1.0 SUMMARY

Claims within the Discovery Creek Project are owned and/or leased by Aurchem Exploration Ltd., and are located in the Mt. Nansen area in south-central Yukon Territory. Yukon-Shaanxi Mining Company (YSMC) has an option agreement for the claims that make up the the Discovery Creek project and conducted exploration soil geochemistry in 2008. The project area hosts numerous porphyry and epithermal Au-Ag-Cu-Mo-Pb-Zn mineral occurrences. Previous exploration at the property has included: geochemical soil sampling, geological mapping, ground and airborne geophysical surveys, trenching, and reverse-circulation and diamond drilling. The Tit Mountain Breccia target lies in the center of the property, was previously identified by drilling and a ground geophysical I.P. survey, and was the focus of the 2008 YSMC exploration program. The Tit Mountain Breccia target has been identified by previous investigators as consisting of two separate breccia bodies ranging from 32 to 49 m in size (in plan view). Two of the best Au intercepts from previous reverse circulation drill programs over the Tit Mountain breccia targets include: 129.5 m averaging 1.94 g/t Au and 4.1 g/t Ag from hole number 94-05, and 10.5 m averaging 1.49 g/t Au and 13.5 g/t Ag from hole 94-04 (g/t = gram per metric tonne).

The YSMC 2008 field exploration program was conducted from the last week of August to the second week of September and included geochemical soil sampling over the Tit Mountain Breccia target. A total of 440 soil samples were collected with soil auger tools on a grid with maximum dimensions of 600 m in a northerly direction and 1400 m in an easterly direction. The 2008 soil grid partially covers the following 13 quartz mineral claims: Bull 2, 3, and 4; JBF 1, 6, and 7; J. Bill #28 and #30; Jon-Wedge 2 and 3; LGCS 1; Myrtle; and Wedge 9. The soil samples were collected on east-west lines that were spaced every 50 meters and sampled on 25 meter spacings along each line. The soils were submitted to ALS-Chemex and analyzed at their laboratory in North Vancouver, B.C.. Sample preparation included screening to -180 um (or 80 mesh) and the small size fraction was analyzed for: (1) Au (ALS CODE package Au-ICP21); and (2) 51 multi-element ICP analysis using the ultra trace level-aqua regia partial digestion method (ALS CODE package ME-MS41).

Gold values from the 2008 soil sampling program located in the vicinity of the two Tit Mountain breccia bodies ranged from 0.012 to 6.45 gpt. The 2008 Au in soil results form three anomalies (>0.050 g/t) within the 2008 soil grid area: (1) a moderately large anomaly up to 525 m by 200 m in size in the southeast part of the grid that partially covers the surface projection of the two previously identified Tit Mountain breccia bodies; (2) isolated single- to triple-point anomalies throughout; and (3) narrow linear (<25 m wide) to small circular anomalies (<105 m in diameter) in the northwest part of the soil grid. The 2008 Au in soil sample results compare moderately well with pre-2008 soil sample results that were presumed to have been collected with maddock tools. Existing disturbance from pre-existing trenches, drill holes, and roads adjacent to trenches all occur adjacent to the two mineralized Tit Mountain breccia bodies which may have locally influenced the 2008 Au in soil results. Although 2008 Au in soil values > 0.050 g/t trend off of the 2008 sample grid, no additional soil samples are recommended in the area of the Tit Mountain Breccia target since the 2008 Au in soil results did not upgrade the pre-existing Au in soil values, and because no new large Au in soil anomalies were identified.

2.0 INTRODUCTION AND OBJECTIVE

The Discovery Creek Project consists of 278 quartz mineral claims and hosts numerous porphyry and epithermal Au-Ag-Cu-Mo-Pb-Zn mineral occurrences in the Mount Nansen area of the central Yukon. Yukon-Shaanxi Mining Company Inc. is a mining and exploration company owned by Yukon-Nevada Gold Corporation (YNGC) and the Northwest Non-Ferrous International Investment Company Limited (NWI). NWI is 100% owned by Northwest Geological Exploration and Mining Bureau for Non-Ferrous Metals of the People's Republic of China (NWME).

