACTOR: Britton Brothers

COORD SYSTEM: NAD 27: EASTING: 459105 NORTHING: 7099382

COORD SYSTEM: NAD 83: EASTING: 458987 NORTHING: 7099570

NAD 27 (CORRECTED for historic grid): EASTING: 459075 NORTHING: 7099392

SECTION LINE 459075 (historic grid)

DRILLING DETAILS

Hole Diameter: HQ

Overburden: 10.67m

Deviation:

Casing: 10.67m

Core Size: HQ

Cement (# Bags): 0

Plug Depth: N/A

Notes: No plug necessary.

SAMPLING DETAILS

Sample Sequence: B292980-B293000 and B380201-B380246

Requisition #: MASP448STRGOL.05Q | Date Shipped: 21-June-05

Lab Record #: VA05052040 | Date Received: 30-June-05

Sample Sequence: B380247-B380300

Requisition #: MASP448STRGOL.05Q | Date Shipped: 24-June-05

Lab Record #: VA05054218 & VA05053956(301-306) | Date Received: 05-July-05

Sample Sequence: B290356-B290387 (returns)

Requisition #: MASP448STRGOL.05Q | Date Shipped: 24-June-05

Lab Record #: VA05053955 | Date Received: 04-July-05

Duplicates: B292982, B380202; B380222; B380242; B380262; B380282; B380302

Preparation Duplicate/ Check Assay: B292989; 380209; 380229; 380249; 380269; 380289

Standards: B292990 (3C); B380210 (4D); B380230(1A); B380250 (6F); B380270 (6F); 380290 (3C)

Blanks: B292996; B380216; B380236; B380256; B380276; B380296

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-10.67	0.00	10.67	Casing (No core recovered)						
80	10.67-18.29	10.67	18.29	MSED: Meta sediments (argillite) , foliations are mm scale w/ foliations at 10-11 metres at 60 ° wi limonite semi pervasive on foliation; lim predominant on fractures. Core is black with minor qtz boudins and stringers, no sulphides present at surface. Not silicified (scratches with nail).	3					
12	18.29-19.30	18.29	19.30	GNDD (Granodiorite Dike), upper contact not vis. Broken core, qtz vn wi dissem aspy (tr) pieces; lower ctc at 60-65°		2		3		
80	19.3-21.54	19.30	21.54	Meta-Sediments; very broken core; Foliation at 40-50°; GND vein at 40° (7cm); qtz veins at 90° to GND dike at 20° (or 155°) TCA; trace diss aspy; GND intruded metaseds parallel to foliation at 40° TCA						
10	21.54-22.49	21.54	22.49	GND; broken core; sections of bleached GND with sulphides and quartz veinlets		2		3		
80	22.49-57.91	22.49	57.91	MSED; Foliation at 0° or parallel to CA; upper contact at 40° TCA						
				At 24.47m MSED's become silicified and core badly broken						
				At 27.43m recovery increases; Foliations and crenulations at 45° TCA to as steep as 85° TCA at 30.78m						
80		35.05	36.58	MSED foliation at 45° TCA; hematite on fracture surfaces; veinlets running at 45° TCA contain trace cpy in vein; At 35.56 3 cm GND dyke at 40° TCA; broken qtz vn present with weathered aspy						
80		36.58	38.10	MSED; Foliation to 0 ° TCA and becomes crenulated; changes to 30 ° TCA at 37.62m; Sheeted vn set at 37.06m at 40 ° TCA (3 0.5 cm qtz vns)						
80		38.10	39.62	MSED; Good recovery; lim on fracture surfaces; Foliation at 70° to 45° TCA at 38.3m						
80		39.62	42.34	MSED; Foliation at 50 ° TCA; Core becomes darker (more arg?) and broken; Recovery decreases, becoming very poor (30% at 41.15m)						
				At 40.20m - 3 cm and 4 cm qtz veins; grey qtz at 60° TCA; trace aspy; gravel sized MSED at 42.04m						
80		42.34	43.30	Core becomes bleached (silicified) and contains 10 - 15% subhedral aspy and 5% py; at 42.95m core becomes gougy; small qtz pieces and argillite present in gouge; gouge to 7cm at 45° TCA						5
80		43.30	44.50	Poor core recovery; core is commonly reduced to gravel size or smaller pieces (<1.5cm); broken qtz vns are present in gravel; solid pieces of core show lineations @85° TCA						
80		44.50	50.29	Foliation at 85° TCA; trending to 50° at 46.84m; Heavy limoninte staining in fractures; Core recovery is good; At 49.59m, 18cm bleached, silicified section related to 3cm qtz vein.						
		50.29	51.82	Core is silicified and intruded by bleached GND dykes (3cm) dykes cut through 1cm qtz vein; hem staining absent; MSED becomes fragmented into gravel size pieces; core recovery becomes very poor						
		51.82	54.86	Core recovery poor; numerous vnlts throughout; Foliation continues at 45-50 °; often crenulated						
		54.86	56.39	Core is dark green, chloritized (?); Euhedral aspy crystals disseminated throughout; Gouge at 54.16m (5cm); qtz eyes; core becomes black (argillite) with foliation at 50° TCA			4

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
		56.39	57.91	Core becomes clay rich and altered; Recover is very poor (32%); QZZ starts to appear as frags at 57.60m; contact btw QZZ and MSEDs not visible						
70	57.91-67.45	57.91	67.45	Quartzite (QZZ) - Fine grained; Pyrite on some fractures; disseminated and aspy also present diss throughout; veinlets carry abndt aspy; Recovery good (75%)						
80	67.45-72.10	67.45	71.33	MSED with foliation angles at 60° TCA; diss py and aspy present throughout; At 67.98m 5 cm gouge at 60°; At 70.77m 4cm gg at 70° TCA; foliation is crenulated 69.65 to 69.85m						
		71.33	72.10	Metaseds more silicified; Quartzite? Clayey gouge at 71.43m, 6cm, at 60° TCA; At 71.81m a 5cm grey quartz vein, fractured, at 80° TCA.						
70	72.10-76.20	72.10	73.15	QZZ/MSED ctc; interbedded through interval; At 73.05m 10cm grey qtz vein at 45° TCA						
70		73.15	76.20	QZZ; Good rec, diss aspy throughout; sulphide veinlets at 75.36 to 75.45m						
80	76.20-76.90	76.20	76.90	MSED; Foliation at 60°; high silicic alteration; At 76.25m a 7cm qtz vein; vugs present, possibly due to weathering out of sulphides						
70	76.90-78.42	76.90	78.42	QZZ; Sulphide veinlets (py) present; 11cm vein at 77.92m; vugs with weathered aspy present						
80	78.42-85.34	78.42	82.30	MSED; Foliation at 65-70° TCA throughout; MSEDS are altered heavily around selvages via silica or chlorite; at 81.95m 9cm clayey gouge qtz and MSED frags.						
		82.30	85.34	MSEDS black with foliation at 50° TCA; at 82.51m to 82.76m altered to clay; very micaceous; Diss aspy and po present; Euhedral aspy crystals present on some fractures						
70	85.34-107.40	85.34	90.62	QZZ; Transitions from MSED to QZZ' initial foliations at 60° reducing after 86.05m to absent by 88.39m; Initially core is broken, becoming more competent as QZZ more dominant at 88.05m						
70		90.62	92.96	QZZ with interbedded MSED; MSED black and micaceous (biot) to argillic; no visible foliation in MSEDS at 50° TCA; Core is broken; At 92.08m 6cm clayey gouge at 50° TCA; Diss py in gouge; Qtz eyes						
70		92.96	96.75	QZZ; Good core rec; diss py present; vugs filled wi py						
70		96.75	103.13	QZZ with interbedded MSED; Recovery decreases; Foliations at 45° where vis; often crenulated; Qtz stringers running at 30° TCA contain aspy.						
70		103.13	107.40	QZZ; Carbonate present on most fractures; occasionally found wi py on top of slickenslides; numerous vnlts fill wi py or oxidized py; at 107.4m GND ctc at 45° TCA

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10	107.40-114.83	107.40	109.34	Appears to be extremely weathered GND; Difficult to tell due to intense alteration; Core is badly decomposed with very poor recovery; sugary texture; 40% qtz 20% plag 5% Hbl; Bt appears to be absent due to alteration; Alt'd to ser and chl; Qtz veins are broken, remnant massive sulphide vein at 107.96m, 2cm at 55° TCA; Diss py present throughout.		4	3	2		
10		109.34	110.65	GND more competent; Alteration less intense; Disseminated aspy present; Veins contain more sulphides in areas of chloritic alteration		2	2	1		
10		110.65	114.83	QZZ with GND Dyke (?); At 110.65m, 7cm at 80° TCA; Sulphide veins in Dyke, altered by QZZ contains 30% aspy; At 110.80m, 12cm at 80° TCA						
				Euhedral aspy on fracture at 114.26m mnr py also present; 10cm qtz vein at 114.58m; Diss aspy present throughout						
80	114.83-117.17	114.83	117.17	MSED; Black with foliations at 50° TCA; Lineations are crenulated; veins have large selvages; Fractures parallel TCA filled with carb						
70	117.17-123.58	117.17	123.58	QZZ wi interbedded MSED; Foliations at 50°; QZZ host to sulphide veinlets; py and aspy						
80	123.58-134.11	123.58	134.11	MSED; Foliations predom at 45° TCA but locally at 85° at 126.90 to 126.96m and at 128.02 to 128.13m; Boudins and crenulation present						
80	134.11-134.71	134.11	134.71	MSED; Silicified metased and quartzite; no vis ctc; At 134.56m contact with bleached intrusive						
10	134.71-135.72	134.71	135.72	GND med grained bleached intrusive; Alteration makes it difficult to identify less altered section 40% qtz, 20% plag and 15% biot; Likely GND						
80	135.72-138.68	135.72	137.56	MSED; Foliation at 40°; local banding altered to chlorite at 136.82m						
80		137.56	138.68	MSED wi small GND dykes; 8cm at 137.56m at 50° TCA; 4cm at 137.86m at 50° TCA; gouge at 137.96m 20cm at 50° TCA

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-14.02	0.00	14.02	Casing (No Recovery)						
80	14.02-36.58	14.02	18.29	MSED; Appearance is black with finely laminated layering (meta-beds), distinguished by minor compositional variation; Complex structure, bedding is from 0 to 60° to CA; qtz veins are parallel to bedding AND convoluted in shape and girth; Cross cutting bedding; very minor limonite.	1				1	
80		18.29	21.34	Veins <1cm through MSED; variable orientations throughout; weakens rock. Gouge section abuts competent (but crumbly) rock at 30° to CA; Gouge length is 20 cm. Bigger veins from 19.81m to 20.34m appear rearranged (see diag in written log); ox'd py concentrated in lenses at margins.	2			1	2	
80		21.34	22.86	Gouge - brecciated MSED, limonite more pervasive where core is broken	2		1	2	2	
80		22.86	24.38	Veins <1cm following bedding plane (30° to CA); offshoots from these veins at 60° to vein itself.	1			1	1	
80		24.38	28.96	Qtz veins (milky) every 10 cm or less, and are parallel to bedding, but a few (~5%) are narrow and 130° to CA (Bedding at 45 deg), Sulphides concentrated at margins of quartz, evidence of motion across veins.	1			1	1	
80		28.96	30.48	Limonite staining on irregular fracture faces is bright orange; Quartz-rich section toward bottom of sample, heavy carbonate alteration creates crumbly white clay to sand texture in 10 cm section at 20° to CA.	1			1	2	
80		30.48	36.58	Silicified MSED; Quartz-rich from large and numerous veins - 90% parallel to metased bedding	1			1	1	
10	36.58 - 192.02	36.58	41.15	GND; contact not seen as recovery is poor and core is v broken up. Lim stained on numerous microfracts and throughout matrix of GND; color is orange-brown with GND texture showing through. White calcite on fracture faces; to 41.15m very broken core, with ave size 2.5cm in diameter.	3			1	2	
10		41.15	43.80	More competent; Regular fractures at 50° and 110° to CA; Avg size 8cm long; limonite still pervasive.	3			1	2	
10		43.80	47.24	Very broken core; Limonite pervasive with calcite on fracture faces; Crumbly clay to sandy texture. From 45.52 to 45.65m carbonate is pervasive (white crumbly texture).	4			1	2	
10		47.24	50.29	V. poor recovery (21-25%), crumbly, carb and lim sand with remnant GND, qtz eyes, and GND pieces, largest 3cm.						
10		50.29	51.82	More competent GND with texture; Limonite near pervasive; so occasional pale orange brown color permeates	2			1	1	
10		51.82	53.34	Similar to above but with quartz veins/sulphide veins						
10		53.34	54.86	GND very broken up with limonite precipitated on fractures (and micro-fracts); Most have calcite crystallization as well, up to 2mm thick on larger faces.	2	1	1	1	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		54.86	56.39	Microfractures/veins at 2 angles: 30° and 150° to CA						
10		56.39	57.91	Alt'd GND continues						
10		57.91	59.44	Xenolith (amphibolite, f-grained) 3cm by 3cm at 58.20m.						
10		59.44	60.96	95% loss of core (5% rec); Crumbly with one calcite vein; Chlorite alteration on fracture faces						
10		60.96	64.01	Alt'd GND continues	2	1	1	1	2	
10		64.01	65.53	More altered GND due to increased shear action (mechanical alteration); Qtz eyes in carb-lim rich weakened but competent core.	2	1	1	1	2	
10		65.53	67.07	Veinlets continue to indicate mechanical action and shear for 1st metre; Followed by silicified section (hard - nail won't scratch it, GND texture faded). Sphalerite seen; opaque black; tabular, hard						
10		67.07	68.58	Very broken core with poor recovery (47%)	4	1	1	1	2	
10		68.58	70.10	Strong limonization of GND wi limonitic quartz veins with sphalerite and minor aspy; one unaltered section from 68.9 to 69.2m (between veinlets)	3	1	1	1	2	
10		70.10	73.15	Small areas of unaltered GND; Max 15cm long between fractures and microveinlets of limonite and calcite (to 79.25m)	2	1	1		2	
10		73.15	79.25	Sericite slickenslides are seen on regular fractures at 40° to CA; Sphalerite appears as 2-3mm (max) angular black mineral in middle of vein, associated with cpy and aspy (attached to diff grains of sph); Aspy also disseminated in selvage of veins.	2	1	1		2	
				1cm massive aspy vein at 76.54m; aspy (90%) with calcite (10%); Slickensides still at 76.61m; dendritic growth of biotite on surface overtop of slickenslides						
10		79.25	85.29	Limonized and carbonitized GND; original texture still visible (qtz, bt, etc); but matrix highly carb-rich (yellowish-white) and oxidized powdery limonite (orangey-brown) infiltrates the rock with >1cm selvages.	2	1	1		2	
10		85.29	85.67	Light grey unaltered GND with one qtz-carb vein at low angle	1				1	
10		85.67	86.95	Limonite + carbonate alteration pervasive; Weak, crumbly rock; coarse sand makes up 40% of sample; Max size: 10cm lengths. Color: deep greenish brown with yellowish white patches in coherent pieces	4	2	1	1	3	
10		86.95	88.39	Highly altered to extremely altered. SHEAR ZONE (mechanical alt'n a factor). Quartz eyes visible btwn dark brown-black fine laminations with movement indicators; Sericite slickenslides well developed on planes at 55° to CA; Shear foliation at 80-85° to CA; Gouge clay last 12cm of sample	4	1	1	1	2	
10		88.39	92.96	Crumbly soft rock to sand-size fragmented GND; 90% stained by limonite and carbonate; Colour is med brown; Weak slickensides pronounced in minor sericite, parallel to long axis of fracture face at 55° to CA.	3	1	1	1	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		92.96	93.61	Light brown clay dominates this sample (70%) plus quartz eyes and a few <3cm GND (highly altered) chunks.	3	1		3	1	
10		93.61	96.62	Carbonate and limonite altered GND; Pervasive through veinlets and matrix; Crumbly and very broken up.	3	1		1	2	
10		96.62	96.82	Aphanitic; GND texture erased to dark grey/dark green; chloritic and oxidized (sulphides?) and limonite pervasive	4	2	3		2	
10		96.82	99.95	GND s at 93.61-96.63m above, with slightly more sericite	3	2		1	2	
10		99.95	101.13	Highly altered GND. Calcite throughout veinlets and forming large areas. 100% clay to gravelly texture.	4	3	1	2	3	
10		101.13	109.30	Limonite and carbonate altered GND (crumbly and weak core); lim/carb pervasive through veinlets and matrix. Overall colour is whitish brown. Regular low-angle limonite-covered fractures (20°); Weak slickenslides at 108.7m in sericite/chlorite on face @30° to CA.	3	2	1	1	2	
10		109.30	110.65	Zone of extreme alteration surrounding a 2cm calcite vein with alteration to clay in 20cm selvage; Surrounding clay is very altered but competent core; GND texture totally erased to dark green-blue grey, with a matte lustre for 20cm beyond either edge of clay; Extreme edges are yellowish brown from pervasive limonite and calcite throughout core.	3	3	1	2	3	
10		110.65	111.80	GND texture returns, but is infused with limonite and calcite; crumbly texture around	2	1	1	1	2	
10		111.80	114.87	Unaltered GND separated by qtz veins and their selvages; Also microfractures infilled with limonite with tiny (0.5cm) selvages, brown and oxidized; Occurrence ~5 per 20cm (minimum); Weak slickensides on fracture face in calcite/limonite at 30° to CA; Slicks at 30° to CA.	1		1		1	
10		114.87	117.60	Section is very altered; Dark blue-green grey with 1cm-5cm limonized selvages around microfractres; Dull appearance; GND texture erased; Competent core; 100% recovery here.	3	3	2	0	2	
10		117.60	122.65	Unaltered GND except selvages around qtz veins and limonite-covered microfractures; Low angle microfracture faces show slickenslides in chlorite, limonite.	1		1		1

5 = All Sulph Oxidized

Date: June 16-19th, 2005

LOGGED BY: M Stone

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar., 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-22.86			Casing (No Recovery)						
10	22.86-59.64m			GND (Main Interval). GND is highly altered to sericite/clay making modal composition difficult to interpret. Alteration trends to pervasive lim around 44m. 40% qtz, 20% kspar, 15% bt, 5% hbl.						
10		22.86	27.03	Altered GND, good recovery. Core shows significant alteration to sericite. 2cm massive sulphide veins at 25.12m, 25.18m, 26.13m, 26.48m, 26.52m. At 25.80m, 30cm gouge at 30° to CA terminates at sulphide vein. At 26.21m, 6cm gouge. Dissem py and aspy present to 27.03m.		4		2		
10		27.03	29.17	GND shows less alteration and less sulphides in veins, more competent. Diss aspy.		1		1		
10		29.17	30.48	GND is bleached, altered to ser. Sulphide veins present.		3				
10		30.48	33.63	GND unaltered, except for vein selvages. Core is broken, with decreased recovery as well as sulphide content.		1				
10		33.63	34.60	GND highly altered to clay. Disseminated aspy present. Sometimes concentrated on what appears to be fracture faces.						
10		34.60	34.85	25cm grey qtz vein with fractures filled w/ py; oxidized py on faces.						
10		34.85	44.01	Slightly altered GND w/ diss aspy found throughout. Veins reduce in size, frequency and sulphide content. Core becomes more broken; most gravel-sized at 41.15 to 44.01m. Slickensides present on weathered aspy at 41.65m.	1					
10		44.01	50.29	GND - Start of lim staining on fractures. Core recovery is still poor, core is broken, gravel-sized common. At 44.62m clay gouge, no contact. Aspy present on fractures at veins.	1					
10		50.29	51.82	GND. Limonite staining pervasive throughout sericite altered. Slightly bleached sulphides located on exterior of veins. Mafics removed where veins occur. Carb veinlets invade sporadically.	1	2				
10		51.82	53.34	GND. Slightly altered. Mafics visible. Sericite on fractures. Minor chlorite. Slickensides present on fractures. Qtz veins milky.	1	1				
10		53.34	56.39	Slightly limonized, competent GND. Carb veinlets pervasive. Aspy on fractures slickensided. @54.46m, clay gouge along frac at 80° to CA.	1	1	2	1	1	
10		56.39	57.91	Slightly altered GND, bleached sections with mafics altered to chlorite. @57.02m, GND changes to bleached with py/aspy (0.1-1%). Sulphide veinlets until end of interval.	1	1	3	1	2	
10		57.91	58.93	Slightly altered GND. Cb veinlets, slight lim staining. @57.91m, large quartz vein (4 cm?) with disseminated sulphides (aspy) @58.35m, sheeted qtz vein set (of 3) at 60 ° @58.93m, contact with fault gouge perpendicular to CA.	1		1	1	1	
10		58.93	59.64	Gouge zone, highly altered to clays. Little competency remains. Bleached white, crumbles easily. @59.64m, contact with MSED, no discernable angle		4	2	2		
80	59.64 - 70.10			QZZ metaseds, highly siliceous						
80		59.64	60.96	QZZ, limonized carb veinlets, lamination visible at 50°, 60° and 65° to CA. Clay (ser?) in frac	1			2		
80		60.96	62.48	Limonized QZZ, clay section @ 61.95m	1			1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
80		62.48	67.06	Slight limonitic colors (orange/brown). Core is broken; laminations visible on some whole pieces 30° to CA. Two small qtz veinlets x-cut bedding but no visible sulphides. Two 2cm qtz veins parallel bedding. In between 64.01-65.53m, qtz pieces show aspy, but no structure can be inferred.						
80		67.06	70.10	QZZ, grey with no lim. In pieces. Large qtz vein chunks visible (w/ trace aspy) but no visible measurement could be made. Section broken to gravel/cobble size. Poor recovery from 68.58 - > 70.10m.	0					
10	70.10-72.16	70.10	72.16	Highly altered GND. Bleached light green/white/off white. Milky qtz veins. Altered to clay. Py veinlet (<.2cm) 35° to CA. Sheeted qtz veins.10cm apart, 0.3cm thick at 50° to CA. @72.16m, contact with MSED at 60° to CA.						
80	72.16 - 72.61	72.16	72.61	MSED highly silicified, bleached whitish grey. Chloritized vein contact at 72.61m at 90° to CA.		1	1	1		
10	72.61 - 75.38	72.61	73.45	Highly clay altered GND. Bleached sericite rich, mafics present		4		2		
10		73.45	74.33	Highly chloritized GND - V. green colour, few mafics present			4		1	
10		74.33	75.38	Highly altered GND. Bleached white/green. No mafics present. Chalky, brittle but competent. Diss aspy found from 75.14 - 75.38m.		4	2	4	1	
80	75.38 - 78.53	75.38	76.20	MSED - Aspy in veinlets, 3 at 50° to CA. Parallel laminations. Highly silicified, clay altered.		2		3	1	
		76.20	78.53	Diss sulphides: 30% py. Parent rock MSED with high silicification. Foliation undulating. Cave in @ 77.72m. Small sulphide veinlets at 40° to CA, py on frac. Carb veinlets throughout.		1		1	1	
10	78.53-85.90	78.53	85.90	Highly altered GND. Bleached white/green, little to no mafics. Bt almost completely altered to chl. Speckled green color. At 82.73 - 83.47m, Small undulation of MSED bottom contact at 45-50° to CA.		1	4	1	1	
80	85.90-89.20	85.90	89.20	MSED: Regular qtz veins along foliation. Black, light grey banding. QZZ to phyllite. Small sections of GND visible (<10 cm typically, not throughout entire circumference of core). Foliation at 45- 65°. Qtz infilled in between foliation.	1	1	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10	89.20-90.80	89.20	90.80	Small section of highly altered GND. Olive green colour. Few mafics. Slowly grades into MSED, starting @ 89.97m with xenoliths of MSED in GND. Veining sheeted, often paralleling laminations.	1	2	4	1	1	
80	90.80 - 99.06	90.80	91.54	MSED: Silicified. Some sections showing foliation @ 60° to CA. Sulphide vein at 91.22m.	1	2	1		2	
		91.54	94.90	Black, relatively unsilicified MSED. Planar foliations. Qtz not as infilled as above. Foliations at 30-40° to CA	1	1	1	2		
80		94.90	97.54	Slightly more silicified MSED. Foliations at 50° to CA where visible. Qtz infilled.	1	1		1	1	
		97.54	99.06	Darker MSED. Dark grey to black, some carbonate veinlets. Little silicification. @99.06m - contact w/ GND (fine grained) is @50°.	2	1			1	
11	99.06 -100.85	99.06	100.85	Speckled GND, yellowish tinge, to otherwise dark grey GND. Fine grained.	1	2	2	1		
80	00.85 - 103.4	100.85	103.47	MSED. Altered, silicified. Whitish green w/ abundant qtz infilling. Some weathering to clay w/ qtz eyes	2	2		1	1	
10	03.47 - 106.1	103.47	106.10	Dark grey to black GND. Few crystals visible. Some biotite and amphiboles but very dark colour. Many carb veinlets	2	1	1	1	1	
80	06.10 - 149.3	106.10	106.68	Highly altered MSED. Qtz invasive everywhere. Colour: green/light green w/ abundant carb veinlets	2	3	1	1	2	
80		106.68	108.20	MSED. Milky qtz veinlets spreading out randomly. Foliations @ 50° to CA. Sulphides cross cuts foliation.	3	1	1		1	
80		108.20	115.82	MSED, foliations at 50° alternating bands of light and black. Foliation often infilled with qtz. Broken, weathered section @ 112.20m. Pieces are angular and range from sand to pebble size.	1	1		1	2	
80		115.82	128.02	MSED altered to green color in few locations. @120.40m, S fold visible; perpendicular to core axis with chl band in middle. Many large qtz veins, but little visible mineralization. @119.07m, Cave in rubble; low angle predominant (<20°) carb veinlets. Qtz veins clear @123.44m, large aspy vein @ 126.49 - 127.84m, sulphides located on margins of small qtz veins, cross cutting MSEDS @ 20°-40° to CA opposite 50° MSED.	1	2	1		1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
80		128.02	131.77	Clay gouge at start of interval.MSEDS are much more silicic with qtz invading between foliations and replacing entire sections (up to 15 cm wide). Qtz has green color while seds are dark grey/black. Foliations planar. Fracture planes along foliation still at 50° to CA. Qtz veins crosscut through foliation and infiltrate between. @131.06m - foliation undulating and ends abruptly, with clay and breccia at terminus.	1	1	3	1	2	
80		131.77	134.11	MSED more bleached, white/light grey/yellow tint with green colouration. Trace diss sulphides. Core broken to small cobbles. Qtz veinlets show selvage, often more visible than the veins. Seds are slightly steeper at 60° to CA	1	1			2	
80		134.11	138.20	MSEDS darker, less qtz, though still prevalent in between foliation. MSEDS darkening with depth, becoming speckled and some brown color showing.	2	3		1	1	
80		138.20	142.97	Bleached and highly fractured/weathered MSED. Color light green to white, rich in clay. Foliation barely visible. Foliations at 60-70° to CA @143.26m - Mislatch	2	5	3	2	2	
80		142.97	149.35	Black/white banded MSED. Silica rich with large section of quartz. Green tint hints at chlorite. Veins cross cut MSED. @148.25m, po veinlets very abundant.	1	1	2	1	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-17.07m	0.00	17.07	Casing (no core recovery).						
10	17.07-219.46m	17.07	19.81	GND is broken w/ lim staining on frac, becoming pervasive @ 21.02m. Pieces are 10cm to gravel-sized, mixed w/ sugary texture. Recovery is poor.	2			1		
10		19.81	21.96	Core is more competent, recovery is good.	1			1		
10		21.96	22.86	Core is reddish colour and has dissem aspy. Contact w/ gouge @ 50° to CA @ 22.50m. Gouge is 7cm in width & contacts w/ limonized GND on other side.	1			1		
10		22.86	24.38	Core becomes more broken, pervasive lim & on frac sfc's. Trends to more clay alteration @ 24.00m.	2			2		
10		24.38	25.30	Core is softer; altered to clay. Sericite becomes dominant clay. Recovery good, still competent.	2	4				
10		25.30	27.43	Core is less competent & broken. Lim is pervasive and on frac. Pieces are gravel-sized, some show rounded faces.	2					
10		27.43	30.11	Core becomes more competent. Lim pervasive and on frac.	2					
10		30.11	31.52	Core is alt'd to clay, sugary texture. Dark red iron staining; possible qtz, py.	2	3		2		
10		31.52	32.00	Less ser alt'n, core is more competent. Good recovery, lim pervasive & frac.	2	2		1		
10		32.00	35.58	More intense ser alt'n, core is more fractured, recovery less. @ 33.47m: 5cm clay gouge @ 45° to CA.	2	3		2		
10		35.58	36.11	Core competent but fractured, lim on frac.	1	0		1		
10		36.11	36.74	Contact @ 45° w/ decomposed GND. Highly alt'd to clay w/ pervasive lim soft, but competent. Qtz eyes and GND frags present. Zone of hydrothermal alt'n.	4	3		3		
10		36.74	38.33	Return to competent GND. Lim on frac, minor pervasives. Vns crosscut frac angle. Vns @ 40°, frac @ 130°.	1			1		
10		38.33	39.62	Alt'd to sugary texture. Qtz eyes and GND frags present.	4	3		3		
10		39.62	47.02	GND becomes competent, less pervasive lim, mostly on fracs. Fracs predominantly @ 30° to CA, as are carb vnlets. 8cm clay gouge @ 44.60m @ 45° to CA, and 4cm clay gouge @ 44.75m @ 45° to CA.						
10		47.02	48.26	gravel size frags, lim pervasive and on frac.	2			2		
10		48.26	51.62	core more competent, recovery increases. fracs @ 40° and 145°. less pervasive lim, lim on fracs.	1			1		
10		51.62	51.82	GND soft w/ sugary texture, qtz eyes and GND frags present. relict qtz vn @ 51.82m. likely hydrothermal alt. lim pervasive.	3					
10		51.82	53.34	recovery decreases, core becomes fragmented, ser alteration increases on fracs. frags are gravel-sized to 15cm and angular.	3	2		1		
10		53.34	54.05	GND is competent, good recovery. pervasive lim & deep red stained. oxidized sulfide vns--red stain may be related to oxpy.	3			1		
10		54.05	60.96	core is more competent w/ less pervasive lim. fracs still show heavy lim stain, fracs have NO preferred orientation.	1					
10		60.96	61.14	moderately alt to chl, qtz vn is fractured and offset. aspy is oxidized heavily and has left vugs.	2	1		1		
10		61.14	67.06	core is becoming more competent, minor pervasive lim, mostly on fracs. few vns, fracs have no preferred orientation.	2	1		1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		67.06	68.58	core even more competent, recovery very good. minor pervasive lim fracs @ 35° and 55°.	1					
10		68.58	74.68	GND is unalt. lim NO longer pervasive, limited to fracs. veinage increasing. GND is unalt, po occurs for first time in hole.	0					
10		74.68	75.01	less recovery, more alt. return of pervasive lim on interval, fracs have as preferred orientation. frac faces of core are reddish brown--likely due to oxpy. aspy present on faces.	2					
10		75.01	80.77	GND alt only as selvages. no pervasive lim, found on frac only. fracs normally at 50°, recovery is good.	0					
10		80.77	82.64	core is dark green in color and easily scratchable, heavily alt to chlorite. fracs are covered in red brown oxide, weathered py. minor dissem aspy. also found in sulphide vnlets. core is fractured and broken w/ reduced recovery.			4			
10		82.64	83.40	core is a very light white-green color. sericite dominant alt type. contact w/ chl section occurs at 65° @ 82.68m on an oxidized sulphide vn. core is fractured randomly, but is less broken. dissem py abundant.		3	2			
10		83.40	84.91	chl alt lessening, no sulphide vns are present.						
10		84.91	91.44	return to unalt GND. heavy lim staining on faces. fracs predominantly @ 50° to CA.	1					
10		91.44	96.84	unalt GND. trace lim stain on frac. ascent after 92.05m, recovery is very good. increase in number and frequency of vns.	0					
10		96.84	98.26	GND becomes crumbly, less competent. sericitic alt present on fracs.		2				
10		98.26	99.21	core becomes clay, green color, alt changes to chl. aspy present on some frac faces. slickensides present overprint aspy--post mineralization.			3			
10		99.21	99.62	unalt GND, good recovery.						
10		99.62	100.16	GND is bleached. mafics are absent. core is white-ser alt.		3				
10		100.16	101.39	core changes from white to green. becomes softer @ 100.98m. 7cm clay gouge unit at 50° to CA. cross cuts qtz vns. possible fault.		2	3			
10		101.39	106.68	unalt GND. frac at 45-50° to CA.						
10		106.68	107.10	GND is green-chl alt. qtz vns are fractured and crosscut by calcite vnlets.			3			
10		107.10	123.10	unalt GND, good recovery. fracs @ 45° and 60°. fracs are filled w/ carbonate from 111.25m-123.10m. vns appear to be dominated by po. selvages are mainly qtz, but chl may also be present. core shows an increase in veinage. @ 115.82m: rounded GND frags w/ pervasive lim -likely from drillers reaming.

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		123.10	126.31	GND is lighter in color, more feldspar, w/ min ser. core becomes marginally softer.		1				
10		126.31	129.54	core becomes softer as ser alt increases.		2				
10		129.54	132.59	core is more competent, ser alt is reduced to fracs only.						
10		132.59	133.76	unalt GND. greyish color, more competent, good recovery.						
		133.76	134.62	GND is dark green in color--chlorite alt. section also contains 3 massive sulphide vns up to 1cm thick @ 40° to CA.			3			
10		134.62	137.74	unalt GND w/ chl on frac faces. fracs @ 45° and 80°. po in vns, aspy in selvages, py on slickensides.						
10		137.74	138.68	core is light green. ser & chl alt. softer & less competent, contains sulphide vnlets; py.		2	2			
10		138.68	143.26	unalt GND, core is fractured and broken, chl is present on frac. the majority of frac angles are random, but 45° and 80° are still present.						
10		143.26	144.78	GND becomes softer, more ser alt present. @ 144.39m: 15cm clay gouge @ 45° to CA. slickensides present--fault.		2				
10		144.78	147.11	fault zone. core is highly alt'd to clays. qtz vns are powdery. GND frags present up to 5cm. the most intense deformation occurs from 146.20m-146.98m. core is black, very coherent clay containing winged (?) qtz eyes, showing a crustal rotation. fault contact @ 45° to CA. @ 146.44m: 5cm qtz frag containing ~15% py; py may have been emplaced during faulting. the py filled fracs appear to stem from the black clay, w/ a thin zone of py in the clay surrounding the qtz frag (~1mm).						
10		147.11	149.35	core is light green in color, soft but competent. fracs are irregular and random. the majority of vning is sulphide vnlets in fracs. py is dominant, but aspy also present.		2	3			
10		149.35	150.88	core is softer & broken and contains less chl and more ser. no sulphide vns, poor recovery.		3	1			
10		150.88	152.40	core regains coherency, more chl, less ser, sulphide vns return.						
10		152.40	153.92	core is again softer and broken, no sulphide vnlets, poor recovery.						
10		153.92	157.92	core regains coherence w/ increase in chl and decrease in ser. sulphide vns and vnlets return. recovery increases. chl/ser contact @ 45°, diss py present.						
10		157.92	159.30	core becomes unalt GND. more competent, good recovery. vns are mostly qtz. fracs @ 40° & 80°.						
10		159.30	162.57	GND alt by ser and chl. core is broken and fracs coated w/ ser. recovery is reduced to ~67%. sulphide vnlets dominant again, fracs are random.

DRILL LOG LEGEND: P1	DATE: 19-20-June-05	PAGE 7 of 10	
DRILL HOLE # : DG05-287C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		162.57	165.32	core is more intensely alt to clays. core is crumbly, soft and contains qtz eyes, and is coherent until disturbed.						
10		165.32	166.12	core becomes less alt, much more coherent, recovery is greatly increased. sulfide vnlets no longer present.						
10		166.12	174.04	unalt GND, core is grey-blue. recovery is excellent, vns are predominantly qtz.						
10		174.04	175.01	core is alt to ser and chl, light green color. @ 174.14m: 6cm grey qtz vn @ 50°, slickensides on end of vn.						
10		175.01	183.46	unalt GND, recovery excellent, fracs @ 30°.						
10		183.46	184.73	core is dark green in color, chl alt. contains massive sulphide vnlets--py. fracs @ 50°, as are the vns. core is fine grained.			2			
10		184.73	185.17	core appears more granular, alt is more intense, chl and ser present. soft but coherent core. massive sulphide vns present @ 184.73m & 185.17m, flanking the alt zone.		2	2			
10		185.17	186.63	GND becomes med-grained, still has green color--chl. fracs continue at 50°.			2			
10		186.63	187.45	less alt GND, starts fine-grained & changes gradually to med-gr.						
10		187.45	191.52	unalt med-gr GND, frac at high angle 75°.						
10		191.52	192.75	zone of chl alt. core is green and scratches easily. sulfide vnlets fill some fracs.			2			
10		192.75	213.84	unalt GND, fine-gr, frac @ 45° and 50°. vns follow fracs, dominant sulfide is po.						
10		213.84	216.96	unalt GND, med-gr. @ 213.86m: 0.2cm fault @ 65° to CA. py present overprinting slickensides. 15cm zone of chl alt around fault.						
10		216.96	219.46	fine-gr GND.						
				EOH		-				

DRILL LOG LEGEND P2

Selvages 0 = No Alteration 5 = Intense Alt'n

Ox. State 0 = No Oxidized Sulphides 5 = All Sulph Oxidized

Date: 19-20-June-05

LOGGED BY: Terry Croteau & Tom Patchell

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar, 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0 - 10.36			Casing; recovered 30cm of GND. Pervasive lim, half of the core is altered to clay, oxidized aspy vein present	3					
10	10.36 - 195.37			GND - See previous logs for description						
10		10.36	12.19	Core is soft but coherent. Light grey in color. Oxidized sulphide veins are present throughout. Aspy is dominant sulphide. No lim present				3		
10		12.19	13.72	Core is still soft, but becomes broken into gravel sized pieces. Minor lim on frac. Recovery is poor.	1			3		
10		13.72	15.24	Core becomes more solid, clay alt'n present on fractures. Fractures show no preferred orientation. No lim present	1			2		
10		15.24	18.29	GND is light grey in color and highly fractured. Fractures normally @ 45° and 120°. Clay alteration on fractures is greatly reduced. No visible veins present.	1			1		
10		18.29	21.63	First occurrence of pervasive lim. Fractures are at 30° and 70°. Sulphide veins present are generally found at 30° to CA. The number and size of the sulphide veins have increased. Core is still broken, but most (85%) of the pieces are greater than 10cm. Recovery still poor.	3					
10		21.63	29.32	GND - lim is pervasive and heavily stains fractures. Clay alt'n is also common on fracture faces. Core is fractured and broken with 30% gravel size, 50% up to 10 cm and 20% greater than 10 cm. Fractures occur at 50° and 130° to CA. Sulphide veins continue to be present. @22.06m - 2cm sulphide vein at 30° to CA. Contact with quartz vein. Aspy dominant sulphide.	3			1		
10		29.32	30.48	Core is much more competent, good recovery. Less pervasive lim, and a decrease in sulphide veins.	2					
10		30.48	32.00	Core becomes fragmented into gravel sized pieces (80%) and pieces up to 10cm (20%). Pervasive lim is almost absent, but fractures are coated.	1					
10		32.00	34.13	GND is soft but coherent. Clay alt'n present, core has sugary texture. Pervasive lim increased as well as that on frac faces. Fractures at 20° and 100°.	3			2		
10		34.13	34.43	End of pervasive limonite						
		34.43	36.58	GND has become silicified. Blue-grey color. Disseminated aspy, and py found throughout. There is no visible contact with unalt'd core at beginning of interval. Contact at end, 70° to CA.						
10		36.58	41.15	Unaltered GND. Dark grey color, fractures at 60° and 110°. Euhedral aspy crystals found on frac faces. Veins run parallel to fractures. Core is broken in places with 20% of pieces <10cm.						
10		41.15	45.72	GND is silicified. Grey green color. Highly fractured and broken. Euhedral aspy crystals growing on faces. Most pieces (85%) are gravel sized, very angular.			2			Si
10		45.72	50.89	Unaltered GND. Dark Grey color, more competent and increased recovery. Small qtz veins present (most <.5 cm) as sheeted vein system. Aspy can still be found on most frac faces. @48.62m - 10cm clay altered section. Contact at 50° to CA			1			
10		50.89	51.82	Clay alt'd GND is granular with abundant euhedral aspy crystals.				2		
10		51.82	52.72	Unaltered GND. Fractured and broken (80% > 5 cm)						
10		52.72	54.86	GND is bleached, mafics almost completely absent. Aspy is present as fracture fill, in veins, and as diss euhedral crystals. Core is broken 60% < 10 cm. Fractures at 40° and 60°. Color likely due to veining.		3

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		54.86	56.00	GND is less bleached, bt becomes visible. Core still contains significant aspy veinlets and grey qtz veins with above avg concentrations. @55.22m core is broken into gravel sized pieces with aspy on fractures.		1				
10		56.00	59.44	GND in larger pieces, dark grey in color. Carbonate on frac surfaces, and aspy veinlets fewer in number. Euhedral aspy crystals still present on many frac faces.				1	1	
10		59.44	60.98	GND is soft, and altered to clay - sugary texture. Core breaks when handled. Recovery is poor. Diss aspy present.		1		2		
10		60.98	65.53	GND more coherent, less clay alt'n - found only on fracture. High aspy concentration in veins. Fractures @ 10°, 40° and 160°. Recovery is good.				1		
10		65.53	68.58	Core is broken and 80% is gravel sized or smaller, 20% > 5cm. Clay alteration has left much of the core with a sugary texture. Diss aspy present. Recovery is poor.				3		
10		68.58	70.10	Very poor recovery. Intense clay alteration. Core is broken into gravel sized pieces (20%) and smaller (80%). Sugary texture, looks like broken concrete. Aspy with slickensides found on several faces.				4		
10		70.10	71.63	Clay alteration is less intense. Recovery increased. Core is still broken into gravel sized (40%) and larger (50%). Diss aspy can be found within fractures at 50° and 110°.				2		
10		71.63	76.20	Good recovery. Competence is greatly increased. Fractures at 30°, 50° and 140°. Carbonate fills many fractures and is found on frac faces. Aspy and chl also found on frac surfaces.			1	1	1	
10		76.20	77.72	Core is broken into gravel sized (85%) and larger pieces. Diss aspy present. Chl on frac as well as carb. Sulphide veins are oxidized.			1		1	
10		77.72	79.25	Core is still broken, but pieces are larger. Some faces contain aspy with slickensides. Carb and chl still on faces			1		1	
10		79.25	82.30	Core is light green in color and shows increased veining. Carb veins present and selvages on qtz are cb. Frac at 60° and 105°.			2		1	
10		82.30	90.37	Core is dark grey, less carb alt'n present. Chl still present on frac. Veins are still small (< 0.2 cm) with above avg aspy percentages. @85.04m, aspy on face showing slickensides. @85.14m, 6cm gouge. Qtz eyes and GND frags present. No visible contact; @85.24m, 7cm gouge @ 40° to CA. Qtz eyes and GND frags present.			2		1	
10		90.37	94.49	Core is light green color with diss aspy found throughout. Sulphide veinlets are common. Carb alt'n in core, but more present on frac faces. Fractures at 60° and 140°.		1	3		2	
10		94.49	98.31	Core is grey, less chl alt. Carb alt is still present on frac. There is a reduction in the number of veins and sulphides present. @97.01 7 cm bleached section with diss aspy -> likely selvage, but no vein visible		1	1		1	
10		98.31	99.06	Core is green (<10% mafics), fractures filled with aspy. Selvages also contain aspy. Increase in sulphide veins.			3

DRILL LOG LEGEND - P1	DATE: June 20 - 22, 2005 PAGE 5 of 8		
DRILL HOLE # : DG05-288C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescen 5 = Strong Efferves

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		99.06	108.60	GND is light grey color with fractures at 50° and 140°. Fracture faces are covered with carb and ser. Numerous aspy veinlets present, but a decline in qtz veins. Aspy with slickensides present on some fractures (5%) others (50%) have euhedral aspy crystals.						
10		108.60	109.73	Core is light green color and contains diss aspy. Fractures show ser and carb alt'n and are at 40° and 120°. Diss py present. @109.23m, 3cm heavily altered to clay at 40° to CA. Slickensides present.		1	2		1	
10		109.73	112.78	Core becomes broken, with more clay alteration on broken surfaces. Chl alt'n is reduced. Aspy with slickensides found on some frac surfaces.		1	1		2	
10		112.78	113.40	Core is light green color with ser and carb on frac surfaces. Diss aspy present as well as an increase in the number of veins and % sulphides.		1	2		1	
10		113.40	118.34	Return to dark grey GND. Rock is fractured and broken. Fractures show euhedral aspy crystals, 5% have aspy with slickensides. Carb alt'n still occurs on most (80%) frac faces. Veins continue to be small and are found in sheeted sets.					1	
10		118.34	119.12	Intense clay alteration follows low angle fractures (relative to CA) 0-20° and 160-180°. Core is soft and contains diss aspy.		3	1	2	2	
10		119.12	123.44	GND is light grey in color and chl alt'n is common on frac faces. Carb veins and veinlets become more numerous, cross cutting qtz and sulphide veins at 140° and 170°.		1	2	1	1	
10		123.44	129.54	Alteration is reduced, minor chl and ser on frac surfaces. Sheeted vein sets are present. Veins are small (0.2 cm) and most contain aspy.		1	1		1	
10		129.54	131.06	Core is green, increased chl alt'n. Rock is soft but competent. Veins are larger in this section and sulphide content is higher.			2		1	
10		131.06	134.11	Core returns to dark grey color. Sheeted vein sets more frequent @ 45°. Carb veinlets crosscut at 175°.					1	
10		134.11	141.73	The end of the sheeted veins. Carb filled fractures are common. Fractures are at 30° and 145° to CA. GND is dark grey in color. Recovery is good. @140.11m, clayey gouge; qtz eyes and GND frags present.					2	
10		141.73	143.26	GND is greenish color with less carb alt and veins. Ser and chl on frac surfaces. Fractures at 60° and 165°.		1	2	1		
10		143.26	149.35	Unaltered GND. Dark grey color. Most (95%) of veins are carb veins. Fractures also filled with carb running at 20°, 40°, 70° and 170°. Slickensides on frac surface with minor aspy showing same feature.