The objectives of the 2008 exploration program were to:

1. Conduct a soil grid sampling program using soil auger tools over previously identified Au-Ag mineralized breccia bodies located near the center of the claim block on the north flank of Tit Mountain. Previous soil sampling (pre-2008) was presumed to have been collected using maddock tools and older analytical laboratory techniques so the 2008 soil sampling program was designed to confirm previous soil anomalies and to compare the results with the pre-2008 Au in soil results.

2. Visit the numerous mineral occurrences in order to collect GPS coordinates of historic prospects and drill holes, and to help plan the summer 2009 exploration program.

3.0 PROJECT DESCRIPTION

3.1 Property Location, Claims, and Access

The Discovery Creek Property (Latitude 62°07´N and Longitude 137°08´W) is located in the Dawson Range approximately 65 km west of Carmacks in south central Yukon Territory in NTS Sheet I03 (Figure 1). The property is accessible by a gravel road from Carmacks. Numerous pre-existing dirt roads and trails also lie within the property that allow access to most of the historic prospects, trenches and exploration drill holes. Some of these pre-existing roads are also used by several seasonal placer gold mining groups working in the area.

The property consists of 278 quartz mineral claims owned or leased by Aurchem Exploration Ltd. consisting of approximately 4,829 hectares (Figure 2). A complete list of the claims that make up the Discovery Creek Project are listed in Appendix A. Yukon-Nevada Gold Corp., on behalf of

Yukon-Shaanxi Mining Company Inc., entered into an option agreement with Aurchem Exploration Ltd. on the Discovery Creek Project in late June, 2008.

3.2 Summary of Previous Investigations and Exploration

Placer gold was discovered in the Mt. Nansen Creek in 1899. Placer gold mining has been conducted intermittently in the area creeks since 1910. Lode Au was later discovered at the Brown-McDade deposit in 1943 which led to the discovery of several other nearby Au-Ag deposits: Webber, Huestis, and Flex. The aforementioned deposits along with other prospects in the area are hosted in a series of anastomosing veins within faults and shear zones that occur in a 2.5-km-wide and 15 km long northwest-trending corridor (Figure 3).

Published gold and silver production statistics from Brown-McDade and the other nearby lode deposits from 1967 to 1999 are listed in Table 1 below and total over 50,027 ounces. Published resources (not 43-101 compliant) in the Mount Nansen area are shown in Table 2.

From 1946 to 1976 several companies mined and developed the following high-grade Au-Ag deposits located in the southern part of the Mt. Nansen area: Brown-McDade, Webber, and Huestis. During the 1970's several companies explored for porphyry Cu-Mo deposits centered on the Mt. Nansen Porphyry Complex in the central portion of the Discovery Creek project area. Widespread drilling during this time period identified a low-grade porphyry mineralized system located at the headwaters of Nansen and Victoria Creeks and their tributaries.

Exploration in the 1980's lead to the development of the Brown-McDade open-pit oxide deposit. This open-pit operation produced approximately 38,757 oz Au and 162,420 oz. Ag between October 18, 1996 to February 1999 from mostly oxide ores. The 700 tonne per day capacity conventional cyanide (CIL) mill was refurbished by B.Y.G. at the site and commenced operations on January 1, 1997 (B.Y.G. Natural Resources Inc., 1997). The initial nine months of mine production were below expectations due to processing of unanticipated clay-bearing oxide ores with the following statistics: average mill throughput of 325 tonnes per day, and total production of 84,790 tonnes averaging 8.06 g/t Au and 66.63 g/t Ag resulting in the production of ~19,335 oz Au (B.Y.G. Natural Resources Inc., 1997). Average Au and Ag recoveries from the mill for the first nine months of production were 88 percent and 46 percent, respectively (B.Y.G. Natural Resources Inc., 1997).