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		149.35	151.49	Reduction in carb veins, return to qtz veins. Chl alt'n dominant. Fractures occur at 40° and 95°.		1	2		1	
10		151.49	153.92	Rock is light grey green color, and shows clay alt'n. Qtz eyes and GND pieces are present indicating hydrothermal alt'n. Core is highly fractured and broken into gravel sized pieces (45%) and >5cm (55%). Gouge contacts @ 30° to CA @ 152.40m,for 8cm.		1	1	2		
10		153.92	157.74	Core is green and peach coloured. Selvages and fractures are filled with K-spar and carbonate. Py makes its first appearance as a sulphide vein @ 154.72m. Frac at 40° and 110° @157.11m, 10cm gouge @ 60° to CA, followed by diss aspy in 8cm of intense chl alt'n.			2		2	3
10		157.74	161.54	Dark grey GND with minor ser, carb and chl alt'n on fracture faces. Fractures at 30°, 70°, and 170°. Veins crosscut by 170° fractures. Euhedral aspy crystals present on frac faces @160.02m to 161.54m.		1	1	1		
10		161.54	166.12	Core is green with peach-filled fracs and selvages. K-spar grains are peach in color, combined with chl to give distinct color. Diss aspy present from 161.54 - 164.02m. Diss py present 164.02 - 164.50m.			2		2	3
10		166.12	172.21	Dark grey GND, chl and carb on frac faces. Diss aspy from 167.64 - 169.16m. Very few veins. Those present are small (0.2cm or less). Po makes its first major appearance @ 171.30m.			1		1	
10		172.21	173.48	Intense clay alt'n has made core soft and brittle. Fragments of unaltered GND can be seen within. Fractures filled with carb. Contact with unaltered GND at 30° to CA. Diss aspy is present.				3	1	
10		173.48	179.83	Light grey, med gr GND. Fractures contain ser and carb alt'n. Fractures @ 20° and 50°. Very few veins found in this section. Those that do occur are 0.2cm or less.		1			2	
10		179.83	182.88	GND is finer grained with less carb alt'n. Fracture surfaces show chl alt'n and euhedral aspy crystals. Core is highly fractured and broken. 40% gravel size, 60% > 5cm.			2			
10		182.88	195.37	Fine gr unaltered GND. Dark grey in color with an increase in bt and hbl. Fractures show chl alt'n, carb limited to a few selvages. Core is less broken. Few veins, but sulphide veinlets are common. Po is dominant sulphide at these depths, with minor cpy also present. Aspy can also be found in trace quantities.			1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0 - 7.01			Casing/Overburden						
80	7.01 - 53.61			MSED: Variable composition/textures and mineralogy						
80		7.01	9.14	MSED rusty brown in color; Foliation at 30° TCA; Core very coherent and recovery is good: At 9.01m clayey gouge contains qtz eyes and MSED frags	2					
80		9.14	15.24	MSED core is broken into angular frags less than 8cm in diam; Poor recovery ~30%; At 11.69m, 5cm quartz vein at 50° TCA contains 5% aspy in fractures; Aspy appears to have weathered out of the remaining fractures.	1					
80		15.24	15.69	45cm clay gouge; Brown rusty color at 40° TCA; Contains qtz eyes and MSED frags; Adjacent rock is highly fractured and friable; Gouge is soft but coherent	3			4		
80		15.69	16.09	Broken rusty colored MSED; Limonite staining on fractures; Pieces <10cm	1					
80		16.09	17.89	MSED limonite staining on fracture; Foliation at 40°.	1					
80		17.89	20.12	Core is broken; Gravel size frags pervasive limonite and on fractures; At 19.43m, 38 cm gouge at 80° TCA, qtz eyes and MSED frags present	3					
80		20.12	20.71	MSED; Increase in competency and rec; Limonite stain on fractures only; Foliation at 45° TCA	1					
80		20.71	21.34	Core is composed of rounded MSED frags within a black matrix; Soft, altered to clays; Possible FAULT; No visible slip direction; Core crumbles if touched.	1					
80		21.34	23.62	MSED; Good recovery; Foliation at 40° TCA; Minor pervasive limonite; Limonite on fractures dominantly	2					
80		23.62	24.38	Core becomes fractured, recovery decreases; Broken fragments < 15cm; Foliation continues at 40° TCA	1					
80		24.38	27.80	Core regains competence; Good recovery; Limonite on fractures; Foliation still at 40° TCA; At 26.89m 15cm GND dyke at 40° TCA; At 27.23m 8cm GND dyke at 40° TCA						
80		27.80	28.79	MSED broken into gravel size fragments; Rounded; Limonite is pervasive; Quartz fragments indicate possible veins; At 28.1m, 8cm clayey gouge, contains quartz eyes.	3					
80		28.79	31.82	Core again competent with good recovery; Limonite on fracture faces; Foliation at 40° TCA; Quartz becoming interbedded in the MSED at 40°.						
80		31.82	32.25	Core is broken into gravel sized frags; Heavy limonite staining on fractures	2					
80		32.25	33.33	MSED: Competent fractures at 40° and 130° TCA; 130° cross cuts foliation running at 40°; minor staining on fractures faces.	1					
80		33.33	33.87	52cm gouge unit at 30° TCA crosscutting the foliation; Gouge contains qtz eyes and MSED frags; Minor limonite staining.	1					
80		33.87	40.24	Core becomes dark green-black MSED; Foliation is harder to distinguish, where visible it is at 40° TCA, but changes to 5° TCA and becomes crenulated at 36.69m; Foliation returns to 40° TCA at 37.23m; Fractures continue at 40° and 130° TCA.	1					
80		40.24	44.00	Core is fragmented with heavy limonite staining on fractures; Foliation at 40° TCA; At 43.89m 4cm GND dyke flanked by 1cm veins at 40° TCA						
80		44.00	44.85	Core is more competent; Limonite and sericite on fractures; Foliation at 40° TCA						
80		44.85	48.97	Core is again fragmented; Foliation is at 10° TCA; Minor limonite staining on fractures; 47.74 - 48.77m recovery is 10%						
80		48.97	53.49	MSED: Core is fractures and broken with sericite alteration and pervasive limonite foliation at 85° TCA; At 48.97m a 10cm clay gouge at 85° TCA contains qtz eyes and MSED frags; At 50.71m a 10cm clay gouge at 85° TCA contains qtz eyes and GND frags						
80		53.49	53.64	MSED/GND ctc; MSED is folded with qtz eyes, slickenslides present on fractures and contact; At 53.56m a 5cm black gouge composed of MSED frags, qtz eyes and GND frags						
10	53.64 - 207.26			GND: Fine to med grained; The majority of the veinage occurs after 67.2m

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		53.64	60.56	Moderately broken altered GND; Hematite is pervasive and on fractures; Fractures occur at 45° and 80° TCA; Core is highly fractured and broken; Minor clay alteration on fractures; At 59.44m sugary texture intersected by 9cm qtz veins	2			1		
10		60.56	63.79	Core is still fractured and broken; but pervasive limonite is reduced as well; Less on fractures; Also, very little clay alteration; At 61.3m to 62m minor clay alteration on fractures	1					
10		63.79	66.56	GND is grey in color and altered to sericite; Texture is soft but coherent; Core is permeable; Recovery is poor; Fracture angles observed by texture.	2	2		1		
10		66.56	88.92	Unaltered GND; Pervasive Limonite is absent, found only on fractures; Fractures at 40° and 110° TCA; Carbonate also found on fractures; Recovery is good; At 73.15m minor sericite on fractures; At 76.95m, 7cm qtz vein at 60° TCA; At 77.03m, 6cm qtz veins at 60° TCA; At 88.29m, a 6cm qtz vein at 30° TCA; At 88.89m, 8cm qtz vein at 30° TCA; Veining increases in size after 75.65m as well as in frequency; Sulphides begin to appear in veins; The majority is aspy with minor py; Most veins contain only trace amounts of either sulphide.	1					
10		88.92	92.96	Unaltered GND; Limonite no longer present in any form; GND is dark grey with increased veinage.		1				
10		92.96	93.76	GND is greenish grey; Mafics almost totally absent; Chl alteration dominant; Possibly a large selvage; At 92.46m, 2cm clay gouge at 40° TCA			2			
10		93.76	96.01	Unaltered GND; Fractures at 60° and 120°; Reduction in number and frequency of veins; GND is still dark grey.						
10		96.01	96.61	Core is light grey to green; Sericite and chlorite alteration present; Metased xenolith at 96.13 to 96.50m; 4cm grey gouge at 45° TCA, 2cm rusty stain of hematite.		1	2	1		
10		96.61	103.63	Unaltered GND; Fractures at 30° and 100° TCA; Carbonate present on most veins; Disseminated pyrite found at 102.11m; Possible fine grained VG(?)

DRILL HOLE # : DG05-289C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		103.63	111.25	Unaltered GND; Good recovery; Fractures are at 35° and 110° TCA; Color is lighter grey than previous; Sulphides increase in concentration with po and cpy as dominant sulphides; Diss py and aspy still present on fractures; Fine grained, difficult to distinguish with hand lens; May be fine grained gold (?) present; The fractures containing sulphides also show slickenslides beneath.						
10		111.25	116.71	Unaltered GND; Light grey, becoming med grained; Fractures at 50° and 80° TCA; Po and aspy dominate vein sulphides; Trace disseminated aspy still present; At 113.38m 4cm gouge at 85° TCA; At 117.05m aspy showing slickenslides.						
10		116.71	120.40	GND is light green color and scratches easily; core is highly fractures and broken; Fractures occur at 50°, 80°, and 110° TCA; Pieces range from gravel size to >10cm; 50° fractures frequently contain slicks, but no mineralization.		1	1			
10		120.40	128.02	Unaltered GND, grey, fine grained; There is less mineralization present in the veins, but aspy is now present disseminated in the selvages.						
10		128.02	130.66	Unaltered GND; Decrease in veins and mineralization. Good recovery; Aspy found on slickenslides on fracture surfaces; Fractures at 30°, 60° and 120°.						
10		130.66	134.11	Chlorite alteration as well as sericite alteration on fractures; The number of veins increases as does mineralization; Core is broken with most fractures random; recovery is less than previous interval.		1	1			
10		134.11	135.36	Core is green, more chlorite alteration and an increase in the size of veins; This is also the start of a 10.32m zone of intense veining, alteration and mineralization at 135.36m		1	2			
10		135.36	135.64	28cm qtz vein; Total length may be greater as it was found at the end of run; Contact at 20° TCA; Fractures are filled with pyrite ~ 20%		2	3			
10		135.64	136.36	32cm qtz vein at 30° TCA, fractures filled with massive aspy; Selvage contains diss disseminated py						
10		136.36	137.86	Chlorite alteration is more intense; Core is highly fractured with clay in fractures; Quartz veins also fractured; Aspy fills fractures between qtz and altered GND		1	3			
10		137.86	138.16	Massive sulphide vein at 10° TCA; Composed of Aspy 70% oxidized; In 30cm quartz vein at 30° TCA; Py in qtz vein fracture						
10		138.16	139.40	Intensely altered GND; core is soft but competent; Clay and chlorite alteration; Quartz eyes and GND frags present; Disseminated aspy throughout						
10		139.40	139.96	56+cm quartz vein; vein is broken at both ends, and in the middle, true length may be greater, angle cannot be determined; Fractures are filled with massive aspy; Trace VG (?)						
10		139.96	141.73	GND; Altered chlorite and sericite; recovery good; Light green color; Disseminated pyrite found throughout, and in fractures						
10		141.73	145.60	Core is darker green color; Highly fractured and broken; Pieces range from gravel size to 20cm; Fractures continue to be filled with sulphides: aspy and py.

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		145.60	147.82	GND shown significantly less alteration being present; Mostly as vein selvages; Mineralization is reduced and core is more competent; Recovery is very good.			1			
10		147.82	155.77	Slightly altered GND; Core is dark grey/green; Core is highly fractured and broken; Recovery is less than previous; Po returns in veins. @151.14m, clay gouge at 30° TCA; 2cm gouge is followed by a broken qtz vein in deformed GND; Fracture face shows pyrite with slickenslides; Small fault, core is too broken to get width.			1			
10		155.77	161.54	Core is again green with chlorite; It is competent with good recovery; Quartz and carbonate mottle the core; Quartz veins are deformed, broken and fractured; Carbonate fills fractures, as well as possible tension gashes; At 160.97m qtz crystals show foliation direction at 45° TCA; Possible shear; Sulphides are found bordering carbonate filled fractures and gashes; Slickenslides present on some fractures.			3			
10		161.54	162.04	FAULT ZONE: Deformation is most intense; Fault is composed of black clay filled with porphyroclasts and quartz eyes in S-fabric indicates sinistral movement; Contact at 45° TCA; Py in fractures; At 161.94m fault gouge, 10cm, w/ quartz eyes.				5		
10		162.04	166.12	GND is moderately alt'd, pale green color. Highly fractured and broken w/ most of the core being gravel-sized w/ 10% being up to 10cm. Chl & ser alt'n on fracs. Some fracs filled w/ py. Recovery is less.		2	2			
10		166.12	170.69	Core shows similar alt'n but is more competent. Gravel-sized pieces are almost absent, w/ 85% greater than 10cm.		2	2			
10		170.69	175.26	Core becomes fractured and broken to gravel size pieces. Clay alt'n on frac increases. Decrease in vn size and frags. Core is light grey in color, med gr, dissem po present.		1	1	2		
10		175.26	176.78	Core changes to white-green in color and becomes broken. Carbonate alt'n dominant. Carb also found on frac faces.			2		3	
10		176.78	177.23	Core is alt'd heavily to clay; soft but competent. Qtz eyes and GND frags present. @177.12m: 30° contact w/ possible small (~2cm) fault. Qtz appears to show 30° foliation, contact @ black clay w/ py filled frac.						
10		177.23	179.64	Ser and chl alt'n in the form of selvages only. Alt'n of frac srfc's is limited to minor carb ~30°.						
10		179.64	182.38	Return to dark grey, unalt'd GND. Core is still fractured and broken, but recovery has increased. Fracs normally @60°. Po returns in vns.						
10		182.38	183.14	Core is light green colour, w/ ser alt'n on frac. @182.62m: ~2cm gouge @ 45° to CA, filled w/ black clay and massive py. Slickensides present.		1	2			
10		183.14	184.40	Clay alt'n increased, especially on fracs. Core crumbles when handled.				3		
10		184.40	185.63	Light green color, increased competence and recovery. @185.20m: 2cm sulphide vn @50° to CA; contact between chl and ser alt'n. Ser fills frac around round xenoliths of chl alt'd GND. Looks like a conglomerate.		2	2			
10		185.63	186.72	Grey GND, frac & broken frac @60° and 140°, less chl and ser.			1			
10		186.72	190.80	GND is more competent, better recovery. Clay alt'n is higher and core can be easily broken. Soft but coherent. Fracs @50° and 110°. Core is light grey color.		1	1	3		
10		190.80	192.87	Core is broken into gravel-sized pieces (80%) and frags >7cm. Less recovery, core is dark grey.				1

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-290C

PROJECT: Dublin Gulch - 1735

GROUND ELEVATION: 905m

BEARING: 180 | DIP: -50°

DATE STARTED: 23-Jun-05 | DATE COMPLETED: 26-Jun-05

LOGGED BY: Melodie Stone

CONTRACTOR: Britton Brothers

COORD SYSTEM: NAD 27: EASTING: 459109 NORTHING: 7099040

COORD SYSTEM: NAD 83: EASTING: 4598991 NORTHING: 7099224

NAD 27 (CORRECTED for historic grid): EASTING: 459079 NORTHING: 7099050

SECTION LINE(historic grid): 459079E

DRILLING DETAILS

Hole Diameter: HQ

Overburden:

Deviation:

Casing: 4.57m

Core Size: HQ

Cement (# Bags): 0

Plug Depth: N/A

Notes: No plug necessary.

SAMPLING DETAILS

Sample Sequence: B381927 - B382075 and B382080 - B382098

Requisition #: MASP448STRGOL.05Q | Date Shipped: 8-Jul-05

Lab Record #: VA05060235, VA05058633 (alternating) | Date Received: 21-Jul-05, 15-Jul-05

Sample Sequence: B382076 - B382079

Requisition #: MASP448STRGOL.05Q | Date Shipped: 8-Jul-05

Lab Record #: VA05060567 | Date Received: 21-Jul-05

Sample Sequence: BB382099 - B382156

Requisition #: MASP448STRGOL.05Q | Date Shipped: 10-Jul-05

Lab Record #: VA05060237, VA05058634 (alternating) | Date Received: 21-Jul-05, 15-Jul-05

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)							
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other		
-1	0-4.57	0.00	4.57	Casing--No recovery (casing to 4.75m w/ recovery)..								
80	4.57-4.75	4.57	4.75	Schistose argillite. Fine laminations (meta-seds), denoted by layered micas-musc & bt.	0	0	1	0	0			
10	4.75-22.50	4.75	5.60	GND, relatively competent. Unalt'd btwn vnlets, covered w/ limonite-selvages up to 0.5cm wide. Broken on vnlets.	1	0	1	0	1			
10		5.60	15.00	Brown, crumbly, limonized GND. Lim is pervasive. whole rock appears oxidized; largest core pc is ~8cm long. Most <2cm in diameter. Reduced to coarse sand @ 7.0m, for 20cm. Ave recovery for this section is 33.8%.	4	1	1	3	2			
10		15.00	20.15	More competent GND infused w/ zoned k-spar/qtz vns. These k-spar/qtz vns' zonation is highlighted by 1-2mm wide layers of oxidized hematite, producing a rosy red/deep orange color, which appears to pervade the whole rock. Also throughout is minor chlorite alt'n and silicification. From 15.86m-19.81m: vns are not clearly visible (only few small ones), but rock is still extensively hem & lim stained and alt'd. Slickensides on 45° face w/in clay alt'd section, 20cm wide at 17.3m.	4	2	3	2	2			
10		20.15	22.20	Highly alt'd GND; 90% GND texture is erased to fine-gr, v. colourful rock. Colors due to chl, lim, clay weathering (white-yellow), ox'd sulphides (black).	4	3	3	4	1			
10		22.20	22.50	Bleached, soft GND. Texture normal (visible grains), but more crumbly and broken up.	2	0	0	2	0			
1	22.50-24.38	22.50	24.38	Highly alt'd, broken up to crumbly to coarse sand-sized pc's. Hematite staining also continues, through 40% of section. Lim staining through all, and covering frac srfc's. Pocket of clean 'beach' sand at 22.86m-23.0m, hypotheses to follow @ 29.14m.	4	0	2	1	0			
10	24.38-28.96	24.38	28.96	Drastic change in lithological alt'n to pale bluish white, crumbly, clay & chl alt'd GND. @26.8m: sulphide vn is 80% ox'd py, 20% aspy in slickenside form.	0	4	3	3	0			
1	28.96-29.14	28.96	29.14	Light to med brown sand, size 1mm grains of bt, qtz, feldsp. Well-sorted beach sand. Origin unknown. Ideas: (1) Frac infill; (2)Ground up GND then washed w/ water (but no evidence of frac or fault); (3)Contamination from above in hole (but no record of problem from drill). Three more zones of washed sand/gravel in hole as well, w/in 15m zone.	1	0	0	0	0			
10	29.14-30.50	29.14	30.50	Clay/chl alt'd GND as previous to sand.								
1	30.50-30.60	30.50	30.60	Subangular to subrounded pebbles-cobbles of metaseds (50%) and pure qtz (30%). 20% silty sand, med brown.								
10	30.60-32.00	30.60	32.00	Clay/chl'd GND as before pebbles	0	4	3	4	0			
1	32.00-32.30	32.00	32.30	Light to med brown sand, well-sorted except first 5cm has dark grey clay (30%). Parts up to 10cm long were core-shaped but not competent.								
10	32.30-196.90	32.30	34.00	Sericitized GND, orig texture 80% erased. Evidence of shear; slickensides shown on frac faces & w/in soft, alt'd zones; shown in feldspars (plagioclase) and sericite.	0	4	1	2	0

UNIT CODE	From → To:	GEOLOGICAL DESCRIPTION From:	To:	Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		34.00	37.20	Alt'd GND; less sericite, chl & clay; more silicified; appears heated to aphanitic texture w/ oxidized sulphides. Overall color is dark brownish grey. Vnlets all rearranged, convoluted directions, lim. Dark grey sand makes up 5% of first sample (appears as first 5cm of section, little bit under core in box).	3	1	0	1	0	
10		37.20	39.88	Minor alt'd GND w/ small sulphide vns at random orientations, bent and sheared. Mostly ox'd sulphides in vns w/ milky qtz & feldspar (k-spar).	1	1	1	0	0	
10		39.88	43.35	Minor alt'n grading to mod alt'd GND, mostly chloritization. GND texture preserved and core remains relatively competent. Slickensides on vn faces shown in k-spar & ox'd py.	1	1	3	0	0	
10		43.35	52.54	Sericitized & chloritized, soft GND. Alt'n is pervasive so rock is crumbly: pale greenish grey to white. ~2 sulphide vns per metre on frac faces, usually at 20-30° to CA. Ox'd py and ser form slickensides, vns rearranged to random orientations.	0	4	3	3	0	
10		52.54	57.74	Original GND texture reappears and selvages are more clearly visible around vns. Rock is less sheared as well; less movement indicated in vns.	0	3	2	2	1	
10		57.74	59.07	Highly alt'd GND; wide selvages around sulphide and sulphide/qtz vns make rock crumbly, especially at vns. Minor slickensides on these faces.	1	4	3	2	0	
10		59.07	65.40	Highly-mod alt'd GND. Orig texture preserved btwn vns' selvages. 75% alt'd, v. broken up & crumbly. Slickensides appear @ 63.5m, none previous.	0	3	2	1	1	
10		65.40	66.17	Three large sulphide vns (3cm, 1cm, & 1cm wide) surrounded by extremely alt'd but competent core. GND texture completely erased.	1	4	3	2	2	
10		66.17	73.68	Mod alt'd GND. Orig texture preserved btwn vns' selvages. More competent and recovery is good (>80%). From 66.17m-67.06m: core is striped w/ bands of silicified old qtz vns. V. minor (<2%) ox'd py associated, not used in vn count. Vnlets of carb shift sulphide vns dextrally if sulph vn is to 60°.	0	3	2	1	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		73.68	74.68	Extreme alt'n surrounds 5 sulphide vns, no orig GND texture, all alt'd out.	0	4	3	3	2	
10		74.68	77.72	Carbonate veinlets throughout section, approx 5 per 10cm interval. Highly alt'd section. Only relict qtz and bt remnants of GND texture. Overall colour greenish white to pale grey.	0	4	1	2	2	
10		77.72	80.22	Carbonate pervasive in 20cm and 50cm lengths, separated by 25cm of moderately alt'd GND (minor cb, chl, and silicified) around sulphide vein. From 79.25 to 80.22m, rock is this mod alt'd coherent core.	1	3	2	2	3	
10		80.22	82.00	Extremely alt'd GND. Sericite and carbonate pervasive. Entire section is too crumbly to remove from box in core form. 1-2mm bt grains evenly distributed are the only remaining GND texture. Veins no longer visible. Few wisps of sulphides and linear crumbles of carbonate but nothing definitive.	2	5	3	3	4	
10		82.00	85.62	Mod alt'd GND. Texture preserved through predominantly carb-alt'd rock. Veinlets randomly oriented and pervasive through matrix of GND. Po appears as subhedral grains within qtz/carb veins with grey qtz (max. 0.5cm) within milky qtz/carb selvage.	0	1	1	0	3	
10		85.62	91.44	Zone of high alt'n. Carb + chl + ser pervasive so rock is soft and crumbly. Overall colour is greenish pale grey. Sulphide veins at 86.15m (1cm) and at 89.4m (0.5cm).	0	3	3	0	3	
10		91.44	91.94	Selvage and vein sample. Vein is grey qtz with ~20% sulphides (ox'd py and aspy). Selvage shows high alt'n. Sulphides concentrated in centre of vein in 1cm wide section. Few 1-2mm lenses w/in qtz vein as well.	0	3	3	1	3	
10		91.94	95.19	Low to mod alt'n. GND texture preserved between carbonate veinlets and qtz/carb veins, which have chloritized selvages.	0	1	2	0	2

DRILL LOG LEGEND P1	DATE: July 4-8, 2005 PAGE 7 of 16		
DRILL HOLE # : DG05-290C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		95.19	96.72	Mod to highly alt'd GND. Chl+carb alt'n pervasive, plus silicification makes texture grade to cryptocrystalline but GND texture still visible in 10% of sample.	0	2	3	0	3	
10		96.72	97.83	Highly alt'd GND. Carb+chl+ser alt'n pervasive such that rock is easily broken, but coherent. 10% preservation of GND texture.	0	4	4	2	4	
10		97.83	101.92	Highly alt'd GND. Carb/chl/ser alt'n pervasive. Rock is highly broken and crumbly, as alt'n is throughout matrix.	0	4	4	3	4	
10		101.92	102.66	Unalt'd GND w/ qtz veins w/ very few sulphides and small selvages	0	1	1	0	0	
10		102.66	111.25	Carb-infused GND. Crumbling to coarse sand texture w/ no longer than 15cm lengths of competent rock. Recovery is good (65-70%), but quality so poor, veins are not readily visible; count is probably low. Disseminated aspy throughout GND.	0	1	1	2	4	
10		111.25	115.26	More competent GND. 60% competent rock sulphide/carb veins may have started as only sulph veins; carb secondary. Crumbly section abuts competent at 17° to CA.	0	1	1	1	2	
10		115.26	119.78	90% competent GND. Crumbly carb-infused sections (1-12cm wide) make up 10% of section and intersect at 25° to 40° with sharp boundaries. Sample from 115.82 to 116.71m contains one crumbly section with sulph vein adjacent to 25cm long section of 'bleached'/carbonitic GND w/ texture preserved. Colour is orange-green beige. (orange=siderite (ox'd carb), green = chl). From 117.35 to 118.15m, another alt'd section (2 samples). There are at least 2 generations of qtz veining here, plus the carb. Latest qtz episode is most visible, so these veins are noted. Aspy throughout width of vein (not selvage).	0	1	1	1	1

DRILL LOG LEGEND P1	DATE: July 4-8, 2005	PAGE 9 of 16	
DRILL HOLE # : DG05-290C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		119.78	121.92	Fewer qtz veins continue into silicified GND. Colour is med grey, texture cryptocrystalline except speckles of 1mm bt. Rock readily breaks on randomly oriented veinlets of carbonate.	0	0	1	0	1	
10		121.92	124.97	Silicified GND infused with carb; rock is soft and crumbly. Veinlets of calcite generally run at 45° to CA, so breakage is predominantly on this angle as well. 20% soft carb-clay. Slickensides in carb veins.	0	1	1	1	3	
10		124.97	129.54	Back to less-carbonitized, silicified GND (as 119.78-121.92m), veinlets of carb at lower angle	0	0	1	0	1	
10		129.54	131.71	Gradation back to unsilicified GND. Qtz veins w/ carb/chl selvages more prominent. Aspy is 1-2mm, w/in qtz veins, not ox'd or alt'd. From 131.06 to 131.71m, 2 qtz veins and 2 sulph veins account for entire sample's alt'n (65cm chl'd and cb'd to yellowish green)	0	0	3	1	2	
10		131.71	134.56	Carb-infused cryptocrystalline, silicified GND w/ numerous qtz veins. 50% carb-clay crumbles. Sulphide 'veins' attached to edges of carb veins and/or qtz veins.	0	1	2	3	3	
10		134.56	135.39	Unalt'd GND (not silicified), w/ 20% carb-clay crumbles.	0	0	1	1	1	
10		135.39	137.80	Silicified cryptocrystalline GND w/ qtz veins with large chl'd selvages. Carb veinlets in random orientations - web appearance - cause breakage of otherwise competent core. (<5% clay). Good potential for gold here. <1mm flecks seen	0	0	1	0	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		137.80	139.08	Section v. broken up. Influx of carb.	0	0	1	2	3	
10		139.08	141.62	Unalt'd GND w/ qtz veins with carb/chl'd selvages. Solid rock.	0	0	1	0	1	
10		141.62	144.78	50% unalt'd GND w/ qtz veins, 50% highly alt'd around carb-infused sections, at 60° to CA. Carb'd sections are crumbly at centre (max 20cm) with competent, yellow-white surrounding selvages (up to 10cm on either side). Slickensides in sulphides (aspy and py) at margins of qtz/carb/sulph veins	0	1	1	1	2	
10		144.78	146.21	Zone of extreme alt'n. GND texture barely visible beneath carb/chl alt'n, causing rock to be soft but still competent. Lenses of sulphides on carb veins show moderate slickensides	0	2	4	2	4	
10		146.21	153.53	Qtz veins with selvages continue into zone of greater carb alt'n in veinlets and through matrix of ~40% of section, causing crumbly/competent alternating sections approx 20cm long, ave. Late carb veins overprint old qtz veins and incorporate sulphides (from qtz to carb vein). Veins are at 120° to each other.	0	1	2	2	2	
10		153.53	161.24	Carb-infused GND. Competent sections <15cm long. Carb veining is wider than before: approx. 5-10% of sample is pure calcite!	0	1	2	2	3

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		161.24	161.99	GND is competent but highly alt'd with carb and chl, and is silicified around 6 sulphide-rich veins. On broken face more old qtz veins are visible but highly silicified. Mod slickensides on sulph-vein face.	1	0	3	0	4	
10		161.99	163.67	Relatively unalt'd section; carb influx, sections crumbly	0	1	2	2	3	
10		163.67	166.12	Highly to extremely alt'd GND. Carbonate pervasive across competent and incompetent ("carb-clay-crumbie") sections. 60% crumbly.	1	1	3	3	4	
10		166.12	167.61	Selvage and 15cm sulphide vein. Upper selvage is more carbonitized (crumbly), than lower selvage (competent). Lower selvage contains 2 qtz veins (may help to explain less carb down there).	1	1	3	1	3	
10		167.61	168.82	Numerous grey-milky qtz veins w/ lots of aspy (2 samples)	1	1	3	0	2	
10		168.82	175.26	Moderately silicified GND with ~30cm sections of carb-infused, crumbly rock. Qtz veins visible in competent sections and as linear relicts qtz pebbles. ~50% of section is broken up, crumbly rock.	1	2	3	1	3	
10		175.26	181.36	Highly to extremely alt'd GND silicified plus chl/cb selvage alt'n around sheeted qtz veins and sulphides. Slickensides seen on sulph vein faces, in ox'd py and ser and calcite.	1	2	3	1	3

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		181.36	187.76	Unalt'd GND between selvages of qtz and sulphide veins. Less carbonate and fewer (but larger) veins. Unalt'd GND in between selvages, up to 50cm long, making up 25% of section. Slickensides in aspy on fract'd veinlet face. From 186.21-186.46m, carbonate is pervasive for 24cm. Clear boundaries at 80° to CA.	0	1	2	1	2	
10		187.76	190.20	Zone with qtz veins and large chl-cb selvages separated by unalt'd GND, in length up to 10cm (15% of section). Slickensides seen on broken sulphide vein face in ox'd py and ser.	1	1	2	1	2	
10		190.20	195.07	Unalt'd GND w/ small grey qtz/carb veins (<0.5cm, mostly). Few grey qtz veins up to 1cm wide; one grey qtz/carb vein 2cm wide. Veinlets of carbonate overprint qtz veins, sometimes using same pathway, others not. Approx 14 carb veinlets/metre.	0	0	1	0	1	
10		195.07	195.67	Top of section is 2cm qtz-carb-sulph vein, followed by 47cm of carb-infused crumbly GND w/ three 1cm sulph veins. One sulph vein (100% ox'd py) and 5cm selvage at end of sample.	1	1	1	2	3	
10		195.67	196.90	Unalt'd GND w/ aspy-rich qtz veins w/ small selvages	0	0	1	0	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-5.18m			CASING; no recovery						
10	5.18-266.57m			GND						
10		5.18	10.67	GND: 15% qtz, 20% feldspar, 30% hbl, 35% bt. Qtz veins (max 1cm) with silicified selvages, up to 20cm wide. Granular appearance w/ oxidation of feldspars to light yellowish orange. Hem ox'd to reddish black w/in veins (~5%). Calcite crystallized on veinlets/fracture faces. Overall, rock is fractured to crumbly sand texture. Xenolith of argillite w/in GND at 5.25m. Finely laminated, dark grey-black. Size is 6cm by 5cm. Type '3' veins are 85% grey, opaque qtz and 15% white opaque calcite throughout. Magnetite is <2mm grains, concentrated near margins of veins; hematite distributed in veins, grains <2mm, up to 8%.	1	0	0	0	1	
10		10.67	12.19	Broken to gravel-sized silicified GND. Mafic minerals reduced to <10%.	1	0	0	0	1	
10		12.19	13.72	More competent, slightly silicified GND. Texture predominantly erased.	1	0	0	0	1	
10		13.72	20.61	GND. Original composition (as at 5.18m). More competent. Only 5% of section is gravelly/sandy, rest are in sections up to 40cm long. Sulphides concentrated at margins (not within) of veins; veins are milky qtz, 50% have grey qtz <3mm wide in centres. Black ox'd magnetite seen on fracture faces. Between veins, thin film of black, <1mm. Metallic mineral, soft hexagonal to tabular, ox'd to black and green: chalcocite (?), throughout GND. Noticeable large grains, up to 1cm in diameter or 3cm long.	1	0	0	0	1	
10		20.61	21.79	V broken to sandy gravel texture. GND oxidized on fracture faces and throughout crumbly sections. Rusty orange brown ox'n product of hematite/limonite.	2	0	0	0	1	
10		21.79	28.50	Competent core with moderate recovery (65%); composition GND as at 5.18m (mafic). At 27.25m, aplite vein (4cm) is cross-cut by 1cm qtz vein. Aspy associated w/ aplite is conc at this intersection.	1	0	0	0	1	
10		28.50	31.32	Crumbly and broken GND. One 10cm gouge section w/ 10% clay, 90% sand, brown, contacts GND at 20°	2	0	0	1	1	
10		31.32	35.05	GND as at 5.18m	1	0	0	0	1	
10		35.05	45.72	50% unalt'd GND as above, 50% crumbly to sandy v. broken up rock. Alternates between them at 0.5m intervals. Recovery averages 50%. Most loss occurs at broken sections. Samples separated where changes occur.	2	0	0	1	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		45.72	49.76	Limonite coats fracture faces, 1mm thick. Opaque orange-med brown. Pervasive limonite through core at 46.0-49.76m	3	0	0	1	2	
10		49.76	51.82	GND as at 5.18m, broken with lim on fewer fract faces	2	0	0	1	1	
10		51.82	55.55	Dark grey, partially silicified GND. One 15cm broken up section at 52.40m to coarse sand texture (qtz eyes, etc). Minor limonite and calcite on fracture face, generally at 40° and 15° to CA. In qtz/carb veins, ox'n appears as limonite.	1	0	0	0	1	
10		55.55	57.91	V coarse-grained qtz-rich GND. Euhedral bt up to 6mm in diameter. Disseminated aspy throughout, assoc. w/ bt. Feldspars weathering to clay minerals. Coherent core, however, w/ moderate to good recovery. This rock appears to be alt'd due to veining, as its contact is at 45° to CA (same as veins). Lim staining in wide (up to 5cm) selvages around veinlets.	1	0	1	0	1	
10		57.91	62.48	Lim staining 80% pervasive over section of otherwise unalt'd GND. Qtz veins have small qtz-alt'd selvages dominated by lim. V minor chl in selvage of qtz vein @ 61.00m. GND texture preserved throughout.	3	0	0	0	1	
10		62.48	64.01	GND texture 90% erased in this section, to aphanitic dark grey. v. broken up w/ limonite in wider veins (~2mm) w/ calcite. at 63.70m, a 1.5cm angular qtz piece is surrounded by hexagonal shaped concentration of mafic (bt) material.	4	0	0	1	2	
10		64.01	68.58	Unalt'd GND w/ lim on fract faces (10°-30° to CA); qtz veins partially silicified. Older episodes of veining not recorded, because these veins are too difficult to distinguish well.	1				1	
10		68.58	70.25	GND. Very broken up w/ lim on regular fracture sets at 30° and 130°. Start out 'clean' and go to crumbly and more irregular. Two types qtz veins: (1) large, milky, and (2) small w/ thin, central grey qtz with milky selvages. Evidence of motion w/in minerals: shear bands along 2 planes of motion.	2			1	1	
10		70.25	71.94	Gradation from crumbly, ox'd and carb'd GND above to unalt'd GND below. Silicified selvage on one vein, none on other.	1				1	
10		71.94	75.49	Unalt'd GND. Straight and clear qtz veins w/ little silicified selvages. Po appears, and lots of scorodite w/ aspy.	0	0	0	0	0	
10		75.49	76.02	Extreme alt'n around 3 qtz veins. GND texture totally erased to clay texture. Sericitized, chloritized and ox'd.	4	1	3	3	1	
10		76.02	80.25	V minor alt'n in GND with qtz veins	1	1	1	1	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		80.25	82.18	Mod'ly to highly alt'd GND. Broken up and alt'd to clayey to coarse sand texture. Carb veins parallel to CA have slickensides in ser and carb.	3	2	2	2	2	
10		82.18	83.96	Mod alt'd GND around veins. From 83.5 to 83.82m, core is bleached, crumbly white around dark grey sulphide veins	2	1		1	1	
10		83.96	89.11	Unalt'd GND. Straight qtz veins with small silicified selvages.						
10		89.11	90.32	Abrupt change (due to recovery loss?) to bleached, clay-rich extremely alt'd GND. Colour is pale grey - white w/ lenses of ox'd sulphides up to 0.7cm wide. GND texture erased. Soft and crumbly.	1	2	3	3	3	
					0	1	2	0	1	
10		90.32	91.44	Competent hard rock. Silicified GND separated by chl-rich selvages around qtz veins.						
10		91.44	94.93	Same as previous but veinlets of carbonate more prevalent, up to 20 per metre in random orientations, in irregular lines	1	1	2	2	2	
10		94.93	115.82	Highly to extremely alt'd GND. Ser + chl +cb alt'n overprints original GND texture. Colour pale greenish white. Ox'd py in veinlets to veins, usually at 0-25° to CA. Qtz veins visible in places, but generally overprinted by alt'n. 80% competent rock, 20% clay texture (carb + ser). At 106.45m, slickensides in ser and carb on vein face at 0° to CA. Slickens @50° to CA on face.	1	3	3	3	3

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		115.82	123.44	Minor alt'd GND. Broken up due to carb-infusion from 115.82 to 117.05m. 95% unalt'd GND. Silicified and chl'd qtz vein selvages are the only alt'n besides minor carb veining through rest of section (below 117.05m).	0	0	1	1	1	
10		123.44	125.61	Carb-infused GND. Veinlets and throughout matrix of GND causes rock to be soft and crumbly			1	2	3	
10		125.61	129.84	Back to unalt'd GND. Sheeted qtz veins with silicified/ chloritized selvages. Late calcite with qtz is up to 20% of veins.			1		2	
10		129.84	131.16	Chloritized and carb'd coherent rocks.		1	3	1	2	
10		131.16	134.56	Unalt'd GND w/ sheeted qtz veins. At 134.11m, slickensides on fract face at 45° to CA, in ser +carb+chl+ox'd py (soft clay material).		1	1		1	
10		134.53	139.38	Increased carbonate content (up to ~10% of section) causes rock to appear somewhat bleached. Texture soft and easily broken, crumbly over 40%. Qtz veins continue, selvages with ser + chl still visible, silicified sections more competent than non-sil.		1	1	1	2	
10		139.38	144.78	Highly alt'd GND, w/ carb becoming pervasive in some sections up to 40cm long. Rock is carb-clay soft and crumbly. Chl also intense. Colour med greenish grey.		1	2	2	3

DRILL LOG LEGEND P1 | DATE: June 26 to July 16, 2005 | PAGE 1 of 16

DRILL HOLE # : DG05-291C

FeOx: 0 = Unoxidized; 5 = Intensely Ox'd

Ser, Chl, etc: 0 = Unaltered; 5 = Intensely Altered

Carbonate: 0 = No Effervescence; 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		144.78	156.97	GND, alt'd only around qtz veins (selvages). Sheeted veins at 50° to CA.		1	1		1	
10		156.97	170.69	GND w/ approx 6 qtz veins per metre and 15 carb veinlets per metre of core. Outside selvages and carb'd (crumbly) sections, rock is unalt'd. Colour med grey.		1	1		1	
10		170.69	173.74	Sheeted qtz veins continue through more carb-rich zone. Veinlets of powdery, opaque white carbonate are at 60° and 10° to CA and cause rock to crumble.		1	1		2	
10		173.74	178.31	Selvages dominate core (section is 70% minorly alt'd w/ ser and chl). Less carb means more competent rock. Slickensides on faces at 40° in ser, chl.		2	2		1	
10		178.31	182.88	80% unalt'd GND. 30cm zone of carb-rich. 30cm chloritic selvage around 3 1cm qtz veins. All competent. Slickensides in ox'd and unox'd py on face at 30° to CA.		1	1		1	

DRILL LOG LEGEND P2

Selvages 0 = No Alteration 5 = Intense Alt'n

Ox. State 0 = No Oxidized Sulphides 5 = All Sulph Oxidized

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar., 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

Date: June 26 to July 16 , 2006 (stopped June 26-July 10 for fire)

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		182.88	185.93	Another carb-rich zone. White, crumbly carb in veinlets and throughout matrix of GND overprints qtz veins. Some chl'd selvages still visible.		1	1	1	2	
10		185.93	188.98	Mod'ly alt'd GND. Minor carb in veinlets and through 50% of matrix. Qtz veins have silicified and chl'd selvages twice as wide as the veins themselves.	0	2	1	1	2	
10		188.98	192.02	GND texture is 95% erased to aphanitic chloritic/sericitic competent core. One 5cm qtz vein at 196.60m. Colour is medium greyish green, minor veinlets of carbonate overprint rock at low angles (<20° to CA)						
10		192.02	193.55	Highly alt'd GND. Carb (white, powdery) in veinlets and through matrix of GND. Texture crumbly over 60% of section. Competent core up to 15cm long.	1	2	2	2	3	
10		193.55	202.89	Minor to mod alt'n through section, depending on carb infusion amount, sections up to 30cm of mod alt'n. Silicified and chl'd selvages are small around qtz veins.		1	1		1	
10		202.89	204.75	V little carb; qtz veins w/ chl'd selvages interrupt unalt'd GND.		1	1			
10		204.75	208.22	GND infused w/ carb, so crumbly and broken. Sheeted qtz veins continue.		1	1		3	
10		208.22	212.73	Moderate carb alt'n overprints qtz veins and their sil'd, chl'd selvages. At 212.40m, 30cm section of sub-rounded, lim-covered cobbles, ave size 5cm; may be due to late brittle faulting and motion, with influx of lim-rich meteoric waters, or surface waters infiltrating rock and weathering it.	1	1	1	1	2	
10		212.73	216.41	Remnant qtz vein pieces within carb-rich GND. Coherent core (70%) appears sheared, hence the vein destruction. Sulphides in veinlets throughout section.	1	1		2	3	

DRILL LOG LEGEND - P2

DRILL LOG LEGEND P1	DATE: June 25 to July 16, 2006	PAGE 13 of 16	
DRILL HOLE # : DG05-291C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		216.41	219.03	Veins now unsheared, selvages still present beneath moderate carb alt'n.	2	3	1	2	2	
10		219.03	219.46	Dark grey aphanitic, silicified GND. Dark grey to black clay and carb on fracture faces. Grades into next section...		1	1	2	1	
10		219.46	220.43	Ser/chl/carb alt'n, moderate. GND texture 50% erased to pale whitish green colour.		2	3	1	3	
10		220.43	228.60	Unalt'd GND w/ sheeted qtz veins continuing but with less defined margins - has been 'reheated' or cooled more slowly here than up in hole. Also far less carbonate here; rock is solid. Straight fractures in random orientations. At 221.35m, qtz vein contains ~20% py and has obviously been offset along late sulphide veinlets.		1	1		1	
10		228.60	231.52	Sulphide veins begin, with large selvages of chl, ser (+minor carb) alt'n.	1	2	2			1
10		231.52	223.17	Carbonate content increases so rock is v broken up into lengths less than 10cm.	1	2	2	1	2	
10		233.17	240.09	V minor silicification and chloritization of GND around qtz veins, which are fewer but larger. One 12.5cm grey qtz vein at 237.42m. Sulphide veinlets offset qtz veins sinistrally if qtz veins are at 30° and sulph veins are at 160° to CA. Carbonate appears in few veinlets, later than other veinlets/veins. Concentrated (up to 5%) in 30cm length from 237.56 to 237.86m.	1		1		1

DRILL LOG LEGEND P1	DATE: June 25 to July 16, 2005	PAGE 15 of 16	
DRILL HOLE # : DG05-291C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; QVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		240.09	240.94	Crumbly carb-infused GND. Veinlets and throughout matrix. Coherent core <10cm long. Clay rich. Ox'd py throughout (from old sulph veins).	2	2	2	1	3	
10		240.94	244.56	Fewer qtz veins in unalt'd GND. Sulph veinlets still offsetting qtz veins, as at 233.17 to 240.09m.	1		1		1	
10		244.56	245.36	Crumbly/clay to competent highly alt'd GND. Chlorite and silicification are pervasive and colour is solid greenish grey. Only qtz eyes left of GND texture. Carbonitic clay contacts are at 125° (upper) and 25° (lower).	2	2	3	2	2	
10		245.36	248.41	Minor to mod carb alt'n throughout. Otherwise unalt'd GND w/ continuing qtz veins and sulphide veinlets.	1	1	1	0	2	
10		248.41	259.08	Unalt'd GND w/ sheeted veins, at lower angles (<10°), for first sample, to 249.94m. Mod to strong slickensides on fracture faces. Solid core.			1		1	
10		259.08	266.57	More carb alt'd GND. Texture is granular, somewhat crumbly but overall GND texture preserved, just softened. Sulphide veins more numerous and bigger - up to 0.5cm wide. Fewer qtz veins, somewhat rearranged by weak foliation parallel to carbonate and sulphide veinlets.	1	1	1	2	3	
			E.O.H.

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-12.19			CASING						
1	12.19-13.72			OVB: Core is broken, 70% rounded pebbles of qtz, QZZ, MSED, + other detrital material. Likely from drilling on washed gravel pile. Poor recovery.						
70	13.72-25.91			QZZ: 90% qtz, 5% k-feld, 3% bt, ±2% sulphides						
70		13.72	15.24	Core is broken. Silicous, lim staining on fract faces. Some fracture faces have clay on surface. Fractures are filled w/ sulphides py, aspy. Diss py and aspy can also be found. At 14.94m, a- 30cm qtz vein. Unable to determine angle or contact. Light grey colour, fractures ox'd, tr py.	1			1		
70		15.24	19.81	Core becomes more broken, still highly silicious. Less lim on frac faces. Veinlets of sulphides, also fracture fill, and small (<1mm) euhedral py crystals on frac faces.	1					
70		19.81	21.34	Fracture are heavily stained by lim. Minor ser can be found on a few (5%) of frac faces. Py and aspy fill irregular fractures. Also found as diss sulphides	2	1				
70		21.34	25.91	Core is broken into mostly (80%) gravel to cobble size pieces. Minor lim staining on pebbles from 22.86 to 23.10m. Minor clay on frac surfaces. Diss py found throughout.	1			1		
70		25.91	27.43	Core is dark grey, still. Silicious, minor lim staining, no clay.						
80	27.43-38.10	27.43	28.13	MSED. Core is dark grey to black, fine gr. Qtz eyes and lenses are present. Black colour is due to graphite. Foliation present, but no preferred orientation, instead "s". Possible fault (looks similar to 287C). Diss py on faces (1%).						
80		28.13	28.96	Core is light grey, with white laminae. Silicious with ser on faces. Foliations at 40° to CA. At 28.73m, 23cm clay gouge contains MSED frags.		2		3		
80		28.96	33.53	Bleached, silicified MSED. Core is a light tan colour. Foliation often difficult to distinguish, overprinted. Where visible it ranges from 65-75°. Chl common on fractures, as is ser and clay.		2	2	2		
80		33.53	38.10	Core is less silicious. Chl alt'n more intense, ser and clay alt'n is reduced. Foliation at 45-50°.		1	3	1		
81	38.10	38.10	48.77	HFLS: Core is foliated. Colour is banded brown, violet and green. Foliation is at 50° to CA until 42.87m, where it is at 70°to CA. It returns to 50-60° at 49.20m. Very few qtz veins or sulphides are present. Fractures are filled with chl, ser, and minor carb. Frac faces show the same. The qtz veins that do exist run parallel to foliation. At 43.04m, 2cm clay gouge. Core on either side shows slickensides. Core is soft, easy to scratch - chl.		2	2	1	1	
80	48.77-49.37	48.77	49.37	HFLS giving way to more silicious MSED. Foliations no longer visible. Increase in carb veinlets. Trace py on fractures.		1	1		2	
81	49.37-56.39	49.37	56.39	HFLS - Similar to HFLS at 38.10m, with more intense clay and chl alteration. Frequent areas of gouge. Foliation at 50-55° from 49.37 to 53.43m, at 60-65° from 53.43 to 56.39m. At 51.52m, 3cm gouge at 45° to CA. At 53.04m, 6cm clay gouge at 70° to CA. At 54.52m, 4cm gouge at 70° to CA.		1	3	3	1	
80	56.39-59.44	56.39	59.44	MSED - Silicified, difficult to scratch. No visible foliation. Minor ser on frac.		1		1	1	
81	59.44-62.48	59.44	61.56	HFLS. Foliation at 80°, minor clay alt'n.		1	2	1	1	
81		61.56	62.48	HFLS heavily alt'd to clay (80%). Small fragments of HFLS found within		1	2	4	1	
80	62.48-64.71	62.48	64.71	MSED - Silicious MSEDs. Foliation is difficult to distinguish: From 62.48-64.01m, @80° to CA; From 64.01-64.71m, @50° to CA. At 62.75m, 10cm trace py on frac faces w/ slickensides.		1	1	1		
81	64.71-65.53	64.71	65.53	HFLS. Chl and clay on fracs. Foliation at 80°, crenulations		2	2	1	1	
80	65.53-67.06	65.53	67.06	Silicious MSED. Black, with white, 1mm bands at 85° to CA. Contact with hornfels at 70°		1	1	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
81	67.06-70.98	67.06	70.98	HFLS. Foliation at 85-90° to CA. Qtz intrudes between foliations at 69.72m and contain 1% py. Chl and ser on frac faces.		2	2	1	1	
80	70.98-73.15	70.98	73.15	Silicious MSED. No visible foliation. Increase in veining, with minor sulphides. Core is black with green bands. Frac faces @72.70m show py on them. Contact w/ hornfels at 70°						
81	73.15-81.80	73.15	74.68	Foliation at 80° to CA. At 73.40m, 6cm grey qtz vein, at 80° to CA, trace py. At 73.97m, silicified MSED, ser on frac's.		2	2	1		
81		74.68	76.20	Very poor recovery (16%), pieces of qtz vein (3-5cm) and HFLS. At 76.18m, 2cm gouge, sandy.						
81		76.20	81.80	HFLS. Foliation at 60°. Qtz intrudes foliation or crosscuts. Chl content increases after 79.25m. At 79.25m, foliation becomes 70-75°. At 81.32m, foliation at 80-85°.		2	3	1	1	
80	81.80-82.30	81.80	82.30	Silicious MSED. Fractures filled w/ carb light grey colour. Py on frac surface (tr.). At 82.10m, 3cm sandy gouge at 40°. Contact w/ HFLS to 80°.				1	2	
81	82.30-83.72	82.30	83.72	HFLS. Foliation @ 75-80°. Slightly more clay alt'n. At 82.73m, 5cm grey qtz vein @90° to CA.						
80	83.72-85.15	83.72	85.15	Silicious MSED w/ interbedded HFLS. Foliation only visible in the HFLS at 80-85° to CA. Tr py on MSED frac faces.		1	2	1		
81	85.15-87.43	85.15	86.56	HFLS. Foliation @ 80-85° to CA. Core has a slight green tinge to it - chl dominant alt'n. Minor ser and clay on frac. Smells like sulphur when scratched - minor sphalerite		1	3	2		
		86.56	86.87	~20cm grey qtz vein, broken, no visible contacts. 15-20% massive sulphides: py + aspy						
		86.87	87.43	Broken pieces of qtz vein w/ py and aspy as massive sulphides. Also pieces of silicified MSED.						
80	87.43-91.44	87.43	91.44	MSED. Silicified, no visible foliation or contact. Tan coloured clay on frac surfaces.				1		
81	91.44-92.96	91.44	92.96	HFLS. Foliation @ 75-80°. Qtz veins intrude foliation. Carb veinlets follow foliation at 75-80°		1	3	2		
80	92.96-94.86	92.96	94.86	Silicified MSED. Foliation difficult to see, but @ 45-50° where visible. At 93.16m, 7cm grey qtz vein. Bismuthinite on frac face.						
81	94.86-101.88	94.86	101.88	HFLS. Foliation at 94.86m at 70°, at 96.01m, 75-80°, at 97.56m, 55-60°, at 99.06m, 55-60°, at 100.56m, 60-65°. Clay and chl alt'n common. Cb veinlets abundant.		1	3	2	1	
80	101.88-105.16	101.88	105.16	MSED. Silicified, foliation @ 101.81m - 85-90°, @102.11m - 70-75°, @103.63m - 75-80°. Foliation is difficult to distinguish due to overprinting. At 104.08m, 8cm tan coloured sandy gouge. MSED frags present.		1	2	2		
81	105.16-111.25	105.16	107.20	Silicified HFLS. Does not scratch easily. Less chl and ser alt'n. Violet and green colour. Foliation at 60°.		1	1	1		
81		107.20	111.25	HFLS. Easy to scratch, higher chl content - more green banding. Foliation @ 107.2m - 80°, @108.20m, 90-95° - crenulated for 9cm. After this, @110°. @109.73m - 110°. @110.33, 4cm clay gouge @80° to CA. @110.82m, 5cm clay gouge @70° to CA.		2	2	2	1	
80	111.25-114.30	111.25	114.30	Silicified MSEDS. Foliation visible: @111.25m, 60-65°. @112.78m, 70-75°. @111.99m, 10 cm qtz vein grey qtz @80° to CA. Contains 1% po. Diss py present, also intrudes foliation.		1	1	1		
81	114.30-115.54	114.30	115.54	HFLS. Easily scratched by nail. Foliation @60-65° to CA. Chl on frac faces. Carb veins return, crosscut foliation		1	3	2	1	
80	115.54-116.50	115.54	116.50	Silicious MSED. Light grey color. Carb on frac faces. Foliations @ 75-80° to CA					1	

DRILL LOG LEGEND P2

Selvages
0 = No Alteration
5 = Intense Alt'n

Ox. State
0 = No Oxidized Sulphides
5 = All Sulph Oxidized

Date: July 8 - 10th, 2006

LOGGED BY: Terry Croteau

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar, 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
81	116.50-117.35	116.50	117.35	HFLS. Soft, easily scratchable. Foliation @ 70-75° to CA. Chl alt'n dominant.		1	2	2	1	
80	117.35-118.87	117.35	118.87	Silicious MSED. Dark grey, banded. Foliation @ 70-75°.						
81	118.87-123.44	118.87	123.44	HFLS and silicious MSED, interbedded. Foliation @119.07m - 45-50°, @120.90m - 70-75°; @ 121.92m - 60-65°. The HFLS has lower angle foliation than the MSED.		1	2	1	1	
80	123.44-202.69	123.44	125.83	MSED. Chloritized with several large (> 5cm) qtz veins. Carb on frac faces and in veinlets. Some veins are irregular, some follow foliation. @123.49m, 8cm grey qtz vein @ 65° to CA @124.47m, 8cm grey qtz vein @ 75° to CA, tr py @124.73m, 10cm qtz vein @40° to CA, 1% po			3		2	
80		125.83	134.11	Foliation @ 125.83m - 55-60°, @126.49m - 55-60°, @128.02m - 55-60°, @129.59m - 70-75°, @131.06m - 75-80°, @132.59m - 85-90° to CA. Cb veinlets crosscut foliation as do sulphides, which are rare containing only trace amounts.		1	2	1	1	
80		134.11	147.83	MSED Silicious, dark brown to dark grey. Most qtz veins run between foliations. Some are irregular shape, as well as filled gashes. Foliation @134.11m - 85-90°, @135.64m - 85-90°, @137.16m - 85-90° - aspy crystals on frac faces @138.68m - 85-90° @140.24m - 75-80° @141.73m - 65-70° @143.26m - 70-75° - diss po and cpy @144.78m - 70-75° - diss po and cpy @146.30m - 65-70° - diss po and cpy There is an increase in shear over this interval. Boudins are present starting at 144.78m and continuing until 154.85m.		2			1	
80		147.83	149.35	Core is light green, contains abundant ser, chl. Trace diss po present.		2	2	1		
80		149.35	154.85	MSED Grey green to grey. Shear is highly visible as boudins. Foliation @149.35m - 55-60° @150.88m - 45-50° @152.40m - 65-70° @153.92m - 65-70° Qtz fills gashes, crosscutting foliation or follows foliation or crenulation. Diss py occurs from 149.35 - 152.40m in darker core. Diss aspy occurs from 152.40-154.85m in lighter coloured core		2	2	1	1	
80		154.85	158.50	Core is light green to white. Ser alt'n. Veining increases, filling gashes and between foliation. Carb alt'n increases. Foliation @ 65 - 70° to CA. Shearing indicators absent.		3	1		2	
80		158.50	161.54	Silicified MSEDS. Foliation is difficult to distinguish, most has been overprinted. Dissem aspy, vnlets and euhedral crystals on frac face. Foliation (where visible) @ 50-55°.						
80		161.54	175.26	MSED and HFLS interbedded. Boudins present--increased shear. Carb alt'n increased. Foliations at: 161.54m--60-65°; 163.07m--65-70° (7cm qtz vn @163.82m); 164.59m--65-70° (8cm qtz vn @ 165.21m); 166.12m--60-65°; 167.64m--65-70°; 169.16m--60-65°; 170.69m--75-80°; 172.21m--55-60°; 173.74m--60-65°. Qtz vns follow foliation. Trace dissem py present. Sulphide content increased compared to other intervals.		2	2	1	2

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-293C

PROJECT: Dublin Gulch - 1735

GROUND ELEVATION: 762m

BEARING: 000 | DIP: -50°

DATE STARTED: 11-Jul-05 | DATE COMPLETED: 14-Jul-05

LOGGED BY: Terry Croteau July 13-16, 2005

CONTRACTOR: Britton Brothers

COORD SYSTEM: NAD 27: EASTING: 458456 NORTHING: 7098452

COORD SYSTEM: NAD 83: EASTING: 458337 NORTHING: 7098635

NAD 27 (CORRECTED for historic grid): EASTING: 458426 NORTHING: 7098462

SECTION LINE(historic grid): 458426E

DRILLING DETAILS

Hole Diameter: HQ

Overburden: 15.24m

Deviation:

Casing: 18.29m

Core Size: HQ

Cement (# Bags): 0

Plug Depth: N/A

Notes: No plug necessary.