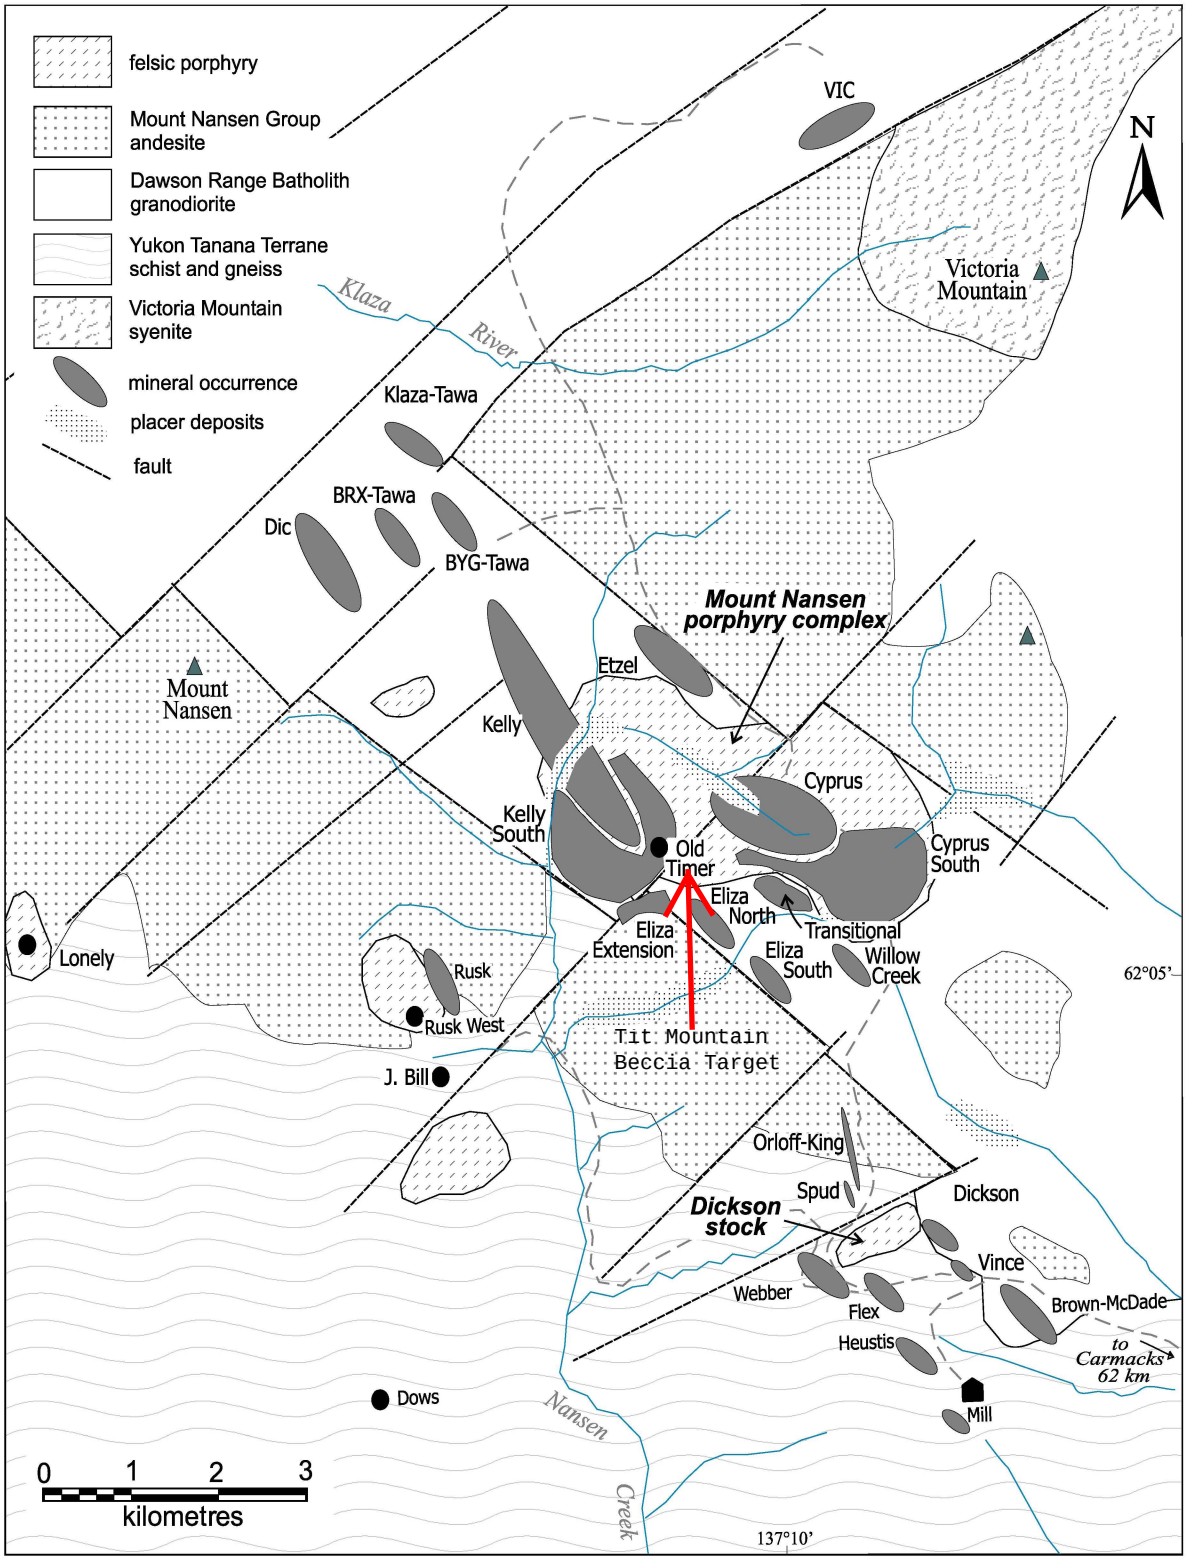

Figure 3. *Generalized geological map of the Mount Nansen trend. The white area includes granitic rocks of all ages and types, but is dominated by the mid-Cretaceous Dawson Range Batholith. The Tawa occurrences collectively comprise the Essansee occurrence (Yukon Minfile 115I 067) and the Eliza and Willow Creek occurrences comprise the Goulter occurrence (Yukon Minfile 115I 093).*

from Hart and Langdon (1997)

A SAG mill was later added and increased the production capacity to 1,000 tonnes per day and started operating on September 30, 1997. At the end of the 1997 field season, reported refractory resources at Brown-McDade were 3,729,706 tonnes averaging 10.22 g/t Au equivalent (B.Y.G. Natural Resources Inc, 1997).

Table 1. Total Published Au-Ag Production from the Mount Nansen Area, Yukon.

Deposit	**Years Operated**	**Au Production (oz)**	**Ag Production (oz)**
Webber, Huestis, and Brown-McDade	1967-1968	2,369 (estimated recovery at 65%)	37,844 (estimated recovery at 50%)
Webber, Huestis, and Brown-McDade	1969	1,283 (estimated recovery at 65%)	23,789 (estimated recovery at 50%)
Huestis	1975	1,918 (estimated 65% recovery)	21,846 (estimated 50% recovery)
Webber, Huestis, and Brown-McDade	1975-1976	~5,700 (estimated at 65% recovery and 12 g/t ave grade)	~59,194 (estimated at 50% recovery and 162 g/t ave grade)
Webber, Huestis, and Brown-McDade	1997	19,829	98,654
Webber, Huestis, and Brown-McDade	1998	15,190	38,849
Webber, Huestis, and Brown-McDade	1999	3,738	24,917