FROM	TO	LITHOLOGY

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-15.24	0.00	15.24	Casing. 1% recovery, lim on MSED.						
1	15.24-19.81	15.24	16.76	Very poor recovery. 10cm of QZZ, lim stained.						
1		16.76	18.29	Sand, gravel, pebbles. Diverse lithology, likely bedload from creek.	3			1		
1		18.29	19.81	Diverse lithology, core is composed of rounded section of boulders/float, bedload. Lim pervasive & staining.	2					
90	19.81-21.34	19.81	21.34	Broken QZZ. Lim staining on faces. Trace dissem aspy found on faces.	2					
1	21.34-22.86	21.34	22.86	Rounded pebbles-cobbles of diverse lithology mixed w/ broken QZZ & MSEDs. Lim staining on faces. Foliation where visible @ 50-55°.	2					
90	22.86-36.58	22.86	35.05	Broken QZZ w/ lim staining on frac faces. Foliation where visible 55-60°. At 24.38-28.96m: dissem py & aspy. @ 27.83m: Euhedral aspy on faces. @ 28.89m: 7cm sandy gouge. No contact angles.	2					
90		35.05	36.58	QZZ--minor lim staining, absent by end of interval.	1					
80	36.58-59.44	36.58	48.23	Silicious MSED. Colour is light to dark grey, core is broken. Foliations @36.58m: 60-65°- diss aspy; @38.10m: 65-70°- diss aspy; @39.62m: 60-65°- diss aspy; @ 42.67m: 50-55°; @ 44.20m: 55-60°; @ 45.72m: 55-60°; @ 47.24m: 55-60° - diss aspy. Very few vns in section, sulphides mostly dissem or found as euhedral crystals on frac faces.						
80		48.23	55.46	Silicious MSED. Colour varies from light to dark grey. Lim staining returns on faces. Foliation @ 48.23m: 60-65°; @ 48.77m: 65-70°--py on frac face; @ 50.29m: no visible foliations; @ 51.83m: 65-70°; @ 53.36m: no visible foliation; @ 54.86m: no visible foliation--diss py.	2					
80		55.46	56.39	Core is light grey green, heavily lim stained, easily scratchable, no visible foliation.						
80		56.39	57.91	Light brown to light grey MSED. Fracs are filled w/ ox'd py, filling 3% of core. The fracs & vnlets crosscut, as well as follow the foliation. There is no preferred angle (high or low). Foliation @ 55-60°, lim on frac faces.	2	1			1	
80		57.91	59.44	Silicified MSED. Light to dark grey. Foliation @ 55-60°. Low angle (165-170°) carb vns crosscut foliation. Lim on frac faces.	2	1			1	
1	59.44-60.96	59.44	60.96	Broken, rounded pc's of diverse lithology. Possibly came from higher in hole.	2	1	1	1	1	
80	60.96-102.28	60.96	65.00	Light grey MSED. Core is broken, and frac faces covered w/ lim. Foliation @ 60.96m: 55-60°; @ 62.48m: 55-60°; @ 64.01m: 35-40°; @ 64.21m: 45-50°. at 63.31m: 22cm of breccia. Foliation uphole @ 35-40°, downhole @ 55-60°. Contact angles uphole @ 60°, downhole @ 30°. Clasts range from light grey to dark grey MSEDs & qtz. Foliation still visible in MSED clasts. Clast movement may indicate a normal fault (HW uphole), at a high angle ~80°, crosscuts foliation.	2	1

FeOx: 0 = Unoxidized; 5 = Intensely Ox'd
Ser, Chl, etc: 0 = Unaltered; 5 = Intensely Altered
Carbonate: 0 = No Effervescence; 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0 - 4.57			Casing - No Recovery						
1	4.57 - 13.72	4.57	10.67	OVB: Core consists of GND, MSED, QZZ fragments. GND is solid, core with intervals of gravel to cobble size.	1					
1		10.67	13.72	Clay gouge; Clay mixed with pebble and gravel sized pieces with diverse lithology; Contact with breccia at 56° TCA; 3m sample, very poor recovery.						
1	13.72 - 44.88	13.72	15.24	Beginning of a 24.71m zone of breccia and gouge; Cb alt'n is dominant; Limonite is pervasive in the gouge; Recovery is poor. 40cm of breccia contact with MSED @ 30° TCA; Clast size ranges from 1mm to 1cm, with 80% from 2-.5cm; They appear to be unsorted and oriented to follow the 30° angle of the MSED contact; Py found in matrix					1	
1		15.24	16.76	Clay gouge; Hematite is pervasive; Original foliation preserved; At 15.26m, 55° TCA; Dark grey MSED frags present; Contact with breccia not present	3	2		4		
1		16.76	19.81	Breccia and clay gouge; Clasts are larger and sub-angular; Py fills fractures; No contact angle; Gouge at 18.09m; Pervasive limonite; Relict brecciated vein 3cm wide at 18.11m; At 19.51m returns to breccia.	3			3	1	
1		19.81	22.56	Breccia; Carb alt'n increases; Matrix now contains carbonate; Quartz veins are fractured and filled with carbonate; Clasts in the breccia are larger, up to 4cm with 80% 0.4 to 1.5cm; Clasts appear to follow 40° angle TCA; Slip direction appears normal.	3			3	3	
1		22.56	23.42	Breccia is black and shows intense clay alteration; No limonite present; At 23.09m, a 5cm qtz/cb vein at 85° TCA; Most veins in section fragmented and offset; Fractures filled with carbonate				3	1	
1		23.42	25.91	Core is much less brecciated with original foliation visible. At 24.68m, foliation at 30° TCA; Carbonate alteration is less intense; Pyrite visible in fractures in areas of clay alteration; At 25.31m, 44cm of clay alteration and gouge; Contact with breccia at 50° TCA; Minor limonite staining on fractured quartz veins.				3	1	
1		25.91	34.56	Breccia: Carbonate alteration dominant in matrix; Clasts range in size from 0.1cm to >5cm, with an average size of 1.5cm.; At 27.43m tension gashes filled with fragments and quartz and carbonate cement; Extensional - Normal fault?; Limonite is pervasive in gouge at 28.46m, 32.4m, 32.2m and 33.73m; At 37.91m Tension gashes and movement of clasts indicate extensional movement, likely high angle - gashes at 75° TCA.	1	1		2	2	
1		34.56	38.43	Breccia and gouge; Breccia is composed of smaller clasts 0.1 to 0.3cm with 80% 0.5cm; Gouge is dark grey, greasy feel, graphitic; Original lineation is visible at 36.68m; Foliation at 50° to 55° TCA; Gouge contains qtz and MSED frags; At 33.46m = 20cm clay gouge; At 35.46m = 57cm clay gouge.	1	1		2	2	
1		38.43	44.88	Fault Zone; Dark grey; Contact with breccia at 20° TCA; Qtz eyes and MSED porphyroclasts; At 38.25m = Most intense deformation, 80cm dark grey, graphitic with abundant qtz eyes. Porphyroclasts contain disseminated pyrite; Contact is breccia at 20° TCA; Contact angles between breccia/fault/gouge at 39.24m at 40° TCA; At 41.15m, at 45° TCA. At 42.67m, at 56° TCA; At 44.2m, at 50° TCA; Clay alteration tends to follow relic foliation angles at 60°.	1	1		2	2	
80	44.88 - 95.31	44.88	48.77	MSED and gouge/heavy clay alteration along foliations; Carbonate alteration present mostly on fracture faces; Contact with fault zone at 60° TCA.; Foliation at 44.88m, at 25-30° TCA; At 45.72m foliation at 35-40° TCA; At 47.24m foliation at 45-50° TCA.		1		4	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
80		48.77	53.34	MSED (phyllitic); Dark grey to reddish brown bands, soft and easy to scratch; Several sections contain more siliceous MSED between foliations, but showing no foliation themselves. These sections are a maximum of 0.8cm long. Foliations at 48.77m, at 47-50° TCA; At 50.29m, at 45-50° TCA; at 51.82m, at 35-40° TCA.		1	1	1	2	3
80		53.34	54.86	MSED; Intense clay alteration between foliations; Unaltered areas are more siliceous and show no visible foliations; At 53.34m 10cm of sticky, malleable clay, grey in color.		1		4	2	
80		54.86	57.35	MSED; Brown to grey-blue in color; Very strong effervescence between foliations with HCL; Foliations at 55-60°.				2	5	
80		57.35	57.91	MSED; Possibly carbonaceous; Core is black and very fine laminations present; Minor clay alteration; Foliation at 75° TCA.				2		
80		57.91	59.44	QZZ and Argillite (MSED); No foliation in QZZ or arg, Contacts at 30° and 75°; 75° more common; Cb veins abundant at 10-30°.				2	2	
80		59.44	62.48	MSED and Argillite; Core is dark grey to black; MSED shows intense alteration, much less in Argillite; Argillite is carbonaceous; At 60.96m, 25cm of siliceous MSED; Foliation where visible is 55° to 60° TCA.				4		
80		62.48	70.48	Siliceous MSED 90% and QZZ 10%; MSED is light brown to grey; QZZ contact angles follow foliations, but contain no visible foliation; Foliations at 62.48m = 75-80° TCA; 64.01 m = 80-85° TCA; 65.53m = 70-75° TCA; 67.06m = 80-85° TCA; 68.58m = 70-75° TCA; 70.10m = 70-75° TCA; MSED is phyllitic; At 62.48m = 9cm sandy gouge - No contact; At 63.92m = 8cm clay gouge = no contact; At 69.90m = 9cm sandy gouge at 75° TCA				2	1	
80		70.48	78.58	QZZ (MSED); QZZ with interbedded siliceous MSED; Foliation is visible in the MSED at 65-70° TCA; There is an increase in the qtz vein size and intensity; They appear in the MSED and follow foliation; Trace pyrrhotite present in veins; At 78.52m a 0.2 cm sulphide vein with 40% pyrrhotite.			2	1		
80		78.58	83.82	Siliceous MSED; Qtz veins still present; 2cm-7cm wide; Foliation at 78.58m = 60-65° TCA; At 79.25m = 55-60° TCA; At 80.77m = 55-60° TCA; At 82.3m = 55-60° TCA; Core is light grey, veins between foliations			1	1		
80		83.82	89.29	MSED; Moderate to intense clay alteration between foliations; Foliations at 83.82m at 65-70° TCA; At 85.39m at 65-70° TCA; At 86.62m at 55-60° TCA (crenulation cleavage); Becomes parallel TCA at 87.99-88.39m; At 88.39m is 70-72° TCA; At 85.72-86.62m = 0.2cm py vn running parallel TCA.		2	2	3		
80		89.29	95.31	MSED; Dark Grey to black, phyllitic; Foliation at 89.29m = 50-52° TCA; At 89.92m = 55-60° TCA; At 91.44m = 50-55° TCA; 92.96m = 50-52° TCA; 94.49m = 55-60° TCA; Qtz veins found between foliations; Low angle carbonate veins common (10-30° TCA)

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
70	95.31 - 98.63	95.31	98.63	QZZ; Light grey coloured, highly fractured; Hosts several large quartz veins (3-10cm); Veins are also highly fractured or broken; Trace to 1% oxidized pyrite found on fracture faces; Fracture angles varied 30-50°, crosscut by 150-165°.						
80	98.63 - 155.63	98.63	99.54	MSED: Intense clay and sericite alteration of MSED; No visible foliation angles; Unaltered MSED fragmented into gravel sized pieces, phyllitic; No visible foliation.		2		3		
80		99.54	102.11	MSED: Light to dark grey, phyllitic; Foliation at 99.54m = 50-52°; At 100.58m = 40-42° TCA; At 100.58m, 12cm argillite before change in foliation angle		1		1		
80		102.11	113.30	MSED: Core is soft easily scratchable; phyllitic; dark grey color. Foliations: at 102.11m = 55-60° TCA; At 103.63m = 45-50° TCA; At 105.16m = 40-45° TCA; At 106.68m = 45-50° TCA; At 108.2m = 45-50° TCA; At 109.73m = 45-50° TCA; At 111.25m = 45-50° TCA; 112.78m = 45-50° TCA: Quartz veins between foliations. The number of carb veinlets are reduced.		2	2	2	1	
80		113.30	115.82	Siliceous MSED: Light grey color; Increase in qtz and carb veins over interval; Qtz veins follow foliations where visible; Carb veinlets crosscut foliation at 113.3m = 40-45°; At 114.3m = 45-50° TCA						
80		115.82	118.87	MSED Light to dark grey; Phyllitic Qtz/Cb veins follow foliations; Cb veins crosscut foliations at 115.82m = 50-52° TCA; At 117.35m = 35-40° TCA; Clay alteration is increased after 117.35m		3	2	2	1	
80		118.87	121.92	MSED light grey-green; Chl alteration dominant, but sericite and clay still present; Cb veins continue to crosscut foliation; Foliation at 118.87m = 70-75°; At 120.40m = 65-70° TCA; 121.92m = 40-45° TCA		2	3	2	1	
80		121.92	122.47	Silicified MSED with crosscutting qtz veinlets and sulphide veins; Cb veinlets present.					2	
80		122.47	128.02	MSED: Intense clay alteration, light to dark grey color; Quartz between foliation; Foliation at 121.92m = 35-40° TCA; At 123.44m = 40-45° TCA; At 124.97m = 45-50° TCA; At 126.49m = 50-55° TCA; At 125.34m = 40cm clay gouge contains remnant MSED frags; At 127.22m = 60cm clay gouge with remnant MSED frags.		2	1	3	1	
80		128.02	129.94	MSED: Clay alteration greatly reduced; Chlorite alteration increased on fractures; Carbonate veins at low angle, cross cut foliation; Foliation at 128.02m = 35-40° TCA; At 129.54m = 40-45° TCA.		1	2	2	1	
80		129.94	132.28	Argillite (MSED): Dark grey, no foliation; Cb veinlets abundant.						
80		132.28	134.11	MSED: Dark grey-brown phyllitic; Fewer Cb veins/veinlets; Foliation at 132.28m = 85-90° TCA; At 132.59m = 45-50° TCA.		1	2		1	
80		134.11	135.64	Siliceous MSED: Dark grey-black; Qtz veins follow foliation; Cb altered and veining greatly reduced; Foliation at 60° TCA.						
80		135.64	141.23	MSED: Dark grey to black; Cb veinlets almost completely absent: Qtz veins between foliations; Po appears in veins; Foliations...At 135.64m = 55-60° TCA; At 137.16m = 50-55° TCA; At 138.68m = 55-60° TCA; At 140.61m = 40-42° TCA.

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
70	191.82 - 198.60	191.82	198.60	QZZ: Light grey to brown; Foliation rarely visible; Very few veins (qtz and carb); Few Sulphide veinlets; Aspy altered to scorodite; Disseminated aspy found throughout -ox; Foliation at 55-60° where visible.					1	
80	198.60 - 234.70	198.60	202.34	MSED: Grey to dark grey; Phyllitic, Carbonaceous; Qtz Follows foliations, often irregular vein patterns; Foliations: At 198.6m = 60-65° TCA; At 199.64m = 65-70° TCA; At 201.17m = 45-60° TCA.		3	2	2	1	
80		202.34	205.54	Siliceous MSED: Light grey color; Increase in low angle cb veins; Foliations: At 202.34m = 52-55° TCA; At 204.22m = 65-70° TCA.					1	
80		205.54	209.79	MSED: Dark grey to black; Reduction in Carbonate veining; Qtz veins between foliation; Foliation: At 205.54m = 60-62° TCA; At 207.26m = 40-45° TCA crenulated; At 208.79m = 50-55° TCA boudins present; At 206.02m = 9cm grey quartz vein at 70° TCA; 1% py and 1% aspy.		2	1	2	1	
80		209.79	213.36	Siliceous MSED and QZZ; MSED grey, QZZ light grey; The QZZ has more veins, larger size and contains po (tr-1%) and disseminated po. Foliation: At 209.79m = 60-65° TCA; At 210.31m = Not visible; At 211.14m = 60-65° TCA; At 211.84m = 60-65° TCA; At 212.16m = Carb vein at 35° TCA; Contains 3% po; Carb veinlets also contain po.					1	
80		213.36	217.59	MSED: Grey to black; Very few veins present; Foliation: At 213.36m = 50-55° TCA; At 214.88m = 55-60° TCA; At 216.41m = 65-70° TCA; Boudins present after 215.52m.						
80		217.59	219.77	Siliceous MSED; Light grey color very little foliation visible; Foliation at 45-50°. At 217.59m a 40cm QZZ at 60° TCA.						
80		219.77	231.65	MSED: Dark grey to black; Phyllitic where dark grey, carbonaceous where black; Qtz veins crosscut foliation until 230.12m, where they run parallel. Foliation: At 220.98m = 60-65° TCA; At 222.5m = 55-60° TCA; At 224.03m = 55-60° TCA; At 225.55m - 50-55° TCA; At 227.08m = 45-50° TCA; At 228.60m = 55-60° TCA; At 230.12m = 60-62° TCA; At 220.11m = 2cm py vein at low angle 10-30° following contact with QZZ: The QZZ also has disseminated aspy, cpy; The contact between the two is a fault plane with 11-15cm of slip. Fault plane crosscut foliation; Slip was near vertical; Fault Zone is 40cm long at 25-30° TCA.		3	2	1	1

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-295C

PROJECT: Dublin Gulch - 1735

GROUND ELEVATION: 1022m

BEARING: 000 | DIP: -50°

DATE STARTED: 15-Jul-05 | DATE COMPLETED: 20-Jul-05

LOGGED BY: Melodie Stone

CONTRACTOR: Britton Brothers

COORD SYSTEM: NAD 27: EASTING: 459755 NORTHING: 7099152

COORD SYSTEM: NAD 83: EASTING: 459636 NORTHING: 7099337

NAD 27 (CORRECTED for historic grid): EASTING: 459725 NORTHING: 7099162

SECTION LINE(historic grid): 459725E

DRILLING DETAILS

Hole Diameter: HQ & NQ

Overburden: 35.05m

Deviation:

Casing: 33.53m

Core Size: HQ & NQ

Cement (# Bags): 0

Plug Depth: N/A

Notes: No plug necessary.

ASSAY INTERCEPTS

FROM:	TO:	INT:	Au (g/t)	SAMPLE QUALITY:

COMMENTS: (Ground conditions, fracture zones, water flows, drilling problems)

Switched from HQ to NQ at 66.63m.

DRILL LOG LEGEND P1	DATE: July 15-20, 2005 PAGE 1 of 14			
DRILL HOLE # : **DG05-295C**	**FeOx** 0 = Unoxidized 5 = Intensely Ox'd	**Ser, Chl, etc** 0 = Unaltered 5 = Intensely Altered	**Carbonate** 0 = No Effervescence 5 = Strong Effervescence	

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0.00 - 33.53	0.00	33.53	no recovery						
10	33.53 - 281.94	33.53	48.50	GND: v. broken up to crumbly GND. Limonite covers fracture faces and is pervasive through ~50% of rock. 14cm clay-gravel seam at 42.60m. Recovery is v. poor (ave ~40%).	3	0	0	1	2	
10		48.50	59.44	GND: Sand to gravel texture over 90% of section. Med yellowish brown. From 57.01 to 59.44m, rock is ox'd pervasively to sand/clay texture. Variable colours w/in, due to some hematite staining to deep reddish brown, and ox'd calcite to yellow. Overall colour med to light brown. One vein visible at 59.32m, in competent section 12cm wide. No selvage visible. Recovery is poor: 40%.	5	0	0	2	3	
10		59.44	64.01	GND still highly ox'd and ~40% alt'd such that GND texture is no longer visible; from competent (80%) to clay rich (20%). Recovery improved - up to 100% (lowest: 89%).	3	1		2	2	
10		64.01	79.38	GND: At 66.63m, core size switches from HQ to NQ. GND texture preserved in competent core with excellent recovery. Limonite throughout, in veinlets and in GND matrix. (Limonite contains carbonate.)	3				2	
10		79.38	89.92	GND: Unalt'd GND separated by wide chl/cb selvages around qtz veins, carb veins and sulph veins. V minor limonite staining in patches throughout rock	1	1	2		2	

DRILL LOG LEGEND P2

Selvages
0 = No Alteration
5 = Intense Alt'n

Ox. State
0 = No Oxidized Sulphides
5 = All Sulph Oxidized

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar, 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

Date: Drilled July 15-20, 2006

LOGGED BY: M. Stone

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		89.92	99.06	GND: silicified, aphanitic rock. Appearance is uniform dark grey with low-to-high angle carb veinlets, only 1mm wide, with ~1cm selvages. Few well-defined qtz veins	1		2		2	
10		99.06	106.68	GND: Chloritized/ ser'd GND with preserved texture.	1	2	3	1	2	
10		111.25	114.30	GND: v. crumbly dark grey GND. Ave cobble size is ~4cm in diameter. 2.5cm, pure qtz pebbles, two qtz veins in situ.			2	1	1	
10		114.30	126.49	GND: unalt'd GND separated by wide chlorite and carbonate-rich selvages. Sample actually only contains ~10-15% unalt'd GND due to the large amount of veins, and their large selvages (>30cm). Selvage at 115.50m hits unalt'd GND at 30° to CA (attributed to carb-qtz veins); veins are qtz, qtz-carb, and sulphide. Veins are called qtz-carb ("3") if carb content is greater than qtz content. Similarly, 'sulphide' veins ("6") contain more sulphides than anything else.		2	3	2	3

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		126.49	132.99	GND: First metre is gradation into aphanitic, pale greenish grey to dark grey, uniform texture, except veinlets of carbonate at 20° and 140° to CA (approx 40 per metre). Weak slickensides on fracture faces. Carb-qtz veins appear 'smeared' out, with both qtz and carb in elongate, thin lenses.	1	1	3	2	2	
10		132.99	140.21	GND: unalt'd GND separated by chl'd and carb'd selvages, not as wide as before, up to 20cm in width. Section is ~60% unalt'd GND, and 40% alt'd; all is solid and competent with v good recovery. Qtz veins have much smaller, silicified selvages while carb veins have larger carb'd and chl'd selvages.		1	2		2	
10		140.21	141.73	GND: One sample with intense chl and carb alt'n. Sulphides in veinlets accumulated in zone from 140.75 to 141.05m, with carbonate in clear, large veins. Within selvage, carbonate forms 1-4mm grains with irregular shape but stand out amongst chl'd GND.			4	1	3	
10		141.73	152.41	GND: A lot less carb here. Unalt'd GND with qtz veins. Carb-qtz veins contain more and larger po and aspy than qtz veins. At 146.10 to 146.30m, fracture face at 5° to CA shows strong slickensides in chl and qtz and calcite to 50°.		1	1		1	
10		152.41	155.49	GND: Dark grey, aphanitic, silicified GND. Only 1mm bt preserved. Carb'd, chl'd selvages surround qtz/carb/sulph veins (up to 2cm), and veinlets (up to 1cm). One vein of unalt'd GND intrudes this aphanitic silicified rock. 2.4cm wide, at 15° to CA, at 154.30m.	1	1	2		1

DRILL LOG LEGEND P1	DATE: July 15-20, 2005	PAGE 7 of 14	
DRILL HOLE # : DG05-295C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		155.49	164.66	GND: Back to unalt'd GND w/ small qtz veins with po. Carb in selvages and a few veinlets		1	1		2	
10		164.59	177.90	GND: Section is 40% carbonate-rich competent GND. Selvages around carb/qtz/sulph veins and veinlets. GND texture preserved throughout. Sulphide veins in first sample - 164.59 to 166.12m indicate a sense of shear, dextral if vein is to 40°. Shear zone is 15cm wide, actual.		1	1		3	
10		177.90	182.62	GND: 90% alt'd with carb and chl but still competent with 100% recovery. Actual carbonate veins appear: approx 2 per metre and 0.5 to 2cm wide		2	4		3	
10		182.62	192.03	GND: 60% unalt'd GND. Carbonate veins and qtz veins w/ po continue, but fewer and smaller sulphide veins (explains less alt'n). One 4cm carb vein at 185.25m contains large, brecciated clasts of chl'd GND 1-4cm in diameter.	1		2		2

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		192.03	196.70	GND: Zone of extreme alt'n; all silicified and chloritized, and carbonate-rich. Sulphide veins and veinlets reappear. Last sample (195.61-196.7m), contains many (7) sulphide veins, all but one are >90% ox'd py. One vein is unox'd. Massive aspy here as well, not in straight vein, but more irregular.	1	1	4		3	
10		196.70	207.27	GND: Unalt'd GND with far fewer veins			1		1	
10		207.27	220.98	GND: Increase in carbonate within GND causes rock to be crumbly and v broken up. Longest core is ~30cm, but only 2 lengths. Low-angle carbonate and qtz veins still visible in angular fragments; veins have corroded edges, so are silicifying GND - not sharp boundaries, difficult to spot (most). One qtz vein at 211.30m is 2.5cm and has ~20% sulphides: po and py. No selvage. On the surface of this vein a strong lineation appears in calcite, bt and clay-alt'd feldspars. Sample from 220.98 to 222.51m contains sulphide-rich qtz veins. At 60°, vein contains 30% massive aspy. Vein at 50° contains 15% po and 5% cpy (no aspy)		1	1	1	2	
10		220.98	224.03	GND: One sample. Chloritized section surrounding sulph-rich qtz veins and sulphide veinlets (ox'd py). Small clay alt'n due to carb.	1	1	3	1	2	
10		224.03	234.69	GND: Unalt'd, somewhat finer-grained GND. Ave mineral size is 1-2mm. Many episodes of sheeted qtz veins; some are difficult to see, others are clear, all are at similar angle (50-60°)			1		1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		234.69	236.22	GND: Concentration of sulphide veinlets (ox'd py) within carbonate-rich, crumbly GND	2		1	1	4	
10		236.22	245.36	GND: Highly alt'd section - carb-infused and chloritized. Sulphide vein(let)s continue, approx 4 per metre. Sample from 239.09 to 239.39m is one 21cm qtz vein with only one preserved selvage (upper). Lenses of sulphide within are up to 1cm wide. Diamagnetism of these lenses indicates presence of bismuthinite (but not visible).	3	1	2	1	3	
10		245.36	251.46	GND: Fine-grained unalt'd GND w/ minor sheeted qtz veins and minor carb alt'n.					1	
10		251.46	254.51	GND: Carbonate appears in veins; result is minor carb alt'n over 50% of section. One carbonate vein (1.3cm wide) at 252.95m has 24cm chl'd/carb'd selvage but sulphides are not prominent in carb'd section. More po (nice, large grains), in qtz veins with irregular edges.	1	1	1	1	1	
10		254.51	260.60	GND: Coarse GND texture preserved over 30% of section. Wide chloritic and oxidized selvages around qtz veins. Rare euhedral 2mm aspy disseminated in these selvages. Massive pyrite veins (only partly ox'd) at 258.70m.	2	1	2		2	
10		260.60	263.65	GND: Highly alt'd around qtz/carb/sulph veins.	1	1	3		2	
10		263.65	266.70	GND: V minor chloritic and carbonitic alt'n around qtz/carb/sulph veins.	1		1		1

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-296C

PROJECT: Dublin Gulch - 1735

GROUND ELEVATION: 916m

BEARING: 000 | DIP: -50°

DATE STARTED: 19-Jul-05 | DATE COMPLETED: 21-Jul-05

COORD SYSTEM: NAD 27: EASTING: 459153 NORTHING: 7099840

COORD SYSTEM: NAD 83: EASTING: 459034 NORTHING: 7100025

NAD 27 (CORRECTED for historic grid): EASTING: 459123 NORTHING: 7099850

LOGGED BY: Terry Croteau

SECTION LINE(historic grid): 459125E

CONTRACTOR: Britton Brothers

DRILLING DETAILS

Hole Diameter: HQ & NQ

Overburden: 4.57m

Deviation:

Casing: 4.57m

Core Size: HQ & NQ

Cement (# Bags): 0

Plug Depth: N/A

Notes: No plug necessary.

SAMPLING DETAILS

Sample Sequence: B381181 to B381238

Requisition #: MASP448STRGOL.05Q Date Shipped: 5-Aug-05

Lab Record #: VA05066350 Date Received: 12-Aug-05

Sample Sequence: B381239 to B381384

Requisition #: MASP448STRGOL.05Q Date Shipped: 8-Aug-05

Lab Record #: VA05067824 Date Received: 12-Aug-05

Sample Sequence: B281385 to B381387

Requisition #: MASP448STRGOL.05Q Date Shipped: 8-Aug-05

Lab Record #: VA05069644 Date Received: 21-Aug-05

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
1	0.00 - 4.57	0.00	4.57	Casing with 9% recovery. MSED and GND, likely from boulders.						
80	4.57 - 30.17			MSED - Derived from pelitic to arenaceous sediment. Foliated, may be phyllitic or carbonaceous						
		4.57	9.14	MSED - Pervasive lim and lim staining on frac faces. Core is broken and recovery is poor. Foliation difficult to determine because of broken core. Foliation @4.57m is at 30-32° TCA. @6.10m, -> 50-52°; @7.62m -> 15-20°; @7.62m -> 0.2cm aspy vein @ 60° to CA	3	2	1	1	1	
80		9.14	18.29	MSED: Same as above, but more competent with better recovery. Boudins present throughout indicating increased shear. Foliation @ 9.14m -> 25-30°; @10.67m -> 30-35°; @ 12.19m -> 35-40°; @13.72m -> 35-40°; @15.24m -> 30-35°; @16.76m -> 35-40°	3	2	1	1	1	
80		18.29	21.80	MSED - Lim continues pervasively and on frac faces. Boudins are present, but reduced in frequency. Foliation @ 18.29m -> 20-25°; @19.81m -> 35-40°; @21.34m -> 30-32°.	3	2	1	1	1	
80		21.80	24.65	Silicious MSED. Dark grey colour, pervasive lim is reduced. Foliation @ 21.80m -> 30-32° @22.86m -> 25-30° @24.38m -> 20-22° @18.29m - 1cm aspy vein @ 20° to CA, 90% aspy, 2% py	2				1	
80		24.65	30.17	MSED - Lim pervasive and on frac faces. Argillic alt'n increased. Foliation is generally at lower angles. Foliation @ 24.65m-> 35-37 @ 25.91m ->22-25° @ 27.43m -> 22-25° @28.96m -> 22-25° @28.26m - 30cm sandstone bed. Brown, oxidized, 85% qtz, 10% K-feld, Laminae @ 22-25° to CA. Contact with MSED @ 22°.	2	3	1	2	2	
12	30.17 - 32.57	30.17	32.57	GND Dyke. 40% qtz 20% plag. Grey, with pervasive lim. Frac faces are stained dark red. Euhedral aspy crystals can be found within the red staining. Veins present are small (< 0.2 cm). Uphole contact not visible. Downhole contact @ 35° to CA	3					
80	32.57 - 120.40	32.57	37.50	MSED - Dark Grey. Pervasive lim is reduced, but still prevalent on frac faces. Carb veinlets increase in number. Foliation @ 32.57m -> 35-37° @ 33.53m -> 35-37° @35.05m -> 30-32° @36.58m -> 25-30°	2	3	1	1	2	
80		37.50	45.72	Silicious MSED - Minor pervasive lim, also reduced on frac faces. Increase in number of veins as well as size and mineralization. Boudins present throughout. Foliation @37.50m -> 22-25° @38.10m -> 40-42° @39.62m -> 25-30° @41.15m -> 25-30° @42.67m -> 25-27° @44.20m -> 27-30°	1				1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
80		92.63	93.75	MSED: Pervasive lim present until 92.96m. Lim staining on frac faces increased (60%). 80% of veins crosscut foliation @30-32 °		1				
80		93.75	104.49	Silicious MSED. Dark grey, few qtz veins. Lim staining on fractures (60%). Foliation @93.75m >30-35°, @94.49m -> 30-35°, @96.01m -> 30-32°, @97.54m -> 25-27°, @99.06m -> 40-42°, @100.58m -> 40-42°, @102.11m -> 45-50°, @103.63m -> 35-40°. @102.11m - 12cm grey qtz vein @ 45° to CA.	1	2	1		1	
80		104.49	118.87	QZZ. Light grey to grey, very little visible foliation. Interval contains a might higher concentration of sulphides than all previous intervals. Aspy veins are dominant type, as well as py. Very few veins (10%) are quartz. @105.86m - 3cm massive aspy vein. No contact visible. Vein is broken and may be larger @106.98m - 1cm massive aspy vein + sphalerite @25° to CA @107.31m - 10cm massive sulphide vein. 25% aspy, 45% py + qtz @ 60° to CA @108.58m - 1.5cm massive aspy vein @45° to CA - 1cm sphalerite vein @45° to CA @112.50m - broken massive aspy and py vein. Core recovery is 67%, vein has a minimum size of ~10cm and may be 15-20cm or greater. No qtz present. Vein is 80% aspy, 20% py. Picture 100-0059 and 100-0060		1	1			
80		118.87	120.40	QZZ/HFLS Transition between QZZ and GND dyke. Light grey QZZ with interlayered HFLS. Diss aspy in QZZ. Foliation in HFLS @35° to CA.		2	2		1	
12	120.40 - 121.92	120.40	121.92	GND - 40% qtz, 20% plag, 15% bt, 15% hbl. Dark grey, fine grained. Contains higher than usual amounts of hbl compared to other holes. Few qtz or sulphide veins. Cb veining increased. No visible contacts with surrounding core.					1	
80	121.92 - 198.12	121.92	124.97	Silicious MSED. Dark grey. Foliation at beginning of interval @20° to CA grading to 45° after 123.44m. No indication of contact with GND		2	1	1		
80		124.97	128.64	QZZ. Light grey, with relic foliation visible @45° to CA. Sulphide veinlets crosscut, as do low angle cb veinlets (10-30° to CA)			1			
80		128.64	130.86	Silicious MSED. Dark grey. Qtz veins follow foliations, and cb veining is reduced. Foliation @128.64m -> 45-47°, @129.54m -> 40-42°		1	1		1

DRILL LOG LEGEND P1	DATE:	PAGE 1 of 10		
DRILL HOLE # : DG05-296C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence	

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
80		130.86	131.82	QZZ. Light grey green, minor chl alt present giving green color. Py crystals on frac faces. Qtz, cb and sulphide veins crosscut.			2			
80		131.82	133.29	MSED. Grey brown. Py on frac faces. Soft, easy to scratch. Foliation @38-40°		2	2	1	1	
80		133.29	142.20	QZZ - Light grey. Residual foliation @134.11m -> 50°, @140.71m -> 35-45°. Increase in qtz/sulphide veins and sulphide concentrations. Core is broken and fractured until 141.03m where it regains competency. @134.61m - 4cm massive aspy vein @80° to CA @140.21m - 4cm massive sulphide vein @5° to CA; 40% sph, 20% py @140.39m - 8cm massive sulphide vein @50° to CA; 40% aspy, 30% sph, 20% py. Also present in the vein is a vug containing lead grey delicate acicular crystals. These are likely some form of Sb-Pb sulphide. Possibly stibnite, but more likely boulangerite or jamesonite. See photo. @134.61m marks the beginning of a zone of massive sulphide veining continuing until 158.40m. Veining may be related to the QZZ and very silicious MSED in the interval. Sulphides found throughout this core are more often found in QZZ than in MSED.		1	2			
80		142.20	144.31	Silicious MSED - Dark grey. Sulphides are almost absent in this interval. Foliation @142.20m -> 30-32°, @143.26m -> 37-40°						
80		144.31	144.63	APL dyke. Uphole contact @20° to CA. Downhole @35° to CA. Diss py and aspy present.						
80		144.63	146.30	QZZ - Light grey. No visible foliation. @145.46m - 7cm sulphide vein @55° to CA, 50% py, 10% aspy, 5% sph						
80		146.30	150.76	Silicious MSED - Dark grey, reduced veinage and sulphide content. Foliation @146.30m -> 45-47°, @147.83m -> 30-35°, @149.35m -> 45-47°		1	1	1	1	
80		150.76	151.48	QMON - Dark grey-green. 25% K-spar, 25% plag, 10% qtz, 15% bt. Uphole contact @80° to CA. Downhole contact not visible		1	3	1		
80		151.48	152.40	MSED - Dark grey. Foliation @20-25°. Silicious		1	1	1	1	
80		152.40	167.64	QZZ - Light grey to grey. There is an increase in sulphide veining. Foliation @152.40m -> 30-32°, @161.54m -> 32-35°. @154.67m - 60cm gouge @30° to CA @156.50m - 30cm grey qtz vein. No visible contact. 1% sulphides @156.80m - 2cm massive sulphide vein @60° to CA, 90% py, 10% aspy @158.15m - 15+ cm massive sulphide vein. Broken, with no visible contacts. Possibly 15-20cm or more in width. Sulphide concentrations range from 50% py & 50% aspy to 30% py & 70% aspy. The difference in concentrations could indicate more than one vein. Partial reconstruction yielded a contact angle near 75° @166.48m - 50cm gouge with QZZ fragments @45° to CA			1

BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-16.50	0.00	16.50	Casing - No recovery						
80	16.50-82.10	16.50	35.05	Highly oxidized to crumbly gravel and sand texture. Competent rocks with visible laminations are in chunks up to 10cm long. From 16.50 to 24.20m rock is dominated by yellowish brown clay to crumbly angular gravel. From 24.20 to 34.80m texture is course sand to angular cobbles and the colour is dark grey with dark brown limonite on all broken faces. There is a 25cm zone of yellowish brown from 34.80 to 35.05m. No qtzite or veins in section so no samples. Foliation is not visible over much of section; Where it is: @21.00m: 10°, @22.45m: 20° - 160° (folded), @24.80m: 20°, @28.60m: 30°, x-cutting qtz/carb veinlet at 120°, @31.90m: 5°, x-cutting carb vn to 120°, @33.00m: 10°.	4			2		
80		35.05	42.30	More competent but still heavily oxidized MSED. Aphanitic texture and mineralogically separated between mafic, felsic and pure qtz laminations. Foliation measurements: from 35.05 35.35m: 105-120°, @36.65m: 60°, @38.50m: 125°, @39.90m: 40-65°, and @42.10m: 40°. Speckled oxidation product of iron within qtz vns (up to 15%) could be hematite or old magnetite (1-2mm grains). "Vein" from 40.27-40.57m has saccharine texture; looks like qtizite but is deemed a vn as it has similar angles as nearby vns x-cutting foliation.	4			1	1	
80		42.30	51.05	MSED: Crumbly coarse sand (75%) to 10cm lengths of core (25%); MSED is zoned (~2m) to mafic-rich and felsic rich sections; All with fine foliation still visible; Qtz veins still crosscut foliation. Foliation: At 42.35m = 45°; @44.6m = 50°; @46.4m = 50°; @47.7m = 30°; @49.0m = 15°; @50.5m = 30° TCA.	3			2	1	
80		51.05	58.64	MSED: Mineralogically separated MSED into wide zones of laminated mafics and pure qtz approx 40cm wide on avg; 10cm yellow clay-rich zone at 57.2m; Gravel clay from 57.5-57.91m; Carb in irregular veinlets; Stained with limonite; Foliation: At 51.3m = 25° TCA; @52.25m = 30° TCA; @53.9m = 25° TCA; @55.6m = 50° TCA; @56.45m = 45° TCA; @58.0m = 30° TCA; Various Indicators of extension and compression: at 51.72m a qtz bleb appears to be old vein compressed to interact with and re-route foliation in MSED, or could be compressed post-separation in MSED; other zones have feldspars concentrated at the edges of pure quartz as well. These are not considered veins here; "Veins" are typically associated with calcite-siderite (limonite) and have selvages.	2			2	2	
80		58.64	64.68	MSED: Predominant color is medium to light brown, from intense oxidation of iron-rich rock. Non-oxidized zones include more felsic minerals and quartz layers. Porphyroblastic texture stands out against laminated, oxidized sections. Porphyroblasts possibly andalusite (tabular aggregates). First appearance of hornfels at 60.50-60.70m. Foliations: @58.8m = 40° TCA; @60.60m = 55° TCA; @62.00m = 30-50° TCA; @63.4m = 50° TCA; @64.3m = 55° TCA.	4	1		2	2	
80		64.68	74.17	MSED: Oxidation, limonite staining and carbonate-infused clays are greatly reduced; Rock is Biot-Hornfelsed. Veins and irregular blebs of qtz with minor carbonate still appear, are generally roughly parallel to foliation or are within it, with augen texture. Some veins crosscut the foliation and are noted here. Between 65.53m - 67.06m no veins appear. Qtz blebs (>4cm in diameter) have offshoots of qtz parallel to and at a complementary angle (90° TCA) to foliation, eventually pinching out. Foliations: @ 64.68m = 50°; @66.0m = 50°; @67.2m = 50°; @68.45m = 45°; @70.0m = 50°; @71.0m = 45°; @72.6m = 45°; @73.85m = 45° TCA.	2	2		1	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
80		74.17	79.85	MSED: With fine laminations and fat qtz blebs; From 74.17m to 75.83m color is light orange from intense carbonate and limonite throughout qtz-rich zone. Texture crumbly, with quartz pieces ~ 2cm in diameter. Foliations: @74.4m = 35°; @76.0m = 20°; @77.5m = 40°, @79.0m = 40° TCA.	3			1	1	
80		79.85	82.10	Very crumbly MSED covered with limonite to 80.77m, average size of 2cm; From 80.77m-81.70m, more competent but intensely stained yellow and orange (lim and carb); At 81.7-82.1m, competent with few limonite-covered fracture faces. Foliations: @ 80.1m = 50°, @81.9m = 50°, @82.1m = 45° TCA.	3				2	
81	82.10-119.54	82.10	88.39	MSED: Aphanitic HFLS with qtz veins highly rearranged and often parallel to foliation. Their appearance is compacted, rounded blebs, with 'tails' frequently pointing into foliation. HFLS color is dark purplish black. Foliation: @82.5m = 40°, @84.2m = 40°, @85.9m = 40°, @87.55m = 40°.	2				1	
81		88.39	92.96	MSED: HFLS continues; Silicified 'veins' parallel to foliation are less irregular-shaped, more smooth eyes within foliation. Veins crosscutting foliation contain sulphides and have jagged edges, incorporating into foliation. Real aspy associated with veins in this zone. Foliations: @88.6m = 40°, @90m = 60°, @91.5m = 60°, @92.8m = 60°.	2		1		1	
81		92.96	107.80	MSED: Silicified Hornfels, deep purple to greenish purple. Qtz veins (with carbonate) still parallel to and at a high angle to foliation, contain aspy/some scorodite, and moly. QZZ zones (v. silicifed) up to 20cm, wide contain disseminated aspy in tiny (1mm) grains, unaltered. HFLS sections show porphyroblasts of andalusite in random orientations acicular. Foliations: @ 93.5m = 60°; @94.8m = 55°, @96.1m = 40°; @97.6m = 50°; @99.4m = 40°; @101.0m = 40°; @102.2m = 40°; @103.6m = 55°; @104.6m = 35°; @107.0m = 40° TCA.	1				1	
81		107.80	113.53	(MSED) Silicified HFLS; Qtz-rich zone with very minor carbonate and limonite on fracture faces; From 111.25 - 113m is QZZ; Section is 80% qtz, 20% is 1-2mm veinlets of HFLS, biot, chl, ser, cb. These veinlets are derived from pieces of HFLS trapped into intruding qtz from the GND intrusion (just below 119.54m); Foliations: @107.9m = 30°; @109.65m = 40°; @110.90m = 30 - 50°; @112.22m = 35-50°.	1	1			1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
81		113.53	119.54	MSED: Last section of MSED's contact wi GND at 119.54m; HFLS more effected by carbonate, somewhat broken up, still 70% competent core or angular cobbles, 30% carb-clay and HFLS-Clay (dark purple, flaky to crumbly and soft).		1		1	2	
10	119.54-161.00	119.54	136.28	GND: As MSED/HFLS acted as a caprock to carbonate intrusion, calcite is concentrated in this uppermost section of GND. It is more permeable than HFLS as well. Carbonate seen in veinlets, veins and throughout GND matrix (btwn qtz, biot, plag, etc.), causing it to be crumbly and soft and carb-clay rich. Nothing competent until 126.49m where core lengths are up to 15cm. One length of 20cm at 134.92m. 22cm wide zone of dark grey clay at 129.4 - 129.62m contains ox'd py? All sericite/carbonate altered.						
10		136.28	143.26	GND: Section is 90% alt'd with carb and chlorite throughout the matrix of GND, such that the color is greenish-brown-grey. At 142.60m, a qtz/carb vein contains large spahlerite and chalcopyrite in up to 1cm irregular to subhedral bands. Oxidation noted is predominantly within sulphides-pyrite.	1	1	2		2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		219.00	222.50	GND: Intensely altered GND (sericite); Core is stained green and softer than unaltered GND; Unaltered/Altered ctc runs near parallel to core in places; Contact is moderately gradual; Abundant disseminated blebs of very fine grained pyrite (20%) within 2-3cm of contact with unaltered GND.		3				
10		222.50	236.42	Core alternates between unaltered and sericite altered GND (unaltered GND is more abundant); Contact w/ GND is shallow (0-20°); Secondary altered GND contains disseminated blebs of very fine grained py near the contact; Minor local chlorite altered GND at 228.6 - 228.68m with 10% very fine grained blebs of pyrite; Between 235.15 - 235.87m area of sericite alteration with carbonate alteration as well; Within zone is a 0.5cm pyrite vein at 30° with slickenlines at 60° TCA.		2				
10		236.42	237.15	GND: Intensely altered GND (mostly carbonate alteration with more sericite alteration - greenish hue); Very soft - possibly fault breccia; Thick (1.5cm) quartz veins are cross cut.				2	3	
10		237.15	242.16	GND: Return to alternating unaltered GND and sericite altered GND; Pyrite veins (0.05 - 0.5cm) are common in sericite altered GND; Pyrite associated with carbonate veinlets and qtz veins and disseminated on and around slip faces; Slip faces have chlorite; 20° face with 80° slickenlines; 60° face with 90° slicks; Qtz vein offset (dextral) by carbonate filled fracture.		1				
10		242.16	248.94	GND: Intense sericite alteration with local carbonate alteration; Local intensive sulphide veining and fracturing; Abundant pyrite veining (some offset by carbonate filled fractures) at shallow angles (0-30° TCA); Chloritic slip faces at 5-30° with lines at 60-80°; Sulphide/carbonate vein offset (sinistral) by 5cm.		3			2

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0.00 - 8.23	0.00	8.23	Casing - No Recovery						
80				MSED - Varied composition. Derived from pelitic to arenaceous rocks. May be silicious or phyllitic. Alteration is commonly sericitic, with minor chloritic and argillic present. Foliation is initially at a much lower angle to CA than previous holes.						
80	8.23 - 72.25	8.23	18.29	MSED - Dark grey. Limonite is pervasive and heavily stains fracture faces. Foliation is at low angles to CA. Foliation @ 8.23m -> 10-12°, @9.14m -> 10-15°, @10.67m -> 30-32°, @12.19m -> 40-45°, @13.72m -> 30-32°, @15.24m -> 20-25°, @16.76m -> 0-10°. Recovery is poor. Core is broken into gravel sized pieces (70%) and 5cm or larger (30%). @16.76m, 18cm APL dyke @10° to CA. Fabric appears gneissic and is parallel to CA.	3	2		1	1	
80		18.29	32.73	Silicious MSED - Dark grey to dark blue. Foliation continues to be between 10° and 45° to CA. Lim is less pervasive, but continues on the fracture faces. Foliation @18.29m ->15-20°, @19.81m -> 25-30°, @21.34m -> 25-30°, @22.86m -> 22-25°, @24.38m -> 20-22°, @25.91m -> 20-25°, @27.43m -> 30-35°, @28.96m -> too broken for measurement, @30.48m -> too broken for measurement, @32.00m -> 30-35° - folded. @20.72m - 5cm APL dyke @85° to CA.	2					
80		32.73	36.72	Intense clay alt'n throughout section. Core is soft but coherent. @36.85m - 15cm gouge containing MSED frags - possible hydrothermal alt'n.	2			4	2	
70		36.72	54.86	QZZ - Light grey to grey. Residual foliation @ higher angles to CA (55-60°). Qtz veins increase in number and size, up to 35cm. 95% of the veins are 1-3cm in width. There is also a corresponding increase in sulphides, though less intense. 70% of the sulphides are found on fracture faces and 75% of the aspy has been altered to Scorodite. @50.29m - 9cm grey qtz vein @ 60° to CA @51.82m - 8cm grey qtz vein @ 50° to CA @53.34m - 35cm grey qtz vein @ 40° to CA, 5% scor			2	2	1	
80		54.86	58.63	Silicified MSED - light grey to grey. Lighter coloured qtz ellipsoids are banded by darker coloured feldspar, bt and hbl, giving the core a gneissic appearance. The banding passes through the veins indicating it was a later process. Veining is similar in intensity to above interval.						

DRILL LOG LEGEND P2

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
70		58.63	60.96	QZZ - Same as previous QZZ interval, with a max vein size of 9cm.						
80		60.96	66.85	Silicious MSED - Dark grey. Qtz veins continue intensity and large size. Foliation @60.96m -> 50-52°, @62.48m -> 45-47°, @64.01m -> 50-55°, @65.53m -> 55-60° @66.35m - 10cm gouge. Contains angular 1-5cm MSED frags. No contact angle visible.		1	1			
70		66.85	68.58	QZZ - Light grey. Veins decrease in number to 2, and in size to a max of 0.2cm. Relic foliation is @45-50° to CA			1			
80		68.58	71.02	MSED - Dark grey, 40% argillite. Chl alt'n is increased, while ser alt'n decreases. Foliation @68.58m -> 45-47°, @70.10m -> 45-47°. There is an increase in veining compared to previous interval. @69.77m - conjugate vein set. 2cm grey qtz @60° and 115° to CA. 2cm bt selvage		1	2			
		71.02	72.25	Silicious MSED - same as above with a higher silica content. Likely due to contact with GND dyke @ 72.25m		1	2			
12	72.25 - 72.82	72.25	72.82	GND dyke - 30% qtz, 20% plag, 15% bt. Contact @20° to CA. The first 17cm of GND is bleached and contains only 1% bt. Veins are small (<0.2 cm) containing trace sulphides.						
80	72.82 - 95.49	72.82	88.79	MSED - Silicious, grey to dark grey. Veining is similar to previous MSED interval with a max of 4cm. Sulphide veins are present with 95% ranging from 0.1-0.2 cm Sulphides have been replaced by bt. Bt selvages are also common among qtz veins. Qtz and sulphide veinlets crosscut foliation. Foliation @72.82m -> 55-57°, @73.15m -> 50-52°, @74.68m -> 45-47°, @76.20m -> 40-45°, @77.12m -> 45-47°, @79.25m -> 50-55°, @80.77m -> 50-52°, @82.30m -> 60-62°, @83.82m -> 60-62°, @85.34m -> 60-62°, @86.87m -> 50-52°		1	1	1	1	
70		88.79	93.52	QZZ - Veining is reduced as is the sulphide content. Cb fills fractures. @90.36m - 29cm GND dyke @50° to CA. GND is bleached with 1% mafics present. Light green color, minor chl present.			1			
80		93.52	95.49	Silicious MSED - Dark grey, no major veining. Foliation @93.52m -> 60-62°, @94.49m -> 65-67°. @95.49m - contact with GND dyke @40° to CA		3	1	1	1	
12	95.49 - 95.89	95.49	95.89	GND Dyke - Light blue-grey color. Phaneritic, 10% bt, which is less than most GND in other holes. No visible veins.

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
80	95.89 - 208.39	95.89	104.91	Silicious MSED - Less silicious than previous intervals. Foliation becomes higher angle to CA. There is an increase in veining and sulphide concentrations. Py can be found on frac faces. Foliation @95.89m -> 64-67°, @96.01m -> 65-67°, @97.54m -> 55-60°, @99.06m -> 60-62°, @100.58m -> 67-70°, @102.11m -> 70-75°, @103.63m -> 70-72°, @105.16m -> 85-87° @103.63m - MSEDS are brecciated and cemented by carbonate. Intense ser on frac faces.						
70		104.91	112.94	QZZ - Shear Zone - QZZ is intensely altered and deformed. Core is brecciated and half is reduced to sand size grains of qtz. Qtz veins are the last to be deformed and 90% still visible. Veining is increased as are sulphide concentrations, though most are oxidized						
80		112.94	119.71	MSED - Dark grey to black, easy to scratch. Ser on frac faces. Chl occurs in bands of 5-20cm and is associated with veins. Veining is reduced from previous interval. Foliation @112.94m -> 50-55°, @114.30m -> 50-55°, @115.82m -> 45-50°, @117.35m -> 55-60°, @118.87m -> 35-40° @115.58m - 22cm SZ @ 10° to CA.		1	1		1	
70		119.71	123.24	QZZ - Light grey, increase in veins, 90% of sulphides oxidized. Residual foliation @ 45-60°, crenulated. Cb veinlets present and on frac faces.			1		1	
93		123.24	127.13	SZ - Sheared MSED and QZZ. Core appears brecciated and highly fractured. Intense argillic alt'n follows breccia. Contact angles range from 10-30°. Chl and ser alt'n also intense, but less than argillic. Cb alt'n is greater than chl and ser, but less than arg. Qtz veins present but are fracture or reduced to pebble sized pieces. Sulphides have been heavily oxidized (90%)		2	2	4	3	
80		127.13	138.88	Silicious MSED - Grey to dark grey. Increase in qtz veining but few visible sulphides. Qtz veins between foliations. Foliation @127.13m -> 50-60°, @128.02m -> 80-85° folded, @129.54m -> 40-45°, @131.06m -> 45-50°, @132.59m -> 40-45°, @134.11m -> 20-50 "s" shaped fold, @135.64m -> 57-60°, @137.16m -> 57-60°. Intense ser on frac faces. @138.78m - 3cm apl dyke @ 55° to CA		3	1	1	2	
70		138.88	147.05	QZZ & MSED - 80% QZZ with intermittent bands of silicious MSED 5-30cm long. The foliation in the MSEDS is crenulated or folded into "s" patterns, making it difficult to measure. Veining is reduced in this section. Contacts between QZZ and MSED do not have a preferred orientation. 90% are undulatory and random. @144.72m, 16cm APL dyke @45° to CA. Foliation where measurable @ 50-60°		1	2		1	
80		147.05	159.32	MSED & QZZ - 80% silicious MSED with bands of QZZ ranging from 10 - 60 cm in width. Veining is similar to previous interval and sulphides are not visible. MSEDS show less folding, but it is still present. Foliation @147.05m -> 40-42°, @147.83m -> 47-50°, @149.35m -> 47-50°, @150.88m -> 50-55°, @152.40m -> 45°, @153.92m -> 47°, @155.45m -> 49°, @156.97m -> 46°, @158.50m -> 53°. @ 151.95m - 84cm GND dyke @ 60° to CA. GND is bleached, with 1% bt present. Ser and CHL alt'n dominant. Two 0.1cm sulphide veinlets present @ 40° and 70° to CA.		2	1		1	
70		159.32	163.84	QZZ - Light grey. Increase in number and size of qtz veins (max 10cm). Chl alt'n is increased, more intensity around veins. Relic foliation is at lower angles to CA. Foliation @ 32° to CA. @ 160.08m - 10cm qtz vein @ 32° to CA. Chl on frac faces. @ 160.92m - 37cm HFLS. Cb veins present after HFLS <0.5cm @ 10-30° to CA			2		1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
80		163.84	169.93	MSED interbedded with QZZ and HFLS - Foliation is initially at a higher angle to CA, but several small intrusions cause lower angles and folding. The small intrusive bodies (1-2cm) @ 165.50m and 166.32m are aplite. HFLS can be found surrounding them. Foliation @163.84m > 43°, @164.49m -> 45°, @166.12m -> 25°, @167.64m - not measureable, @169.16m -> not measurable. @165.50m - foliation @10°,40°, and 10° in "S" fold (see drawing ~)		2	2		2	
70		169.93	172.21	QZZ - Light grey-green, chl alt'n dominant. Few qtz veins, cb veins more common. Residual foliation @ 50° to CA, becoming 35° at end of interval		1	2			
80		172.21	176.41	MSED - Soft, easily scratchable. Foliation @ 35° increasing to 50° @ 174.74m @174.52m - 62cm GND dyke. Bleached and sericitized, 1% bt. Uphole contact not visible, downhole contact @ 80° to CA.		1	2		1	
12		176.41	178.01	GND dyke - Bleached, 5% bt, grey green color. Chl higher than ser alt'n, minor cb alt'n. Fractures @40° and 140°. Four 2cm qtz veins present, with trace aspy. Downhole contact @45° to CA.		2	3		3	
						2	3		3	
81		178.01	185.93	HFLS - Violet, green, white. Cb veining increased. Foliation still visible. Foliation @178.01m -> 37°, @178.31m -> 50°, @179.83m -> 45°, @181.36m -> 50°, @182.88m -> 50°, @184.40m -> 45°. Cb veins are at low angles, 10-25°. Very few veins in interval. No samples.						
81		185.93	190.76	HFLS & QZZ - Same as previous interval with an increase in QZZ and veining. Core contains 30% QZZ. Foliation @ 185.93m -> 40°, @187.45m -> 37°, @188.93m->45°, @190.50m -> too broken. Cb veining is reduced to 1 - 2 cm vein @ 25° to CA						
81		190.76	195.07	HFLS - Dark blue, with violet and green. There is a larger increase in veining with a max of 75cm. The sulphides also increase, but they are oxidized 50-90%. Scor and bt are common oxidation types.						
81		195.07	208.39	HFLS - Argillic alt'n becomes dominant form, chl also major alt'n. Cb alt'n increased. Qtz veining shows a large decrease in size (Max 3cm) and in number. Po, cpy and aspy found in veins. Foliation difficult to measure due to shearing. Gouge is also common: @ 195.95m - 15cm clay with qtz eyes and frags. @ 198.36m - 7cm clay with qtz eyes, MSED frags @ 204.84m - 0.5cm wide, 34 cm long gouge @12° to CA - slip plane @ 205.74m - 10cm gouge @30° to CA. Clay with MSED frags and ser Alteration becomes more intense after 207.47m where 70% of core shows argillic alt'n. Diss py, aspy, found throughout		2	3	3	2	
12	208.39 - 209.41	208.39	209.41	GND dyke - Light grey, 5% bt. Ser alt on frac faces. No visible qtz veins or structures as core is broken. Minor cb veinlets (2). Uphole contact not visible, downhole @70° to CA.		1			1	
81	209.41 - 243.36	209.41	215.82	Silicious HFLS - Grey, violet, green, dark blue. Hard, silicious, increased qtz content as veins and qtz eyes. Diss po found throughout. Minor potassic alt'n. Chl, ser on frac faces. Foliation @209.41m -> 30°, @210.31m -> 30°, @211.84m -> 40°, @213.36m -> 45°, @214.88m -> 45°		2	2		1	1

61		215.82	231.65	HFLS - Dark blue-grey to black. Poikiloblastic texture common. Core contains 10-15% bt, 10% andalusite -> biotite-andalusite HFLS. Cb present on 90% of frac faces. Cb also dominant form of veins (60%). Qtz veining increased from previous interval, as well there is a corresponding increase in sulphides. Residual foliation is crenulated and crosscut by the veins. Qtz veins follow foliation. @227.08m - 40 cm GND dyke. 15% bt, no qtz veins, cb veins present. Uphole contact @35°, downhole contact @40° to CA		2	3	1	3	
81		231.65	237.74	HFLS - Intensely altered. Ser on frac faces. Cb is pervasive and on frac faces. Foliation @231.65m -> 50°, @233.17m -> 25°, @234.70m -> 25°, @236.22m -> 27° @231.89m, 7cm gouge, clay rich with HFLS frags		2	1	2	3	
81		237.74	240.79	Silicious HFLS - Pervasive Cb is increased. Core is highly fractured. Alteration obscures most foliation. @239.27m - Core becomes powdery on surface, argillic alt'n increased with ser and chl. Transitional before GND		2	1	2	4	
81		240.79	243.36	Gouge - Core is white, and intensely altered to clay. Crumbles when touched. Fragments in gouge are QZZ. Transition zone between HFLS and GND. Residual foliation @242.32m -> 55° to CA. Cb is pervasive. No visible veins		2	2	4	4	
10	243.36 - 280.42	243.36	245.36	GND - 30% qtz, 35% plag, 15% bt, 15% kspar, 5% hbl. Core is initially bleached, cb pervasive, only 5% mafics. By 243.84m is 90% unaltered. @ 243.84m - recovery poor (19%), core is broken into rounded gravel sized pieces.		2		3	4	
10		245.36	257.56	GND - 70% unaltered GND. Cb in veinlets and pervasive. Chl can be found on frac faces. Small (<0.5 cm) sheeted vein sets make their first appearance, as do aspy veinlets. There is an increase in aspy and po in the veins, compared to previous intervals. Fractures are @45° (parallel to veining) and 145° (crosscut veining).			1		2	
10		257.56	271.27	GND - Same as previous interval, but contains less pervasive cb. The larger veins (>2cm) occur in areas of chloritic alt'n, which has also increased on fracture faces. @262.88m - Slickensides on 40° frac faces @80° from CA			2		1

BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)						
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-3.35	0.00	3.35	Casing, No core						
80	3.35-21.67	3.35	10.67	Silicified sed (quartzite). Moderate qtz vning with few vns x-cutting. Core appears to have a pinkish colour to it (possibly k-spar alt'n?).	3					
80		10.67	21.67	Much of core is highly fractured with limonite on fractured surfaces. Coherent core is darker with near parallel qtz vning and foliation between 60° and 45° to CA. Core that appears darker is less oxidized. Qtz vn selvages have pinkish colour possibly due to k-spar alt'n.	3					
80	21.67-67.06			Most of core has been intensely alt'd to clay with remnant qtz eyes or vn's. There are few intervals of dark fol'd core (as above). The clay alt'd core tends to be more ox'd (limonite) than dark MSED.	3			4		
80		39.00	41.00	Dark fol'd MSED. Fol'n gradually changes (down hole) from 1-30°. Fresher qtz vn's x-cutting fol'n at 70° to CA. Qtz vn's still ox'd but contain fresh f.g. py (1-2%). White laths (plag?) present along fol'n planes.	2					
80		41.00	44.20	Clay-rich broken core with short (20cm) intervals of dark fol'd MSED.	4			4		
80		44.20	44.83	Dark MSED with fol'n from 0 to 30°.	2					
80		45.70	46.80	Incoherent clay-rich core (fault gouge?)						
80		52.48	52.92	Dark MSED with fol'n about 30°.	2					
80		60.96	67.06	Broken up Quartzite. Size of blocks vary from mm-scale to 10cm in length.	2			1		
10	67.06-81.40	67.06	72.17	Highly frac'd GND with limonite on all frac faces. Frac'd blocks are coherent. Locally alt'd to clay (5cm flt gg?). Ox'd frac faces tend to be filled with carb.	2			1		
10		72.17	81.40	GND is intensely alt'd and frac'd with lim on faces. GND is incompetent (crumbly). Abundant carb frac filling. At 77.62m slip face at 60° with lines at 70° to CA.	3			3	2	
10	81.40-83.40	81.40	83.40	Grey GND, mod frac'd with limonite on frac faces. Multiple mm-scale limonitic frac's (~45°). Gradually fades into ser/chl alt and carb alt. Five near parallel vn's (carb, qtz and cb/q) within 30cm with ser alt'n in middle and chl alt'n surrounding. Slip face at edge of chl alt'n: 60° face with 60° lines.		3			3	
10	83.40-114.30	83.40	114.30	Back into grey GND. High % vning - mostly qtz with some carb. Qtz vns have small selvages. Possible VG mixed in with po and cpy. Thin cb vnlts tend to have wide ser selvages overprinting some qtz vns. Local areas of greater frac'ing with carb alt'n/frac filling (10-50cm). At 88.79m: a 5cm clay alt'n (flt gg?). Slip faces: at 99.36m: face at 60° and lines at 70°, at 114.00m: face at 30° and lines at 50°.		1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)						
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		95.64	97.16	Sample B363372 - heavily frac'd core and limonite. Remnant qtz vn's with euhedral aspy up to 0.4 x 0.2mm. Also, abundant cb frac's.	1					
10	114.30-120.40	114.30	120.40	Similar grey GND but with multiple zones of intense ser alt. Zones up to 75cm long (ser alt'n more intense in middle of zone commonly with limonite selvage among fractures). Fractures: at 119.60m - face at 70° and lines at 70°, at 119.80m - face at 40° and lines at 50°, at 117.76m - face at 10° and lines at 10°, at 114.40m - face at 10° and lines at 10°, at 114.41m - face at 60° and lines at 45°, and at 114.70m - face at 70° and lines at 80°. Carb frac filling still present but less abundant than above. Contact between GND and ser alt'n is distinct. Qtz vn'ing is slightly less abundant than above. Alt'n most likely due to fracturing.		5				
10	120.40-130.06	120.40	130.06	Back into grey GND (similar to 83.40-114.30m). Limonite and carb frac filling are becoming less prominent. Frac faces/slip faces are of limonite, carb or chl. Slickenlines are fairly abundant: at 124.57m-face at 45° lines at 45°, at 126.49m-face at 30°, lines at 60°, at 127.50m-face at 50°, lines at 50°, at 128.02m-face at 30° lines at 10°, at 129.34m-face @10° lines at 30°, and at 129.34m-face 30° w/ lines at 45°. Majority of qtz vn'ing is near parallel except at 129.84m where vn's are x-cutting.					1	
10	130.06-132.45	130.06	132.45	GND is much lighter in colour and softer and is carb-rich. Very minor qtz vn'ing. Sharp contact with grey GND. At 130.80m slip face at 10° with lines at 10° to CA.					3	
10	132.45-137.70	132.45	137.70	Grey GND with minor qtz vn'ing and minimal alt. Slip faces occur at 132.87m on 20° face w/ lines at 20°, at 133.72m on 70° face with 80° lines, and at 135.92m on 45° face and 45° lines

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10	137.70-152.40	137.70	152.40	GND continuously changes from relatively unalt'd GND. Carb alt'n have sharp contacts with GND. Contacts commonly have slip surfaces. At 137.70m slickenlines at 80°, at 141.73 m with lines at 85°, at 142.00m, lines at 85°, @147.83m lines at 85°, at 148.90m lines at 60°, at 150.78m with lines at 75°. Carb alt'd core is softer and lighter in colour - locally intensely alt'd to carb/clay. Py smearing on slip faces. Minimal limonite on frac'd core. Most qtz vn's are < 1cm wide.					4	
10		152.40	165.49	Grey, relatively unaltered GND with multiple near parallel quartz veins; Qtz vns are thicker but do not contain much sulphides; Sericite alteration selvages are common among thicker (>2cm) veins; Only one occurrence of pyrite vein surrounded by 3cm sericite selvage occurring along fracture; Fractures commonly associated with thick (~3cm) sericite selvages; Slickenlines also common; At 155.55m = Face at 40° with lines at 45° TCA; At 156.67m = face at 45° with lines at 60° TCA: At 156.88m = face at 45° with lines at 80° TCA: At 161.40m = face at 60° with lines at 75° TCA; Local carbonate "fault gouge"(?) at 159.1m and 60°.		1			1	
10		165.49	181.36	Carbonate altered GND; GND is softer and lighter color; Local intervals of sericite alteration (166.32 - 167.64m); Short local intervals of mostly unaltered GND; Sericite alteration also occurs as selvages for fractures; Quartz veining is minimal but dominantly 45° TCA; Abundant factures with slickenlines preserved at.....165.70m = Fractured at 70° and lines at 85°; At 166.0m = fractured at 30° and lines at 45°; At 167.5m = fractured at 10° with lines at 70°; At 168.6m = fractured at 30° with lines at 55°; At 169.75m = fractured at 60° with lines at 70°; At 174.2m = fractured at 30° with lines at 40°; At 176.0m = fractured at 45° with lines at 70°; At 177.1m = fractured at 45° with lines at 80° TCA; At 179.12m = fractured at 40° with lines at 45° TCA; At 181.0m = fracture foliation at 60° with lines at 60°.		1			3	
10		181.36	191.04	Grey GND with minor to moderate carbonate alteration throughout; Sericite alteration is also apparent in short intervals (30cm); Multiple slip faces.....At 182.18m = fracture foliation at 45° with slickinlines at 70°; At 185.63m = fol'n at 45° with lines at 65°; At 186.13m = fol'n at 10° with lines at 10°; At 186.75m = fol'n at 60° with lines at 75°; At 188.88m = fol'n at 50° with lines at 70°; At 190.4m fol'n at 40° with lines at 90° TCA.		1			2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		191.04	195.07	Core is altered to a creamy pale green color; Sharp contact between unaltered and altered core at 45° TCA; Irregular veins of K-spar (creamy peach color) are abundant throughout (mostly mm-scale but up to 1cm); Core is speckled with anhedral to subhedral K-spar grains throughout; Along fracture and slip faces, darker green (chlorite altered?) pyrite commonly associated with fractures (v.f.gr. blebs) and smeared on faces; Pyrite in fractures found with grey clay matrix (ox'd sulphides); Sericite alteration is dominant throughout; Quartz veining is minimal; Fracturing at 193.25m = face at 50° with slickenlines at 60°; At 194.1m = Face at 10° with slickenlines at 60°.						
10		195.07	212.20	Grey GND with minor carbonate filled fractures; Local sericite alteration around fractures; At 199.64m = Rounded MSED clasts (rounded by drill), most likely cavings; At 209 - 209.25m = Intensely altered to green clay with quartz eyes; Pyrite common on slip faces (+ graphite?); Fractures at 195.8m = Fracture foliation at 30° with slickenlines at 40° TCA; At 198.0m = Fract fol'n at 65° with Slickinlines at 65°; At 205.11m = Fract fol'n at 30° with slickinlines at 30° TCA.		1			1	
11		121.20	216.87	Dark grey GND; Fine grained and softer than previous grey GND; Appears unaltered; At 212.67m - 212.70m = Intrusion of biotite poor GND (felsic?) with sharp contacts at 60°; Qtz veining is minimal (no vein >1cm); Fracturing common with chloritic (?) slickenlines; Sharp contact with felsic GND at 60°; Fractures: at 213.4m = Fracture foliation at 20° with slickenlines at 30°; At 213.88m = Fract fol'n at 45° with 50° lines; At 216.46m = Fract fol'n at 60° with lines at 70°.		1			2	
10		216.87	229.92	Grey GND with moderate to low quartz veining; Locally core is sericite altered (mod) up to 50cm; Low carbonate alteration also occurs (up to 50cm) giving core a lighter appearance and making it softer; Pyrite often occurs smeared on slip faces with chlorite; Where GND is slightly carbonate altered, quartz veining is very minimal; At 221.19m = sulphide vein with pyrrhotite and biotite with slight chlorite alteration (0.5cm); Fracture faces (foliation) with slickenlines: At 219.80m = 60°/70°; At 223.13m = 10°/30°; At 224.24m = 50°/50°; At 229.02m = 45°/45°.		2			1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0 - 4.88	0.00	4.88	Casing - no recovery						
10	4.88 - 68.86	4.88	38.24	GND: GND is highly fractured and broken up with limonite on all surfaces; Oxidations is also present throughout GND; Locally competent core (up to 21cm pieces) at 30.68m; 95% of core is too broken up to recover vein info; Generally low recovery throughout interval; Possible fault gouge at end of interval (37.5 - 37.8m) made up of limonitic clay, very crumbly; Slickensides present at 24.45m at 45° TCA, at 34.95m at 45° TCA.	4					
10		38.24	51.00	GND is extremely oxidized; Oxidation appears to be large selvages (up to 20cm); Small - 2cm selvages also present; Oxidation selvages are also carbonate altered; Possible sericite alteration in less oxidized core (rusty green color); Core moderately broken up; Only minor quartz veining; Completely oxidized sulphide veins are present at 55m; FAULT GOUGE present from 46.95 - 47.35m, Sharp contact with oxidized GND with slickenlines at 85° TCA; Slickenlines at 49.8m at 70° TCA.	5					
10		51.00	58.84	GND is oxidized to a much lesser degree - only present along fractures and locally minor oxidation throughout, also small (1cm) weak limonite selvages; 40cm interval of highly fracture core (3x3x3 cm pieces - average); Quartz veining still low; Core switch because slightly softer and paler GND to Grey GND (~1m intervals) with sharp contacts; Sulphides in quartz veins have been leached out, leaving vugs (52.07m); Slickensides: at 55.55m = 70° TCA.	3

DRILL LOG LEGEND P1	DATE: August 14-20th 2005	PAGE 3 of 12	
DRILL HOLE # : **DG05-300C**	**FeOx** 0 = Unoxidized 5 = Intensely Ox'd	**Ser, Chl, etc** 0 = Unaltered 5 = Intensely Altered	**Carbonate** 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41 BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		58.84	61.33	GND: Back to very limonitic GND with overprinted sericite +/- chlorite alteration within oxidized selvages; Sulphide vein at 59.83m contains 50% fresh, fine grained pyrite; Fresh fine grained euhedral pyrite inside vugs (up to 0.2x0.4cm vugs) of quartz veins are present.	5					
10		61.33	64.01	GND: Back into less oxidized GND with limonite on fractures as previously described; Vuggy quartz veins still present with limonite staining inside and fresh euhedral fine grained pyrite.						
10		64.01	68.86	GND: Highly fractured with intervals up to 30cm of competent core; Limonite on/in carbonate lined fractures and opened faces; GND appears slightly more mafic here (?); Quartz veins contain vugs (5x3x4mm); Slickenlines: at 64.01m = 70° TCA; At 66.23m = 60° TCA.	3					
30	68.86 - 74.08	68.86	74.08	GND: GND has higher percentage of biotite, giving it a much darker appearance (mafic?); Minor quartz veining; Large quartz veins have sericite alteration selvages; From 68.86m - 69.52m = intense sericite alteration with large 5x6cm blebs of quartz with carbonate fractures; From 71.0 - 71.5m = Highly fractured MGD (3.5 x 5 x 2 cm avg) with calcite and some limonite on fractures; Slickenlines: at 70.11m = 60° TCA; At 73.35m = 30° TCA.		1				
10	74.08 - 80.92	74.08	80.92	Grey GND with no apparent alteration; Local carbonate alteration from 75.90 - 76.23m; Majority of quartz veins have quartz selvages; MGD interval with sharp contact from 77.02 - 77.16m at 30° TCA; Pyrite common in carbonate fracture filling.					1	
30	80.92 - 88.39	80.92	88.39	MGD (More mafic GND): Back into MGD as prev. description; Quartz veins commonly have quartz flooded selvages; Frequent carbonate fracture filling; Slickenlines: at 84.15m = 45°; At 81.37m = 45° TCA.						
10	88.39 - 91.62	88.39	91.62	GND: Has been altered to a greyish green colour (sericite) to a deeper green color (chlorite?); Chlorite altered GND is much softer and is crumbly whereas ser altered GND is much more competent (retained silica); Carbonate fracture filling is abundant throughout; Quartz veining is minimal, but tends to be thicker (~4cm) with low sulphide content.		5	5	1		
10		91.62	93.96	GND: GND is light in color with high carbonate content = carbonate alteration; Interval is very crumbly; High k-spar content (cream color); K-spar is very soft; Minimal quartz veining with sericite/chlorite selvages (~1m) slickenlines present on broken core.		2		2	4	2
30		93.96	99.49	MGD: Back into MGD as seen in 66.86 - 74.08m; Quartz veining is more abundant; Carbonate fracture filling abundant; Core moderately broken up.

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		99.49	105.65	GND: GND has become very felsic; MDG/GND contact distinct but crumbly; higher carbonate and k-spar content; Creamy k-spar is harder than interval 91.62 - 93.96m; Carbonate fracture filling has pale green hue (sericite); Quartz veining tends to be irregular +/- displaced or in blebs with carbonate fractures; Core is relatively soft; Slickenlines: at 99.69m on 10° face, lines at 10° TCA; At 102.0m on 20° face, lines at 85°; At 103.83m on 60° face, lines at 70° TCA; At 102.51m, on 0° face, lines at 70° TCA.		2	1	3	2	
10		105.65	124.97	GND: GND slightly darker (greyer) than previous (99.49 - 105.65m); Less abundant carbonate fractures; Less abundant k-spar; GND is also harder and less broken-up; Local sericite alteration (intensive) from 110.65m - 111.49m (largest interval), sharp contact with quartz vein at 45°; Local intensive carbonate alteration 106.76 - 106.97m and 109.92 - 110.14m; Quartz veining tends to be more abundant in sericite altered veins; <2mm qtz/chl/sulphide (po) veins are common; Chlorite + carb common on slip face with smeared pyrite; Slickenlines: at 113.3m on 30° face, lines at 60°; At 115.3m, face at 50° with lines at 50°; At 119.9m, face at 119.9m with lines at 70°; At 121.92m, face at 30° with lines at 60° TCA.		2	1	2	1	
10		124.97	147.83	GND: Grey GND; Very gradual change from previous interval (105.65 - 124.97m); GND is slightly darker; Carb and chlorite alteration are present on a majority of the fracture and slip faces - commonly with pyrite smearing; Pyrrhotite and arsenopyrite common in chl/s selvages; <1mm qtz+chl/cb/po veinlets common with quartz/ser selvages; Minor intervals of slightly more felsic (?) GND; Slickenlines: at 128.15m, face at 10° with lines at 45° TCA; At 135.8m, face at 45° with lines at 45° TCA; At 142.5m, face at 45° with lines at 60°.		2	2	2	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		147.83	156.32	GND: Grey GND that is more heavily fractured and broken up than the previous interval (124.97 - 147.83m); Long shallow (0-30°) fractures abundant with cb/s/chl and commonly pyrite; At 153.7m = 1cm felsic granitic (very fine grained) vein at 30° TCA; Slickenlines: at 150.65m, face at 45° with lines at 50° TCA.		2	2	3	2	
10		156.32	166.24	GND: Grey GND; GND still more heavily fractured than previous interval (147.83 - 156.32m) with a general size of 4x4x3cm; Locally more competent core up to 35cm in length; Locally very crumbly sand sized; Blocks commonly have sericite +/- chlorite alteration; Fracture faces mostly have calcite with a tinge of green (pale sericite), commonly with pyrite; Slickenlines: 165.65m, face to 45° and lines at 50° TCA; At 163.37m, face at 60° with lines at 65° TCA; At 165.85m, face at 30°, lines at 45°.		2	2			
10		166.24	168.46	GND: Intensely sericite altered =/- chlorite alteration; Extremely crumbly to completely altered core; Crumbly core contains remnant quartz veins as quartz eyes aligned; Disseminated pyrite throughout; Competent core has abundant carbonate throughout; Slickenlines at 168.43m with face at 5° and lines at 70° TCA.		5	2			
10		168.46	175.00	GND: Grey GND, competent; Quartz veins tend to have large-moderate sericite selvages; No real obvious alteration in interval.						
10		175.00	189.63	GND: Majority of GND has been argillic altered; Contacts between unaltered GND and argillic altered GND tends to be sharp at about 45-60° (vein parallel?); Unaltered intervals ~60m (4 of them); Sericite selvages occur along fractures with calcite and chlorite on fractures (up to 6cm); Common to see quartz veins at edge of sericite/chlorite fracture selvages; Slickenlines: At 178.2m, face at 45° with lines at 45° TCA; At 178.7m, frac at 20° with lines at 60°; At 184.7m, face at 10° with lines at 20° TCA; At 190.25m, face at 30° with lines at 60°.				4	1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-3.65	0.00	3.65	Casing						
10	3.65-17.34	3.65	17.34	GND: 40% pervasively stained GND; Very broken up where competent, with longest core length of 19cm; Weathered to clay over 20% of section; This clay is pale whitish-yellow brown or bright orange-brown; Recovery is poor to excellent (0% - 87%); Generally corresponding to clay context (increased clay = reduced recovery); First 5 samples contain selvage-less 0.5cm quartz veins at ~60° TCA, as well as wide selvages (primarily oxidized) with no visible veinage; These selvages probably result from microfractures serving as channels for atmospheric and meteoric waters; From 12.19 - 17.34m is 90% stained pale brown, even through competent sections; Boundary between oxidized and unoxidized is clear but irregular, surrounding veinlets and veins.	3	0	0	1	1	
10		17.34	24.38	GND: 60% of section is oxidized and limonitic GND reduced to sandy/granular texture - fine to coarse. Colour is pale yellowish brown; Yellow due to oxidized carbonate (still effervesces weakly); Competent GND sections (up to 10cm long) are pervasively oxidized to pale brown, but with GND texture preserved; Fine grained, 2mm minerals (bt, feldspar) maximum diameter.	4	0	0	1	1	
10		24.38	35.05	GND: Intensely broken-up, crumbly GND; Sandy texture over 80% of section; All limonitic and ox'd; Competent core (up to 20cm long) is pale brown, ox'd with pervasive limonite; Texture preserved in only 10% of competent material rest is faulted such that the rock is aphanitic and has brecciated (angular) quartz along planar foliation at 50° (40-60°) TCA; Definitive fault material between 26.7 - 27.35m and from 32.0 - 33.0m in competent sections; Broken regularly at 70° TCA.	5	0	0	1	1	
10		35.05	48.45	GND highly weathered by closely-spaced veinlets of carbonate-rich limonitic material throughout matrix. Feldspars weathering to clay minerals. Broken-up crumbly; Veins less visible. Small veins of calcite produce carb-rich selvages/zones; Soft, opaque, dull grey, semi-metallic sulphide in quartz veins (chalcocite?) appears, <5% of vein, somewhat (~50%) weathered to chlorite/sericite; At 39.7m = quartz/k-spar vein contains increased hem (ox'd), hematite continues; Increasingly brecciated through section, last 3m contain no competent pieces larger than 10cm long; Texture is brecciated - GND chunks in crumbly clay/fine to coarse sand-size material matrix.

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)							
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other		
10		48.45	56.88	FAULT ZONE. GND texture reduced to 1mm-grain size; coherent core 50% of section, shows re-arranged, brecciated fine grained GND; Considerably weakened/weathered along veinlets of carb-rich limonite in irregular orientations approximately 5 veinlets/square cm.	4	1	1	2	2			
10		56.88	75.53	GND: Typical GND texture re-appears, with fewer, but still prevalent limonite coated veins, causing intense breakage. Selvages around limonite veinlets are visible here (again) - irregular in width, up to 2cm; Moderate slickenslides on fracture faces at 20° TCA; Biotite, limonite, feldspar; 15cm silicified zone at 70.6m, broken at 30°-60° TCA.	3	0	1	1	1			
10		75.53	76.76	GND/FLT: Small zone of extreme weathering and aphanitic texture; FAULT ZONE: Brecciated-gouge for 20cm from 76.40 - 76.6m; General trend of shear is at 40° TCA; Veins are in first 30cm of sample	4	2	1	2	2			
10		76.76	89.07	GND; similar to 35.05-48.45m: Limonitic veinlets through matrix, weathering feldspars; Zones of intense shear noted; At 82.1 - 82.5m = Gouge/brecciated quartz/GND; At 84.25 - 84.85m = Clay gouge (30cm) and brecciated GND - shear to 130° OR 50°, At 87.42m - 88.35m = 90% clay, 10% brecciated GND and quartz. Strong shear to 30° TCA; At 79.3m = small sulphide vein (oxidized pyrite and aspy) parallels 1cm quartz vein; At 74.2m is an angular, 2cm xenolith of basalt which may contain sulphides (black, semi-metallic). From 83.82m - 84.18m is a zone of relatively unaltered GND; Calcite and limonite concentrated into veins/veinlets (8) at 160° TCA. This interval of coherent core is followed by 60cm of clay gouge and brecciated rock, heavily oxidized (noted above as zone of intense shear). At 87.42m, a 93cm zone of intense shear contains 2 quartz veins, slightly brecciated and probably re-oriented into shear direction.	4	0	0	2	2			
10		89.07	97.54	GND: Gradational zone between heavily limonized rock (entire hole to here) and white clay mineral/carb-rich GND with preserved texture (med-grained GND); Slickenslides visible in sericite/carbonate on fractures at <20° TCA; Diss aspy ~1 % of GND.	2	1	1	0	1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		97.54	112.78	GND: Virtually no limonite staining left. GND is still soft and very broken up due to carbonate weathering. Competent core up to 24cm long in section. 80% is crumbly and less than 10cm long, not complete diameter due to <10° TCA pervasive fractures. Slickenslides in quartz/carb vein at 104.3m expressed in oxidized pyrite; Fracture plane at 10° TCA (rough surface). Sample from 104.51 - 105.16m contains many quartz veins, some crosscutting at 25° and 75° TCA; Veins at 75° appear later, po concentrated at intersection (1cm grain). Also veins at 50° TCA contain ~15% py and some cpy and py. Crosscutting veins again at 109.2m; Large (4cm) quartz vein with <1mm oxidized pyrite overprinted by small, 0.5cm wide quartz veins containing po concentrated at intersections with edge of larger vein.	1	1	1	3	4	
10		112.78	116.47	GND: Clay gouge zone with clayey oxidized sulphide lenses; Fabric/lenses are at 50-80° TCA. Brecciated GND and qtz (<2cm in diameter) make up ~30% of section. 70% of the grain sizes are 1-2mm and smaller. Sericitic and carbonate-rich; Color is pale beige to dark grey.	2	4	2	4	4	
10		116.47	128.02	GND: Coherent carb-rich core with 20% GND texture still present. Sulphide veins and veinlets pervade - ~5 per metre. Sometimes these veinlets are just partial, pinched out at lenses. No selvage info noted because alteration covers the entire section, as noted on this page.	2	3	1	3	4

DRILL LOG LEGEND - P1

DATE: Aug 14 - 20, 2005 PAGE 7 of 16

DRILL HOLE # :
DG05-301C

FeOx
0 = Unoxidized
5 = Intensely Ox'd

Ser, Chl, etc
0 = Unaltered
5 = Intensely Altered

Carbonate
0 = No Effervescence
5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		128.02	140.11	GND: Beginning of visible selvages around qtz/sulphide veins, so 40% of section is unaltered. Veinlets of oxidized sulphides are common, only veins >2mm are recorded on second page, but veinlets are ~20/metre. Sulphide vein at 138.15m is branching into surrounding rock and pyrite (60% ox'd) appears disseminated into irregular veinlets for 20cm surrounding vein. Sheared-out GND with carb and sulphide-rich clays from 139.05 - 139.60m.						
10		140.11	144.78	GND: In addition to selvages surrounding qtz and sulphide veins, separated by unaltered GND: This section also contains zones of carbonate-rich clay gouge (2): from 140.2 - 141.22m and 143.56 - 143.8m. In these zones GND texture is 'smeared' out into a trend at 10-35° TCA. Slickenslides (minor) noted on low angle fracture faces (rough).	1	2	2	2	3	
10		144.78	155.44	GND: 80% unaltered GND. Competent core with excellent recovery. Selvages visible on infrequent qtz,carb and qtz/carb veins. One large qtz vein from 149.77m to 150.60m contains small chunks of altered GND; sericitic alteration at margins. Slickensides (minor) in calcite on rough, low-angle fracture faces. Change from HQ to NQ at 151.33m; Crumbly carb-infused section from 154.0m to 155.3m (last sample).	0	2	1	0	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		155.44	162.36	GND: Predominantly (90%) altered GND with chlorite and carbonate, minor sericite. Zone of many sulphide veinlets/few <1cm veins, approx 3 per m. Competent core, but softened to clay-rich in selvages surrounding sulphide veins. Oxidation of pyrite and carbonate.	1	2	3	1	2	
10		162.36	165.84	Larger qtz veinlets within still-competent GND. Sulphide veins continue with clay'd, oxidized pyrite, to a maximum alteration selvage of 50cm. Still, due to decreased number of veins and veinlets, more unaltered GND is present (50%).	1	2	2	0	1	
10		165.84	169.71	Carbonate-infused GND. Crumbly and soft, makes veins/veinlets difficult to see.	1	1	1	3	3	
10		169.71	181.50	GND: Unaltered, with quartz veins with small selvages; 60% of these veins have straight edges and clear selvages; 40% have gradational/irregular boundaries with little to no selvages.	0	1	1	0	1	
10		181.50	184.54	GND: 95% powdery/crumbly carb-infused GND.	0	1	0	2	4	
10		184.54	191.07	GND: Coherent core, but highly altered with chlorite, sericite and carb; Carb appears in veins and veinlets, generally at 50° TCA; as well as in ~2mm grains in selvages (alt'd feldspar); GND here appears finer-grained and sheared toward the end of the section. Slickenslides on fracture faces at moderate angles TCA (20-50°). Perfect cubic pyrite (1.2mm) at 188.66m.	1	2	3	0	2

DRILL LOG LEGEND P1	DATE: Aug 14 - 20, 2005	PAGE 11 of 16	
DRILL HOLE # : DG05-301C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		191.07	196.23	GND: Unaltered GND with a few quartz veins and sulphide veinlets; Pyrite seen on face at 90° TCA, in slickenslides. Some are straight, while on the same face, slickens in py are curved.		1	1		1	
10		196.23	213.35	GND: Return of frequent quartz, qtz/carb and sulphide veins/veinlets, with wide selvages. Section is ~40% unaltered GND. Slickensides on margins of quartz vein at 90° TCA at 196.23m, in biotite, chlorite and s. From ~203.0m to 203.5m, alteration (chl,cb) appears to be confined between 2 quartz veins. This is where carb veins are concentrated as well. Two Carb veins (0.5cm and 1cm) between 212.24 and 212.35m contain vg in rounded 2-3mm form. This zone - 211.84 - 213.0m - is also a shear zone. Strong slickensides on sulphide covered fracture at 10° TCA in calcite and sericite. Adjacent to this face is an obviously sheared qtz vein with indication of sinistral movement along this 10° face. Slickensides are at 60° TCA.		2	3		2	
10		213.35	231.12	GND: 80% unaltered GND; widest selvage is 80cm and is associated with increased mineralization (pyrite veins). Qtz veins with low mineralization have only small qtz/chl/cb selvages (<3cm); Slickensides with py at 229.45m on fracture face at 20° TCA (similar to at 211 - 213m).

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		231.12	239.27	GND: Medium grained, with varying degrees of chl, cb, s and q alteration in selvages and along shear planes; These shear planes are at ~0-10° TCA and show an abrupt change from 'clean' GND to carb-infused or chl/cb alt'd GND; Also have slickensides in sericite and clay minerals. This is between 236.5 and 237.9m. Minor slickensides continue to end of section. Interesting note: lower (deeper) selvage around a vein is larger than the upper (shallower) selvage, due to gravity.	1	2	3	1	2	
10		239.27	281.94	GND: Unaltered GND with sheeted quartz veins. Alteration restricted to a few <1m zones, noted below. Slickenslides throughout section on 0-45° fracture faces (rough to smooth). Between 255m and 261m a weak foliation develops in GND, at 120° TCA. Also, rock appears somewhat coarser-grained here, with an increase in 5mm carbonat, 5mm feldspars, 1cm quartz and 3mm black biotite. Length-wise to core, 4cm wide oxidized carb and iron section from 259.2 to 260.6m. At 264.85 - 266.02m, rock is solid selvage around 2 carb veins (3cm and 2cm wide). Their selvages are dominated by chlorite, but are still competent core. Scratchable with a nail. Carb is fine-grained in these selvages; overall color is yellowish deep green. At 267.2 - 267.37m is a dyke of mafic, aphanitic silicified rock. Coarse GND surrounds it on either side, with extra carbonate as well, for ~8cm on either side. Appears like lamprophyre dike. Intersects GND at ~50° TCA. From 276.5 - 276.95m another solid green selvage surrounding 2 quartz veins close together. Again, from 279.05 - 280.2m is a highly chloritized and moderately carbonitized zone. Sulphides disseminated t	1		1		2

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-302C

PROJECT: Dublin Gulch - 1735

GROUND ELEVATION: 1178m

BEARING: 000 | DIP: -50°

DATES DRILLING: Aug 1 - 5, 2005 | DATES LOGGING: Aug 21 - 28, 2005

LOGGED BY: Kevin Piepgrass

CONTRACTOR: Britton Brothers

COORD SYSTEM: NAD 27: EASTING: 460051 NORTHING: 7099266

COORD SYSTEM: NAD 83: EASTING: 459933 NORTHING: 7099451

NAD 27 (CORRECTED for historic grid): EASTING: 460021 NORTHING: 7099276

SECTION LINE (Historic Grid): 460025 E

DRILLING DETAILS

Hole Diameter: HQ

Overburden:

Deviation:

Casing: 0 - 4.57m

Core Size: HQ

Cement (# Bags): 0

Plug Depth: N/A

Notes: No plug necessary.