TOTAL	**1967-1999**	**50,027**	**305,093**

References: Pre-1997 data from Webber, Huestis, and Brown-McDade from Deklerk and Burke (2008) using stated estimated mill recovery rates. 1997 statistics for Webber, Huestis, and Brown-McDade from B.Y.G. (1998) at sedar.com; 1998 and 1999 statistics for Webber, Huestis, and Brown-McDade from Deklerk and Burke (2008)

Table 2. Total Published Au-Ag Resources from Lode Au Deposits in the Mount Nansen Area (not 43-101 compliant).

Deposit	Estimated Tonnes	Ave. Au Grade (g/t)	Ave. Ag Grade (g/t)	Total contained Au (oz)	Total contained Ag (oz)
Webber	58,524	10.9	611	20,555	1,152,197
Huestis (R)	85,727	14.0	283	38,672	781,728
Brown-McDade*	193,706	14.47	100	90,316	624,158
Flex (OP) – indicated; mostly oxide	69,977	6.0	234	13,529	527,622
Flex (OP) - Inferred	38,615	5.8	333	7,217	414,335
TOTAL	**446,549**	**11.84**	**243.25**	**170,289**	**3,500,040**

Notes: Totals do not include: (1) B.Y.G.'s end of 1997 field season refractory resource at Brown-McDade of 3,729,706 tonnes averaging 10.22 g/t Au equivalent (from B.Y.G. Natural Resources Inc., 1997): the total depleted amount of this reported resource post B.Y.G. mining is uncertain; (2) published resources at the Orloff King deposit estimated at 84,500 tonnes averaging 2.1 g/t Au and 52 g/t Ag (Hart and Langdon, 1997); or (3) inferred resources at Eliza Creek, Willow Creek, or Tit Mountain (Schneider, 2007).
References: Deklerk and Burke (2008); all stated resources are not 43-101 compliant
*=underground resource; (R) = refractory ore; OP = open pit ;