SAMPLING DETAILS

Sample Sequence: B363773 - B363853

Requisition #: MASP448STRGOL.05Q Date Shipped: 26-Aug-05

Lab Record #: VA05074725 Date Received: 2-Sept-05

Sample Sequence: B363854 - B363973

Requisition #: MASP448STRGOL.05Q Date Shipped: 29-Aug-05

Lab Record #: VA05074196 Date Received: 2-Sept-05

Sample Sequence: B363974 - B364052

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0.00-4.57	0.00	4.57	Casing						
10	2.57-306.93	4.57	9.14	GND: Broken up, moderately limonitic GND; Oxidation occurs among fracture/vein selvages and fracture faces; Size of core ~5cm long on average; No other alteration apparent; Quartz veins commonly contain limonite stained vugs.	3					
10		9.14	29.26	GND: GND is less broken up than previous (4.57 - 9.14m); Limonite is more pervasive with interval of extremely oxidized GND; Edges of limonite are commonly remnant sericite +/- chlorite alteration overprinted by limonite; Intervals of unaltered grey GND are also common (ex. 20.90 - 21.64m); Quartz veins tend to be vuggy (~5%)	4					
10		29.26	70.32	GND: Grey GND that has undergone intensive oxidation; Oxidation appears to be associated with fractures (commonly cb/calcite filled) and overprints any previous alteration; Previous alteration can still be distinguished (rusty green) eg. 35.88 - 36.18m, oxidation, sericite alteration; Several intervals of unaltered grey GND are present (60cm max) 42.37 - 42.97m; Quartz vein in oxide selvages commonly have limonite stained vugs; From 48.77 - 50.29m core is extremely carbonate altered, crumbly to clayey and limonitic; Quartz veins tend to be small (2-4mm average) with low sulphide content; Low angle (~10° TCA) limonite carbonate lined fractures common throughout - possible fault gouge? (up to 0.5cm); At 69.23m - 8cm limonitic clay interval with polished (no slickenlines) face up hole, having sharp contact with limonite GND and gradual contact downhole at 30° TCA.	3

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		70.32	100.58	GND: Grey GND similar to previous interval (29.26 - 70.32m) only limonite is less extensive, except locally at 79.85 - 80.4m where core is extremely limonitic with sharp contact @ 35° TCA; Non oxidized GND is more dominant where quartz veins occur in limonitic selvages, sulphides are oxidized and veins are left vuggy; Fracture faces still limonitic, commonly with carb/calcite; From 77.35 - 77.5m, 50% of core silicified with 5% biotite and 2 % acicular crystals (bismuth?) - slightly oxidized at edges of silicification - no observed sulphides; At 94.0m chl alteration is more intense around pyrrhotite then the rest of the quartz veins; Slickenlines @ 83.82m wi face at 30° and lines at 45°.	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		100.58	116.52	GND: Grey GND where majority of core has been oxidized with unaltered to non oxidized core in intervals (similar to interval 29.26 - 70.32m); Limonite occurs on all fracture faces commonly with carbonate/calcite; Quartz veins with limonite selvages commonly contain oxidized vugs; Oxidation is moderate except locally as selvage for intensely oxidized, carbonitized and argillic altered interval at 105.47 (5cm) with grey quartz eyes (fault gg?); @ 101.61m ~1cm quartz vein at 30° TCA contains a massive, soft (2-3) black mineral (oxidation product?); Aspy found within black mineral, po and cpy also found in quartz vein; @ 108.44 - 108.77m there is abundant quartz veining or quartz blebs (avg 8x4cm) with 1-2% aspy and trace cpy, proximal to a 2cm quartz vein with 2% aspy.	3					
10		116.52	138.68	GND: Grey GND same as described in interval 70.32 - 100.58m; From 192.4 - 192.75m GND is slightly more mafic with no veining; @ 129.64m a 6cm interval of limonite, carb-rich clay altered GND with remnant quartz eyes; Sharp contact with competent GND at 30°; At 132.69m a 5cm cb-rich, slightly limonitic clay seam with rare <2mmx7mmx2mm quartz eyes, sharp irregular contact at 90°.	2					
10		138.68	141.30	GND is moderately limonitic throughout with locally more intensive selvages with slickenlines (141.08m with face at 40° and lines at 45°); Similar to interval 29.26 - 70.32m; Slickenlines 139.08 with face at 30° and lines at 45°.	3					
10		141.30	142.01	GND intensely oxidized to a rusty yellowish color; Core is soft and becomes softer down hole as argillic alteration intensifies; Core effervesces strongly where it has been altered to clay; Pale lim color possibly due to overprinting of previous alteration (ser?); Quartz veins tend to be irregular and discontinuous; Sharp contact at 142.01m at 45°.	4			4	3	
10		142.01	147.00	GND has undergone intense alteration; Core has a dark green color (chlorite + sericite alteration) but closely examined pale-green-grey (ser alteration); Core interchanges btwn extremely clay altered to slightly clay altered at shallow angles (1-30°); Speckled throughout is euhedral-subhedral, rusty-orange-brown (oxidized) siderite (1-10%); Siderite up to 4x4mm; Siderite dominates core (50%) locally from 142.01 - 142.26m and 146.25 - 146.77m; Quartz veins are broken up and commonly displaced or irregular - appear as breccias (angular quartz clasts randomly oriented).	3	5	5	5	1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		147.00	153.87	GND moderately limonitic throughout as in interval 138.68 - 141.3m; Slickenlines: @ 150.4m face 20°/lines 25°; @ 151.1m face 30°/lines 60°; @ 149 m face 45°/lines 45° TCA; From 150.3 - 151.1m quartz veins are irregular +/- displaced. Limonite alteration is slightly more intense and locally appears blotchy.	3					
10		153.87	155.00	GND: 2 large white quartz veins that have been moderately fractured (carb filled frac's) with limonite faces; Very low sulphide content (tr aspy + py); Fracturing occurs at low angles (20-30°); Between veins is 5cm of sericite + oxidized GND with slickenlines at 154.18 m face 80°/lines 80° TCA: Contact at 155.0m is sharp at 25° with grey clay containing very fine grained disseminated pyrite and quartz eyes (2x2x2mm average).						
10		155.00	161.54	GND with extensive sericite alteration; Limonite staining along fractures is common; Speckled siderite (up to 4x4mm) and massive along fractures at 157.46m and 155.59m; @ 159.94m, 2 parallel quartz-sulphide veins, 0.5cm py vein and 2cm aspy vein. Pyrite vein is very fine to medium grained. Aspy vein is massive aspy; lim fractures occur in both veins but cross-cut fractures within GND; Slickenlines: @155.4m face at 60° with lines at 85°; @ 156.95m face at 30° with lines at 90°.						
10		161.54	170.69	GND: Grey GND with abundant quartz veining; Larger quartz veins tend to have selvages overprinted by oxidation (previous sericite alteration?); Limonite also occurs from fracturing; Possible fault gouge @ 167.25m at 20° (3cm gg adjacent to 1cm quartz vein); Limonite selvages are soft and slightly carbonate altered. Slickensides: @163.70m face at 30° with lines at 40°; @ 166.12m face at 75° with lines at 75°; @ 166.17m face at 30° with lines at 30°; @ 169.00m face at 40° with lines at 65° TCA.	3					
10		170.69	178.31	GND: Grey GND; Limonite+/- carbonate/calcite still appears on fracture faces; Locally core is limonite throughout from 172.51 - 172.81m where core is highly fractured; Limonite is becoming much less prominent; Slickensides: @172.41m face at 20° with lines at 45°; @ 173.0m face at 10° with lines at 10°; @ 176.68m face at 30° with lines at 90°; @ 176.66m face at 60° with lines at 90° TCA.	3					
10		178.31	180.22	GND: Sericite altered GND that has been oxidized; Locally core is very highly fractured and crumbly.	4	5		3

DRILL LOG LEGEND P1	DATE: Aug 21-28, 2005	PAGE 9 of 16	
DRILL HOLE # : DG05-302C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		180.22	181.89	GND: Grey GND with sericite and chlorite alteration; Core is competent; Quartz veins are minimal; Slickenlines: @180.8m face 50°, lines 70°.		4	3			
10		181.89	184.40	GND: Intensely clay and sericite alt'd GND; <2mm py/cb veinlets are common throughout; Fine grained disseminated pyrite occurs locally where core is most intensely altered; Sulphide veins (py) contain dark grey clay (oxidized sulphides?); Core appears brecciated (183.9 - 184.4m) quartz veins are broken up and displaced and crumbly with abundant disseminated pyrite in dark grey clay matrix; Blocks of brecciated (?) core have slickenlines with pyrite smearing.		5		4		
10		184.40	189.22	GND: Highly broken-up and fractured grey GND (longest piece is 12cm); Some blocks appear sericitized; Slickenlines: @187.45m Face at 30° with lines at 70° TCA.						
10		189.22	192.02	GND: Intensely clay and sericite altered GND; Similar to previously described from interval 181.89-184.4m		5		5		
10		192.02	202.91	GND: GND has undergone various degrees of sericite alteration due to fracturing as altered GND tends to have sharp contacts with grey clay and disseminated pyrite or sheared pyrite on slip face; Alteration may be gradual at one end, and sharp at the other end of alteration selvage; K-spar/quartz veins are present, and within sericite selvages are k-spar, and euhedral pyrite xtls; K-spar veins contain some carbonate; No limonite; Slickenlines: @193.80m face at 20°, lines at 60°; @ 196.65m face at 10°, lines at 30°; @ 197.9m face at 45°, lines at 85°; @ 199.1m face at 60°, lines at 85°; @ 199.12m face at 30°, lines at 60°; @ 201.67m face at 5°, lines at 25°.		4				
10		202.91	205.74	GND: Pale green GND; K-Spar alteration appears as selvages, veinlets, and euhedral crystals disseminated throughout; Quartz veins tend to be at very shallow angles; Non K-spar altered core (sericite alteration) is softer than K-altered core; Slickenlines: @205.00m face is at 5° with lines at 50° TCA; Possible sericite overprinting giving K-spar alteration greenish hue?; Quartz veins are commonly irregular +/- displaced.		5				5
10		205.74	210.73	GND: Broken core; @ 205.74 - 207.26m = GND has undergone sericite alteration (4cm selvage avg); @ 207.26 - 210.73m = GND has undergone clay alteration, blocks are smaller and consist of quartz veins and quartz selvages; @ 210.41 - 210.73m = Clay is carb-rich (strong HCL reaction).				4		
10		210.73	216.41	GND: The majority of the GND is sericite altered with scattered euhedral K-spar and veinlets of K-spar throughout; Intervals where GND is not altered (up to 30cm) it is finer grained and darker than normal grey GND.		5				3

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		216.41	220.45	GND: GND is highly broken up and sericite altered; GND is broken into 4x6x4 cm pieces with argillic alteration; Locally, pieces appear darker green due to chlorite alteration; Quartz veining is minimal; K-spar veinlets are present; Cavings present at 219.62m.		5	3			
10		220.45	222.50	GND: Darker, finer grained GND; Sericite selvages occur along k-spar +/- quartz +/- cb or fractures; Fractures typically have dark-grey-green (chloritic) clay faces; @ 222.09m is a 0.5cm quartz-k spar vein where k-spar is more pink than typical k-spar; Slickenlines: @222.25m with face at 45° and lines at 45°.		5				2
10		222.50	235.24	GND: Similar to previous interval (220.45 - 222.5m) but GND is typical with only local darker, finer grained GND (up to 25cm); Slickenlines: @ 224.03m with face at 65° and lines at 65°.		5				2
10		235.24	242.62	GND: Quartz-rich Granitoid (silicified); Fine grained and very hard; Carbonate fractures are abundant with sericite alteration selvages; Quartz veins are white with clean and sharp contacts with selvages; Slickenlines: @237.84m face at 25° with lines at 40°; @ 239.15m face at 70° with lines at 80°; @ 241.75m with face at 70° with lines at 75° TCA. Silicification (4).						4
10		242.62	259.08	GND: Back into Grey GND with intervals of sericite alteration commonly speckled with k-spar crystals (subhedral); K-spar veins and veinlets common within sericite alteration; Contact with quartz-rich GND is sharp at 50° TCA; @ 247.9m a 10cm zone of intense alteration appears brecciated (dark and light clay veinlets with minor disseminated pyrite); Slickenlines: @ 243.0 face at 10° with lines at 30° TCA; @ 254.31m face at 30° with lines at 85°; @ 254.1m a 1cm quartz vein is displaced twice by 2 dextral slips, the slip plane is on 0.8cm k-spar vein (possibly with carbonate), the slip planes are at 40° and 15°; Slickenlines: @ 255.95m face at 10°, lines at 40°. From 257.90 to 259.08m core is highly clay altered (crumbly) and quartz veins are crumbling.		5				2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		259.08	266.90	GND: Back into q-rich granodiorite (silicified) as previously described; Core has less sericite alteration; Contact with grey GND is crumbled; Abundant carbonate fractures/veinlets; K-spar is no longer visible; core is moderately broken up (8cm avg) by steep (60-90°) fractures; Quartz veins are white and clean and commonly fractured adjacent to edges; Quartz veins appear to be post alteration; @ 260.7m coarse grained aspy vein (0.8cm) has crumbled away from 80° face; @ 265.28-265.89m core appears brecciated (quartz vein is broken up and crumbly with fine grained euhedral disseminated veinlets).		5				
10		266.90	272.80	GND: GND is intensely sericite and argillic altered; Core is a pale green colour and very soft; Possibly k-spar alteration was overprinted by sericite alteration as core is beige-green adjacent to veins but still soft; Quartz veins are commonly broken up and crumbly; No observed carbonate/calcite in quartz vein fractures or in GND; @ 268.22m, 16cm quartz vein with grey veinlets throughout contains up to 2.5x2.5x2mm euhedral disseminated pyrite (broken up at either end, no orientation); Slickenlines: @ 267.2m face at 40° with lines at 45° TCA.		5		5		
10		272.80	275.84	GND: GND has been completely sericite altered; Core is harder, darker and more competent than previous interval; Fractures and fracture faces filled with carbonate (less reactive than previously observed).		5		1		
10		275.84	281.12	GND; GND is completely sericite altered with moderate to intense clay alteration; Slickenlines: @ 279.68m face at 30° with lines at 90°.		5		3		
10		281.12	282.23	GND: GND with sericite alteration due to fracturing (carbonate filled fractures)		4				
10		282.23	283.46	GND: Unaltered (slightly more mafic) GND; Fine grained.						
10		283.46	285.51	GND: Unaltered grey GND; Moderate fracturing.						
10		285.51	288.04	GND: Grey GND that has undergone moderate clay alteration; Locally, intensely altered to clay with quartz eyes; Grey-dark grey (2-4mm) clay veins are common at 45° TCA; Slickenlines: @ 287.5m face at 10° with lines at 80°.				4

	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0 - 11.0	0.00	11.00	Casing						
10	11.00 - 292.61	11.00	18.29	GND: Weathered GND, 70% reduced to coarse sand and gravel texture; Competent core not longer than 8cm; Colour of clay is variable: at 12.0m it is orange-med brown, at 16.4m it is light yellowish orange and at 16.4m it is whitish yellow. Competent GND is oxidized to med brown but original texture still present; Hematite makes up 1-10% of veins in this section, 100% oxidized.	4			3	2	
10		18.29	24.08	GND: Sheeted quartz veins at 60° TCA crosscut by veinlets of limonite at 140° TCA; These veinlets have wide selvages - up to 4cm oxidized zones and appear to be later than the quartz veins. From 23.1 to 23.3m, rock is crumbly orangey brown oxidized clay-fine sand; Rest of the section is competent, solid GND with oxidation/alteration surrounding veins and veinlets; From 23.8 to 24.08m, competent core is completely oxidized and GND texture is erased to a uniform orangey brown.	3			1	1	
10		24.08	36.58	GND: Highly altered and oxidized GND; 70% clay to sand texture, crumbly, no structure seen, light to medium brown; Even within competent core, original GND is 70% erased to an aphanitic oxidized and sericitized state; Evidence of brittle-ductile shear movement (sinistral) of quartz veins and slickensides in oxidation products on fracture faces (py, hem).	4	3	2	3	3	
10		36.58	45.72	GND: Highly oxidized and moderately altered GND. All competent. From 43.6 - 45.7m rock is medium brown and aphanitic; GND Texture totally erased and sericitic alteration visible beneath.	3	2	1	1	2	
10		45.72	48.50	GND: Moderate alteration and oxidation zone; Competent core with GND texture (med grained).	3	1			1	
10		48.50	51.82	GND: Oxidized and carbonitic GND; Very broken up to sandy texture over 10%; Limonite (including calcite) fill fractures, brecciating rock into <10cm pieces; At least 2 generations of quartz veining: (1) 0.5cm at 40° contains >10% hematite, often weathered out, always rusty brown stained; and (2) >1cm, higher angle, usually broken up/brecciated by late limonite veining.	4	1		2	3	
10		51.82	64.01	GND: Little carbonate, less oxidation in competent core; GND texture preserved except in narrow selvages around frequent veins; Minor foliation development at 60° TCA and slickensides in sericite/carbonate on ~0° TCA fracture faces.	3				1

BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		64.01	74.68	GND: Highly oxidized section; Limonite throughout GND matrix; Five zones infused with carb-rich limonite, reduced to clay gouge material, no wider than 20cm each; Qtz/carb and qtz veins have silicified selvages up to 2cm wide, moderately oxidized to rusty brown.	4	1		2	3	
10		74.68	86.87	GND: No clay gouge zones; Competent, moderately to highly oxidized. One pure clay seam at 84.70m (8cm wide), carb rich, effervesces; Few 'clear' unoxidized GND zones up to 20cm long, within competent core; Within frequent quartz veins, very little mineralization, but more oxidized hematite (up to 10%), and often weathered out, leaving vugs along the center of the veins.	3	1		1	1	
10		86.87	97.54	GND: Unoxidized GND slightly more prevalent in zones up to 40cm wide; No clay seams but core is still very broken up - to gravel in 10cm intervals (3 zones, 10cm wide); Quartz and quartz-carb veins still frequent; Quartz veins have solid boundaries while carb-rich veins are more gradational. Sulphides (oxidized py, scor'd aspy) are rare.	2	1			2	
10		97.54	104.56	GND: Altered to aphanitic, more sericite present; Selvages difficult to distinguish; Core is ~40% solid, partially silicified; Still very broken up on limonite-covered planes at ~40° and 140° TCA; Veinlets of limonite have wide, visible brown selvages up to 12cm wide.	3	2			3	
10		104.56	108.20	GND: Same aphanitic GND but more highly oxidized and broken up into <5cm pieces over 90% of the section.	4	1		1	3

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41										
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93										

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		108.20	112.78	GND: Same aphanitic GND, silicified and almost completely oxidized, although 100% of section is competent; As for veins, only a few small ones are visible; Oxidized hematite (and pyrite?) seen disseminated through section, so perhaps qtz veins contributed to silicification and were incorporated into GND.	3	2			1	
10		112.78	118.87	GND: Same aphanitic GND; More altered and sheared and broken up, especially from 113.65m to 114.6m, where shear and sericite is intense; Also at 118.55m a 15cm zone of fault breccia; Jointing at 25° and 100° TCA.	3	3		1	3	
10		118.87	132.59	GND: Unaltered GND (50%) with quartz veins with oxidized and/or silicified selvages (50%); Decreased limonite; 80% competent core (pieces >10cm); Common sheeted veins; Sulphides within (py, po, aspy) are oxidized up to 100% at least 50%; Molybdenite appears as soft, bluish-silver, rounded pieces within or beside quartz veins; Quartz veins have clear boundaries and obvious selvages, mostly silicified within sericite alteration as well, often limonitic.	2	1			1	
10		132.59	139.78	GND with numerous 1mm-1cm quartz veins; Selvages up to 10cm, are silicified and sericitic usually with rusty oxidation and carbonate.	2	2		1	2	
10		139.78	140.83	All oxidized and sericitized; GND texture 90% reduced to aphanitic. One quartz vein with strongly-defined selvage.	4	3			2	
		140.83	144.78	GND: Big, frequent quartz veins with oxidized selvages; Limonite still on fracture planes and throughout GND matrix; Slickensides in sericite on low angle fracture faces	3	1			3	
10		144.78	146.86	GND: Completely oxidized and broken up to coarse gravel/sand-size fragments; Colour is pale to medium brown; No competent core but gravel chunks appear as highly sericitized GND or quartz eyes.	5	3		3	4	
10		146.86	159.43	GND: Competent core with a lot less limonite, only thinly distributed along veinlets/fracture faces. Milky white to pale grey quartz veins with ox'd, ser'd, silicified selvages. Minor sulphides are mostly oxidized. Beginning around 150m (+/- 20cm), alteration is more pervasive and GND texture reduced to aphanitic with only qtz eyes preserved (20% rounded, 2mm grains), Other 80% is oxidized/limonite-stained and/or sericitized to pale green; From 152.0 - 156.0m rock is 70% competent and has ~5-10 cm bands of different alteration types; These bands are oriented at ~20°-50° TCA; Sericite, clay rich and oxidized competent GND make up this section. Colourful; First view unaltered GND at 156.0m; Still has branching veinlets of limonite throughout, crumbly brecciated gouge at 156.85m for 15cm; 2 more before 159.43m.	4	3	1	2	4	
10		159.43	161.79	GND: Zone of extreme alteration but minimal oxidation; Remnant bt texture and qtz preserved from original GND, but 90% texture is massive and speckled with oxidized carbonate, up to 3mm in diameter; Veins are relicts, bent, with little to no selvage.	2	5	2	1	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		161.79	165.27	GND: Same sericitized GND except highly oxidized as well; Limonite throughout, so rock is broken up into gravel in 2 zones: 30cm at 163.9m and 15cm at 164.8m; At 162.75m - 163.0m, banding of greenish dark grey clay with white carbonate in between, at 80° TCA; Overall color is strong orangey brown masking bluish green micaceous rock.	5	5	1	2	4	
10		165.27	170.39	GND: GND texture visible over 75% of section, not oxidized and minor alteration; Rock is weakened by influx of carbonate and sericite (no veins associated) at 167.5 - 167.64m; Last 50cm is all rearranged and alt'd GND, surrounding relict quartz vein.	2	2	1	1	2	
10		170.39	195.07	GND: Large zone of silicified and sericitized GND; Texture is cryptocrystalline except for ~10% (secondary?) biotite, up to 2mm in diameter; Frequent qtz, carb and qtz/carb veins produce carb-rich selvages which appear as lighter green than the surrounding deep blue-green rock matrix; The whole section is silicified, so is probably a selvage of the sheeted veins itself, but cannot be separated between veins here; Selvages are carb'd, ser'd and sil'd; Super carb-rich zone at 175.26 - 175.50m; Softened and broken into <10cm pieces; From 189.55 - 195.07m is all "selvage", carb-rich and weakened GND, no more silicified deep blue-green.	1	5	2	1	3

DRILL HOLE # : **DG05-303C**	**FeOx** 0 = Unoxidized 5 = Intensely Ox'd	**Ser, Chl, etc** 0 = Unaltered 5 = Intensely Altered	**Carbonate** 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; QVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		195.07	204.22	GND: From 195.07 - 196.6m is a gradation from sericitized and silicified GND to unalt'd GND between veins. After this, veins are similarly frequent and have carb/ser selvages but are separated by less alt'd GND instead of deep blue-green silicified; This "less altered" GND has minor sericite alteration, such that texture is 80% preserved, outside of selvages, but rock is still sericite-rich; Slickensides at 200m.	1	4		1	3	
10		204.22	208.79	GND: Carb-rich GND, weakened and broken up, especially from 205.74-208.5m (middle of section); Pieces ≤10cm long, not full core diameter. In this zone as well are slickensides in fresh pyrite and sericite, on low angle fractures, 20° TCA, slickensides to 80°.	2	4	1	2	4	
10		208.79	217.93	GND: Carb still prevalent but not as much as above; Numerous large quartz veins (up to 7cm) with sulphides both within and concentrated at boundaries of veins; Larger and stronger selvage alteration associated with increased sulphide content in/beside veins; At 220m, a 6cm quartz vein is at 5° TCA, so is seen across ~1m interval; Sulphides are minimal (~2% po and trace ox'd py); Bt alt'n within, 5%.	2	4	1	1	2	
10		217.93	228.60	GND: Unaltered GND with slightly fewer and smaller quartz veins with well-defined selvages; Veins in 2 orientations (0-5° and 50-60°) appear to be coeval, or high angle offset low angle veins, slightly.		2	1		2	
10		228.60	243.84	GND: More weakened by carb veinlets in random orientations, so broken up to crumbly in spots up to 30cm long; Between 241.0 and 242.6m, low angle quartz veins contain a high concentration of carbonate and chlorite (up to 50%).		2	1	2	3	

DRILL LOG LEGEND P2

Selvages
0 = No Alteration
5 = Intense Alt'n

Ox. State
0 = No Oxidized Sulphides
5 = All Sulph Oxidized

Date: August 5 - 10, 2005

LOGGED BY: M. Stone

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar., 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		243.84	259.08	GND: 95% unalt'd GND; Few quartz veins have <5cm selvages; Sericite, chlorite and silicification alteration moderate within; Competent core except where moderate carbonate intrudes on veinlets at random angles TCA: from 246.89m - 247.07m and 242.9 - 243.0m. This section contains two types of quartz veins with the same mineralization (~5% po); Thin (0.5cm) veins at 50-60° TCA with 2-3cm selvages, and 1.5-2cm veins with little or no selvages, generally at 50° TCA; Each section usually contains 1 wide one and 3-4 of the smaller type.		1	1		1	
10		259.08	271.27	GND: Somewhat more alt'd and broken up core; Evidence of movement from 259.5 - 260.0m; Carb, chl and ser rich zone and one qtz vein moved 1cm, sinistrally; Other than these zones of alt'n, rock is unaltered GND with ~2-3 carb-rich qtz veins per metre.	1	2	2		2	
10		271.27	280.42	GND: Moderate carb influx weakens otherwise unalt'd GND; 4-6 quartz veins per metre. Whole section is crumbly and broken up; Carb veinlets at low angles TCA cause breakage.		3	2	1	3	
10		280.42	292.61	Unalt'd, competent GND. 5mm to 2cm qtz veins still frequent: ~5 veins per metre.Three zones of sericitic/chloritic/minor carb alt'n: from 285.40-286.10m, from 286.8-286.9m, and from 287.50-288.04m. Last sample contains 2 types of qtz veins - one 3cm vein contains sulphides, one does not.

ASSAY INTERCEPTS

FROM:	TO:	INT:	Au (g/t)	SAMPLE QUALITY:

COMMENTS: (Ground conditions, fracture zones, water flows, drilling problems)

At 445 ft and 465 ft, 10 foot blocks instead of 5 foot blocks were placed, therefore the hole was 10 feet shorter than originally recorded.

Reduced from HQ to NQ at 398 ft (121.30m) due to bad ground

DRILL LOG LEGEND P1	DATE: Aug 28 - Sept 1, 2005 PAGE	of 12		
DRILL HOLE # : DG05-304C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		83.82	89.92	GND: GND is highly fractured (full diameter of core is rare); Fractured faces are limonitic and react vigorously with HCl; Fracture faces with darker limonite staining only weakly react with HCl; Locally clay alteration is more intense at very shallow angles.	4			2		
10		89.92	92.96	GND: GND slightly less limonitic; GND moderately clay altered throughout with local intense clay alteration from 90.0 - 90.25m; Slight sericite alteration throughout (pale green color); Quartz veins vuggy from previous sulphides; Slickenlines: @92.36m face at 30°, lines at 45°.	2	2		3		
10		92.96	96.01	GND: Fairly competent and unaltered GND; Fracture faces with limonite and commonly with carb/calcite; Limonite selvages common with fractures.	1					
10		96.01	101.04	GND: GND is moderately limonitic; Core is highly broken, with rare full diameter core; Quartz veins are vuggy from previous sulphides.	1					
10		101.04	115.82	GND: Unaltered GND, very competent, grey in color; Limonite staining still present on fracture surfaces; Only very minor limonite selvages along fractures; Quartz veins are predominantly grey with distinct edges.						
10		115.82	127.75	GND: Grey GND which has been moderately oxidized; Core is moderately broken up (10cm avg); Fracture faces are limonitic, commonly with carbonate and calcite; Locally core is highly broken up (117.35 - 118.45m); Core reduces to NQ at 121.56m	3

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10	0-1.52	0.00	1.52	Casing						
81	1.52 - 9.14	1.52	9.14	HFLS: Deep purple and aphanitic. Banded with light brown-grey layers on a 1-2cm scale throughout section; minor rusty orange-brown on irregular fracture faces, also with late carbonate, sometimes incorporated as layers within this banded rock; Pale grey layers are silicified hard (cordierite), deep purple layers are scratchable with scriber; Foliations: @2.0m = 80-90°, @4.0m = 40°; @ 6.0m = 35°; @ 8.0m = 30°.	2	0	0	0	1	
80	9.14-23.78	9.14	23.78	MSED: Zone of brecciated MSED; No complete diameter core until 22.40 - 22.86m where oxidized MSED has a general foliation of 40°; Recovery btwn 5 and 42% except btwn 10.67-12.19m and from 22.86 - 23.78m where it improves, but is still crumbly, with oxidized, convoluted metabeds; Argillaceous alteration throughout section, related to sericitic replacement along metabeds; One sample taken from this section where one qtz vein cuts competent, complete core and pebbles are rich in pure quartz. Only trace oxidized pyrite present.	4	3	0	3	2	
81	23.78	23.78	28.56	Competent HFLS; Metabeds folded in places - open, rounded and box folds; Pale grey layers (mentioned from 1.52-9.14m) not present here; Quartz and quart/carb veins cut across foliation but contain no sulphides or gold.	1	1		1	1	
80	28.56-38.10	28.56	32.00	MSED: Sheared/brecciated MSED; Sample taken from 30.48-32.0m because oxidation and shear have made this section of variable composition ("mixed bag" of MSED's).	4	2		4	3	
80		32.00	38.10	MSED: Strong banding; Quartz veins incorporation into foliation.						
81	38.10-99.27	38.10	44.20	MSED: HFLS with 'globular' veins of pure quartz, incorporated into MSED foliation. Few crosscut (noted); Very deep purple to purplish grey here.	1	0	0	0	1	
81		44.20	47.92	MSED: Oxidized (light brown) zone, stemming into foliation from quartz veins; These veins have calcite int the centre very few sulphides; Still HFLS; From 44.15 - 46.8m is all oxidized, weakened MSED.	3	1		1	2	
81		47.92	57.41	MSED: HFLS with pure quartz incoroporated into foliation; This quartz may have once been veins; Few 'new' veins (crosscutting) have trace oxidized pyrite and occassionally aspy.					1	
81		57.41	60.48	MSED: Competent HFLS with incorporated quartz into foliation and few wide crosscutting quartz veins with noticeable selvages; Micaceous replacement of semthing (sulphides?) preset within some veins.		1	1		1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
81		60.48	64.61	MSED: Predominantly (75%) 'bleached', silicified HFLS; Color light brown to grey; Still aphanitic and finely layered.	1	2			1	
81		64.61	76.20	MSED: Deep purple HFLS to smokey beige color with large quartz veins - up to 80cm; Within these veins are patches of micaceous materials appearing to be retrograded from HFLS patches. Some have metallic sheen. Evidence of shear from 75.5 - 76.2 m, quartz veins moved sinistrally.		1	1		1	
81		76.20	80.77	MSED: Slightly more carbonate veinlets, so rock is broken up, rare full diameter, pieces <10cm.		1		1	2	
81		80.77	84.69	MSED: More oxidized, whole section limonite infused along metased layers; Crumbly and medium brown.	4	2	0	2	2	
81		84.69	88.39	MSED: HFLS competent except 30 cm with extra carbonate.		1		1	1	
81		88.39	97.54	MSED: Oxidized and sheared HFLS from 88.39 - 92.96m; Pale grey-light brown HFLS to end of section; From 96.01 - 97.54m shear and clay alteration.	2	2		2	1	
81		97.54	99.27	MSED: Sericitized pale light brown/grey HFLS; Very broken up.	1	3		1		
10	99.27 - 102.11	99.27	102.11	GND: Highly clay altered; Color is greenish beige to white; GND texture barely distinguishable as quartz-eyes, no foliation.		3	2	3	1	
81	102.11 - 106.40	102.11	106.40	MSED: HFLS metased again; Last meter of section shows GND texture overprinted by HFLS foliation; Quartz veins still squished into foliation with beige-grey HFLS; Quartz-carb veins (noted) are similar to those in the GND dyke above.	2	2		1	2	
10	106.40 - 259.08	106.40	120.30	GND: Very crumbly and weak, carb-infused.		1	1	2	4	
10		120.30	132.59	GND: Somewhat more competent GND: Regular fracturing at 60° and 135° TCA; Alternating between very crumbly and broken and competent over 1-2m intervals.		3	2	2	3

10		132.59	146.30	GND: Somewhat broken up by crumbly carbonate infusion.		2	1	1	3	
10		146.30	153.92	GND: @147.25 - 147.83m, two 2cm quartz veins contain massive po; One vein contains more po than quartz; These are the only sulphide bearing zones in the 1.53m sample; Po-bearing quartz veins 1cm or less, continue through unaltered, competent GND.		1			1	
10		153.92	163.07	GND: Moderately infused with carbonate GND.	0	1	0	1	2	
10		163.07	167.64	GND continues but with much larger veins (up to 20cm), plus small ones ~1cm; Pyrrhotite is euhedral, in grains 2-3mm in diameter, and massive, in aggregates up to 2cm, often the full width of the vein. Magnetic.						
10		167.64	188.98	GND: Still unaltered GND; Quartz veins sheeted, smaller and with less mineralization of sulphides (4% po at most); Sulphides decrease to a minimum of 0-2% between 181 and 188m; Last interval has 2 veins with aspy, disseminated tiny grains (≤ 1mm) through vein and selvage. Half altered to scorodite.		1			1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		188.98	205.21	GND: @ 190.5, 8cm of pure quartz (vein) is presenrved, but pebbles and lack of upper contact indicate some loss of recovery; From 190.9 to 193.3m is fault material; 40cm of brecciated quartz and GND within brown gouge material, followed by moderately re-arranged quartz veins (no selvage as all moved) black clay seams (veinlets) and slight brecciation all infused with carbonate. Two large quartz veins (18cm and 24cm) in the section, thickness unknown, assumed contacts @~50° TCA; Outside of this zone, the section is unaltered GND with sulphide-rich veins, occassional trace VG; Except from 201.07 - 201.78m, evidence of shear and limonite infusion, where rock is moderately broken up with limonite on faces.	1	2	1	1	2	
10		205.21	217.93	GND: Mostly (60%) moderately altered GND; Zones of carbonate (208.5 - 208.7m and 208.0 - 208.3m); Zone of limonite (209.5 - 210.8m); Zone of sericite (211.0 - 213.0m); Rest of unaltered GND with few quartz veins, not much mineralization.	2	2	1	0	2	
10		217.93	226.62	GND: Unaltered GND with quartz veins; Good mineralization but a lot of alteration within veins, po to bt and other minerals to chlorite; These are positioned within veins where sulphides are normally found.		1			1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		226.62	244.14	GND: Moderately sheared GND: Most quartz veins are only partially present (some are moved/sheared) usually into ~30° TCA angle; Infusion of clay minerals and carbonate weaken rock; Between 237.74 - 239.27m, three quartz veins appear; 2 dark grey quartz veins at 5° TCA with carbonitic selvages (competent), as well as one milky quartz vein within the usual quartz/sericite selvage; @ 241.35m a 4cm concentration of fresh mafic minerals appears, generally at 40° TCA, includes bt, cpx, hb, ser; Last sample, 243.28 - 244.14m, is 75% rearranged, sheared; Quartz eyes within grey clay, trending with fine laminations at 70° TCA; Matrix of GND infused with sericite and carbonate; Clear boundary with next section, at 130° TCA.	1	3	1	2	3	
10		244.14	259.08	GND: Highly altered GND; One large quartz vein with 3 other large quartz veins in one 1m sample (251.46 - 252.00m) contains oxidized and unoxidized pyrite; Alteration pervasive across entire section, with yellowish green color, predominantly calcite and sericite; First three meters are black silicified GND with 2-10cm 'selvages' around microfractures - no vein, only selvage. Pale beige-green in color; All competent core except directly adjacent to largest quartz vein, where carbonitic clay infuses sericite-rich selvage to form gouge-clay for 10cm on either boundary.	1	4	1	1	3

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0.00 - 10.06	0.00	10.06	Casing - No recovery						
10	10.06 - 271.27	10.06	19.81	GND: Unaltered portions of core is typical grey GND; Oxidation is pervasive throughout interval; Where previous alteration selvages occur, oxidation/limonite is much more intensive; Fractures/fracture faces contain calcite/carb and is also very limonitic; Siderite is common within fractures; Core is moderately broken up/fractured - 9cm average length with low angle fracturing (15-45°); Quartz veins contain vugs stained with limonite; Clay alteration occurs locally at 14 - 14.2m with dark rusty red-brown foliation at 45°; Unaltered GND from 17.9 - 18.25m (gradual contact).	4					
10		19.81	28.96	GND: GND is very clay altered and limonitic; full diameter core is rare, most core is extremely crumbly; Carbonate is present throughout core but not abundant; It's difficult to identify fracturing; No recovery from 21.34 - 22.86m.	4			5		
10		28.96	73.15	GND: GND is similar as previously described from interval 10.0 - 19.81m; @ 40.25m, a 0.4cm quartz vein contains blebs of a black massive, soft mineral with a black, slightly shiny, streak - possibly chalcocite?; It is common to see fresh fine grained speckled biotite on calcite fracture faces; Unaltered GND from 50.68 - 50.98m and 51.38 - 51.82m with fresh quartz veins (2% po); Intervals 59.44 - 60.96m (B365357) & 60.96 - 62.48m (B365358) are heavily fractured; Full diameter core is very rare; Limonite, calcite and speckled biotite on most faces.	3

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		73.15	88.39	GND: GND similar to previous, except GND is more heavily fractured; Broken blocks are angular with an average size of 5x3x3cm; Random blocks of full diameter core up to 15cm; Slickenlines: @81.27m face at 40° with lines at 40°; @ 85.30m 55°/65° TCA.	3					
10		88.39	92.96	GND: GND is relatively unaltered, minor limonite occurs locally throughout core in intervals up to 25cm; Limonite is also present where local quartz flooding occurs (silicified core); Limonitic interval contacts are gradual (rarely sharp): GND is competent.	1					
10		92.96	108.82	GND: GND is same as previously described in interval 10.0 - 19.81m; From 100.45 - 100.55m core is extremely carb altered and clay alt'd and very limonitic; Slickenlines: @ 94.38m = 2°/60° TCA; @ 106.6m broken, angular clocks of MSED occur. Thickness of MSED cannot be determined (<25cm); Various blocks show a sharp contact with GND at 15°-20°. MSED consists of black and light brown bedding/foliation.	3					
10		108.82	118.87	GND: GND similar to previous from intervals 88.39 - 92.96m	2					
10		118.87	125.21	GND: GND has been intensely sericite altered and oxidized; Locally core has been very clay altered as well; Where sericite and clay alteration is most intense, carbonate alteration is also strong; Core appears brecciated from 119.38 - 119.55m with abundant angular white quartz clasts (1x.5x.5cm avg); Brecciation has sharp up hole contact with white quartz vein (3.5cm) and shear zone at 30° TCA; Breccia matrix is very limonitic with abundant smaller quartz clasts (2x2x3mm avg), no carb alteration is observed; Shear zone contains major elongate v f gr massive pyrite along foliation at 20° and 60° TCA; Matrix consists of small quartz eyes (2x2x2mm) and sericitized GND; Throughout SHEAR ZONE are large vugs (up to 3x3x1.5cm) stained with limonite, perhaps due to brecciation or oxidation of sulphides.	5	5

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		125.21	131.06	GND: Unaltered GND with slight oxidation, same as described from interval 88.39 - 92.96m; Slickenlines: @130.9m = face at 30° and lines at 60°.	1					
10		131.06	143.26	GND: GND is moderately clay altered through out most of the interval; Oxidation is pervasive throughout as well; Core appears much lighter in colour; Core is heavily fractured from 131.06 - 132.15m and 140.21 - 141.3m; Clay alteration tends to be more intense where core is heavily fractured; Quartz veining still commonly vuggy and stained with limonite; @ 140.4m minor shear zone (~5cm) with foliation at 20°. Shear zone consists of sericite altered matrix with small quartz eyes (2x2x2mm) and massive, black, clayey pyrite.	4			3		
10		143.26	156.97	GND: Unaltered God same as previously described from 88.39 - 92.96m; Oxidation only along fractures/fracture faces except locally at 148.86 - 149.35m where GND is moderately oxidized throughout; From 153.01 - 153.76m GND is moderately clay altered (3) and paler; Abundant calcitic fractures throughout; Evidence of quartz veining but veins too broken/irregular to measure; No foliation. Slickenlines: @149.33m face at 30° with lines at 45°; @ 150.8m 30°/45°; @ 151.65m 60°/75° TCA.	1					
10		156.97	163.07	GND: Unaltered grey GND; Rare limonite on fractures; Fracture faces/fills still contain calcite but now seeing sericite selvages up to 8cm (non-oxidized); Fracture faces also have darker green mineral (chl?) with calcite; Quartz veining becoming more abundant; @ 157.08m, 0.8cm quartz vein displays 2.5cm sinistral displacement by calcite filled fractures; Slickenlines: @158.48m, face at 20° with lines at 30° TCA; @ 159.05m, face at 30° with lines at 60°; @ 159.45m, face at 2° with lines at 45° TCA.

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		163.07	170.69	GND: Grey GND is softer and slightly lighter in colour due to clay alteration; For the most part, core is competent except locally where it is moderately oxidized and heavily fractured with carb/calcite filled fracts from 164.59 - 165.65m and 166.52 167.64m; Shear zones tend to be more intensely clay altered and have dull grey clay zones along the foliation; Quartz eyes within shear zones are brittle and slightly softer; Shear zones: @163.37 - 163.42m at 50°; @ 164.08 - 164.17m at 70°; @ 167.8 - 167.90m at 35°; Dull grey clay stringers (whitish streaks) commonly contain v f gr py disseminated throughout; Slickenlines: @166.15m face at 40° with lines at 45°; @ 167.0m face at 10° with lines at 60°; @ 168.0m face at 30° with lines at 45° TCA.				3		
10		170.69	178.50	GND; GND is only slightly clay altered, slightly lighter grey than grey GND; Calcite fill fractures throughout; Limonitic fractures approx 60%, decreasing down hole; Intense clay alteration occurs locally from 175.2 - 175.36m and 178.25 - 178.38m; <1mm veinlets consisting of chlorite and carbonate are common with po, and at various angles; Slickenlines: @ 174.45m face at 5° with lines at 1°; @ 175.56m face at 30° with lines at 40° TCA.				1		
10		178.50	190.50	GND: Unaltered GND with small intervals of sericite alteration; Same as previously described (156.97 - 163.07m), though no limonite on fractures; Smeared pyrite common along slip faces; Slickenlines: @ 179.7m, face at 15° with lines at 15°; @ @ 182.38m face at 60° with lines at 2°; @ 182.4m face at 30° with lines at 40°; @ 186.05m face at 30° with lines at 45°; @ 186.68m face at 45° with lines at 5° TCA.						
10		190.50	198.12	GND: GND has undergone chlorite and sericite alteration; Sericite alteration is more abundant throughout intervals; Sections of only slight sericite alteration occur from 194.36 - 195.0m and 195.0 - 195.42m; Chlorite alteration is most abundant up hole; Where only sericite alteration occurs, euh-subhed grains of k-spar (up to 4x2.5mm) are speckaled throughout as well as <1mm veinlets of k-spar; From 190.5 - 191.07m (B365472), 2 quartz veins occur...one thick (>10cm) white with down ctc at 45° TCA, containing fine to med gr euhedral pyrite; Other vein 1.8cm thick, containing abundant v f gr massive py as stringers and blebs throughout; Minor SHEAR ZONE/FAULT GOUGE at 193.29m at 70° TCA (1.5cm); @ 197.95m, 2 quartz veins at 80° are offset 1cm by a dextral motion by 5° fracture containing v f gr py; Slickenlines: @ 194.3m, face at 20° with lines at 50° TCA; @ 196.9m, face at 70° with lines at 2°; @ 197.05m face at 80° with lines at 90° TCA.		5	3			3

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		198.12	203.60	GND: GND is slightly sericite altered throughout; Clay alteration gradually increases downhole (1 to 2); A 4cm white quartz vein (@ 30° TCA) is displaced at 201.28m (40°), 201.45m (40°) and 201.62m (70°); @ 201.62m dextral displacement is measured to be 6cm at 70° with 0.8cm fault gg; @ 199.6m, a 3cm white quartz vein with large massive pyrrhotite blebs (4x2cm); Slickenlines: @199.54m the fracture face is at 60° with lines at 90° TCA: @ 200.00m the face is at 1° with lines at 1°.		2		1		
10		203.60	211.84	GND: Core is highly clay altered, moderately sericite altered, and locally clay altered (with more intense clay alteration); @ 203.6 - 205.74m = SHEAR ZONE with low angle foliations (10° - 30° and 60°), containing angular quartz veins clasts (white) up to 3x3cm. Also abundant small quartz eyes throughout, soft sericitized, clay altered matrix with carbonate; Quartz vein in shear zone displaced and broken up; Slickenlines: @ 205.5m, face at 5° with lines at 30°; @ 210.85m face at 30° with lines at 85°.		3		5	3	
10		211.84	224.03	GND: GND is intensely sericite altered as previous interval but clay alteration is less extensive (intervals up to 40cm); Where clay alteration is most intensive, carb alteration occurs (small gm-gy clay); Massive py from 220.61 - 220.72m; From 221.38 - 221.82m core appears brecciated with white quartz vein clasts and irregular/displaced quartz veins. Fine to med gr euhedral py is disseminated throughout; K-spar grains (eu-subhed) and vnlts throughout tend to be softer and slightly carb alt'd; K-spar veinlets and euhedral, speckled grains become more abundant down hole; Slickenlines: @212.39m - face at 45° with lines at 5°; @ 212.8m face at 45° with lines at 85°.		5		3		
10		224.03	258.52	GND: Slight ser alteration; Locally, intense sericite alteration with euh-subhed k-spar grains and vnlts (228.6 - 228.86m, 229.3 - 229.45m, 232.7 - 233.0m, 234.75 - 235.35m, 239.27 - 239.94m, 244.37 - 245.71m - 247.47 - 247.91m and 250.18 - 259.41m); Fracture faces are chl/ser altered with carb/calcite; From 235.15 - 235.35m sericite core appears brecciated; Core is competent with abnt k-spar vnlts (mm to 1.7cm); Fine - C gr py blebs also abndt (~15%); Large massive spy bleb (2.5x1cm) present (~5% of breccia zone); Breccia zone has sharp contact with 70% f gr py and 20% k-spar; From 240.4 - 240.94m MGD is present with sharp contact to unaltered grey GND at 5° TCA; Slickenlines: @233.2 = 40°/80°; @ 233.3m = 70°/5°; @ 235.17m = 80°/5°; @ 240.25m = 20°/75°; @ 245.6m = 80°/5°; @ 246.49m = 45°/45°; @ 248.2m = 30°/90°; @ 249.3m = 40°/75°; @ 249.42m = 5°/60°; @ 249.42m = 85°/85° TCA.

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)							
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other		
-1	0.00 - 6.71	0.00	6.71	Casing								
10	6.71 - 291.08	6.71	38.10	GND: Pervasively moderately oxidized GND, such that overall colour is medium greyish brown; GND texture medium grained; Throughout section, there are ≥1cm quartz veins and grouped 0.5cm quartz veins with minimal mineralization, all oxidized or altered to biotite; Selvages are carb-quartz altered and small; @27m one 10cm zone of pervasive alteration includes sericite, silicification, muscovite and rusty oxidized hematite, 0.4cm in width, 3cm long.	3	0	0	1	2			
10		38.10	61.18	GND: GND even more oxidized, broken up to crumbly; Recovery moderate; Veins continue but are less visible due to amount of breakage; Veins contain greater concentration (up to 5%) of oxidized hematite and ~2% of massive metallic silver to tarnished black sulphide (chromite?), soft; @ 50.5m a 40cm zone of silicification and carbonitization (totally oxidized) surrounds 2 quartz veins and one carbonate veinlet. This same alteration forms wide selvages (~10cm, avg) around veinlets of carbonate and oxidized pyrite (? black, opaque), often breaking at veinlet; Larger quartz veins often have ~2% open space where it appears minerals have weathered away or 'popped' out during transport; @ 54.2m a zone of carbonate-rich oxidized clay/fault gouge appears, texture fine sand (<1mm).	4	0	0	1	3			
10		61.18	86.87	GND: Very crumbly section; Oxidation/limonite continues. 10% of section is in pieces <1cm, down to fine sand; Maximum length of competent core is 14cm, rarely full diameter; Unknown metallic silver/tarnished black sulphide seen here associated with sphalerite; could be galena but not supershiny metallic as mentioned above	4	1		2	3

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		86.87	110.50	GND: Slightly more competent GND but oxidation still pervasive; Carb-rich selvages reduced to fine sand texture over <5% of section; First 2m of section show moderate alteration in selvages and are quite competent (90%); Strong slickensides in carbonate/limonite on fracture faces at 40° TCA; @ 92.96m, a 40cm zone of sericite alteration occurs, with sericite. Carb influx and a loss of GND texture. A 0.2cm veinlet of oxidized iron product (hematite) may account for some of this alteration - a channel for hydrothermal waters. No slickensides but ductile shear is a possiblity here; From 96.01 - 97.54m fractures at 0° TCA break up rock which appears previously silicified and coarse-grained (up to 1cm grains of quartz and masses of biotite). @100.58m, clear large quartz veins with >5% sphalerite begin. Core is more competent here as well, to 107.25m; @ 103.63m, disseminated aspy seen covering ~5% of fracture face, no associated vein seen.	3	1	0	1	2	
10		110.50	117.35	GND: Oxidation much less prevalent but mineralogically and texturally altered with sericite, carbonate and chlorite; Evidence of shear and faulting: @ 111.45m, a fracture plane at 15° TCA has 2 sets of slickensides at 90° to one another (conjugate), expressed in bt, ser, chl, carb, hem (ox'd); On one side of this fracture, quartz veins appear while on the other side are none (plane of motion); Mineralization concentrated at margins of quartz veins, sometimes appearing as separate sulphide veins (at slightly different angles, possibly a later generation of the quartz veins); One set of slickensides @ 112.70m on fracture face at 30° TCA; From 115.82 - 117.2m influx of carbonate weakens rock along irregular fractures.	1	1	1	0	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		117.35	128.02	GND: Unaltered GND with mineralized, frequent quartz veins; Sphalerite continues, as well as massive po with a relatively large amount of cpy. Aspy appears irregularly (locally up to 10%, and association with quartz vein - may be later); Large vein @ 119.90m contains well-formed, shiny large biotite within vein.	1	1	1	0	1	
10		128.02	134.11	GND: Increase in carbonate with limonite along 30° and 130° fract, plus at irregular angles; Weakens and breaks rocks into <1cm pieces in 3 zones; Longest competent core is 15cm; 75% unaltered GND - alteration occurs in small selvages surrounding quartz veins, carbonate veinlets and the last sample of the interval is gradation into sericite-rich zone.	2	2	0	1	2	
10		134.11	138.27	GND: Zone of extreme alteration: sericitized, predominantly, plus moderate carbonitization; Only quartz eyes left of GND texture and overall colour is dark bluish green; Limonite on most fracture faces with some infiltration (selvages up to 1cm) into surrounding rock; 'Veins' noted are not solid or straight - only chunks of quartz in a line: chunks are rounded and have sulphides (partially oxidized py) within interstices of quartz.	2	5	2	0	2	
10		138.27	142.71	GND: Still highly altered, but with more carbonate, in anhedral to subhedral laths up to 3cm long and 0.5cm wide, within lighter blue-green matrix than previous section.	1	5	1	1	3	
10		142.71	147.83	GND: Approx 50% unaltered, unoxidized GND; Wide (10cm) oxidation selvages around cracks/veinlets of limonite; Quartz veins and sulphide veins have selvages as well, and irregular veinlets of limonite continue through section; Massive pyrite associated with >2cm quartz veins is linearly distributed through vein as well as 10cm of vein, in same orientation.	2	2	0	0	2	
10		147.83	153.16	GND: Wide selvages around qtz and sulphide veins dominate section; Med grained unaltered GND.	1	3	0	0	2

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		153.16	161.54	GND: Moderately to highly altered GND, surrounding numerous quartz and sulphide veins; Slickensides (weak to moderate) are seen throughout section, expressed in sericite + carbonate. Also motion along fractures-quartz veins truncated, and irregular in width and orientation; Because alteration is so pervasive in some areas (on 1-2m scale), selvage widths are difficult to distinguish, especially where veins are numerous; Pyrite in veins is predominantly fresh (not oxidized), but when associated with carbonate it is virtually all oxidized and clay rich; Regular fracturing @ 30 - 60° (variable across section, ~8 per m, straight).	1	4	1	1	3	
10		161.54	182.04	GND: Poor recovery. Rock is soft (sericite and carbonate altered) and is very broken up from 161.54 - 168.8m. Followed by very hard, silicified GND with little to no carbonate alteration, from 169.0 - 170.35m; Sericite still affecting this section, appears previous to silicification; Rock grades between two extremes (varying amounts of late carbonate) for whole section; Pyrrhotite appears 'fused' (black magnetic mass with the occasional fresh po within).	0	3	0	1	1	
10		182.04	183.44	GND: Weak, quartz-rich section of GND; Weakened by intense sericitization and carbonatization; Low specific gravity; Colour is white.		4		2	4	
10		183.44	213.60	GND: Moderately carb-altered God with sericitized selvages around medium to large (2-3cm) quartz veins (~2 per m) with mineralization; @ 192.5m, a 5cm zone with sharp boundaries at 15° TCA, appears to be sheared into position. These clues continue to end of section.	0	3	1	1	3

DRILL LOG LEGEND P1	DATE: September 4 - 8, 2005 PAGE 9 of 14		
DRILL HOLE # : **DG05-307C**	**FeOx** 0 = Unoxidized 5 = Intensely Ox'd	**Ser, Chl, etc** 0 = Unaltered 5 = Intensely Altered	**Carbonate** 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		213.51	217.00	GND: Limonite appears again on fracture faces; GND competent with regular fracturing at 60° TCA.	1	1	0	0	1	
10		217.00	217.93	GND: Highly altered section; GND texture reduced to quartz eyes within sericitized/carbonate altered matrix; 2 to 3 quartz veins still visible with no distinguishable selvages; One quartz vein has ~60% oxidized pyrite, clay rich.	1	4	1	2	2	
10		217.93	225.55	GND with numerous medium-sized quartz veins; Late carbonate alteration moderate; Weak, broken up to crumbly rock.	0	2	0	1	3	
10		225.55	245.36	GND: Weak, crumbly carbonate-rich GND: Other than late carbonate, GND is unaltered except from 230.4 - 230.55m with a wide selvage around carb/oxidized pyrite clay vein-sericitized; Slickensides expressed in sericite and carbonate on fracture face @ 50° TCA; Sericite/carbonate for 10cm @ 241.4m surrounding quartz/carb vein; Increased sulphide content in veins is associated with larger selvages especially (oxidized) pyrite.	0	1	0	1	3	
10		245.36	254.51	GND: Competent core except in a few sericite-altered zones, from 246 - 246.7 (surrounding sulphide-rich quartz veins) and from 247.0 - 247.4m (same) and 247.8 - 248.0m, and 250.5 - 250.6m; These sericite zones are more crumbly than unaltered GND in between; Quartz veins toward the end of the section show decreased mineralization; The last 50cm is gradational to the next section.	0	2	0	0	1	

DRILL LOG LEGEND P2

Selvages
0 = No Alteration
5 = Intense Alt'n

Ox. State
0 = No Oxidized Sulphides
5 = All Sulph Oxidized

Date: September 4 - 8, 2005

LOGGED BY: Melodie Stone

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, cc = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar, 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		254.51	263.65	GND: Pervasively sericitized GND; Crumbly and clay-rich. Also carbonate-rich; Quartz eyes remain; Shear evidence in 'smeared' oxidized pyrite veinlets and quartz veins moved 1-2cm dextrally at 50° TCA; Selvages removed/not visible in altered matrix; Quartz veins only partial within altered matrix, often been sheared away; Carbonate veinlets and sulphide veins at 70-80° TCA.	1	5	0	3	3	
10		263.65	284.29	GND: Carbonate and sericite alteration still strong, but separated by medium to dark grey unaltered GND; Carbonate alteration more effective here, even unaltered GND is infused with it for 1-2m in bottom half of section (late carb); Colour of altered zones is more pale beige (early) than the blue-green of the last section (early = competent, late = crumbly); Section is 80% competent rock; Section is 10% unaltered GND to 277.37 and then 40% unaltered from 277.37 284.29m; Late carbonate effects both altered and unaltered GND throughout section; Alteration is not always attrubuted to veining, often no vein visible whre pervasive sericite/carbonate alteration appears; Slickensides visible on most fracture faces at 45° TCA; 'Bleached' section from 283.0m to 284.1m where color is yellowish white, contacts unaltered GND (upper) at 20° TCA; May be considered selvage around low-angle quartz veins and one high angle sulphide vein. Silicified.	1	4	1	2	4	
10		284.29	286.51	GND: Competent core; Unaltered with quartz veins to 285.5m, where fracture at 0-5° TCA (parallel for 1m) denotes shear zone boundary; Half of core is still unaltered with quartz veins (altered selvages) while half is totally carbonate and sericite infused and texture sheared through with carbonate and oxidized sulphide clays.	0	2	1	1	3	
10		286.51	288.39	GND: Sheared material now makes up entire core, apparent shear direction is @ 50° TCA; 70% of section is soft, clay-rich crumbly, carb-rich, sericitic gravel (quartz eyes) to clay texture. Veins seen in competent bits (pieces no longer than ~12cm). Contact with competent next section is at 55° TCA.	1	4	1	3	4	
10		288.39	291.08	GND: Unaltered GND between selvages surrounding quartz and carbonate veins with minimal mineralization.	0	2	0	0	3

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
1	0-6.10	0.00	6.10	Casing. No recovery.						
80	6.10-27.43	6.10	27.43	MSED are very broken up and frac'd with poor recovery. Frac faces are lim with mnr cb. MSED's interchange between silicified bio and grey qtz fol'd MSED and non-silicified dark bio-rich, soft, white, randomly orientated, euhedral laths. QV's are common but with no fresh mineralization observed (2% ox'd vugs). Interval 7.62-9.14m is one broken up qv (sampled B365548). Silicified core is more abundant. Fresh bio blebs occur locally in bio-rich, soft core. Foliations: 9.44m at 30°, 11.90m at 45°, 13.40m at 60°, 14.50m at 50°, 15.54m at 60°, 18.00m at 60°, 24.20m at 45°.	2					
81	27.43-34.30	27.43	34.30	MSED; HFLS is heavily frac'd and much more lim than previous interval. Core is dark, soft, bio-rich and very fine grained and foliated. Qv's x-cutting fol'n have fingered into the fol'ns. Very fine grained soft white minerals speckled through out. Contact with GND is between 33.53 and 35.05 (crumbled sub-rounded core). From 33.23-33.53m core is extremely clay alt'd (flt gg?) and lim. Foliations: 28.76m at 45°, 29.15m at 30°, 29.47m at 45°, 30.20m at 50°, 31.80m at 45°.	4					
10	34.30-299.31	34.20	49.20	GND is typical as seen in previous holes. GND has been mod ox'd with lim and cc/cb on frac faces. Core is very frac'd and broken up with comp pieces up to 35 cm (5x4x3 cm avg.). Locally core is mod cb alt'd from 39.98-40.17 m). Rare dark grey-black blebs that are fairly hard (~5) with v.f.g. specs (Aspy?) within qv's. Where ox'n is most intense, may have been previously ser alt'd as darker red-brown grains are very soft and non-cb. Slickenlines: 41.80m face 30°, lines 70°.	3					
10		49.20	62.48	GND is extensively clay alt'd through out and lim. Cb alt'n is also mod through out. GND is extensively weathered as, locally, core crumbles into sand (56.30-56.40). No shearing observed. Contact with non-clay alt'd GND is abrupt but crumbled. Qv'ing is minor and commonly displaced by frac's. Slickenlines: 52.12m face 30° lines 5°, at 62.00m face 5° lines 85°.	4			5	3	
10		62.48	112.78	GND is mod ox'd through out interval. Cb/cc frac's/frac filling is abundant through out core. Qv's tend to be heavily frac'd by cb (lim) frac's. Qv's are vuggy with lim staining (weathered sulphides). Silicified GND occurs locally at 62.88-63.38m with sharp contact to GND at 5° and is bery ox'd and vuggy. MGD bleb (74.52-74.60m) with frac'd contact and x-cut by qv's (mm-scale). From 83.92-84.31m core is very clay alt'd and cb-rich and lim with contacts at 45°. From 96.45-96.65m dark bio-rich MSED blocks are subangular. Fol'n occurson blocks (3x3x3 cm avg.) but no full diameter MSED core is present and can't be measured. Qv of unknown thickness occurs (>2cm). Qv is white with no mineralization. Slickenlines: 70.60m face 5° lines 80°, at 76.20m face 40° lines 30°, at 76.70m face 50° lines 80°, at 79.55m face 30° lines 40°, at 95.51m face 45° lines 60°, at 104.40m face 15° lines 60°, at 104.60m face 45° lines 5°, at 111.45m face 30° lines 60°, at 111.60m face 10° lines 80°, at 112.48m face 65° lines 65°.	3

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		125.06	128.02	GND is intensely ox'd mod frac'd (8 cm avg) and, for the most part, comp. Small intervals exist where core gradually fades into slightly ox'd, ser alt'd GND and then back into less ox'd GND (4). Possibly, intensely alt'd core was previously ser alt'd GND(?). Fresh ser alt'd GND occurs locally from 125.70-125.75m with sharp contacts at 60°. Clay alt'n occurs at uphole contact for 20 cm. Down hole contact fades into rel unalt'd GND with abundant lim frac selvages.	5	5				
10		128.02	137.31	GND is, for the most part, mod ox'd. Intervals of nearly unox'd GND are common (up to 30 cm) with sharp frac'd +/- slip contacts. Core is mod frac'd (8 cm avg). Cb/cc is common in/on frac's. At 128.74m within 12 cm qv is deep purple staining (Hem?) with massive py at edge of vn. Slickenlines: 129.15m face 45° lines 85°, at 131.92m face 45° lines 60°, at 138.30m face 15° lines 80°.	3					
10		137.31	153.92	GND appears fresh. Ox'n occurs as salveges along cb and lim frac's. However, GND is highly ox'dlocally with sharp contacts to fresh GND. GND is very slightly ser alt'd through out. At 141.05m a 1.2 cm qz/py vn (at 45° with 20% py) is sheared (multiple fracs and dissplacements) with 1.2 cm dextral dissplacement at 30°. The qv is also stretched into shear zone. Shear zone ~7 cm wide. Slickenlines are present at edge of shear zone: face 60° lines 2°. Within shear zone, ser alt'n is more intense (3). Another clay-rich shear zone at 145.07-145.12m present with fol'n at 70° and with slickenlines in two directions on the same face: 85° and 75°. From 145.12-146.60m core is heavily frac'd (no full diameter core) and highly ox'd. From 146.60-147.39m core is intensly ser alt'd with 4 dark red-brown (ox'd) cb-rich frac salveges at 30°. From 144.78-145.07m core is slightly ser and clay alt'd (lighter colour) with 5.5cm qz-po vn.Slip faces commonly have py smearing. Slickenlines are abundant through out. Slickenlines: 138.00m face 70° lines 70°, at 139.40 face 50° lines 50°, at 140.55 face 5° lines 50°, at 142.00m face 40° lines 45°, at 143.50m face 10° lines 30°, at 145.90m face 60° lines 20°, at 15	2	1				
10		153.92	161.27	GND is ox'd throughout and is heavily fractured (cm-scale blocks). fracs are 1mm, commonly w/ cb/cc.	2

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		211.84	233.76	Grey GND has been very slightly ser alt'd. Core is comp. Frac's / frac faces contain cb/cc and ser. Locally frac'ing is more abundant (ie. 222.50-225.55m). Diss py and smeared py are common on frac faces and slip faces (with Chl). At 211.77m a 0.5 cm qv shows 1 cm sinistral displacement along a 2° cb/ser frac. At 218.11m a 30° cc frac contains 20% Po and 2% Cp. mm-scale stringers of qtz-chl-po are common. Slickenlines: 213.30m face 5° lines 80°, at 218.60m face 5° lines 80°, at 223.40m face 30° lines 50°, at 224.13m face 50° lines 10°, at 228.20m face 20° lines 20°.		1				
10		233.76	239.27	GND is intensely ser alt'd except for minor intervals of mod ser alt'd GND. Mod clay alt'n occurs locally from 234.28-238.41m and contains fine grained, euhedral diss py (5%). QV within interval is softer and slightly irregular. Slickenlines tend to be distinct with smeared py. Diss py occurs through out ser alt'd core ~1% along with a trace of aspy. QV are commonly displaced (up to 1.5 cm) by shallow frac's. Slickenlines: 235.01m face 80° lines 80°, at 235.11m face 20° lines 85°, at 236.25m face 10° lines 60°, at 236.64m face 45° lines 2° at 237.45m face 30° lines 85°.		5				
10		239.27	251.46	Grey GND is very slightly ser +/- chl alt'd. Intense ser alt'd core occurs locally [5] (up to 33cm). Intense ser alt. appears to be associated with fracturing (pre-qv) and qv develop within fractures as ser selvages are of different thickness on either side of qv and fractures are adjacent to qv. MGD occurs from 249.70-250.29 and is f.g. MGD also appears ser alt'd throughout. contact with grey GND is gradual. 1-2mm vnlts with 1-10% chl are common and tent to be po +/- aspy-rich (10-20%). F-mg euhedral and smeared py common on fracture and slip faces. Slickenlines: at 243.25m face 45° lines 75°, at 244.65m face 15° lines 45°, and at 249.12m face 5° lines 30°. At 245.26m a felsic dyke (2.5cm) cuts through GND at 15%. Dyke is qtz rich with 5° f.g. bio x-cut by qv.		1	1			
10		251.46	272.23	Grey GND is slightly clay alt'd and very slightly ser alt'd. Plag grains are abundant and are soft and white. Core is highly fractured (cb/cc filled with ser). Q.V.s tend to be highly fractured (cc) commonly with mm-scale displacement. QV also tend to have 0-10% chl. Blocks of very slightly ser/chl alt'd GND occur with slip faces on contacts. Slickenlines: at 254.10m face 40° lines 75°, at 257.16m face 10° lines 30°, at 257.36m face 60° lines 5°, at 265.15m face 20° lines 60°, at 270.00m face 40° lines 70°, and at 271.01m face 20° lines 45°.		1		2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-8.53			CASING - no recovery						
10	8.53 - 274.62	8.53	15.24	GND. Unalt'd except minor oxidation and selvages around few qtz veins. Recovery is poor.	2	1				
10		15.24	21.34	Fine-grained GND; colour is greyish-beige (dry). Oxidation is pervasive.	4	1				
10		21.34	22.68	GND, all stained orange-brown except 2 small 'blue' sections of un-limonized GND, 4cm and 2cm wide. Even qtz in veins is orangey brown. Crumbly gravel texture toward end of sample.	4			1		
10		22.68	30.00	Very crumbly and broken up. Completely limonite-covered, even in otherwise unalt'd GND. Pieces up to 20cm long, but no full-diameter core. Very little clay (<5%), but very gravely to coarse sand-texture.	5	1			3	
10		30.00	34.27	Competent but weak GND. Moderately limonized and carbonitized. Veins and fractures are highly limonized with ox'd selvages. GND texture is normal - med. grained.	3				2	
10		34.27	38.40	Very crumbly, broken, limonized GND. No complete-diameter core. 60% reduced to sand and <1cm chunks of GND and qtz eyes.	4	1		1	1	
10		38.40	50.05	Competent, slightly limonized, med-grained GND. Veins are very thin, <1cm, @~30° to CA, with ox'd Fe-minerals to orange-red within veins. One different set in one interval are all ~1cm thick and appear more as silicified zones (minor bt within is disseminated). Minor hematite in veins as well (ox'd purple-black).	1	1			1	
10		50.05	57.69	Very fine-grained, silicious GND. Pale grey and uniform to ~55m. Few veins. 1cm qtz vein at 55m has slightly more silicified-than-surrounding selvage. Nearby carbonate/limonite vein has intensely orange-brown selvage, uniform for 20cm surrounding. No mineralization. Uniform ox'd orangey brown to end of section	4				2	
10		57.69	68.58	Med-grained GND with minor to moderate limonite staining; some patches of 'blue' GND ~3-5cm in diameter.	2				1	2

DRILL LOG LEGEND P1	DATE: September 1-8, 2005 PAGE 3 of 12		
DRILL HOLE # : **DG05-309C**	**FeOx** 0 = Unoxidized 5 = Intensely Ox'd	**Ser, Chl, etc** 0 = Unaltered 5 = Intensely Altered	**Carbonate** 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION: Comments:	ROCK (Alteration): Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		68.58	80.50	Moderately ox'd GND; oxidation especially concentrated around veins and fracture infills (limonite). Competent core, regular breakage at 40° and 135° to CA. 'Other' sulphide noted throughout last section, and occurring more massively here - few veins contain >5% of it. Silver, submetallic lustre to dull grey; appears massive or flakey (micaceous), soft (2-3).	3	1			1	
10		80.50	89.92	Oxidation moderate to strong - thick crumbly to flattened (carb-rich) limonite covers most faces and can also be seen within GND matrix. Qtz veins have poor mineralization and contain only brown-black oxidation products. Fresh py (trace) seen in one vein. Recovery is good.	4	1			3	
10		89.92	92.96	Unalt'd, competent medium-grained GND with minor oxidation in 'selvages' surrounding limonitic fracture infills. This is the largest section of 'blue' GND in hole down to this point. Good mineralization within qtz veins at 20-40° to CA.	1				1	
10		92.96	98.89	Limonite returns pervasively. Rock broken into <10cm pieces to 97.4m. Recovery poor from 94.49 to 96.01m. Few 'blue' patches ~5cm in diameter at 98.5m - irregular boundaries due to lim. stained selvages around fractures.	4				2	
10		98.89	105.16	Even more limonite here. Opaque and uniform around veins. GND texture 20% erased into medium orange brown.	4	1			1	
10		105.16	117.35	Pervasively limonite-stained GND. Brown. Weak rock. Broken along parallel to CA (length-wise to core), and at 90° to CA, regularly. As well, fractures at random angles in between 0 and 90°. Gouge material (brecciated GND in clay to fine sand texture) for 15cm at 109.50m. Other evidence of motion in truncated veins (no direction avail.) along fracture. Sericitic alteration in wide selvages around lim-stained qtz/carb veins and totally oxidized sulphide veins. More gouge at 115.95 to 116.20m. Where selvages are not noted, they are not visible due to pervasive oxidation through section.	4	2			2

BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		117.35	121.92	GND texture returns to visibility, beneath limonite colouration, still pervasive.	3				1	
10		121.92	127.27	Back to very limonite-rich rock. 75% is opaque, brown and uniform with virtually no sign of GND texture. Sericite dominates the outer edges of these limonitic zones, up to a few cm wide. Coarse carbonate grains are also seen with textured GND zones.	4	2			2	
10		127.27	140.21	Less stained GND. Clear GND separated by selvages (lim around veins and fractures, little throughout GND matrix. Veins and veinlets are easily distinguished but most appear lim-stained and rearranged, i.e. bent or sheared. Only one carbonate vein is pristine white and un-moved. Limonite is carb-rich.	3			1	2	
10		140.32	158.50	GND with zones of variable lim-staining (oxidation) and carbonate. To 143.25m, surrounding bent, low-angle qtz veins is opaque light brown alteration in GND, to greenish grey GND with 2-4mm coarse grains of lim-stained carbonate. From 143.25 to 145.0m is 80% unalt'd, 'blue' GND. 20% is qtz veins w/ moderate mineralization and small qtz selvages, as well as a few thin carbonate/lim veinlets with relatively wide selvages. These vein types continue throughout section, with variable frequency, but usually 2-4 per metre. Zone of brecciated, sandy, lim-covered pebbles from 151.2 to 151.6m, with some loss of recovery here. Large selvages around fractures: 4cm+ 'chunky' carbonate within lim as above. Outer selvage (2cm+) is moderately silicified and has minor sericite. At 156.75 to 157.75m, evidence of shear appears - foliation development (at ≥50° to CA) and increase in clay minerals. GND's	3	1		1	2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		158.50	159.42	Fault zone's focus. All fine-grained gouge except general line of (usually) broken qtz veins. Clay-rich (30%), and colourful - yellow, orangey brown, blue green, for 40cm. Granular texture reappears at 159.2m.	4	3		3	3	
10		159.42	163.07	GND texture here - ~20% unox'd, unalt'd, weak from numerous lim fract in-fills. Qtz veins still not complete.	3				1	
10		163.07	164.59	Carb-clay veins at 25° and 135° to CA through sericitic/ opaque lim'd brown rock, very weak and crumbly.	4	3		3	5	
10		164.59	181.36	Unalt'd, competent GND except surrounding qtz, qtz/carb and carb veins. Mineralization is good. VG seen associated with pyrite, also significant aspy and po. Minor limonite and carbonate. Sericite appears in selvages more strongly toward middle-end of section. Scorodite seen (bright blue-green) in one vein and selvage.	2	2			1	
10		181.36	185.94	Sericitic alteration pervasive here. Limonite and oxidation confined to veinlets and minor within selvages, minor through matrix, last metre of section. Good mineralization. One sulphide vein at 182.4m contains 1-2mm euhedral pyrite, ox'd and un-ox'd	1	1			1	
10		185.94	202.69	From 185.94 to 191.27m, rock is unalt'd GND except selvages surrounding qtz veins ± carbonate. At 191.27m, zone of extreme alt'n begins with massive sulphide veins to 192.50m. After this alt'd section, rock is competent and unalt'd except silicified and ser'd selvages surrounding qtz veins. One carb/ser-covered fracture breaks core in half at 0° to CA from 194.5 to 195.0m. No evidence of motion here.	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		202.69	207.27	60% strongly alt'd with carb and ser. All alt'n associated with qtz, qtz/carb, and carb veins. Minor limonite on randomly-oriented fractures and within selvages. One 8cm zone of carb-rich (+ser) clay at 205.86m, associated with black clay veinlet (ox'd py?).	1	3		1	2	
10		207.27	225.54	Sheeted qtz veins with small qtz/ser/carb selvages. Mineralization is variable from vein to vein - some have up to 10% sulphides (including scor, bt, and ox'd), while others have <1%. Selvages increase in intensity and sericitic and carbonitic alteration and size toward middle of section.	1	2			2	
10		225.54	262.13	Competent, unalt'd GND with excellent recovery. Sheeted qtz veins (grey qtz). Very little breakage - common 5 foot lengths of core. Breaks are at zones of weakness (carb-rich veins, concentrations of veins, or within selvage material). Breaks are few. Selvage material blends into surrounding medium-to-coarse grained GND texture. Scor. conc at boundaries to veins; po exposed on rough breakage faces - pale silvery bronze - metallic lustre. Appears 'flattened' over qtz, etc). Slight carb increase from 247.40 to 248.60m and loss of recovery; weakness: slickensides in po - metallic, mod'ly ox'd into carb clay which is also slickensided - no vein assoc on face at 50° to CA. Nearby vein at 50°; Selvages increase in intensity with increased sulphide content in vein and at margins in selvages; Carbonate-sand and brecciated GND contacts competent GND @ 30° to CA @ 262.0m, crumbly and weak foliation for ~1m; Fractures have no selvages but fracture faces show a thin film of clay/carb and one face has ~80% coverage of po and minor aspy with no associated vein; Fresh and subhedral		1			1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		262.13	271.28	More carb-rich GND. Breakage into <10cm lengths, random fracture orientations (see tech sheets). Still, good recovery overall. Carb concentrated in selvages further into section: @266.75 - 271.28m. Max selvages noted on next page. Last sample high carb and ser - grades into next section. Strong slickensides on low angle (~10° to CA) frac faces @270m.	1	2			2	
10		271.28	274.62	GND: Strong slickensides noted in low angle fractures continue. Increase in carb + ser alt'n to EOH - selvages often indistinguishable from one another.		2			3

DRILL LOG LEGEND P1	DATE: May 23 - 27th, 2005 PAGE 1 of 22		
DRILL HOLE #: DG05-276C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; QVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-12.19			Casing - no core recovery						
10	12.19-258.00	12.19	14.59	GND (Main interval). GND is limonite stained. Core is extremely broken to grav/sand. Recovery is poor. GND has pervasive limonite in fracs and appears partially decomposed. Mineralogical characteristics include: 40% qtz, 30% hornblende, 20% biotite, 10% limonite & qtz veins				1		
10		14.59	15.24	Fault gouge unit. Limonite pervasive within grey gouge/crumbly brecciated GND with visible qtz eyes. Possible hydrothermally altered GND. Preferable interpretation is hyd. altered GND, within physically decomposed core.	1	1		3		1
10		15.24	17.49	Broken GND (gravel size to sandy clay). Note: poor core recovery, extensive limonite	2		1			4
10		17.49	17.70	Clay gouge fault zone. Core contains extensive predominant clay with visible quartz eyes, pieces of gravel-sized GND, essentially decomposed GND (hydrothermally alt'd) as from 14.59-15.24m.	1	1		4		1
10		18.29	20.88	Extremely poor core recovery (~20%). Round, gravel-sized GND.						
10		20.88	21.34	Core coherency is of sugary gravel; limonite coated pieces. Minor sericite, no visible sulphides.						
10		21.34	25.58	Qtz vn @ 22.63m; 30 degrees to CA, tr aspy dissem, ~0.5cm thick. Trace dissem pyrite @ ~23.26m w/in the GND, no obvious vns in area.						
10		25.58	25.91	GND becomes extremely broken to gravel/sand sizes. Pieces of qtz vns visible; no sulphides or structure observable. Heavy limonite staining.	1			1		1
10		25.91	30.48	Core is becoming more competent. Avg frac angles are ranging from 30-40° to CA. Limonite staining abundant & pervasive on frac srfc's; Qtz vn @ ~26.0m @ 70° to CA. qtz was cloudy grey w/ no visible dissem sulphides.	1					
10		30.48	32.35	Qtz vn @ ~30.60m @ 70° to CA, no visible sulphides, milky translucent color. Qtz vn @ ~30.82m @ 70° to CA, translucent milky qtz.						
10		32.35	33.03	V.broken core due to hydrothermal alt'n. Sugary core w/ minor clay (10%), abundant limonite staining. Minor qtz pc's indicate minor vning.	1			1		
10		34.02	34.90	Same as above only more abundant gravel sized pc's and less qtz vn chips.						
10		35.15	35.50	Milky & clear qtz vn @ 35.21m parallel to CA. No visible sulphides inclusive. A microvnlet @ ~45° to CA x-cutting the vn contained a few dissem aspy.	1					
10		36.56	36.58	Qtz vn @ 40-45° to CA. proximally w/in 5-8cm dissem aspy is present.						
10		37.55	39.62	Alt'd section of GND, extensively fractured. Abundant limonite pervasive & on fracs. Gravel/sand/clay consistency. Qtz pebbles observed indicating vning.	1			1		
10		39.62	41.10	Milky qtz vn @ 41.10m w/ dissem aspy @ 40° to CA. Surrounding 10cm on either side of vn have endured sericite alt'n & have pervasive limonite staining.	1					
10		41.10	42.55	Core is broken but displays qtz vning, which appears to have aided in decomposition of GND. Minor visible sericite (1-2%), pervasive limonite & on fracs. Minor dissem aspy & minor vugging w/in qtz vn pc's.	1	1		1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:		Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		42.80	44.20	Extremely broken GND w/ heavy limonite staining. Some minor qtz pc's indicating vns present but no other info obtainable. Core varies from gravel size to sand to clay (predom sandy gravel).	1			1		5
10		44.20	44.93	25% qtz, 30% k-sp, 10% hbl, 30% bt & 5% other, incl. sulphides. Hydrothermal alt'n across numerous 1mm weathered vns throughout section. Granular limonite covers fractured srfc's. 97% core recovery; core broken into blocks up to 10cm long.	4			1	2	
10		44.93	45.72	1-2mm pyrite grains present w/ intense hydrothermal alt'n; ox'd to siderite on frac srfc's.	3	1		1	2	
10		45.72	46.22	Minor hematite noted, subhedral grains oxidized to bright red. Tiny carb vns, calc & siderite angles indistinguishable as vns are pervasive. Core is gouge to chunks ~6cm in diam.	4			2	2	
10		46.22	47.92	GND varies in degree of breakage from gouge to 15cm solid chunks. Fracs more reg @ 20° angle.	3			2	1	
10		47.92	48.77	Material shows remnants of GND (qtz eyes, bt) but is predom. gouged. Biotite alt'd to v. hard, black mineral. Minor (10%) calcite in frac dominated by limonite.	4			3	2	
10		48.77	49.50	Broken core into ~5cm diam chunks avg, w/ little alt'n except from 49.0-49.2m - gouge zone.	1			3	1	
10		49.50	49.80	Qtz vn seen surrounded by ~10cm pervasively alt'd GND. Ser, aspy noted dissem w/in, as well as limonite. Weakened GND.	1	1			1	
10		49.80	50.29	Broken core. Gouge section 50.7-50.8m. Limonite on fracs, 1mm diam w/ minor calc.	2			1	1	
10		50.29	51.82	GND: broken core; 10cm avg length, reg frac @ 70°.	1				1	
10		51.82	53.34	GND core quite competent; broken along limonitic veinlets. Hematite staining noted in 1-3cm lengths. @ 52.17m: <1cm qtz vn alters GND (limonitic), as well at 53.1m. Aspy seen.	1	1	1		1	
10		53.34	54.86	GND. Pervasive limonite vning, random orient., competent core from 53.5-54.6m, rest is limonized & broken into 5cm blocks max.	1	1		1	1	
10		54.86	56.39	GND: small gouge section @ 55m, otherwise broken into ~5cm diam avg blocks w/ extensive 1mm vns of limonite. 2 qtz vns.	2	2		3	1	
10		56.39	57.91	Fewer mafics in GND where qtz is more smeared out (silicified zone). Aspy appears dissem @ 56.7m & 57.3m . These areas contain more competent core chunks up to 15cm long.	1		1	1		
10		57.91	58.80	Highly broken GND. Qtz vns (3) <2cm wide w/ no sulphides btwn 58.3-58.5m.	2	1		1	1	
10		58.80	59.44	Aspy appears in close proximity to qtz vn. 2 more qtz vns w/ dissem sulphides. Gouge @ 59.1m (adjacent to 2nd qtz vn).	2	1		2	1	
10		59.44	60.96	Competent section (low mafics) to 59.6m followed by limonite-pervasive gouge to fault breccia to 60.96m. Qtz found at 60.5m in centre of gouge material. No sulphides visible.	3	2		2	2	
10		60.96	62.48	Broken GND core. Qtz vns w/in most competent sections; no sulphides noted, no selvages.	2	1		2	2	
10		62.48	64.01	Extremely broken GND. Pc's 11cm long to gouge-sized particles. One thin (0.5cm) qtz vn at 62.5m w/ tiny alt'n ring.	3	2		3	2	
10		64.01	65.00	Gouge and remnant grains of GND to 64.5m. Rock is more competent @ 64.5m to 65.0m; blocks 10cm max.	4	3	2	2	2	
10		65.00	66.40	Pure qtz section to 65.3m. GND to 65.53m for 15cm, then GND to 66.4m. Dissem bt (1%) on frac faces. 5-sided rust print on one qtz sect (~4cm), no rxn rims visible.	1	1			1	
10		66.40	66.86	Angular gravel sized GND, some whole core.	1			1		5
10		66.86	68.02	Good recovery. 2cm qtz vn w/ dissem py & aspy. Near selvage, limonite stained frac perpendicular to vn.	1					5
10		68.02	68.58	Gouge contains remnant GND, qtz eyes, minor clay. Hydrothermal alt'n of GND.	2			1		4
10		68.58	69.98	Good recovery. White qtz vns at 65° & 35°. Minor dissem py & aspy, limonitic fracs.	1					5
10		69.98	70.46	Good recovery. <1cm qtz vns present. Minor dissem py & aspy.	1					5
10		70.46	71.24	White qtz vns at 40°, limonized fracs.	1					5
10		71.24	71.63	Broken GND, up to 10cm long. Limonized fracs, white qtz vn (1.5cm). Broken pc's qtz ~2cm, GND decomposed, hydrothermally alt'd.	2	1		2		3
10		71.63	72.92	Gravel-sized GND, rounded. Some clay present, qtz eyes, white qtz vn.	1

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		72.92	73.15	Qtz vns at top, in competent core, changes to gougy GND; hydrothermal alt'n related to qtz vning.	1			1		
10		73.15	74.02	Gravel-sized GND & qtz, rounded, limonized.	1					
10		74.02	74.49	Gouge, partially alt'd GND, clays w/ qtz eyes & gravel-sized GND, hydrothermal alt'n, limonitic.	2	1		2		
10		74.49	78.12	Broken core, limonized fracs. Qtz vn @ 45°, 8cm qtz lens at 77.72m, minor aspy in some vns.	1	1				
10		78.12	79.08	Good recovery. GND w/ qtz vns at 30°, minor aspy. Fracs show limonite. Py and strong sulphur smell present.						
10		79.08	80.37	GND w/ qtz vns at 30°, fracs are limonitic, dissem aspy btwn 80.19-80.37m, highly oxidized.	2					
10		80.37	80.70	2 massive sulphide vns ~3cm, aspy & scorodite & py present, GND highly alt'd, vuggy.	2					
10		80.70	82.30	Small qtz vns <1cm, limonized frac. Alt'd at 82.0-82.10m, gravel-sized GND w/ clay--hydrothermal.	2	1			1	
10		82.30	83.82	Good recovery. Limonized fracs, 7 qtz vns ~1cm thick, in conjugate sets, 2 series of vn emplacement. Gouge at 83.72-83.82m, qtz eyes present w/ remnant GND w/ hydrothermal alt'n.	1				1	
10		83.82	85.34	<1cm qtz vns in GND, limonized fracs alter rock from 83.22-83.42m. Qtz eyes & hydrothermally alt'd GND present. Preceded & followed by qtz vns at 45°.						
10		85.34	86.87	Good recovery. Limonized fracs, qtz vns <1cm, dissem aspy.	1	1		1		
10		86.87	87.35	Good recovery. Limonized fracs, 2 series of vn emplacement, 1st qtz at 45°, 2nd qtz & calc at 30°, minor aspy present in margins of both vns.	1					
10		87.35	87.93	Highly oxidized GND containing qtz & calc vns. Alt'd to clay w/ GND frags & qtz eyes from 87.65-87.75m. Hydrothermal continues after as oxidation w/ vns. Aspy present in qtz vn margin.	4	2				
10		87.93	88.39	Slightly oxidized GND hosting several small qtz vns. Vns are oxidized at margins. Aspy present in margins.	1					
10		88.39	89.38	Gravel-sized GND mixed w/ clay shows more intense alt'n after 88.8m; higher clay content & becoming crumbly. Qtz eyes present in the clay; possible fault or hydrothermal alt'n. Remnant GND in clay indicates hydrothermal more likely. Gravel size pc's of qtz, possible vns weathered.	2	1		2		
10		89.38	90.74	Slightly alt'd GND w/ limonized fracs grades to gravel sized GND btwn 89.92-90.06m. Qtz vns <1cm present, minor aspy in rim.	1	1		1		
10		90.74	90.99	Alt'd & oxidized GND. Brownish red in color, alt'd to sericite & clays. Qtz eyes present--hydrothermal.	3	1		2		
10		90.99	91.24	Highly oxidized & alt'd GND. Zone of intense clay alt'n; fault gouge at 91.09m, qtz vn <1cm.	3	2		3		
10		91.24	92.11	Mod ox'n & alt'n. Brownish red color. Mushy texture w/ qtz eyes & pebble sized GND; hydrothermal alt'n.	3	1		2		
10		92.11	92.96	Less ox'd & alt'd. Milky qtz vns <1cm. Small zones (1-2cm) of intense alt'n above & below vns. Qtz eyes present in zones; likely hydrothermal. Milky white qtz vns at 92.44m @ indeterminate angle w/ trace aspy at margin. Vn @ 92.70m: 0.5cm, grey, @ indeterminate angle due to alt'n, tr. aspy at margin.	2	1		1		
10		92.96	93.97	High alt'n btwn 92.96-93.14m. Mod alt'n (1) until 93.79-93.90m, which shows high alt'n to clays. Qtz vns at 70° to CA at 93.11m, 1cm diam. Vn @ 93.14m: 3.5cm @ 65° to CA, grey.	2	1		1		
10		93.97	94.49	Mod alt'n (2) until 94.03m where alt'n becomes higher (3). Qtz eyes present throughout clays & GND, likely hydrothermal alt'n. Minor sericite present.	2	1		2		
10		94.49	95.48	Slightly alt'd (1) but mod ox'n in GND. Highly alt'd (4) at 94.90-94.95m & at 95.32-95.38m to clay w/ qtz eyes & GND frags. Broken qtz vn @ 95.4m, grey.	3	1				
10		95.48	96.51	Good recovery. Mod ox'n in GND w/ limonitic fracs. Sericite in fracs & alt'n halos. Qtz vns @ 96.23m, ox'd vn w/ 3% ox'd py & 1% ox'd aspy in vn margin & halo.	2	1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:		Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		96.51	97.54	Good recovery. Mod alt'd (2) & ox'd (2). Fracs show minor limonite. White qtz vns @ 96.84m, 1cm diam, contain 3% po in vns.	2	1				
				White qtz vn @ 97.14m, ox'd rim, 1cm, 35° to CA, 3% py in vns, ox'd py.						
10		97.54	98.10	Slightly alt'd GND. Less limonitic, minor in fracs. Vn @ 97.87m; 1cm milky white qtz @ 40° to CA contains cpy 1%, po 1%, aspy 3%, tr. magnetite. Microfault cuts vn.						
10		98.10	99.06	Good recovery. Minor ox'n from 98.92-99.06m. Fracs slightly limonitic. Grey qtz vn @ 98.85m @ 40°to CA. Grey qtz vn @ 98.9m; 0.5cm, ox'd margin.	1					
10		99.06	99.76	Mod alt'n (2-3) to sericite & clay. Qtz eyes & vns present, but are fractured & displaced. Hydrothermal or shear zone alt'n occurs at 45° to CA. White qtz vn @ 99.50-99.55m @ 60° to CA, tr py (ox) & aspy. Grey qtz vn @ 99.68m, 1cm, frac & displaced, 40° to CA.	1	2		2		
10		99.76	100.58	Start of good core. Weak limonite staining on fracs. Slightly alt'd, minor sericite in fracs. Vn @ 100.23m, 1cm at 40° to CA. no visible sulphides.	1	1		1		
10		100.58	102.11	Less ox'n than above. Vn @ 100.83m, 1cm at 40°, aspy in margin. Milky white qtz vns @ 101.15m, 101.19m, 101.33m, 1cm, tr aspy in margins @ 35°.	1			1		
10		102.11	103.63	Slightly altered GND - minor limonite on fracs. Vein @ 103.44: white qtz	1					
10		103.63	105.16	Slightly oxidized GND. V. little limonite in fracs. Veins run near parallel to CA w/ ox'd margins; py & aspy in margins						
10		105.16	106.68	Relatively unaltered GND. Limonite in fracs. Veins run parallel to CA. Aspy & py in margins. Py slightly oxidized						
10		106.68	108.20	Unaltered GND w/ minor limonite in fracs. Vein at 106.68-106.86m, 0.1cm, ox'd, white qtz at 45° to CA . Vn @ 106.90m: 1cm, grey, @40° to CA, 5% ox'd po, 1% ox'd py. Vein at 107.95m. 0.1cm white qtz with carbonate, at 70°, trace aspy.	1					
10		108.20	109.73	Core is fractured. Lim on few surfaces, qtz & carb veinlets					1	
10		109.73	110.34	Unaltered GND. Minor limonite on fractures. Vn @ 109.77: 0.5cm, at 50°, trace aspy, milky white qtz, offset by micro-fault. Veins at 109.97m and 110.19m, milky white qtz, at 40° to CA, minor po and trace cpy in veins.						
10		110.34	111.25	Unaltered GND. Minor limonite on fractures.						
10		111.25	112.05	Good recovery. Minor ox'n. Stain in fracs. GND is lightly bleached. Dissem po (5%) & aspy (tr.) & py (1%) through entire length.						
10		112.05	113.66	~30% ser alt'n around narrow veins. 13 veins noted. Angles are complimentary (45° & 145°)	1	3	1		1	
10		113.66	114.60	Section is entirely altered w/ sericite + ox'n w/ lim covering fracture planes	3	3	2	1		
10		114.30	115.09	GND same as above unit, but veins/fractures more randomly oriented (20-90°)	3	3	2	1		
10		115.09	116.05	1mm carb/ser. Veins fractured at reg angle: 125°/65°; these tiny veins overprint larger qtz veins w/ sulphides at 145°/35°	1	2	1		1	
10		116.05	116.80	4 qtz. vns. Have clear centres(1cm, max) w/ margins of milky qtz (1cm thick). Py & aspy are in granular clumps on margins and w/l clear qtz centres. Ser/qtz/carb veins: <1mm thick, ox'd. More frequent w/ fractures	1	1	2		1	
10		116.80	117.80	Zone of high alteration but rock is still coherent, except at 117.25 where clay alteration is ~5cm thick. Med. grade, low-angle fracturing has slickensides shown in sericite, perpendicular to breaking plane's long axis. Sulphides appear at margins of fault breccia section (117.05 - 117.13m). Massive sulphides w/ aspy @ exterior edges. py clumped into masses >8cm long and 1cm wide. At 117.5m, v. high chlorite alt'n; only indistinct qtz. grains left. Some are in lines, denoting overprinted veins between 117.45 to 117.80m. Trace po located w/in these lines.	1	3	3	1	1

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		117.80	118.24	Relatively unaltered. Pervasive lens of sericite appears associated w/ qtz lens. Small, partially ox'd carb veins overprinting ser & qtz.	1	2	1	1	1	
10		118.24	118.97	Altered around 3 qtz veins.	0	2	1	1	1	
10		118.97	119.40	Angle at which altered zone turns to unaltered GND is 45°. Sample is unaltered GND. Lenses of po < 4cm long & 0.3cm wide seen adjacent to qtz vein at 119.30m						
10		119.40	119.59	2cm wide milky qtz vn has po & py concentrated in 0.5cm wide section in centre						
10		119.59	121.10	2cm² section of po (uneven cluster). @119.90m, a section of randomly-oriented veinlets of calcite plus one 0.5cm vein of massive sulphides (po, py & cpy) rimmed w/ calcite, to 30°. Qtz vein at 120.11m to 140° not much alt'n assoc. Rest of section relatively unalt'd GND. Qtz veins: @120.16m, 120.47m, 120.76m, 120.86m, 121.02m & 121.20m. All @45-50° to CA. These veins have inner sections of clear qtz, a few mm thick, and outer sections of milky qtz. Po and py seen inside clear qtz.						
10		121.10	122.20	Six qtz veins noted, to 121.43m, after which, there is a zone of highly alt'd (chl+ser) GND. Bleached zone at 121.5m, at 55° to CA, with 0.5cm qtz vein in centre. Qtz vein also at 55°, at 121.6m begins chl alt'n zone to 121.85m. 3cm sericite zone btwn 2 qtz veins 1cm thick; alt'd zone to 122.2m.		1	1		1	
10		122.20	123.50	Silicified sections 3cm wide w/ 3cm alteration halos at 122.27m, 122.4m, 122.63m & 123.2m. Orientation is always 45°. 1-2% py & po w/in bleached sections. 3 qtz veins @ 122.5m, 122.9m and 123.4m @50° to CA.						
10		123.50	125.00	GND w/ altered/bleached sections: 123.65-123.90m (gouge, last 4cm); 124.10-124.14m; 124.50-124.53m; 124.84-124.68m; 124.78-124.83m. Two of these sections have small qtz veins at centre.	0	3	2	2	1	
10		125.00	125.90	GND w/ altered sections: 125.65-125.66m; 125.79-125.80m; 126.40-126.60m.	0	3	1	1	1	
10		125.90	127.39	Sericitized & chloritized GND assoc. w/ 10 1-2cm qtz vns w/ sulphides. Vn locations: 125.9m (70°), 126.17m (60°), 126.23m (40°), 126.4m (70°), 126.44m (70°), 126.64m (70°), 126.74m (50°), 126.90m (40°), 127.26m (50°), & 127.35m (40°). Aspy concentrated @ margins of veins, py w/in vein and at margins	0	3	3	0	1	
10		127.39	128.66	Continued zone of alteration except from 127.39 → 127.5 where veins are <1mm and selvages <2cm Larger qtz veins w/ sulphides @ 127.88, 128.16, 128.21, 128.44 & 128.63m; sulphides situated similar to above.	0	3	3	1	1	
10		128.66	129.64	Sericite & chlorite GND. Qtz veins: @128.89m (60°); @129.42m (60°), trace aspy; @129.95m (90°), trace po; @129.45m (40°).						
10		129.64	131.10	Qtz veins contain trace po & as, lots of py, located: @129.89m (70°), @130.50m (70°), @130.68m (65°). Massive sulphide lens at 129.8-129.85m, 3cm wide. Tr po, py, aspy. Section is mostly s/chl alt'd w/ <10cm wide unalt'd sections.		3	3	1	1	
10		131.10	132.04	Qtz vein at 131.15m at low angle and contains no sulphides. Others, at high angle, contain po. Veinlet network of carbs surrounded by selvages of silicified GND (bleached)					1	
10		132.04	134.23	Unaltered GND w/ carb veinlets randomly oriented w/in. Bleached sections @132.34m (70°), 4cm wide; @132.84m (45°), 12cm wide; and @132.92m (45°), 2cm wide. These may be silicified veins; aspy and py in moderate amounts. Late calcite veinlets offset qtz vein offshoots to 20°. Qtz veins: @133.80m, to 35°, 3.5cm thick; @134.0m, to 35°, 0.3cm thick; and @134.08m, 35°, 1cm thick.		2	1			
10		134.23	134.70	Unaltered GND. Silicified qtz vein at 134.35m, to 45° w/ no sulphides. Vn at 134.52m, 60°, w/ assc po. Qtz/carb vein at 134.62m, at 45° to CA, w/ high percentage of po.		1

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		134.70	135.64	At 134.70m, turns to alt'd at an angle of 40°. Qtz veins: @135.01m (50°); @135.22m (25°); @135.27 (50°) - intersects with previous, same generation; @135.54 (45°). At 135.34m, alt'd turns to unalt'd at a 40° angle.	1	4	3	2	2	
10		135.64	137.16	Unaltered GND except from 136.18→136.26m where chl zone surrounds 0.5cm qtz vein at 50°, and from 136.59 to 137.12m around 1cm qtz vein at 70° to CA. Also in this interval at similar angles are veinlets of 'pure' sulphides surrounded by bleached sections, 2cm wide, within alt zone			1			
10		137.16	137.59	GND has multiple 1-2cm thick qtz veins @ an average angle of 40-60° to C.A., ~1-2% dissem py and aspy present within milky white qtz veins. Core is devoid of limonite staining. GND is still of consistent mineralogical nature, however, episodes of bleaching/leaching of minerals out have reduced sections to extremely sericitic/bleached and occasionally silicified veins @ 137.20m (@ 50°), 137.34 (@40°), w/ dissem py, po, aspy. Sericite on margins						
10		137.59	140.03	GND is extremely bleached. Feldspars have completely reduced with rare to minor (<2%) mafics within GND Clear qtz vns @: 137.69, 137.76, 137.87, 137.95, 138.05, 138.07. 0.25-0.50cm, @50° to CA, w/ tr. euhedral po. and trace aspy. Milky to clear qtz veins after 138.83m contain po.						
10		140.05	140.45	Unaltered GND. Minor sericite on margin of bleached GND		1				
				@ 140.35: milky qtz w/ dissem po						
10		140.45	140.80	Bleached GND w/ trace mafics. Contact w/ unaltered GND @ 45°. Tr. dissem. aspy & po appear to be vein-like in orientation, @~50° to CA, however no clear vn materials present						
10		140.80	142.49	Unaltered GND predominant w/ veining (qtz) and sericite sections as well as on fractures (from 141.85 - 142.49m pervasive). 0.5 to 1.0cm milky qtz vns w/ clear qtz centres contain trace po and aspy. Ser minor, present on margins. Vns ave at 50° to CA.						
10		142.49	143.33	Extremely bleached, sericite-rich, grey white GND. Tr. indiscernible sulphides. Core is easily scratched w/ a nail		1				
10		143.33	143.63	Both qtz veins contact CA at 35°. Disseminated aspy 2-4%. disseminated py 1-2%						
10		143.63	145.30	Extremely bleached, sericite rich, grey white GND. Tr. indiscernible sulphs. Core is easily scratched w/ a nail. At 144.10m, 0.5cm qtz vein w/ 10% disseminated po.						
10		145.30	145.56	Extremely bleached GND w/ abundant sericite adjacent to 9cm thick massive sulphide vn; 90% aspy, 10% py.						
10		145.56	147.60	Slightly green sericitic GND w/ extensive bleaching. Soft core, yet coherent. Minor 0.5-1cm qtz veining		1				
10		147.60	147.83	Fault gouge. Greenish grey clay with sulphide-looking oxidized material. No visible fresh sulphides	2					
10		147.83	148.33	Bleached and sericite rich, broken GND. Core has green sericite hue						
10		148.33	150.53	GND w/ minor sericitic partings marked by soft, green hued core. Minor carbonate veinlets. Veins: @149.37m, 149.48m, 149.52m & 149.59m, 0.25-0.5cm qtz veins with trace euhedral-subhedral po. Vns @ 40-50° to CA. At 150.16m, 150.32m, 150.38m and 150.43m, 0.5-1cm qtz veins @ 50° to CA, trace aspy.						
10		150.53	150.88	Bleached GND w/ 3 1cm qtz vns @50° to CA w/ trace disseminated aspy & po.						
10		150.88	151.20	Fault gouge, uniform light grey clay w/ minor visible qtz eyes. Appears to have ox'd sulphides mixed in, but inconclusive	1	2		5		
10		151.20	152.66	Broken GND w/ sericite-coated fracs and minor sericite partings -- Semi-decomposed GND. One 2cm qtz vein w/ no visible sulphides		3		1		
10		152.66	153.35	Highly bleached, altered GND. Abundant sericite both pervasive and on fracs. Minor sericite/clay partings		3		1