Exploration at the Willow Creek, Eliza Creek, and Tit Mountain targets in the Discovery Creek Project area from 1987 to 2007 is shown in Table 3 below. Most of the drilling was conducted from 1987 to 1992. These two targets contain at least four mineralized northwest-trending quartz-bearing sulfide veins that have been traced in surface exposures and drill holes for over 1,050 m (at Eliza Creek) to 1,600 m (at Willow Creek) in strike length.

Table 3. Summary of Exploration Conducted at the Discovery Creek Project, Yukon.

Zone	Diamond Drill holes	Reverse Circulation Drill holes	Bulldozer Trenching
Willow Creek	27 holes – 2,134 m	17 holes – 1,861 m	1,885 m
Eliza Creek	0 holes	15 holes – 1,699 m	2,075 m
Tit Mountain	6 holes – 723 m	25 holes – 3,366 m	1,045 m

Notes: (1) All exploration data in this table are from lands owned and/or leased by Aurchem Exploration Ltd. within the Discovery Creek project area
(2) Data tabulated from Aurchem Exploration Ltd. digital database gathered from Canada Assessment report compilations and reports (Stroshein, 2007)

The Tit Mountain Breccia target lies in the center of the property, was previously identified by drilling and a ground geophysical I.P. survey, and was the focus of the 2008 exploration program by Yukon-Shaanxi Mining Company Inc. (YSMC). The Tit Mountain Breccia target has been identified by previous investigators as consisting of two separate breccia bodies that range from 32 to 49 m in size (in plan view). Two of the best Au intercepts from previous reverse circulation drilling programs within the Tit Mountain breccia targets include: 129.5 m averaging 1.94 g/t Au and 4.1 g/t Ag from hole number 94-05, and 10.5 m averaging 1.49 g/t Au and 13.5 g/t Ag from hole 94-04 (g/t = gram per metric tonne).

4.0 GEOLOGIC SETTING OF THE MT. NANSEN AREA

4.1 Regional Geology

The Mt. Nansen area lies within a northwest-trending belt of Mesozoic calc-alkaline igneous rocks that intrude and overlie rocks of the Yukon Metamorphic Complex. The Mt. Nansen area lies within the Yukon-Tanana Terrane that is underlain by Devonian and older metamorphic rocks of the Nisling and Nasina Subterranes. The igneous rocks consist of several plutonic suites ranging from upper Triassic to mid-Cretaceous in age which are overlain by at least two volcanic suites ranging from mid- to late-Cretaceous in age. The regional geology of the area has been discussed by Carlson (1987), Tempelman-Kluit (1984), Bostock (1936), and Cairnes (1916).

The metamorphic rocks may be separated into two types: meta-igneous consisting mostly of biotite-hornblende feldspar gneiss, granodiorite orthogneiss, chlorite schist, and lesser amphibolites; and less abundant meta-sedimentary quartz-rich and/or micaceous rocks that consist of gneiss, schist, quartzite, and rare carbonate rocks (as identified in the Brown-McDade pit in the late 1980's).

At least two volcanic suites occur in the region and consist of: the mid-Cretaceous Mt. Nansen Group, and the late-Cretaceous Carmacks Group. The Mt. Nansen volcanic suite makes up numerous small to large outcropping bodies throughout the region consisting mostly of andesitic rocks and subvolcanic porphyry intrusive rocks and will be described further in the next section. The Carmacks volcanic suite comprises extensive, locally stacked, flows of shoshonitic basalt that conformably overlie a pre-70 Ma surface which locally preserves sedimentary rocks. The Carmacks Group is magmatically related to the Prospector Mountain Plutonic Suite (Johnston and Mortensen, 1994).

The Mt. Nansen area lies just beyond the western limit of the youngest Pleistocene glacial (McConnell) advance (Sawyer and Dickinson, 1976). Drainage is characterized by V-shaped valleys and an absence of lakes.