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		153.35	157.25	Mostly unaltered GND w/ qtz vns containing trace to 1% dissem sulphides, minor sericite on vn margins. At 153.34m, 153.40m, 153.60m, 153.63 and 153.71m, qtz veins 0.25-1.0cm thick, @ 35°-50° to CA contain tr-1% disseminated py, aspy. At 154.07m, a 1.5cm qtz/sulphide vein at 50° to CA contains 5% aspy and 1-2% py. At 154.12, 154.23, 154.31, 154.41, 154.43, 154.53, 153.62, 154.65, 154.70, 154.76, 154.85, 154.97 and 155.00m, 0.25-1cm thick qtz veins with trace-1% disseminated po and trace to no arsenopyrite. Average range of vn angles is 25-50° to CA. @155.42, 0.5cm thick qtz vn @50° to CA, w/ tr diss po. One 0.25cm carbonate (dolomite) vein at 156.06m, at 60° to CA contains trace py and ~1% aspy.		2		1		
10		157.25	158.01	GND becomes highly sericitized: soft, has green hue. Multiple qtz veinlets: @157.07, 157.27, 157.38, 157.42, 157.50 and 157.56m, 40-50° to CA, up to 0.5cm, max; most w/ tr. po and tr aspy.						
10		158.01	158.22	Qtz/sulphide veins and veinlet stringers within qtz veins and x-cutting throughout GND. Within the sulphide veins the py seems to always be central w/ the aspy on the margins. Dissem sulphides throughout GND section. At 158.08m, two 1-2cm thick sulphide veins at 50° to CA, contain 60% py and 40% aspy.						
10		158.22	158.50	Broken sericite abundant pervasive. Hydro-alt'd GND appears to be a fault zone. Plenty of bleached clay and qtz eyes.		3	1	3		
10		158.50	160.02	Altered, bleached GND with pervasive sericite alteration, soft core. Minor disseminations/ veinlets/ blebs of sulphides. Commonly, py~1%, as~tr.-1%						
10		160.02	160.15	Semi-massive to massive py ~99% and aspy~1%, @55-60° to CA. Some qtz veining immediately adjacent on margins.						
10		160.15	162.47	Extremely altered/sericitic. Decomposed yet coherent GND. Core has yellow/green bleached hue. Minor qtz veinlets @ 50-60° w/ tr. dissem aspy/py in half of them.		4	1	1		
10		162.47	163.50	Unaltered GND w/ veinlets of disseminated aspy (~50% of qtz vein) @40-50° to CA.						
10		163.50	165.15	Mod sericite alt'd GND. Core is mod. broken w/ occasional veinlets of qtz/dissem. sulphs. Core is v. soft and is bleached. Typical veinlets @ 50° w/ disseminated blebs of subhedral po.		4	1	1	1	
10		165.15	167.42	From 165.15-165.84m, highly altered/bleached clay. GND core is retained but pure white/grey clay veins		5		5		
10		167.42	168.13	Unaltered GND w/ sericite on fractures. Couple of qtz veins @50° to CA, w/ tr-1% po within centre of vein		1		1		
10		168.13	168.58	45cm wide milky qtz vein. Tr sulphs (indistinguishable). Contact angle is 30° to CA						
10		168.58	171.33	Moderately bleached/altered GND w/ sericite abundant on fracs. Minor sulphide/qtz veinlets. Core is moderately coherent. 3 notable veins @: 168.77, 170.10, 171.06m. Qtz veins w/ tr. dissem po and aspy, 2.5, 1, 0.5cm thick respectively. Two at 55°, last one at 80° to CA.						
10		171.33	172.21	GND is extremely bleached, but peppered w/ disseminated sulphs. Predominantly aspy (5-8%) w/ tr. py						
10		172.21	173.85	GND is moderately altered in partings and bleached white/grey. Core is mod-very broken, can't obtain angles from vein frags. Appears to be a few >1cm thick veins in section. Sericite on fracs and occasionally pervasive		2				
10		173.85	180.00	An extremely altered section of GND. Core appears as qtz/sericite and moderate chlorite. Core is silicified and alt mafics are essentially altered. Some qtz veins can be seen w/ dissem. po (tr.)		3	3			
				@175.95: a clay faulted unit w/ a decomposed vn of aspy adjacent, poor core recovery. However the clay is of the graphite texture/colour w/ aspy observable. The aspy vn that remains is 1cm thick at 70° to CA. chl + ser abundant at 185.0 onward.		4	2	5		
				From 178.31 to 178.51m, qtz boudins and stringers of aspy and py. py~10%, aspy 20%. remainder of interval is of sericite and minor chl. Interpreted contact angles are 75-80° to CA.		3	1

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		180.00	181.57	V. minor altered GND. Sheeted qtz veins/veinlets @ ave 40° to CA w/ occasional dissem. sulphides (inconclusive type, tr po)		1	1	1		
10		181.57	182.88	Mod. altered GND. Core appears as bleached greenish hue colour, chlorite is clearly present. Core is soft. Sericite is pervasive and abundant		4	3			
10		182.88	188.98	GND broken although core recovery is 90%. Minor sericite on fracs. Predominant dissem sulph. w/in the vns is po w/ lesser amounts of aspy. Veins are sheeted and relatively constant in thickness ranging from 0.5-1cm. Qtz veins milky to clear.		1	1	1	1	
10		188.98	189.23	GND as above						
10		189.23	191.09	Fault gouge. Light, bleached remnant of former GND due to visible brecciated pieces. Core is broken adjacent to fault and then retains its former competency 20cm distally. no visible sulphides. only qtz eyes and breccia. fault angle: 40-45°						
				At 190.56m, a 5cm wide qtz vein @ 50-55° to CA w/ minor biotite inclusive, very siliceous w/ tr. po.						
				Sulphide vein @ 191.00m, 0.5cm thick, w/ 96% po and 4% aspy, @ 60° to CA.						
10		191.09	191.29	Fault zone, focussed @ 191.19m. Core increases toward fault marked by aspy and grey, ox'd aspy. Also present are slickenside surfaces in sericitized/chloritized GND. Interval appears green/cream-coloured w/ mafics absent		3	3			
10		191.35	194.24	Same as above unit, however centrally the core is competent but has two 2cm qtz veins w/ dissem sulphides, at 50° to CA						
10		195.01	195.58	Silicified, bleached/altered GND. Core has white/green hue, devoid of mafics. Chlorite and sericite dominant with qtz veinlets at 50-60° to CA, w/ rare diss sulphides (po).		2	1			
10		195.58	195.64	Fault gouge w/ bleached GND. Breccia. Fault @ 50-55° to CA.		3	1	4		2
10		197.48	197.81	GND is alt'd to soft, sericite-rich and chlorite. Core is bleached and has a green hue. @197.59m, a graphite grey slickenside surface indicating faulting thus hydro fluids interpreted to alter GND to observed state, mafics almost non-existent						
				At 198.79m, a 2.5cm qtz vein @50-55° w/ tr. po. At 199.03m, 4.5cm qtz vein @40-45° w/ dissem. tr. po. At 199.91, 201.52 & 201.73m, qtz veins 2cm wide, @50° to CA with trace po.						
10		203.10	207.26	GND has abundant sheeted veins @45-50° to CA, typically 0.5-1.0cm wide, carrying ~1% po as disseminations. GND is mostly unaltered w/ v. minor sericite locals. veins spaced 5-10cm apart						
10		207.26	208.56	GND; Good recovery. Veins at 207.56m, milky white qtz, @60°, 1% cpy in vein, 30% ox'd, 0.2% aspy in margin. At 207.66m, a 3cm milky white qtz vein @70° to CA, 2% cpy, 50% ox'd. Veins at 207.74, 207.77 & 207.82m, 0.5cm, milky white @60° to CA - 1-3% cpy in vein, 30-50% ox'd, 0.2% aspy in margins. Veins at 208.48, 208.55, 208.56 & 208.61m, 0.2cm milky white qtz sheeted veins - 1% cpy in veins, trace aspy in margins.						
10		208.56	208.79	GND is bleached, grey-green colour. Sheeted vein set: at 208.60, 208.67 & 208.71m, 0.2cm, light grey qtz @ 35° to CA. Vein at 208.60m has 4cm selvage containing 3-5% po, 0.2% aspy.			2			
10		208.79	208.92	GND is brecciated, qtz frags present. 3% py (50% ox'd) present in broken qtz piece. Possible hydrothermal alt'n.						
10		208.92	209.69	GND altered to green-chlorite. Vein @ 209.09m, 2cm grey qtz @ 30° to CA, 1%py in vein, 10% ox'd. Vein @ 209.71m, milky white qtz @ 30° to CA, 15% py, 10% ox'd. Vein @ 209.42m, 1cm grey qtz @ 60° to CA, crosscut by 2cm qtz vein @ 40° to CA; 5% py in margin of crosscutting vein.			4			
10		209.69	210.39	GND altered to sugary texture. Whitish green colour. Qtz eyes present. Veins @ 209.86 @ 45° to CA, 2cm qtz vein, highly fractured, milky to grey in colour.		4				
10		210.39	211.13	mod. alt. GND, chloritic. Veins @ 210.49 & 210.80m. Milky white qtz @ 45° to CA; 0.2% aspy in vein. Core becomes highly fractured at end.			3			
10		211.13	212.14	Broken GND. Minor clay on fractures. Vein @ 211.33m, 1cm milky white qtz @ 45°						
10		212.14	212.90	GND altered to green-grey colour - chloritized. Disseminated aspy (70% ox'd) present throughout interval		1	4	1

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		212.90	213.36	More clay alteration, broken up core		1	3	2		
10		213.36	213.76	Slightly altered GND contains dissem. py. and cpy			1			
10		213.76	213.99	15cm altered zone. bleached, possible silicified. Abundant po ~5%						3
10		213.99	214.88	Unalt'd GND w/ disseminated aspy. Vein @ 214.06m, 1cm milky white qtz vein @ 50° to CA, 0.2% aspy in vein. Vein at 214.16m, 1cm milky white qtz vein @ 50° to CA, 3% po in vein.						
10		214.88	216.41	Unaltered GND. Vein@ 215.01m, 1cm, white qtz @ 60° , 5% sulphides. Vein @ 215.08m, 3cm, white qtz, @ 50°, 1% aspy in margins, 3% po and 1% cpy in vein. Veinlets at 215.47, 215.68 & 215.89m, 1% po in margins. Vein @ 216.21m, 1.5cm, white qtz, @45° to CA, 3% po in vein.						
10		216.41	217.30	GND w/ chlorite alteration around veins. Veins @ 216.56, 216.68 and 216.89m: 1cm white qtz, @60° to CA, sheeted set. 10-15% po in veins. Vein @ 217.03m, 0.2cm grey qtz at 30° to CA, 2cm selvage, 3%po, 1%cpy in vein.			2			
10		217.30	218.02	GND is fractured and altered to clay within. Minor chlorite alteration also present. Vein @ 217.39m, 1cm white qtz, @50° , 3% aspy in vein, 2cm chl selvage. Broken vein @ 217.70m, ~1cm white-milky qtz.		1	1	1		
10		218.02	218.48	Unaltered GND. Veinlets @ 217.42, 217.53 & 217.63m, 0.2cm white qtz, 5-10% po in chloritic selvages						
10		218.48	219.46	Slightly chloritized GND (1), more pronounced in vein selvages. Carbonate veins intrude fractures and qtz vein throughout interval. Vein @218.58m, 0.5cm milky calcitic qtz, @50° to CA, 2cm chloritized selvage, 1% aspy in vein. Calcite-filled fracture @218.72-218.85m.			1			
10		219.46	220.20	Weak chl alt'n in GND. Veins have strong (4) chl alt in selvages. vein @ 219.63m, 1cm milky white qtz @50° to CA, 2cm chloritic selvage, 1% py in vein, 0.2% aspy in selvage. Vein @219.67m, 0.5cm, @50° to CA, 3% po in vein. Vein @ 219.87m, 1cm qtz with carbonate filled fractures at 50°, 3% py in vein and margin. Vein @ 220.11m, 1cm milky white qtz @ 50° to CA, 3% py.			1			
10		220.20	221.08	Weak to mod (2-3) chl alteration. Veins at 220.30, 220.32 & 220.36m, 0.5cm milky white qtz @ 55° to CA, 1% aspy in veins, 1cm chl selvages. Calcite-filled fractures present.			3			
10		221.08	221.40	Unaltered GND. Vein @221.35m, 0.5cm milky white qtz, @45° to CA, 5% aspy and 6% po in vein.						
10		221.40	222.50	Strong chl alteration and carb replacement/ intrusions. Carbonate shows no preferred orientation. Dissem aspy. Vein @ 331.49m, 1cm milky white qtz @ 75° to CA, no visible sulphides.			4			
10		222.50	223.28	Same as above. Aspy present in veinlets. Fractures showing no preferred orientation and are filled with aspy (90% ox'd). Disseminated aspy also present.						
10		223.28	224.03	Unaltered GND. Vein @223.32m & 223.33m, 1cm grey qtz @ 55°, 15% po in veins. Vein @ 223.84m, 0.5cm grey qtz @ 50°, 20% po in vein. Vein @223.93m, 0.5cm, grey qtz @ 50°, 1% py in vein.						
10		224.03	225.55	Unaltered GND. Vein @ 224.30m, 0.5cm grey qtz at 110°, 1% py, 20% ox'd. Vein @224.73m, 0.5cm grey qtz w/ calcite, @ 60°, 1% po in vein. Vein @ 225.09m, 1cm milky white qtz with carbonate, 3% po. Vein @225.29m, 0.5cm milky white, 5% po in vein. Broken grey qtz vein @ 225.50m. broken qtz vein @ 225.50						
10		225.55	227.08	Unaltered GND. Veinlets @ 225.70 & 225.83m, 0.2cm, milky white qtz @65° to CA, 1% po. Vein @ 225.91m, 1cm, grey qtz, @ 65° to CA, 1cm chloritic selvage, 1% aspy in vein selvage. Vein @ 226.17m, 1cm grey qtz @ 55° to CA, 1% aspy in vein selvage, 20% ox'd. Vein @ 226.45m, 0.5cm, grey qtz, @55° to CA, 3% po in vein.						
10		227.08	228.60	Unaltered GND. Vein selvages are chloritic. Vein @227.20m, 0.5cm, grey qtz @ 55° to CA, 0-2% po. Veinlets from 227.28-227.48m, 6 milky white qtz with 1 3% po. Vein @ 227.78m, 2cm grey qtz, @55°, 2% aspy in vein. Veins @ 228.01 & 228.05m, 0.5cm grey qtz @ 65° to CA, 5-10% po in vein. Vein @ 228.46m, 1cm, grey qtz @ 60° to CA, 1% aspy in selvage. Vein @ 228.54m, 0.2cm, qtz and carbonate, @55°, 5% py in vein.						
10		228.60	229.45	Unaltered GND. Veinlets present throughout. Vein @ 229.30m, 1.5cm milky white qtz @ 60°, broken, with 3% po.						
10		229.45	230.12	Weakly chloritized GND. Core is broken up. Disseminated aspy throughout core and veinlets. Vein @229.98m, 1cm, grey qtz @ 60° to CA, 1% aspy in vein.			1			
10		230.12	230.76	Unaltered GND. Sheeted vein set: Veins @ 230.18, 230.32, 230.45, 230.50 & 230.66m. 0.2cm, grey qtz, @50°, 2% aspy in margins, 1% py in veins

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:		Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		230.76	232.10	GND relatively unaltered except for ~1cm selvages around 0.2cm clear qtz veins, at: 231.01, 231.05 (40°), 231.22 (40°), 231.25 (50°), 231.29 (115°), 231.33 (70°), 231.56 (70°), 231.60 (55°), 231.86 (55°), and 231.91 (60°). Surrounding the clear qtz is milky white siliceous material. There are also planes of siliceous (bleached) GND. Sulphides conc. within clear qtz or silicified areas. Conc of po @ 231.78m (10% of 1cm silicified zone).	1	2	1	1		
10		232.10	233.61	Same rock as above. Qtz veins @ 232.15 (130°), 232.29 (60°), 232.39 (60°), *232.51 (60°), *232.67 (60°), *232.86 (60°), 233.02 (45°), 233.11 (45°). Veins with * contain ~5% po. Also present in this interval are low-angle milky qtz/ ser veins.	1	2	1	1		
10		233.61	234.05	Zone of chl/ser GND. Vein at 233.82m, only 0.2cm qtz clearly visible. Surrounding rock is silicified. Po and aspy disseminated w/in 1cm of qtz. 1cm gouge zone @ 233.94m (has <2% carbonate). Silicified zone at 233.88 has po & aspy.		3	2	1	1	
10		234.05	234.15	Zone of shear and high percentage of sulphides. Highly sericitized to show good slickenside lineation on broken face - approx. perpendicular to CA, also slickens in py. Zone is v. fine-grained ox'd py in thin laminations.	3	4	2	1	1	
10		234.15	234.56	GND altered intensely - ser/chl. Only qtz grains barely visible with no real structure. Clay alteration results in break at 234.30m. At 234.56m, one small qtz vein w/ ~15% aspy ends alteration zone.	1	4	3	1	1	
10		234.56	235.70	Unaltered GND except around 0.5-1.5cm wide qtz veins, at: 234.75 (45°), 234.84 (130°), 235.05 (20°), 235.10 (70°), 235.30 (45°). Sulphides concentrated at edges of veins throughout section in random orientations, but close to 90° to CA.		1	1		1	
10		235.70	236.90	First 20cm altered ser/chl between 2 qtz veins; then unalt'd GND btwn 0.5-1.0cm qtz veins @70° to CA, at: 236.0, 236.08, 236.28, 236.46, 236.74, and 236.91m. Also: regular fracturing @ 45° approx. every 15cm.	1	2	2			
10		236.90	237.35	Moderately chl/ser alt'd GND grades to gouge/ completely sericitized section 17cm long. Two qtz veins: at 237.06 & 237.16m, 1cm and 0.5cm thick, run at 50° to CA. Po + aspy (trace) seen at margins.	1	3	2	2		
10		237.35	238.92	Unaltered GND in between milky qtz veins. Vein @ 237.42m, 45°, 1cm, w/ cpy and po. Vein @237.45m, at 45°, 0.5cm, with aspy. Vein @ 238.6m, to 45°, 3.5cm, with po.	1	1	1			
10		238.92	239.44	Unaltered GND in between milky qtz veins. Bleached (silicified) section @ 239.35m, at 30° to CA, 2.5cm thick, 3% po. Carbonate veinlets to 25° have 0.5cm selvages.	1	1			1	
10		239.44	240.85	Ser/chl altered GND. More broken rock, crumbly, sericitic (clay) pervasive to 240.0m. Qtz veins: @239.5m, 40°, 0.4cm; @239.9m, 45°, 0.3cm; @240.1m, 70°, 0.2cm; @240.23m, 45°, 1.5cm (po, trace); @240.59m, 70°, 0.5cm (aspy, trace). Gouge section 1.5cm wide at 239.5m, to 130°. Unalt'd GND after 240.0m, except veins.	2	3	1		2	
10		240.85	242.35	More altered GND due to increase in carb veinlets in random orientations and calcite veinlet to veins at low angle (20°) to CA. One 2cm wide calcite vein @ 241.63m has geode-like quality (calcite crystallized into open space), 2cm wide, at 20° to CA, reaching to 241.85m. Qtz veins also present, overprinted by and fractured at calcite veins. Qtz veins: @241.24m, 45°, 1.5cm, 2% po; @241.64m, 2° (parallel to CA), 1.2cm, tr aspy; @241.90m, 40°, 1.2cm, 5% aspy; @242.0m, 45°, 0.5cm, 10% po.	1	2			4	
10		242.35	243.84	Chl/ser/cab altered GND; no linear features can be distinguished because of alteration. Some sections of bleached rock were likely sites of qtz veins and have disseminated aspy & po surrounding them, at 242.6m, 242.85m & 243.5m. At 243.78m, a 0.5cm vein of oxidized py denotes a shear plane w/ slickenside lineations in clay minerals. Alteration halo is 6cm wide on either side.	1	4	3	1	3	
10		243.84	244.53	Barely altered GND with 5 qtz veins: @ 243.97m, 25°, 0.5cm, tr ox'd po; @ 244.08m, 70°-20°, 1cm, 5% po, tr cpy; @ 244.14m, 30°, 0.5cm, no sulphs, @ 244.18m, 20°, 1.5cm, trace py; @ 244.28m, 20°, 1.2cm, no sulphs. Slickenside sericite on frac faces. Reg fracture angles are 55° and 145°.		2	1		1	
10		244.53	244.71	Zone of greater alteration. Remnant of qtz vein 2cm long visible. Fracture to 30° shows slicken lineation of sericite + py (5%); ser is powdery (clay alt'n). High conc of carbonate veinlets (random orientations)	1	4	2	1	3	
10		244.71	246.37	Unaltered GND w/ qtz veins (3mm, clear w/ milky edge). Veins: @244.77m, 15°, 0.5cm, 2% diss po; @245.48m, 30°, 1cm, tr po, 2% aspy; @245.82m, 40°, 1cm, 5% diss po. Bleached zone @246.26m contains ~10% po and 2% aspy. Xenolith 1cm by 4.5cm long at 245.76m parallel to C.A. Monazite; has conc of bt outside its rim in GND.	1	2	1		1

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		246.37	247.76	GND unaltered except zone of carb+ser weathering at 246.89-246.96m. Qtz veins: @246.76m, 45°, 1cm; @247.07m, 25°, 1cm; @247.29m, 40°, 2cm, tr aspy; @247.60m, 45°, 1.5cm. No sulphides except as noted.		2	2	1	1	
10		247.76	249.08	Unaltered GND w/ qtz veins & silicified zones containing sulphides. Siliceous planes: @247.80m, 50°, 1cm, tr po; @248.18m, 50°, 1cm, tr po+aspy; @248.56m, 45°, 0.5cm, tr aspy; @248.66m, 45°, -.5cm, 20% po; @248.81m, 50°, 1.5cm, tr po. Qtz vein: @248.38m, 50°, 3cm, tr po.		1	1			
10		249.08	251.04	Unalt'd GND except qtz veins: @249.51m, 50°, 1cm, 10% aspy; @249.56m, 40°, 0.5cm, 5% po; @249.78m, 40°, 1cm, 5% po; @249.93m, 45°, 1.5cm, 10% po; @250.08m, 40°, 2cm, 5% po, tr aspy; @250.28m, 60°, 0.5cm, 5% po; @250.51m, 45°, 0.3cm, 5% po; @250.73m, 45°, 1cm, tr cpy.		1	1			
10		251.46	252.13	Altered/bleached GND, 3 large (3-4cm) qtz veins with diss sulphides, @251.90m, 252.10m, & 252.84m. Both chl and sericite pervasive and on fracs. Core has bleached/green hue and is soft. Core is interpreted as being hydrothermally altered		2	1			
10		252.13	255.79							
10		255.79	255.93	Unit of bleached sericitic GND. Core has green hue. Within middle (255.86m), a 2cm thick qtz vein @70° to CA, with 1-2% aspy, subhedral crystals; indicative of hydrothermal alteration of GND during qtz/sulphide emplacement.		2	1			
10		255.98	258.00	GND has become more mafic w/ increased amounts of biotite and qtz has become more cloudy/milky grey. Perhaps chlorite is having an effect at a microscopic level? Aspy is the predominant sulphide w/in the last several meters prior to E.O.H.						
				E.O.H.

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-18.29			Casing						
10	18.29 - 258 (EOH)									
10		18.75	18.86	Fault gouge, clay is heavily stained by limonite, gouge contains red oxidized material, possibly hematite. Core is extremely broken and recovery is poor. Only one contact on fault can be seen. Interpreted angle of fault is @ 30° to CA.	4					
10		19.81	21.34	Within section, 2 vns, 0.75-1 cm thick of qtz @ 30-35 deg to CA can be seen. However, exact location imperceptible due to broken /poorly recovered core						
10		22.99	23.50	Core becomes sugary sand w/ heavy limonite staining, some red/brown clay (10%). no visible sulphides (difficult to constrain location due to poor core recovery). Some qtz eyes/chips are visible indicating possible veining with in section	4			1		
10		28.26	28.76	Hydrothermally altered to clay/sand. Remnant pieces of GND, sugar texture, heavy limonite staining, qtz eyes, etc. Core is severely broken, high core loss	4	2		5		1
10		28.76	35.20	no descriptions (KW)						
10		35.20	35.30	Lim stained clay zone. Zone of hydrothermal alteration as demonstrated by qtz eyes/gravel/pea-sized pieces of GND which looks to be in situ. Heavy lim, minor hematite and possible ox py.	1	2		4		1
10		36.50	37.65	Broken core; fracs w/ deep red powder (hem staining?), w/ limonite	2					
10		40.32	40.51	Clay gouge, and GND sand, qtz eyes present and clay was orange/red limonite/hematite stained indicating hydrothermal alteration either along fault surface or frac surface	2			2		
10		41.44	48.50	Possible sheeted vein system. Difficult to ascertain in areas due to core recovery and broken core, but veins appear ~ every 5 - 15cm apart and are @ 40-60 deg to CA with widths ranging from (1.5-0.5 cm) many w/ dissem aspy and po						
10		44.20	45.72	V. broken core, v. heavily encrusted by limonitic clay. Broken to sandy grvl texture.	2			3		3
10		46.05	47.00	Core appears to be silicified w/ uneven alteration of the mafics within the GND. There are sheeted clear qtz vns @ 40-45 deg to CA w/ minor diss aspy and po. Lim staining is pervasive.	3					
10		49.10	50.33	Core is extremely fractured to rubbly grvl. Heavy lim. coating. Abundant qtz pieces, possibly continuation of sheeted vn system. Section weathered to clay with some qtz eyes + mafics visible, no noticeable sulphs present.	2	1		1		5
10		50.33	51.82	Mod-Highly alt'd GND with pc's 0.1-8cm well ox'd. Relict grey qtz vn at 51.58m, 2cm wide. Totally ox'd sulphs (pyrite~5%) & hem (5%). Orientation not available (just a loose chunk).	4			1	2	
10		51.82	53.27	Increased competency, core pc's to 24cm in length. Lines of ox'd sulphs define relict qtz vns: @52.0m, 0.5cm, 35°, 15%aspy, 10%py; @52.2m, 0.4cm, 65°, 10%aspy, 5%py; @52.5m, 1.0cm, 40°, 20%aspy, 10%py; @52.6m, 0.3cm, 50°, 20%aspy, 10%py; @52.6m, 0.5cm, 50°, 5%py.	2				1	
10		53.27	53.51	Same material as 50.33m interval. No veins visible.	4			1	2	
10		53.51	54.86	Same material. One relict qtz pc. w/ ox'd py, 1cm wide, no orientation, @54.3m. Grey qtz, 1.5cm wide, 10% ox'd py @54.5m.	4			2	2	
10		54.50	54.86	Zone of extreme weathering to sand-sized particles.						
10		54.86	56.39	Same highly ox'd GND. Trace py, 90% ox'd. No veins visible.	3			1	1	
10		56.39	57.91	Red staining due to ox'd hematite on fracs. Surfaces moderately-alt'd GND. Qtz vn on 4cm$^{2\ block}$ @ 57.22m, 1.5cm wide, tr ox'd py.	3				1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		57.91	59.44	Mod'ly alt'd GND. Disseminated ox'd py (2%) throughout section. Broken into avg 5cm chunks. Qtz vn relict @ 59.43m, 1cm wide, tr ox'd py. Carb (siderite/calcite) minor on weathered vnlet srfc's.	2				1	
10		59.44	60.96	Poor recovery (28%). Mod alt.	2					
10		60.96	62.48	Mod-highly alt'd GND	3			1	1	
10		62.48	64.01	Silicified zone (relict qtz vns): @ 62.69m, 1cm wide, 2% ox'd py, @62.50m, 40°, 1.5cm; @63.20m, 30°, 1cm, tr aspy.	2				1	
10		64.01	64.20	Zone of predominant qtz. Very broken up but vn appears to be >5cm wide. Ox'd py ~10%.	1				1	
10		64.20	65.53	Highly alt'd GND. 'Pure' gry qtz ~1cm thick seen @ 64.25m and 64.30m. Few low angle to CA vnlets of ox'd carb material.	3			1	1	
10		65.53	67.06	Qtz vns @ 65.57m, 0.5cm, 55°, 1-3cm selvage; @65.82m, 1cm, 50°, tr ox'd py; and @67.0m, 45°, 0.3cm, tr ox'd py. Fracture here has movement-induced orientation, shown in calcite. Highly alt'd zone follows, 2.5cm wide.	2			1	1	
10		67.06	67.25	Minor altered GND except on veinlet fractures, where aspy is 95% oxidized to black (scorodite). One qtz vn @67.15m w/ ox'd py (10%) concentrated at centre. Total width 0.5cm with 1cm selvage, at 60° to CA.	1				1	
10		67.25	68.58	Moderate to highly altered GND	2			1	1	
10		68.58	69.63	Competent core. Unaltered to minor ox'n alteration at 10cm alternating sections. Grey qtz veins @ 68.62, 68.65, 68.84, 68.91, 69.10 & 69.15m. Ox'd py (10%), and ox'd aspy - scorodite (~10%).	1	0	0	1	1	
10		69.63	70.10	Highly altered section. One piece clear quartz <1 cm in diameter amongst rubble	3			2	1	
10		70.10	71.00	Relatively competent core with quartz veinlets surrounded by oxidation (1cm selvage). Veinlets @ 70.15, 70.26, 70.42, 70.55 & 70.67m - width 0.2cm @ 40° to CA, contain 3% ox'd py and up to 20% aspy.	1			1	1	
10		71.00	71.63	Zone of intense alteration. Rubble; few subrounded, cloudy grey quartz pebbles.	3			3	1	
10		71.63	72.90	Poor recovery (50%). Moderately altered GND; broken up core. Oxidized on vein fractures. Internal structure lost to ox'n weathering	3				1	
10		72.90	73.60	Extremely weathered section. Clay texture with few quartz/GND chunks, up to 5 cm. Altered sericitically and oxidized to 71.25m where rock becomes more competent, to 15 cm lengths. Overall colour is light orange-brown.	4	2		2		
10		73.60	74.52	Orange-brown colour continues on relatively competent rock (20cm lengths max). Diss aspy 1% and ox py 15%. No relicts	5			1	2	
10		74.52	74.80	Extremely altered section, as at 72.9m. Intense scorodite in latter half (red brown to black). Core yellow, soft and granular.	5			2	1	
10		74.80	76.22	Highly altered section. Overall color is pale yellowish brown. ~15 rusty veinlets @ 90° to CA (0.1 to 0.5 cm) run through entire section and rusty patches up to 1cm in diameter speckle it. Py ~8%, diss aspy throughout, 2%. Scorodite on fractures + carbonate (siderite?). Clay minerals as well on fractures (powdery white).	5			1	2	
10		76.22	76.92	Extreme alteration in GND. Whole section is thick clay texture, pale yellowish brown to mustard yellow. Some remnants of GND: quartz eyes and powdery white clay alteration of feldspars. Carbonic alteration is not in clay, but in sandy areas. Patches of sericite with pearly lustre, ~2 cm, irregular shape.	5	2		4	1	
10		76.92	77.45	GND is broken to gravel size rubble. No visible qtz pieces to infer veining, but core recovery is poor.				5	1	1
10		77.45	78.10	Clay seem: rusty yellow, uniform, w/ qtz eyes. This indicates hydrothermal alt'n or faulting, poor recovery so interpretation is inconclusive. No visible sulphides however limonite is pervasive and coats broken core.						
10		78.10	81.33	Core is very broken. Few qtz vein pieces noted, carbonate veinlets are fracture-filling and are x-cutting each other but do not appear as pervasive. Lim coating on fractures continues to be abundant.				1	1	5
10		82.45	84.77	Sheeted vein unit. Vn's are increasing from 0.25cm to 2-4cm. Thick, milky vn's w/ dissem aspy (tr-1%) in half of vn's. Qtz vn's @ 40-50° to CA. Qtz vn's typically spaced ~10-15cm apart. Veins @ 82.91, 82.98, 83.15, 83.19, 83.24, 83.96, 84.16, 84.44, 84.47, 84.56 & 84.77m. Veins are 1-2cm thick, @40-50° to CA.

UNIT CODE	From → To:	GEOLOGICAL DESCRIPTION From	To:	Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		85.68	86.45	At 85.68m, a 2cm thick qtz/sulphide (aspy ~1%), @40-50° to CA. At 85.85m, a 1cm thick qtz vein (milky to clear) w/ trace dissem euhedral and subhedral aspy @35° to CA. At 86.13m, a 1cm thick qtz vein @40° to CA, w/ trace diss aspy (subhedral grains) along vein margins.						
10		86.45	91.55	Brkn, rubbly, gravel sized GND, no structure visible but qtz vn pieces visible w/ tr dissem aspy						
10		89.92	91.44	V. poor recovery (22%). Broken up core, ~2cm blocks, on average. Mod alt'd GND. Two qtz vein floats 1-2cm w/ ~5% ox'd py. One coherent qtz vein w/ tr aspy on margins, trace ox'd py throughout.	1				1	
10		91.44	92.96	Mod alt'd GND. Monazite xenolith. @ 91.52m. Unalt'd patches of GND show on fresh faces, shapes irregular approx 3cm in diameter. Surrounded by brown-tinted (ox'd) GND. Regular fracture angle @75° to CA. Lim staining on fract faces. Qtz veins: @92.40m, @45°, 1cm, 5% aspy throughout, tr ox'd py; @92.60m, 50°, 0.5cm, tr aspy, tr ox'd py; @93.22m, 40°, 1cm, tr aspy, tr py; @93.32m, 45°, 1.3cm, 5% aspy (margins), tr py (ox'd).	2				1	
10		92.96	93.85	Mod→high alt'd GND. Overall colour is yellowish brown except unalt'd patches ~3cm in diameter, w/ irregular boundaries. Qtz veins: @93.30m, 35°, 0.6cm, tr aspy; @93.38, 30°, 1.5cm, 5% ox'd py; @93.42, float, 1cm, 2%py; @93.58m, 120°, 1cm, 10%aspy (50% to scor), tr py (50% ox'd).	2				1	
10		93.85	94.49	Moderately alt'd GND w/ patches of unaltered, irregular edges. Section infused w/ randomly-oriented veinlets of carbonate, oxidized to limonite. Veinlet @94.15m, to 30° is >30% sulphides (ox'd py - 90%, aspy - 10%), surrounded by unalt'd GND. Qtz vein @94.45m, 50°, w/ 10% ox'd py, 0.5cm wide. Some scor w/ lim on frac faces.	2				1	
10		94.49	96.01	Seven regular fractures throughout section @30°. Qtz veins: @95.50m, 2cm, 20°, tr ox'd py, tr aspy; @95.59m, 1cm, 45°, 10% ox'd py, diss ox'd py throughout rock from 95.59-95.85m; @95.8m, 1cm, 45°, tr po, aspy; @98.85m, 0.5cm, 45°, 5% aspy.	2				1	
10		96.01	97.54	Section mod alt'd GND. Qtz vein @ 96.11m, limonite stained, to 40°, 0.5cm, w/ 5% ox'd py. More qtz veins: @96.27m, 40°, 1cm; @96.33m, 40°, 1cm; These two veins have 1cm2 patches of aspy and surface ox'n ~7% of vein. More qtz veins: @96.60m, 1cm, 30°, tr aspy, tr ox'd py; and @96.62m, 1.5cm, 55°, tr ox'd py, tr scor'd aspy.						
10		97.54	99.15	Continuation of sheeted vn unit. Veins are typically at 40-45°, spaced10-15cm apart w/ widths ranging from 0.25-1cm thick. Veins are milky white qtz, w/ trace aspy or py sulphide disseminations. Some selvages seen but do not typically indicate ox'd sulphides, perhaps vugs. Veins: @98.16m, 0.5cm veins, @40°, tr aspy; @98.53m, 0.5cm wide, @40°, tr aspy.	1	1			0	
10		99.94	100.78	Clay alt'd GND (possible fault acting as fluid conduit). Core is severely alt'd w/ "bb sized" qtz eyes, and small sand-sized pieces of unalt'd GND, all of which are heavily lim-stained, both on surface and pervasively. Some indication of quartz veining from pieces. Clay is yellow/rust-coloured. No visible sulphides.	2	1		5		1
10		100.78	103.00	At 102.49m, a 1cm vein @35° to CA; qtz/carb vein - carb on margins, qtz 0.25-0.3cm thick within center, carrying dissem aspy (trace).		1			2	
10		103.00	109.21	From 103.0m onward, core demonstrates an obvious reduction in limonite (but still on fractures), increased competency, recovery notably higher. At 105.10m, **possible gold location**: a 2cm thick qtz vein @40° to CA, with minor pervasive limonite staining has a very faint grey qtz vein w/ py x-cutting @15-20° to CA. Sulphides noted are within the 20° vein, not in the 40° one. The 20° and 50° dip of hole makes 70° to surface which may be the gold source. The vein @ 20° was v. subtle. At 105.24m, first appearance of ox'd po dissems w/in qtz vns @50° to CA. @108.14m, a 7.5cm qtz vein at 35° to CA.	2

10		109.21	109.94	Alt'd GND. Brown/tan/rust colour. Mafics absent and replaced abundantly, with sericite and chlorite. Limonite is pervasive and on fractures, sulphides partially ox'd, where visible.	2	2	1		1	
10		109.60	110.80	Same as above, however several 1.5cm qtz veins are running within beginning and end of unit. @ 109.79, 109.90, 109.99, 110.14 & 110.24m, 0.5-1cm thick milky qtz vns, @35° to CA, w/ tr dissem aspy. @110.78, a 7cm milky qtz vein @35° to CA.						
10		110.80	111.94	no descriptions (KW)						
10		111.94	112.06	V. fine, uniform, brown clay seam, looks like chocolate ice cream. 100% clay.				5		
10		112.06	119.91	no description (KW)						
10		119.91	120.40	Slightly alt'd GND, pervasive limonite on fractures. Good recovery. Veinlets @120.08m, to 55°, 20%py.	1	1				
10		120.40	121.92	Unaltered GND with limonite in fractures. Qtz vein @ 120.51m, 3cm, milky white, 35°, 20%po. Vein @121.46m, 1cm, milky white, @45°, 20%po, 5%aspy in vein						
10		121.92	123.44	Lim pervasive in fractures. Qtz veins: @121.98m, 50°, 1cm, grey qtz, 5%po in veins; @122.39m, 50°, 1cm grey qtz, 10%po in vein; @122.46m, 50°, 1cm grey qtz, 5%po in vein; @122.92m, 45°, 1cm grey qtz, 5%po in vein; @123.44m, 50°, 1cm grey qtz, 10%po. Veinlets throughout section w/ 10%po and 5%aspy.	0					
10		123.44	124.20	Pervasive lim in fract. Moderately ox'd around veins. Veins: @123.61m, 1cm at 35°, milky white qtz, 1%aspy in margin; @123.73m, 2cm at 55°, grey qtz, 10%py in vein; @123.78m, 3cm at 55°, grey qtz, 5%py; @123.95m, 2cm at 55°, grey qtz, 20%po; @124.05m, 1cm at 55°, grey qtz, 10%po in vein, 5%aspy in margin.	0					
10		124.20	124.46	10cm qtz vein at 50°, 0.1% moly in vein. 10%py in smaller veins at 60°, cut by larger or may be offshoots.	0					
10		124.46	124.97	Mod'ly alt'd GND, pervasive lim in fractures, core is broken up. Vein @124.22m, 4cm grey qtz, at 35°, 1%aspy in margins. @120.66m and 120.83m, 1cm grey qtz at 35°.	3	2				
10		124.97	125.77	Mod alt'd GND. Vein @125.49m, 1cm milky white at 30°. No sulphides.	3	2				
10		125.77	126.98	Slightly alt'd GND. Veinlets common at 55°, 5%py. Vein @125.97m, 2cm grey qtz at 55°, 1% aspy in margins, 5% py in vein.	1	1				
10		126.98	127.57	Mod alt'd around fractures and veinlets at 60°, 5% aspy in veinlet selvage.	3	2				
10		127.57	128.02	3cm qtz vein at 55°. Grey, with 1%aspy in margin. Trends to zone of high alt'n. Clay rich with qtz eyes and GND fragments. Possibly hydrothermal alt'n or shear zone. Qtz vein near zone is fractured and offset in multiple locations - microfaults. @127.80m, 3cm zone of gouge, at 40° to CA, contains fragments of qtz vein, possible fault.	2	2	1			
10		128.02	128.45	Broken, altered GND. @128.27m, broken qtz veins in sugary GND; possible fault. @128.18m, GND alters to clay. Qtz eyes present with GND fragments - possibly hydrothermal. Vein @128.38m, 2cm grey qtz at 45°. No visible sulphides.	3	1				
10		128.45	129.54	Fractured GND w/ lim on fracts. Vein @129.05m, 1cm grey qtz at 50°, 3%aspy in vein, 80%oxidized.	1					
10		129.54	130.08	Slightly to mod'ly alt'd GND w/ disseminated aspy. Vein @129.79m, 2cm grey qtz at 35°, 3%py in vein, 1%aspy in margins.	1

UNIT CODE	From → To:	From	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		130.08	131.06	Unalt'd GND. Veins, grey qtz: @130.16m, 2cm, 30°; @130.36m, 0.5cm at 50°; 10%aspy; @130.41m, 0.2cm at 50°, 1%aspy; @130.55m, 1cm at 50°, 8%py; @130.77m, 1.5cm, at 50°, 5%py.						
10		131.06	132.59	Slightly alt'd GND, limonitic fractures. Veins: @131.38m, 0.5cm grey qtz at 60°; @131.88m, 0.3cm grey qtz @50°, 10%py, @131.95m, 0.5cm grey qtz at 50°, 5%aspy; @132.00m, 2cm grey qtz @50°, 10%aspy, 3%cpy, @132.06, 0.3cm grey qtz, 5%aspy, at 50°.	1	2				
10		132.59	134.11	Unalt'd GND; lim on fractures, veinlets running at 40°.						
10		134.11	134.81	Slightly alt'd GND. Fractures at 55°.	2	2				
10		134.81	135.64	GND is bleached; <1%bt present; disseminated aspy present		2	1			
10		135.64	136.88	Lim on fractures. GND alt'd to grey-green.		1	2			
10		136.88	138.02	Core is highly fractured and broken. Clayey gouge present @ 136.91m, 137.62m, 137.91m @ 45deg to CA. Qtz eyes and broken GND in clay - possible hydrothermal or shear	2	2		4		
10		138.02	139.52	Oxidized GND @ 138.68m becomes gouge ± GND frags. Decomposed GND: qtz eyes and frags present in clay - hydrothermal or shear	2	1		2		
10		139.52	139.98	10cm qtz vein @ 30°. Vein is fractured and shows slickensides on a 30° fracture @139.60m. 5cm qtz vein @ 30° at 139.76m.				3		
10		139.98	141.05	Unalt'd GND, oxidized @139.98m to 141.05m. At 140.75m, core is altered to rust brown, minor sericite, core is weaker, yet competent, but more easily broken	2	1	1			
10		141.05	141.73	Vein @141.37m, 1cm white qtz @30°, 5% aspy, crosscut by 0.3cm grey qtz vein at 60° to CA						
10		141.73	143.26	Unaltered GND. Veins appear to be sheeted set. Minor lim on fractures. Moly found in veining at 143.06m	0					
10		143.26	144.69	Minor lim on fractures						
10		144.69	150.78	At 148.86 a 2 cm x 5cm bleb of diorite as a xenolith within GND, no chilled margin						
10		150.78	150.88	Altered zone with 3 cm qtz vein adjacent. Contact angles at 40° to CA. Core is brown with qtz eyes as breccia within brown sericite matrix. Core is soft yet competent	1	2	1			
10		150.88	159.40	no descriptions (KW)						
10		159.40	163.50	Sheeted vn system. Veins are spaced about every 5-10cm @ 35-50° to CA, with avg thickness 1cm+ . Only recognized sulphide present is diss po, trace to 1%.						
10		163.44	164.59	Altered GND Core is stained heavily (pervasively with lim) and on fractures. Core is mod'ly broken to large gravel sizes. Chlorite prevalent in section, several 3cm veins within unit which may have been conduits of hydrothermal fluids. No visible sulphides. Contact at 163.44m is marked by a 3cm vein @ 40° to CA. The 164.59m contact is less abrupt but @40° to CA, with a marked decrease of pervasive limonite easily recognized by color change and core competency.	3	1	2	0	0	
10		164.59	166.33	GND has a noticeable decrease in veins per m, core is more broken, with lim heavy on fractures, and mod to low pervasively within GND	2	1	1

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		170.69	171.15	Chloritized, altered GND. Core is green/brown with sericite, mod soft. @170.69m, core abruptly alters with initial pervasive lim progressing to chloritization. Contact occurs parallel to central vein in unit @45° to CA. Diss aspy with vein and surrounding 10-15cm of GND (~1%).	3	2	2	0	0	
10		171.15	172.20	Lim stained core decreasing with lim only on fractures @172.20m.	1	1	0			
10		172.21	173.74	Zone of high alteration, colour orangey brown. Reg. fractures at 35° (8), limonite pervasive. Tonalite xenolith at 172.6m, approx. 2 by 5cm.	2			1	1	
10		173.74	175.26	Mod'ly alt'd GND. 1cm^2 xeno of tonalite within largest quartz vein at 174.56m.	2			1		
10		175.26	176.26	Highly alt'd GND. Fractured, colour orangey brown.	2	1		1		
10		176.26	176.78	Wide zone of qtz - 24cm. Crosscut by veinlets filled with lim (176.26m to 176.50m).	1	1				
10		176.78	177.44	Unaltered GND	0	1	1			
10		177.44	178.31	Unaltered GND w/ qtz veins	0	2	1			
10		178.31	179.83	Unaltered GND	0					
10		179.83	180.81	Altered patch, 5 by 8cm, green coloured, irregular edges, 2%po						
10		180.81	181.55	One large, branching qtz vein. Tonalite xeno 3cm by 6cm, rounded edges w/ 2mm reaction rim.		1			1	
10		181.55	183.00	Broken up GND (max length of core 20cm). Unaltered.	2	1			1	
10		183.00	184.40	Extremely altered GND. One branching qtz vein. Colour is yellowish-white. Rock is crumbly and clay-rich. Weak slickenside lineation shows on sericite/limonite fracture faces - shear zone.	4	3		2	2	
10		184.40	185.10	Fractures near parallel to CA infilled with limonite and sericite.	3	2		1	1	
10		185.10	185.50	Silt layer, med brown mud with ~5cm blocks of GND.	1					
10		185.50	186.68	Unaltered GND.						
10		186.68	188.80	Unaltered GND.	1	1				
10		188.08	189.31		2	2			1	
10		189.31	190.50	Unaltered to lightly altered GND	2	1			1	
10		190.50	192.02	Mod alt'd GND. Lim on fractures. Overall colour is whitish green w/ 0.5cm selvages	1	4	2		1	
10		192.02	192.88	GND as above. One qtz vein running nearly parallel to CA goes through core for 34cm, but is only 1cm wide. Shear/gouge section at 192.54m is approx. 2cm wide; altered to white clay texture.	1	4	2	1	1	
10		192.88	193.56	Extremely altered zone to 193.20m, where alt'n becomes moderate. Colour whitish-pale brown. Regular breaks parallel to CA (4).	4	3	0	1	1	
10		193.56	194.47	Mod'ly alt'd GND, as at 190.5m.	3	3	1	1	1	
10		194.47	195.51	Mod'ly alt'd GND, as at 190.5m	1	3			1	
10		195.51	196.60	Mod'ly alt'd GND, as at 190.5m	1	2				
10		196.60	198.12	Mod'ly alt'd GND, as at 190.5m; random fracture orientation	1	2

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-278C

PROJECT: Dublin Gulch - 1735

GROUND ELEVATION: 1037m

BEARING: 000 | DIP: -50°

DATE STARTED: June 1 2005 | DATE COMPLETED: June 4 2005

COORD SYSTEM: NAD 27: 459713E — EASTING: 459713 NORTHING: 7099325

COORD SYSTEM: NAD 83: 459593E — EASTING: 459593 NORTHING: 7099509

NAD 27 (CORRECTED for historic grid): — EASTING: 459783 NORTHING: 7099335

LOGGED BY: Melodie Stone, Terry Croteau, Kristian Whitehead

SECTION LINE 459675 (historic grid)

CONTRACTOR: Britton Brothers

DRILLING DETAILS

Hole Diameter: HQ

Overburden: 19.81m

Deviation:

Casing: 19.81m

Core Size: HQ

Cement (# Bags): 0

Plug Depth: N/A

Notes: No plug necessary.