4.2 Local Geology

The geology and mineral deposits in the Mount Nansen area have been described in Bostock (1936; 1966), Sagger and Bianconi (1971), Sawyer (1976), Carlson (1987), Johnston et al. (1994), Andersen and Stroshein (1997), B.Y.G. Natural Resources Inc. (1997), Hart and Langdon (1997), Meyer (>1998?), Selby et al. (2001), Stroshein (1999; 2007), and Deklerk and Burke (2008). Figure 3 shows the local geology of the Discovery Creek Project and nearby Mt. Nansen area. The summary of the local geology below is taken from the aforementioned sources.

The local geology of the Mt. Nansen area consists of meta-sedimentary rocks that have been intruded by several plutonic suites including: granitic to syenitic rocks of the Long Lake Suite, and rocks of the Dawson Range batholith (Whitehorse Suite), including the Casino granodiorite and the Big Creek syenite. The Casino granodiorite unit ranges in composition from biotite-hornblende granodiorite to hornblende diorite.

The Mt. Nansen Group volcanic suite forms nested caulderas composed mostly of andesitic fragmental units and flows and also include a late phase of hypabyssal quartz-feldspar porphyry and quartz monzonite stocks dikes, sills and minor pyroclastic flows. The largest body of intrusive rock located within the Discovery Creek Project area that is related to the Mt.
Nansen subvolcanic porphyry intrusive complex is approximately 3.2 km long by 1.6 km wide.
The Mt. Nansen porphyry complex hosts disseminated Cu-Mo mineralization in several porphyritic rock types: plugs, dikes, and breccia bodies (Sawyer and Dickinson, 1976).

Rocks exposed in the southern quarter of the Discovery Creek property are dominated by metasedimentary rocks. Rocks exposed in the northern three-quarters of the Discovery Creek property are dominated by the Casino granodiorite and volcanic rocks from the Mt. Nansen Group with lesser subvolcanic porphyry intrusive rock complexes related to the Mt. Nansen Suite, and locally with the Long Lake Suite.

The Au-Ag deposits are localized along a northwest-trending corridor, which has been described as a horst, and are spatially associated with multiple intrusive plugs, stocks, and dike swarms (Hart and Langdon, 1997). Other dominant structures in the area are oriented 020° and east-northeast.

5.0 2008 EXPLORATION WORK PROGRAM

The 2008 exploration program at the Discovery Creek Project focused on geochemical soil sampling over the Tit Mountain Breccia target. The geochemical sampling work was completed from late August to September 11, 2008. A rectangular grid was flagged in the field using hand-held GPS units. The grid consisted of east-west lines spaced every 50 meters. Soil samples were collected on 25 meter spacings along each line. The 2008 soil grid is shown in Plate 1.

A total of 440 soil samples were collected using a 1.3 meter long soil auger tool. The soil descriptions are listed by sample number in Appendix B and include sample location coordinates, sample depth, and the presence or absence of permafrost. A shovel was used to dig away the upper organic-rich "A" horizon and the soil sample was collected using soil auger tools that were forced down to the lower "B" or locally the "C" soil horizons to an average total depth of 60 to 65 cm. Coarse gravels were discarded at the collection site. We found that a three person team could collect approximately 70 soil samples per day. Two teams, each consisting of three geologists, collected most of the soil samples under the supervision of the author.

The soil samples were placed in rice bags and sent in a secured fashion to ALS-Chemex Laboratories in Terrace, B.C. for sample preparation (ALS methods prep 41 and SCR-41) that included drying, screening of each sample to -180 um (80 mesh), and preparing a pulp from the finer screened sample portion for analysis. The soil analyses were conducted in the North Vancouver, B.C. ALS-Chemex laboratory. The samples were analyzed for 51 elements using ICP analysis with the ultra trace level-aqua regia partial digestion method (ALS CODE package ME-MS41). In addition, each soil sample was assayed for Au using the Au-ICP21 method (fire assay using 30 g nominal sample weight) that contains a lower detection limit for Au equal to 0.001 ppm (AA absorption technique). All gold results >1 ppm were reanalyzed using gravimetric assay methods (ALS method Au-GRA21).

YSMC geologists also conducted field visits to the following prospects located within the Discovery Creek claim block:

(1) Willow Creek and Eliza Creek prospects (epithermal vein systems);
(2) Tit Mountain prospect (northwest extension of Eliza and Willow Creek epithermal vein systems including breccia targets on the north side of Tit Mt.);
(3) JCS claims (molybdenum-copper porphyry prospect);
(4) Etzel prospect (epithermal vein target); and the
(5) Slate Creek prospect.

YSMC geologists collected GPS waypoints (using a hand-held Garmin 60CSX GPS unit) for several points of interest (old drill holes, trench boundaries, and road access points). The elevations are only approximate as the WAAS satellites were not used in the data gathering process in the field. The GPS waypoints for those trenches and drill holes surveyed in the field in 2008 were compared with the digital exploration database supplied by Aurchem Exploration Ltd. (compiled in UTM NAD27 coordinate projection and map datum).

The camp used for the field work was located near UTM NAD27 Zone 8N coordinate: 385358E 6885718N. Three wooden tents were set up at this location with two being used for sleeping and the other one being used for the kitchen.

6.0 RESULTS OF 2008 EXPLORATION WORK PROGRAM

Geochemical results conducted by ALS-Chemex Laboratories (North Vancouver, B.C.) for the soil samples over the Tit Mountain Breccia target are attached in Appendix C (certificate numbers VA08135020, VA08135021, and VA08135022). Plate 2 shows a map with the Au assay results for the 2008 soil samples.

Gold values from the 2008 soil sampling program located in the vicinity of the two Tit Mountain breccia bodies ranged from 0.012 to 6.45 g/t. The 2008 Au in soil results form three types of anomalies (>0.050 g/t) within the 2008 soil grid area as shown in Figure 4: (1) a large anomaly up to 525 m by 200 m in size in the southeast part of the grid that partially covers the surface projection of the two previously identified Tit Mountain breccia bodies; (2) isolated single- to triple-point anomalies throughout; and (3) narrow linear (<25 m wide) to small circular anomalies (<105 m in diameter) concentrated in the northwest part of the 2008 soil grid.

7.0 CONCLUSIONS AND RECOMMENDATIONS

The 2008 Au in soil sample results that were collected with soil auger tools compare moderately well with pre-2008 soil sample results that are presumed to have been collected with maddock tools (Plate 3). Figure 5 shows a plot of the 2008 soil sample results vs. the pre-2008 soil sample results located within a 12.5 m radius of the 2008 soil sample locations. Although the 2008 Au in soil results exhibit a poor correlation coefficient with the nearby pre-2008 soil samples (correlation coefficient $r^2 = 0.11$ in Figure 5), the relative values compare moderately well. The 2008 Au in soil results locally found single or double-point Au anomalies (≥ 0.05 g/t) that were

not previously identified from the earlier soil sample surveys. However, the 2008 Au in soil results did not expand or outline any large unknown Au anomalies (≥ 0.05 g/t), or upgrade (or increase) the existing pre-2008 Au in soil values. A total of 2 percent of the 2008 Au in soil values were exactly the same as the pre-2008 Au in soil values. In addition, the difference between the two soil data sets (2008 vs. pre-2008) are equally distributed with respect to one another with 52% of the 2008 Au in soil results being greater than the pre-2008 Au in soil results (the other 46% were lower).

Existing disturbance from pre-existing trenches, drill holes, and roads adjacent to trenches all occur adjacent to the two Tit Mountain breccia bodies which may have locally influenced (upgraded) the 2008 Au in soil results. Although 2008 Au in soil values > 0.050 g/t trend off of the 2008 sample grid, no additional soil samples are recommended in the area of the Tit Mountain Breccia target due to the reasons stated in the previous paragraph.