SAMPLING DETAILS

Sample Sequence: B291480 to B291499 and B291500 to B291609

Requisition #: MASP44855STRGOL.05Q — Date Shipped: 8-June-05

Lab Record #: VA05045519 and VA05044876 — Date Received: 13-June-05

Sample Sequence: B291610 - B291631

Requisition #: MASP44855STRGOL.05Q — Date Shipped: 8-June-05

Lab Record #: VA05046431 — Date Received: 13-June-05

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41; BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1		0.00	19.81	Casing (no core recovery)						
10	19.81-20.25	19.81	20.25	GND / qtz and shale-like metasediments (argillite), gravel sized pieces. Unable to discern whether metaseds due to abundant qtz and granodiorite pieces, however contact / lithology change is proximal. The drill set-up appeared that collar was in metaseds (?). (poor core recovery / and v. broken core). I would interpret this to be the MSED/GND contact.	1					
80	**20.25-26.05**	20.25	23.60	MSED, core is v. broken w/ limonite staining on fracs and pervasive within foliations. Metaseds appear as dark brown to black, fine-grained, less than 1mm thick foliations which have suffered moderate silicification determined by the inability to scratch core with a nail. Foliations are, within the first few feet, at 45° - 55° to CA, with the appearance of foliation angles changing due to folding episodes at a local level. No visible sulphides present however minor hematite staining is observed on some pieces of core. Qtz pieces indicate that veins are both x-cutting and are on foliation. No visible sulphides within the qtz pieces noted. Core recovery is approx 40%. At ~20.50m, silicification diminishes and core becomes essentially argillite (core can now be scratched by a nail).	1					
80		23.60	25.00	From 23.60-23.74m, core becomes qtz eyed; clay gouge with yellow /brown coloring. Appears as hydrothermally altered, possible fault zone.	2	1		3		
80		25.00	26.05	From 25.00-25.91m, argillite has multiple vn sets within it and has thickness of veins ranging from 0.25 - 1cm thick, milky coloured. At 25.60m, 2 vns x-cut each other at 35° and 155-160° to CA. No visible dissem sulphides present. Limonite on fractures but less pervasive on foliation. Core section was poor core recovery but competent core pieces were available for logging.	1					
10	**26.05-65.53**	26.05	30.48	Granodiorite/argillite contact, GND continues on. Core is broken to rubbly gravel; few structural bits intact for logging, lots of qtz pieces.	1			1		
10		30.48	32.00	GND altered to sand-sized pieces. Core is not bleached, heavy limonite staining. Visible qtz pieces indicating veins present. Minor clay mostly sand, mafics easily visible. Core essentially looks weathered to rotten.	2			1		
10		32.00	33.53	Core recovery is poor and core is extremely broken, however it appears as though there is a sheeted qtz vein system occurring, due to the abundance of qtz pieces in the rubble. No visible sulphides noticed w/ in the qtz pieces. Heavy limonite on fracs and pervasive.	2			1		
10		33.53	35.20	Core recovery is very low however several episodes between gravel pieces to clay sections w/ qtz eyes w/ heavy limonite straining on fracs and pervasive. Hydrothermal alteration is evident throughout this particular section, no sulphides noted. Clay is rusty brown and uniform. Remaining core is of sandy gravel consistency.	2			2		
10		35.20	38.10							
10		38.10	39.62	Core has same characteristics as above (33.53-35.20m). Possible hematite staining on fracs.	2			1		
10		39.62	41.15							
10		41.15	44.20	Highly digested GND, mafics intact but core is abundant w/ sericite. Core is salt/pepper in appearance & crumbles when touched. No coherency. Limonite is extremely pervasive & on fracs. Minor 10-15cm units of rusty coloured clay seems very indicative of hydrothermal alt'n.	3	1		1		
10		44.20	45.72	Core becomes much more competent, but limonite on frac/selvages & is pervasive. Ox'd py w/in some vns/vnlets pieces show red rust blebs (may be well-ox'd pyrite).	1					
10		45.72	47.24	Core is extremely broken w/ poor core recovery. Core is sandy gravel in texture w/ v. abundant limonite & bits of ox'd py. Some clay seems relict.	3	1		1		
10		47.24	48.77	Core is essentially a clay gouge. Alt'n zone - Core in places is somewhat preserved, mafics are intact w/ limonite & sericite on fracs & pervasively. Qtz eyes visibly intact. Some indications of veins. Minor hematite staining & ox'd py pieces w/in qtz pieces.	3	1		3		
10		48.77	53.61	Core is extremely broken to sandy gravel or to clay seams. Core recovery is ~50-65%. Limonite is pervasive & abundant, sericite is on fracs & w/in selvages. Mafics are still intact & highly ox'd py can be seen as relict orangey-red blebs on qtz pieces & in broken pieces of core.	4	3		2		
10		53.61	55.53							
10		55.53	55.58	Clay seam w/ qtz eyes, clay is of rusty uniform color. Minor reddish staining on 55.58m contact surface indicating ox'd py (essentially an alt zone).	3	1		4		
10		55.58	55.80							
10		55.80	59.44	Core is very uniformly hydrothermally alt'd to soft, mushy, sandy clay w/ heavy pervasive limonite. Sericite is observed in relict selvages & fracs. Qtz eyes 'bb'-sized abundant. Core looks like it has been digested by meteoric waters. Some reddish blebs & stains reminiscent of former py, not a lot of visible vns. Mafics are preserved where clay is less abundant. Core loss is @ ~80%, thus good representation of actual unit.	5	3		4		
10		59.44	60.96	GND altered to clay/crumbly texture. Colour is orangey-pale brown. Aligned qtz pebbles denote old veins. Carbonate is siderite >calcite.	3	1		3	2	
10		60.96	62.48	Qtz eyes and relict feldspars left in crumbly mess. Ox'd hematite present. Sericite aligned at ~15° to CA	4	2		2	2	
10		62.48	64.01	Colour whitish yellow to orangey brown. Qtz vein at ~62.9m, grey qtz.	3	2		3	2	
10		64.01	65.41	Colour a more medium-dark brown. Crumbly-clay gouge GND. Clear-milky qtz veins	4			3	2	
10		65.41	65.53	Large qtz vein w/ lim on fractures. Diss ox'd py throughout. Ox'd hematite present ~3%	1				1	
90	**65.53-66.00**	65.53	66.00	Qtz vein at 65.53m. Section is argillite (MSED); fine mafic laminations define meta-beds. Felsic section at 65.7m (QZZ) with diss ox'd py, muscovite (15%). Microfolds visible on the cm/mm scale. Ox'd hematite (10%) in mafic sections.	4	1		4	1	
10	**66.00-179.83**	66.00	67.06	Clay to crumbly GND. Largest pieces ~2cm square. Clear qtz pebbles noted at 3 depths	4	1		3	2	
10		67.06	68.58	Highly to extremely altered GND. First 20cm is somewhat coherent core (10cm chunks). After that gouge-clay texture. More competent GND below qtz vein relict, for ~10cm. Gouge to end.	4	3		3	2

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		68.58	70.10	Mod. to highly altered GND. Core coherent from 69.15m with only minor clay alt'n. Oxidation throughout. Colour pale brown.	4	3		2	2	
10		70.10	71.63	Grades from competent (but mod. altered) to highly altered GND. Diss ox'd py throughout section (one patch 1cm^2 near qtz vein)	4	4		2	2	
10		71.63	73.15	Colour orangey pale brown. Core fairly competent, recovery good (89%).	2	1		2	1	
10		73.15	79.25	Mod - highly-altered GND. Colour white-pale brown. Qtz, feldspars, and most bt still in situ with some (30%) alt'n of feldspars to clay (opaque, white) minerals. Matrix material all altered. Qtz veins overprinted by alteration, so they are broken and little to no selvage present. Qtz veins broken and selvage overprinted by alt'n.	3	2		3	1	
10		79.25	80.77	Moderately to highly altered GND trending to gouge @ 79.33-79.67m. Gouge contains decomposed GND frags and a possible remnant quartz vein. 5cm broken qtz vein @ 79.92m	2	1		2		
10		80.77	81.52	Core broken into fragments up to 6 cm, becoming more altered to sericite @81.13 -81.37m. 4cm fractured and oxidized grey qtz with carb vein @81.30m.	1	3		2		
10		81.52	82.55	Clayey gouge dominant with 9cm section of moderately altered GND @82.30m	1	2		3		
10		82.55	83.82	Slightly altered GND with lim on fracs. Core is highly fractured and broken. Fractures predominantly @ 80-85° to CA	1					
10		83.82	85.34	Moderately altered, less fractured and broken. Lim on frac. @83.71m, 2cm clayey gouge @ 45° to CA - shear.	2	1		1		
10		85.34	86.87	Less altered, becoming broken and clay rich @85.94m. Broken qtz veins present in clays, appear offset --possible small scale fault/shear.	1			3		
10		86.87	87.40	Slightly altered GND, more competent	1					
10		87.40	87.77	Zone of fractured and offset qtz veins. Offset sinistrally @50°.	1					
10		87.77	88.24	Unaltered GND trending to carb alt'n after 87.98m	0	1			3	
10		88.24	88.92	Ox'd GND. Qtz veins offset @50°, appears sinistral. Lim on fractures.	2			1		
10		88.92	91.44	Core fractured at 50°, same as the offset angle of the quartz veins						
10		91.44	94.49	Moderately altered GND with lim on fractures. GND has sugary, mushy texture with higher clay content towards end of interval. Qtz veins are fractured or broken.	2			3		
10		94.49	96.01	Intensely altered to clay from 94.49-94.79m. @94.79 ~1m shear zone. Lineation @130°. Winged porphyroblast @96.46m, parallel to lineation direction and shows a sinistral rotation, indicating shear sense. Qtz vns present are broken and sheared. Shear zone is grey-green.	2			1		
10		96.01	96.14	Clay gouge, qtz eyes present - possible hydrothermal alteration, likely related to shear zone above.	1			3		
10		96.14	96.68	Moderately altered GND	1	1		3		
10		96.68	98.28	Broken GND, lim staining, sugary texture. Qtz veins are broken.	2			3		
10		98.28	99.06	Moderately altered GND						
10		99.06	99.68	At 99.06m is a 4cm clay gouge - fault/shear zone. Then, moderately altered GND, lim on frac, more competent than above. Fractured @ 99.48m.						
10		96.68	100.58	Broken GND, Lim on frac						
10		100.58	101.58	Unaltered GND. Fragmented @ 101.46m. Vein @ 100.96m.						
10		101.58	102.11	GND fragmented until 100.68m, becomes fractured w/ lim on fracs						
10		102.11	102.73	Mod'ly alt'd GND. Pervasive lim	2	1		2		
10		102.73	103.63	Broken GND frags (max 6cm). Lim on frac.	1					
10		103.63	103.94	Mod alt GND. Reddish brown colour	3					
10		103.94	104.43	Less altered	1					
10		104.43	105.36	Intensely altered GND. Sugary texture, qtz eyes present w/ GND frags. Qtz veins fractured and offset	3	2		2		
10		105.36	110.51	Intensely altered GND. Core is yellow-beige w/ rusty patches. Qtz eyes, bt and GND frags present in clay. Veins are fractured or broken. Hydrothermal alt'n on shear zne. No obvious lineation or orientation indicators	2	2		3		
10		110.51	111.88	Slight to mod alt'n in GND. Core is fractured w/ pervasive lim as well as on fracs	2	2		1		
10		111.88	113.08	Core is fractured and broken. Qtz veins present, but broken	2	1		1		
10		113.08	114.44	Mod'ly alt'd GND. Sugary texture; becomes more altered to clay @114.12m	1	1		2		
10		114.44	115.52	Fractured GND. Lim on fracs	1					
10		115.52	115.82							
10		115.82	116.83	Mod'ly alt'd GND. Overall colour is med brown w/ alignments of yellow clay minerals (w/ sulphur?). Limonite, including siderite, on fracs	4	1		2	1	
10		116.83	117.90	Minor alt'n in GND. Veinlets noted here because they're different in appearance - straight w/ large selvages; Set of 2 veinlets @117.45 to 117.50m	1	1			1	
10		117.90	119.06	Minor alt'n in GND. Qtz/carb veins have large selvages. Shear sense indicator (drawn), sinistral movement.	1	1	1		3

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		119.06	120.24	Unaltered GND where selvage from large qtz veins not affecting	1	1	1		1	
10		120.24	120.67	Mod'ly alt'd GND	1	2	1	1		
10		120.67	122.09	Unaltered GND. Lim on fracs	1	1				
10		122.09	123.63	Unaltered GND. Lim on fracs; sericite weathered to clay minerals on fracs	1	1		1		
10		123.63	124.97	Minor to unaltered GND. Po. Is pale bronzy silver coloured. Highly altered section (ser=1, chl=3, carb=3), from 123.80 to 124.00m.	1	2			1	
10		124.97	126.49	Unaltered section of GND w/ 7 congruent qtz veins. Aspy/scor concentrated at margins of straight, narrow veins. Some calcite along veins as well (~10%). 5cm x 3cm bleb of alt'd GND, to dark grey. Bt crystals still visible, few small (2mm) qtz crystals as well. Weakly magnetic; Hematite/magnetite(?) @125.18m.					1	
10		126.49	128.02	Unaltered GND except selvages					1	
10		128.02	128.68	GND dominated by silicified selvages of qtz veins. ~10cm gaps between selvages are unaltered. Selvage contains lots of dissem aspy and po.						
10		128.68	128.97	Silicified zone abuts unaltered GND @ 10° to CA. Diss aspy/scor and po. If qtz vein *was* here, it's not visible (possibly just outside core range).						
10		128.97	130.55	Unaltered GND. Qtz veins begin at 129.92m.						
10		130.55	131.44	Unaltered GND. Narrow silicified vein branches w/ scorodite/aspy and minor py. Minor lim on fractures.						
10		131.44	132.36	Unaltered GND						
		132.26	133.10							
10		133.10	133.85	Chlorite alteration zone. Core is bleached to white and green "speckled" core w/ a 3cm qtz vein @35-40° to CA. V. tr aspy disseminated w/in vein material. Mafics are completely depleted		3	3			
10		133.85	142.95							
10		142.95	144.49	Core is altered to a limonite/rusty brown; core is soft yet coherent, sericite and limonite are pervasive. Some clay ~1 3%	2	1		1		
10		144.49	148.38	White, soft carbonates are fracture filling into competent GND. Essentially x-cutting/carbonate stringer veinlets					1	
10		148.38	149.35	GND is fractured / healed w/ carbonate veinlets. Veinlets are gouge - soft and pure flour white.					1	
10		149.35	152.40							
10		152.40	154.40	GND as previous unit (148.38-149.35m), except that some carbonate vns are thicker (~0.25cm) and are running parallel to C.A. No visible sulphides disseminated within the calcite / carbonate vns/vnlets.					1	
10		154.40	158.50							
10		158.50	160.02	GND is oxidized slightly w/ pervasive limonite, minor sericite (both as fracture filling and somewhat pervasive). Core is rusty yellow/brown yet competent.	2	1			1	
10		160.02	163.70	Sheeted vn system appears. Vns are regular and similar. Vns are ave. 0.5-3.75cm in width. They have regular spacings of ~ 5-15cm apart @ an ave angles of 35-40°. Predominant noted sulphide is pyrrhotite @ tr-2%, as disseminations within the vns.		1	1			
10		163.70	164.59							
10		164.59	165.60	Mod'ly alt'd GND. Overall colour is pale whitish green with uneven patches, up to 10cm long of less altered GND, which is pale grey. One straight fracture face (25° to CA) is covered with powdery black alt'n product with various diss. sulphides (aspy, cpy and chalcocite (?) - striated dull gold colour + black granular aggregates), 0.5cm wide, at 165.18m.		3	3	1		
10		165.60	166.86	Unaltered except for wide selvages around qtz veins at beginning of sample. At least minor sericite throughout entire sample.		2	2		1	
10		166.86	167.14	14cm qtz vein: translucent milky white. Selvage also included in sample (total: 28cm).						
10		167.14	168.22	Alt'n is minor but rock is very broken up; fractures near parallel to CA and at ~80° to CA.		2	1		1	
10		168.22	169.43	Minor to mod alt'n in GND. Near-parallel fractures still prevalent but rock is more competent (less high-angle fractures).		3	2		1	
10		169.43	170.96	Minor to mod alt'n in GND. Massive sulphides (vein) beside qtz vein at 170.75m - noted on sample ticket. Minor diss sulphides throughout section (aspy, po).		3	3			
10		170.96	172.56	Extreme alt'n here. Whole sample is gouged out clay material with ~40% remnant GND material: qtz eyes, hb crystals (~2mm), etc.	2	2		4	2	
10		172.56	173.74	Mod'ly alt'd GND. Colinear fractures at 50° to CA (?).		3	1	2	1

DRILL HOLE SUMMARY SHEET

HOLE NO.: DG05-279C

PROJECT: Dublin Gulch - 1735

GROUND ELEVATION: 1024m

BEARING: 000 | **DIP: -50°**

DATE STARTED: June 4, 2005 (night) | **DATE COMPLETED:** June 8, 2005 (day)

COORD SYSTEM: NAD 27: **EASTING: 459701 NORTHING: 7099261**

COORD SYSTEM: NAD 83: **EASTING: 459586 NORTHING: 7099443**

NAD 27 (CORRECTED for historic grid): **EASTING: 459671 NORTHING: 7099271**

LOGGED BY:
Melodie Stone, Terry Croteau, Kristian Whitehead

SECTION LINE (historic grid): 459671E

CONTRACTOR:
Britton Brothers

DRILLING DETAILS

Hole Diameter: HQ
Overburden: 9.14
Deviation:
Casing: 9.14m
Core Size: HQ
Cement (# Bags): 0
Plug Depth: N/A
Notes: No plug necessary.

SAMPLING DETAILS

Sample Sequence: B291632 to B291823
Requisition #: MASP448STRGOL.05Q — Date Shipped: 10-June-05
Lab Record #: VA05046971 — Date Received: 16-June-05

Duplicates:	B291642, B291662, B291682, B291702, B291722, B291742, B291762, B291782, B291802, B291822
Preparation Duplicate/ Check Assay:	B291649, B291669, B291689, B291709, B291729, B291749, B291769, B291789, B291809
Standards:	B291650(4D), B291670(1A), B291690(4D), B291710(7G), B291730(1A), B291750(4D), B291770(3C), B291790(4D), B291810(2B)

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-9.14m			CASING (no recovery)						
10	9.14-201.17	9.14	15.24	V. broken and heavily oxidized GND. Alteration from minor to moderate. Veinlets grey qtz. V. poor recovery from 12.19 to 13.72m (19%). Rock is pebble-cobble size.	4	2				
10		15.24	18.29	Mod. to highly alt'd GND. One qtz vein has bands of alternating siderite and qtz. Adjacent to this is a zone of dark grey-black, grainy alt'n (old xeno?), ~6x4cm.	4	1			1	
10		18.29	24.38	Mod to highly alt'd GND. V. broken core: max 10cm long (1), most <5cm. From 21.34 to 24.38m recovery is poor (34% and 16%). Fewer small pebbles but core is still v. broken.	4	1			1	
10		24.38	25.91	V. broken core w/ one 20cm gouge zone, med. brown.	4	1		2		
10		25.91	27.43	Highly alt'd and broken core - one 10cm length. Colour pale brown.	4	2	1	1		
10		27.43	28.96	Highly to extremely alt'd GND.	4	2	1	1		
10		28.96	30.46	13% core recovery. Gouge to highly alt'd GND.	4	1		3		
10		30.46	32.00	Extremely alt'd to clay texture (90%), with qtz eyes and small GND pebbles	4	2		4	1	
10		32.00	33.56	Poor core recovery (14%). Pebbles.	4	1		2		
10		33.56	34.90	Extremely alt'd GND. Sand-sized, medium brown.	4			3	1	
10		34.90	36.40	Highly alt'd GND. Cobbles no bigger than 5cm. Veinlet at 34.05m w/ 1cm selvage (ox. 100%)	4	1		1	1	
10		36.40	39.37	Highly alt'd GND. Hematite oxidized near qtz veins (2mm subhedral grains).	4	1	1	2	1	
10		39.37	40.50	Highly alt'd GND. More competent, however, with pieces up to 15cm. Black ox'n product on uneven fracture faces. Limonite on microfractures. Gouge zone (5cm) between 2 competent, 6cm GND pieces. No slickensides.	5	2	1	1	1	
10		40.50	42.67	Extremely alt'd GND. Clay to sand-size (90%). Medium brown.	4	2	1	3	2	
10		42.67	43.76							
10		43.76	46.80	GND is v. broken and altered to gouge/sandy gravel with v. minor competent pieces. Core is v. limonite stained on fracs / pervasively and within clay yielding a rusty/yellow-brown color. Sulphides have undergone significant weathering (po + aspy). Qtz pieces in the core are visible indicating vning however thickness / amount and angle to CA are impossible to obtain. Sulphides are within veining or immediately adjacent.	4	2		2		
10		46.80	47.57							
10		47.57	48.90	GND becomes sandy, predominantly, w/ pieces of gravel and clay. Core is heavy limonite-stained and fracs are occasionally hematite-stained as thin skin on surface (black).	2	1		1		
10		48.90	49.03	Fault gouge with heavy limonite staining. Qtz vns w/ slickensides indicating fault movement, angle on surface is ~ 50° to CA.	3	1		2		
10		49.03	49.15							
10		49.15	50.01	At 49.15m is a 0.25cm wide oxidized pyrite vn, pure black, @~ 50° to CA.	5					
10		50.01	50.29	Fault gouge with a slickenside surface on contact at 35° to CA.	2	2		3		
10		50.29	50.41							
10		50.41	53.34	Core is altered to crumbly gouge w/ pervasive limonite and sericite. Core is v. soft yet recovery is good. Some vning can be seen but highly oxidized pyrite is interpretation.	2	4		2	1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)						
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other	
10		53.34	54.86	Chloritized GND core, bleached, green-hued w/ little to no mafics. Minor calcite stringers (frac-filling mostly). Limonite on fracs, looks to be oxidized py on fracs.	2	2	2		1		
10		54.86	55.44								
10		55.44	55.84	Clay gouge alteration zone. Qtz eyes, looks like digested, rotten GND. Limonite abundant, making core / clay yellow-gold color.	2	1		4			
10		55.84	59.31								
10		59.31	59.91	Hydrothermal alteration zone, core becomes sandy to clay w/ some broken pieces. Heavy limonite staining. Qtz eyes present. Some red rusty bits (perhaps weathered sulphides).	3	1		2			
10		59.91	60.96	GND, same as previous unit	3	1		3	2		
10		60.96	64.01	Core has what looks to be a sheeted vn system. Veins are spaced ~ 5-10cm apart w/ similar core axis foliation of 45-50°. Minor dissem sulphides in vns.							
10		64.01	64.66	GND becomes etched and filled w/ limonite and sericite. Some bleaching through mafics. Intact core is easily broken w/ v. minor clay seems. Core is yellow-gold stained in color	3	2		1			
10		64.66	65.13	Large qtz vn. Some limonite and GND inclusive					1		
		65.13	66.78								
10		66.78	67.06	Gouge clay alteration seam, core reduced to sandy clay w/ small qtz eyes, heavy limonite staining. Qtz pieces indicating vning but too small to be certain.	2	1		4	1		
10		67.06	67.40								
10		67.40	67.78	Same GND as above, but w/ no qtz veining visible	2	1		4			
10		67.78	68.17								
10		68.17	69.15	GND becomes altered to bleached, sericite, grey-brown dull color. Minor green (chlorite hue) but not intense. Pervasive limonite, yet core is coherent. Abundant selvages w/ minor sulphides (aspy). Very little to no mafics, qtz vns visible @45-50° to CA, ~0.25-0.5cm thick, and continues to 96.68m.	3	1	2				
10		69.15	70.10								
10		70.10	72.23	Core is extremely broken to gravel and clay. Clay seams have reddish colours, possibly indicating py oxidation. Core is yellow-gold/rusty colour. Core has lost mafics in places, and has slight bleached/chloritic nature. Evidence of hydrothermal/faulting.	4	1	1	1			
10		72.23	75.38	GND is altered to a predominantly mafic-'free' state w/ only minor units of visible mafics. Core has a dull brown colour with visible sericite and minor chlorite. Some siderite w/in selvages. @74.34m pyrite vein oxidized to red/black and minor unoxidized crystals. Vein is ~0.75-1.5cm thick, at 50° to CA.	3	1	1				
10		75.38	76.02	Altered clay seam, hydrothermal alteration is evident from visible qtz eyes and some preserved gravel sized pieces of altered GND. Clay is yellow/gold and consistent in texture. No contacts preserved.	3			4			
10		76.02	77.50	Core remains altered as described in previous section (72.23-75.38m)	3	1	1.0				
10		77.50	83.82	Core remains altered as above description w/ what appears as a sheeted vein system. Veining/selvages are somewhat regular w/ spacing @5-20cm apart w/ a regular angle of 45-50° to CA.	2	1	1				
10		83.82	84.08	Clay seam at hydro alteration zone w/ a 5cm adjacent sulphide (aspy stringer) and veining zone. @84.08-84.13m, clay is gold yellow colour w/ qtz eyes	2	1		4			
10		84.08	89.37	Same as above unit, altered GND. description from 72.23-75.38m interval.	3	1	1

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		89.37	89.92	Clay seam w/ abundant qtz vn pieces with disseminations of aspy (trace).	2	2	1	3		
10		89.92	90.17							
10		90.17	90.48	Yellow-gold gouge w/ qtz eyes. Clay is relatively uniform; some minor pieces of altered GND. No visible sulphides. Inconclusive contact at 90.48m is preserved, @30-35° to CA.	2	1		3		
10		90.48	90.72							
10		90.72	90.80	Same gouge GND - description above	2	1		3		
10		90.80	91.32							
10		91.32	91.40	Same gouge GND - description above	2	1		3		
10		91.40	92.67							
10		92.67	92.80	Core becomes v. altered with dissems / vnlets of py and aspy (~2-5%). Somewhat oxidized at the contact @ 92.80m @ 60° to CA.	3	1				
10		92.80	93.13	Yellow to reddish-gold clay seam w/ GND rubble + qtz eyes. At 90.07m, a 1cm thick qtz vn @50-55° to CA (trace dissem py). At 93.13m, contact angle is 35° to CA.	3	1		5		
10		93.13	93.38	Core is v. decomposed but not to clay as yet. Qtz eyes are visible, core is soft but original altered brown core is still easily transparent. 93.38m: contact @~35° to CA, with some slickensides observed on adjacent GND. At 93.41, 93.53, and ~93.70m, 1-3cm thick qtz vns with py and aspy. Special Note: 68.17 to 96.68m, GND is of the same altered type best described in section: 72.23-75.38m.	4	1		1		
10		93.38	94.80	Zone of high to extreme alt'n. One block competent core at 93.29 to 93.67m, with 2 qtz veins. Rest of sample is gouge/extremely alt'd to clay texture w/ alignment of sericite/chlorite @~90° to CA. Colour from bluish green to light yellowish brown. 3rd qtz vein has been folded w/in competent alt'n zone.	5	4	3	2		
10		94.80	95.75	Highly alt'd but competent core. V. broken. Colour med. brown.	4	2	1	1		
10		95.75	96.01	Strong slickensides along qtz vein margin. Tourmaline (?striated, v. hard, transparent to translucent, colourless to brownish black), + qtz + sericite: fault zone. Sample is one qtz vein; broken up.						
10		96.01	97.54	Strong to moderate alt'n. 2 large qtz veins in first 30cm. Fault gouge at 96.30m for ~10cm w/ 80% sericite, aligned. Qtz vein offset (brittle), on fracture @35° to CA. Slickensides aligned with long axis.	3	3	1	1	1	
10		97.54	98.52	Mod'ly alt'd GND. Limonite on microfractures is pervasive. Xeno at 98.8m: fine-grained diorite.	3	1			1	
10		98.54	99.06	Highly alt'd zone. Competent core w/ regular fractures to 50°. Med brown. Almost no GND texture left (just rounded qtz grains).	3		1			
10		99.06	100.58	Mod'ly alt'd GND with two vein sets. High angle offsets low angle.	2	1				
10		100.58	102.11	Mod'ly alt'd GND. Regular fracture set (6) to 45° and 135°. One has fault gouge material (clay) w/ slickensides. Also slickensides noted on low angle fractures.	3	1		1	1	
10		102.11	103.30	V. broken core. Fracture sets @45°/135° and low angle (0-15°). Gouge material in two low angle fractures. No slickens obvious but calcite smeared out.	3	2	1	1	1	
10		103.30	104.81	Minor to moderate alteration - slow gradation through sample, due to increasing number of veins and veinlets (selvages account for alteration)	3	1	2			
10		104.81	106.97	Mod'ly alt'd GND, w/ >2cm qtz veins @45°. Limonite on irregular fractures. At 105.86m, 2cm fault gouge-clay shows slickensides. Colour brownish grey.	3	1	1	2	1	
10		106.97	107.90	High to extreme alt'n. Limonite and calcite up to 1cm wide. Colour medium to pale yellowish brown. Boundary to less alt'd GND (grey, coarse texture) is at 30° to CA. Patches of orange rust (siderite?) speckle qtz vein and surrounding rock (20cm).	4	2	2	2	1	
10		107.90	109.33	Minor alt'n around veins and veinlets. Two noticeable xenoliths at 108.9m and 109.3m	1	1				
10		109.33	120.40	Minor alt'd GND w/ qtz veins. Regular breaking at 45° and 135°. Calcite on fract faces (<1mm thick). Diss aspy near fract w/in unalt'd GND. At 116.43m rock fract at 50° to CA (3) and some clay alt'n occurred (5cm wide).	1

UNIT CODE	GEOLOGICAL DESCRIPTION				ROCK (Alteration)					
	From → To:	From:	To:	Comments:	Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		120.40	121.92	V. minor alt'n where qtz veins have dissipated into silicified zones (no clear vein boundaries) at 45° to CA w/ sulphides - included in the vein count, page 2.		1	1			
10		121.92	124.81	Qtz/aspy vein @ 45° to CA; 0.5cm. Aspy ~5-8%. GND adjacent on either side is bleached for ~3cm on either contact removing almost all mafics.	1					
10		124.81	130.03	AT 124.81m, a qtz/carb/sulphide aspy vein, @ 45-50°; width ranges from 0.5-0.75cm. Aspy is ~5% of vein components. No bleaching/alteration adjacent to vein	1	1			2	
10		130.03	130.50	Two 1cm qtz veins w/ 5cm chloritized margins.	2	1	2			
10		130.50	131.20	Chloritized/altered GND. Pervasively intruded w/ carbonate/qtz veining and sulphides (including ~1-10% py and ~5-15% aspy). Mafics are scarce in core. Core has a predominant grey colour. Zone ends w/ a slickensided surface @ 131.02m, 40° to CA.	2	1	1		2	
10		131.20	134.11							
10		134.11	135.64	GND altered throughout with calcite to crumbly texture. Approximately half the qtz veins are heavily silicified such that original vein is no longer seen as such, but more of a linear qtz-rich zone at the same angle as the real veins	1	1	1	1	3	
10		135.64	136.70	Minor alt'd. GND w/ pervasive veinlets of calcite overprinted by qtz veins.	1	2	1	1	2	
10		136.70	140.21	Highly alt'd GND. Colour is whitish green, only rounded patches of qtz grains remaining of original texture of GND. Qtz veins still visible as well but selvage is altered into main zone.	2	2	3	1	1	
10		140.21	140.61	Large qtz vein (23cm of core). Relatively low sulphide content						
10		140.61	142.04	GND as at 134.11m. Broken and calcitized.	1	2	1	1	3	
10		142.04	142.53	Less calcite zone w/ 4 large qtz veins. One xeno: fine-grained diorite, long axis parallel to nearby vein (4x2cm)		1	1		1	
10		142.53	143.26	GND as at 134.11m. Broken and calcitized		1	1		1	
10		143.26	145.56	More competent core; v. little calcite		1	1			
10		145.56	146.67	GND as at 134.11m; 50% broken and calcitic	1	2	2		1	
10		146.67	147.15	V. large qtz vein (37cm of core is 'pure' qtz); milky veinlets of calcite are incorporated.					1	
10		147.15	151.54	GND as at 134.11m; 50% broken and calcitic	1	2	1		2

DRILL LOG LEGEND P1	DATE: June 4 - 8, 2005	PAGE 9 of 12	
DRILL HOLE # : DG05-279C	FeOx 0 = Unoxidized 5 = Intensely Ox'd	Ser, Chl, etc 0 = Unaltered 5 = Intensely Altered	Carbonate 0 = No Effervescence 5 = Strong Effervescence

Lith Code: -1 = No Code; OVB = 1; GND = 10; GND (fg) = 11; GNDD (dyke) = 12; QMON = 20; DIOR = 25; MGD = 30; APL = 40; FLCD = 41
BQAH = 60; BAH = 61; CHN = 65; QZZ = 70; MSED = 80; HFLS = 81; PHYL = 82; BQS = 85; QTZ = 90; FZ = 92; SZ = 93

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		151.54	153.04	Sheeted vein system w/in calcitic GND.	1	2	1		2	
10		153.04	153.77	More sheeted veins, slightly more rust on microfractures at 30° to CA	2	2	1		1	
10		153.77	154.70	Highly alt'd section (chl) follows 1cm qtz vein (included in last sample). GND texture erased to whitish green homogeneous rock. Veinlets (0.1cm) of pure pyrite. Fractured on one to shiny plate w/ black ox'n product on surface (wipes away easily).	1	3	4		1	
10		154.70	155.45	Minor alt'd GND hits alt'd section from above at 80° to CA. Qtz veins silicified so appears as all selvage		1	2		1	
10		155.45	156.48	Minor alt'd GND. Calcite veinlets pervade and weaken rock, generally at 30°-50°.		1	1	1	2	
10		156.48	159.56	Minor to mod'ly alt'd GND (selvages produce mod alt'n). Calcite vnlets still pervasive & cause breakage generally at 40-60° to CA.	1	2	2		2	
10		159.56	160.57	Carb & sericite alt'd GND. Color is light grey, texture alt'd to more planar (pseudo-foliation), defined by tabular sericite & calcite. One fracture (to 20°) has smeared out pyrite (gold, platey, striated) at 20° to CA w/ calcite/sericite elongate to 25° from the other side (2 episodes movement?). Sample <1% py.		3			3	
10		160.57	161.54	Limonite appears on frac faces, at 20° & 45° to CA; still v. broken.	1	3			2	
10		161.54	163.07	Limonite increases w/in carb/ser alt'd rock so very crumbly. Color is light grey w/ rust-brown along fracs.	2	3			2	
10		163.07	164.59	Cont'd limonite as irregular fracs every few cm to 163.84m. After this, fewer limonized fractures, but calcite still present on them. Xeno 3x2cm f-grained (and foliated) diorite.	1	3			2	
10		164.59	166.12	V. minor alt'n in qtz-rich GND. Diss po & py throughout sample (<2%). Regular fractures @ 50°, lim no longer. 2x1cm xeno 3cm from qtz vn.		3			2	
10		166.12	167.64	Carb/sericite still present along numerous veinlets in random & irregular fractures.		3			2	
10		167.64	169.16	Minor alt'd GND. Two gouge sections @167.85m (4cm) & 168.21m (1.5cm). Alt'd to clay/sand size; no notable slickensides.	1	3		1	2	
10		169.16	171.40	V. minor alt'd GND. Only alt'n is w/in selvages of numerous qtz vns.	1	2	1		2	
10		171.40	172.26	Large qtz vn w/ lenses of massive sulphides. Selvage from 171.4-171.55m. Vein from 171.55-171.87m, selvage from 171.87-172.00m. Vein (3cm) after that w/ 3cm selvage.						
10		172.26	172.78	Alt'd GND w/ 4 veins of massive sulphides.	1	3	3	1	1	
10		172.78	173.62	Mod'ly alt'd GND		2	2		1	
10		173.62	174.29	Mod-highly alt'd GND. Selvages dominate the sample.		3	3			
10		174.29	175.06	Highly alt'd GND. Competent core. Color whitish green to pale grey.		3	3		1	
10		175.06	175.66	Carb/qtz alt'd GND. Crumbly texture, white to light grey in color.						
10		175.66	175.91	Gouge zone. Clay to gravel sized pieces of GND.						
10		175.91	176.15	Chloritized zone w/ 4 qtz veins. Massive pyrite forms in 0.5cm wide lenses adjacent to qtz; Rock effervesces in acid along these lenses - siderite (oxidized pyrite + carbonates)						
10		176.15	177.76	Unaltered GND						
10		177.76	184.40	Alt'd selvages around numerous qtz veins make up bulk of section.						

DRILL LOG LEGEND P2

Selvages
0 = No Alteration
5 = Intense Alt'n

Ox. State
0 = No Oxidized Sulphides
5 = All Sulph Oxidized

Date: June 4 - 8, 2005

LOGGED BY: M. Stone / K. Whitehead

PAGE 10 of 12

Selvage Alteration: chl = chlorite, k = K-spar, s = sericite, q = quartz/silica, cb = carbonate, b = biotite, ce = calcite

Vein Type: 1 = quartz, 2 = quartz/K-spar , 3 = quartz/carbonate, 4 = carbonate, 5 = quartz/chlorite, 6 = sulphide +/- quartz

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
-1	0-6.10			Overburden - Drill Casing; no recovery						
10	6.10-202.78			GND 40% qtz, 20% kspar, 15% bt, 10% Hal	3			1		
10		6.10	10.67	Broken GND: Core is extremely weathered and broken. Most pieces are angular, but some subangular - rounded. Sugary textured GND also present throughout. Lim is pervasive, and recovery is poor						
10		10.67	12.19	GND alterations trends to more clay rich gouge. Qtz eyes present with GND frags. Lim is pervasive.	3			2		
10		12.19	13.72	GND becomes slightly altered, lim is pervasive. @12.39m, GND becomes more fractured and sugary textured, lim staining becomes more intense. Veinlets present in fractured core; angles are indeterminate.	2			1		
10		13.72	14.02	Core is fractured and broken. Lim is pervasive. Clay alteration is less intense. Veinlets in section appear to be running at 35° to CA	2			1		
10		14.02	15.34							
10		15.34	16.50	Gouge, clay and sand w/ minor gravel pieces. Limonite is heavy on fracs. Zone of hydrothermal alteration. Limonite abruptly ends @ 16.90m	3	1		3		
10		16.50	16.76							
10		16.76	18.29	Core is extremely broken w/ poor core recovery. Aspy can be seen as thin coating on what looks like fractured surfaces	2					
10		18.29	19.29							
10		19.29	21.50	At ~19.20m: a fault/alteration zone. Evident from sandy and clay residue on core. Looks like aspy is remnant, but oxidized	2	1		1		
10		21.50	26.63	GND has bleached intervals, core has suffered some decay from sericite of fracs as evidence, broken core is demonstrating aspy oxidation and crystals	2	2	1	1	0	
10		26.63	31.37	Core becomes intensely oxidized to a dull brown colour, limonite is on fracs and moderately pervasive. Sericite is abundant on fracs and is pervasive. Chlorite is weak to moderate. Core is soft w/ oxidized aspy on fracture surfaces. Veins are essentially relict w/ oxidized aspy. Mafics are scarce and core crumbles when scratched in sections	4	3	2	1		
				From 28.63m to 28.60m, an orangey-gold coloured clay seam w/ oxidized aspy & possibly py. Contact @ 28.69m preserved @ 42° to C.A.	3	2		4		
				Another clay seam from 29.05 to 29.19m. Clay is uniform, light dull brown, w/ minor orangey-gold colours on contact. Uncertain if contact @ 29.19 is preserved but @ 35° to C.A.	3	2		5		
				Clay seam from 29.62 to 29.84m; core is orangey tiger colour. Oxidized and intact aspy and py	3	2		4		
				Clay seam from 30.48 to 30.91m; vein is relict by aspy veining, @~50°. Core is abundant w/ limonite	5	1	1	3	1	
10		31.37	31.50							
10		31.50	33.46	At 31.50m limonite completely and abruptly ends. GND is altered to a grey sericite rich, soft core. Mafics are still present, yet less in abundance than in unaltered GND. Sericite is pervasive and abundant on fracs and vein contacts. Qtz veins are somewhat intact w/ diss oxidized/unaltered aspy predominant. Core is essentially light grey in colour and uniform	4	4	1	2	1	
10		33.46	34.69							
10		34.69	35.08	Grey-white clay gouge alteration zone. No contacts preserved, some minor dissem ox'd aspy	4	3	1	4	1	
10		35.08	36.36							
10		36.36	38.95	At 36.36m, fault/slickensides @ 30° to CA, aspy/qtz vein, aspy ~25%, fault appeared to cut through vein, not activate along vein						
10		38.95	39.43	GND loses its mafics, core is dull greenish grey w/ sericite and chlorite present	3	2	2			
10		39.43	39.70	Semi massive aspy + py qtz vein. Sulphides are somewhat concentrated @ centre of vein w/ stringers/blebs running outwards. Py content ~3-5%, aspy ~40-45%. Qtz remainder w/ qtz being an opaque white						
10		39.70	40.49	GND is essentially digested to qtz eyes and sericite clay (good recovery). Core has a light green chlorite hue and has relict aspy and py vein/veinlets. 39.70 contact @ 30°, 40.49 contact has slicken lineations indicating a fault @ 40°	5	5	2	5		
10		40.49	40.63							
10		40.63	40.65	One 2.25cm thick qtz vein w/ disseminated aspy + py. angle 35-40°. Photo of area included.						
10		40.65	41.03							
10		41.03	43.54	GND continues to be devoid of mafics; sericite and chlorite to a minor state dominate, core is bleached with powdery, light grey colour	3	3	1			
				From 42.14-42.35m, core is altered to white-grey clay and qtz eyes. Slickensided surface @~50° to CA. Surface had minor aspy 'slickened'.	3	4	1	4		
10		43.54	44.20	GND alteration zone, begins with clay predominant and then progresses to clay/ qtz eyes and broken core. All core is bleached with little to no mafics. Aspy is dissem w/ py. Sericite abundant on fracs and mod'ly pervasive	3	3	1	2		
10		44.20	46.50							
10		46.50	47.42	Hydrothermal alt'n zone (gouge). Sericite/qtz eyes/ grey-white clay w/ dissem aspy.	3	3		3		
10		47.42	48.15	Alt'd / bleached core as progressing from above. Gouge unit @47.85-47.93m. Sulphides (semi-massive) pyrite (30%), aspy (5-10%).	3	3	2	1		
10		48.15	50.09							
10		50.09	50.20	Clay gouge unit. Clay is light grey with aspy ox'd within (~5%)	3	3	1	5		
10		50.20	53.23							
10		53.23	53.38	Gouge, broken core, alteration zone. Core is light grey abundant w/ sericite, bleached	3	3	1	3	2	
10		55.38	55.59	Chlorite alteration zone. Core is light grey white w/ green hue. Sericite abundant	3	3	2			
10		55.59	56.39	Gouge/qtz eyes w/in semi-competent hydrothermal alteration zone. Core is light grey w/ pervasive sericite and on frac. Minor carbonates. Trace chlorite	3	3		2	1	
10		56.39	56.61	Medium grey uniform clay, looks like aspy clay. Directly adjacent @ 56.53-56.61m a qtz vein w/ aspy stringers	3			5		
10		56.61	57.09	Gouge alteration zone, core is white grey w/ minor green hue (chlorite). Qtz eyes, sericite dominant	3	4	1	4

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		57.09	57.91	Core continues to be bleached, devoid of mafics, sericite rich, yet competent area caught between 2 hydrothermal alt'n zones. Dissem aspy (1%) and py (tr.)	3	3		1		
10		57.91	58.91	Gouge alteration zone, core is white grey w/ minor green hue (chlorite). Qtz eyes, sericite dominant	3	3	1	3		
10		58.91	61.00	Core is altered/bleached, yet competent. Core is light grey w/ green (chl) hue. Core is easily scratched, little to no mafics. Sericite on fracs, and moderately pervasive	3	3	1	3.0		
10		61.00	61.32							
10		61.32	61.71	Core has been etched and bleached, however, mafics are still intact. Salt/pepper appearance		2	1	1		
10		61.71	62.16							
10		62.16	62.48	Grey white clay seam perhaps fault gouge due to abundant slickensides throughout immediate section		3		5		
10		62.48	62.59	Core has been etched and bleached, however, mafics are still intact. Salt/pepper appearance		2	2	1		
10		62.59	63.60							
10		63.60	66.89	At 63.60m is a slickenside surface w/ aspy and ox aspy on contact @ 45° to CA. Another, at 63.92m, slickenside surface @40° to CA.						
10		66.89	68.48	Altered GND, core is bleached to light grey, greenish hue. Minor aspy dissem bits probable that a vein was proximal only lost in recovery. Core becomes gouge/med grey clay. Core is v. broken w/ poor core recovery. Carb in form of veinlets. At 68.63m, a slickenside surface @40° to CA		2	2	1	1	
10		68.48	70.41	Chloritized, altered, bleached GND. Core has slight green hue (chlorite). Core is sericite rich, core can easily be scratched, contains several qtz/carb veins/veinlets @ 68.78: slickenside, 60° @ 69.76: slickenside, 30°		4	2			
10		70.41	72.60							
10		72.60	75.26	Altered GND. Bleached to light grey, green; essentially the selvage around a qtz/carb and sulphide vein/stringers @ 72.68-72.69m, @ 40° to CA. @ 72.60m: slickenside, 35-40° to CA. At 74.73m, slickensides @ 25°-30° to CA.						
10		75.26	75.37	Altered chloritized GND. Selvage around a 0.5cm wide calcite vein		4	2			
10		75.37	76.00							
10		76.00	77.46	Clay gouge w/ qtz eyes, occasional pieces (some w/ slickenside surfaces). Clay is med grey w/ minor sulphide oxidation mixed in	4	3	1	5	1	
10		77.46	81.03	At 77.72m, a slickenside surface, @40° to CA. At 80.60m, slickenside surface @60° to CA, noted that area is altered w/in 2-3cm away		2	2		1	
10		81.03	81.70	Alteration selvage leading to fault gouge @ 81.70 - 81.87m, alteration selvage is light grey-green (chlorite) abundant w/ sericite and devoid of mafics		4	2	0		
10		81.70	82.30	Carbonate stringers w/ aspy and carb veins running ~50° to CA w/in other side of above mentioned alteration selvage from gouge focal point		4	2		5	
10		82.30	82.32	A 2.5cm wide carbonate qtz vein @ 25° to CA w/ ~5% aspy.						
10		82.32	82.56	Alteration selvage continues. @82.56 - slickenside @ 60° to C.A., aspy. on contact surface		4	2		1	
10		82.56	82.74	Clay gouge, light grey clay w/ qtz eyes, aspy disseminated (~5%); contact @ 82.74m is slickensided @ 20° to CA w/ selvage alteration continuing to ~82.94m		4	1	5		
10		82.74	82.83	A qtz/carb vein (1.25cm thick w/ py and aspy) @ 30° to CA is on a site of a fault indicated by slickensides (@ same 30° angle)						
10		82.83	85.69	@85.07: a slickenside, 65°-70° to CA @85.07: a 1.5cm thick qtz/aspy vein, 65°-70° to CA. Aspy ~20% w/ 10cm wide (either side) chlorite bleached sericite prevalent alteration selvage. Trace py.						
10		85.69	88.94	Core is very broken, yet unaltered. Abundant 'vein like' selvages which are typically @ 40-50° to CA. Broken core is occurring commonly on these vein like selvages, which demonstrate aspy. Core would have an estimate of ~1-3% aspy. Some minor chlorite staining on frac surfaces and occasional slickenside pieces						
10		88.94	89.22	Altered GND. Core is bleached, sericite rich, chloritic stained. Minor mafics visible. Qtz eyes beginning to appear. Aspy stringer/veinlet x-cutting core @ 40-55° to CA, yet sulphides are oxidized mostly	3	3	1	1		
10		89.22	89.95	Core is v. broken, but pieces are demonstrating slickensides on veneers of aspy/calcite. @ 89.92m, slickenside surface of aspy coating. Possible py, 50° to CA.						
10		89.95	90.21	@89.95m: slickenside surface of aspy coating. Possible py, 50° to C.A. Altered selvage GND. Core is light grey-white w/ green (chl) hue. Soft core, abundant sericite w/ trace dissem aspy.		3	1	1		
10		90.21	90.28	White to light grey clay gouge. Qtz eyes		4	1	5		
10		90.28	90.68	Core is v. broken with slickensides on pieces w/ aspy & py & chl on contact surfaces						
10		90.68	91.85	Core is v. broken and is breaking down selvages/veinlets @ 40-60° to CA w/ py and aspy on frac surfaces w/ a lesser extent qtz and carb (sheeted veinlet system may be interpreted)						
10		91.85	92.96							
10		92.96	96.01	GND continues to retain sheeted vein like system. Typical vein/selvage spacing ~ 5cm, and ~55°-60° to CA.						
				From 94.25 to 94.53m, GND becomes slightly bleached and mafics reduce to half regular percentage, w/ a 1cm thick qtz vein, 40° to CA.		1	1			
10		96.01	96.54							
10		96.54	96.80	Core is altered to v. soft. 50% clay, 50% core, core is bleached, yet 5% mafics remain. Chlorite presence gives green hue to colour @ 96.70m: slickensides @ 40-45° to CA.		4	1	3		
10		96.80	97.54	Py and aspy thin frac coating on frac which is along core axis						
10		97.54	98.62							

DRILL LOG LEGEND - P2

UNIT CODE	From → To:	From:	To:	GEOLOGICAL DESCRIPTION Comments:	ROCK (Alteration) Oxide (ox)	Sericite (ser)	Chlorite (chl)	Clay (arg)	Carb (carb)	Other
10		98.62	102.11	Core is abundant w/ fracs (45°-50° to C.A.), common w/ slickensides of aspy/py thus adding to the amount of sheeted veins accounted for.						
10		102.11	117.06	Sheeted veins continue through entire unit, save for bleached altered zone (103.63 - 104.19). Angles typically 40-55° to CA w/ widths ranging from <0.25cm to 0.50cm. Dissem aspy as the predominant sulphide w/ tr po, tr-2% py. Slickensides are common on frac surfaces w/ sulphides on those contacts. Occasional chlorite staining on fracture surface						
				From 103.63 to 104.19m, GND is bleached ,altered zone w/ clay gouge @ ~ 103.74 - 103.89. gouge/pieces of core shows aspy on qtz surfaces, clay is light grey-white	1	2	1	3		
				At 113.53, a 2cm carbonate vein w/ trace aspy (30° to CA) is cross-cut by an aspy veinlet, @45° to CA.						
				From 115.82 to 115.92m, core is altered and bleached, with oxidized aspy, core is easily scratched, sericite is minor to moderate, oxidized aspy veinlets (~5-8%)	2	2	1	1		
10		117.06	117.20	Continued alteration unit as above, core is bleached, however mafics remain, sericite is moderate and grey-looking ox'd aspy is ~5%. Core is easily scratched by a nail, minor clay, some carb veinlets present. Sheeted veining continues at 5-10cm spacing w/ veins/selvages typically 35-50° to CA and <0.75cm wide. Slickensided frac surfaces remain common w/ aspy on surfaces	2	2	1	1	2	
10		117.20	121.42							
10		121.42	121.63	Alteration zone, core is bleached to little or no mafics, sericite and chlorite are prevalent.						
10		121.63	123.44