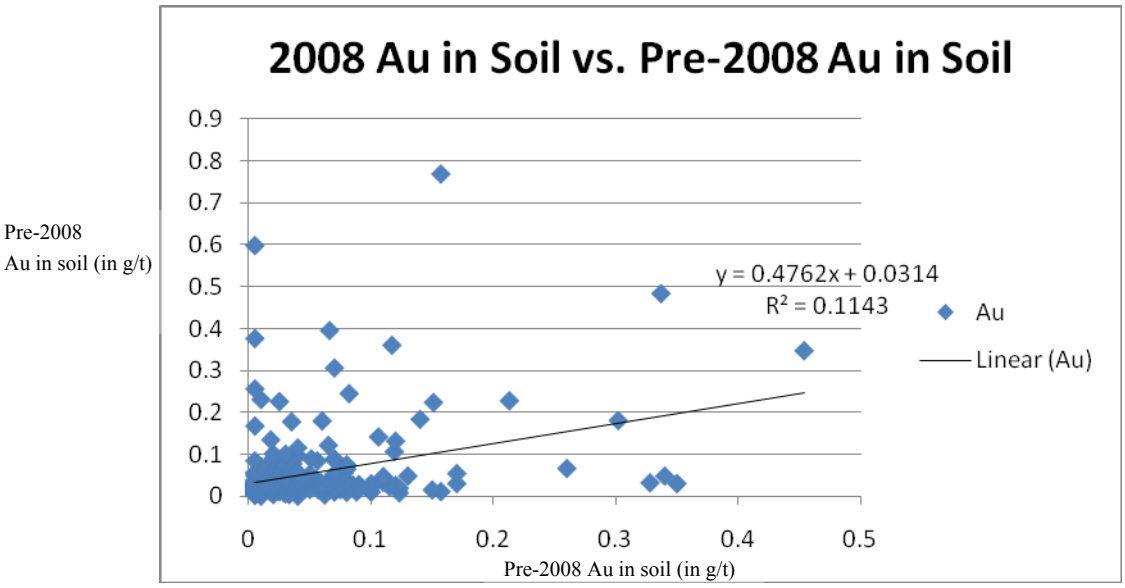

Figure 5. Plot of 2008 Au in soil values vs. Pre-2008 Au in soil values. The Pre-2008 Au in soil values plotted on this chart are located within a 12.5 m radius around the location of the associated 2008 soil sample locations. High-grade Au samples >1.0 g/t were excluded from this figure in order to emphasize the bulk of the lower grade Au data (<0.2 g/t).

7.1 2009 Exploration Plans

Recommended exploration plans for 2009 will include the following:

(1) Induced polarization geophysical survey located between Tit Mountain and the Willow Creek and Eliza Creek targets (~1.0 sq. km area);
(2) Geological mapping and geochemical sampling (rocks and/or soils) at the following targets: between Tit Mountain and the Willow Creek and Eliza Creek targets; Dic, and possibly Cyprus; and
(3) Trenching in the following areas: between Tit Mountain and the Willow Creek and Eliza Creek targets, and at the Dic target (if time and money allows).

8.0 STATEMENT OF 2008 EXPENDITURES: JAN. 1 TO DEC. 31, 2008

Note: Sunny Purewal, controller, on behalf of the Yukon-Shaanxi Mining Company Inc., has provided and approved the Discovery Creek related exploration expenditures statement (in Canadian Currency). The author has not verified these expenditures.

10.0 AUTHORS CERTIFICATES, SIGNATURES AND CONSENTS

TODD W. JOHNSON, M.S., QP

STATEMENT OF QUALIFICATIONS

I, Todd W. Johnson, HEREBY CERTIFY THAT:

1) I am an independent consulting geologist with a business address at 550 N. McCarran Blvd. #254 Sparks, Nevada 89431

2) I am a graduate of Washington State University of Pullman, Washington (USA), with a B.Sc. in Geology (1988) and M.Sc. in Geology (1991); and from the University of Nevada-Reno (USA) with a M.Sc. in Geological Engineering (2003).

3) I am a registered Professional Engineer (P.E.) in good standing with the State of Nevada (USA): license number 016748.

4) I have worked as a geologist and/or a geological engineer on a continuous basis for a total of 18 years since my 1991 university graduation.

5) I am a registered member in good standing with the Australian Institute of Mining and Metallurgy (AusIMM) with member number 227374 (since 2007).

6) I am an active member of the following professional societies: Society of Economic Geologists (since 1989), Association of Engineering Geologists (since 2002), and the Geological Society of Nevada (since 2000).

7) I have read the definition of "qualified person" set out in National Instrument 43-101 and certify that by reason of education, experience and affiliation with a professional association, I meet the requirements of a Qualified Person as defined in draft National Policy 43-101.

8) I am responsible for the preparation of all sections (except Section 8.0) of the Assessment report titled "2008 Geochemical Exploration Report: Discovery Creek Project, Yukon Territory, Canada" prepared for Yukon-Shaanxi Mining Company Inc. dated May 15, 2008 (the "Technical Report"). Section 8.0 (Statement of Exploration Expenditures) was compiled by Sunny Purewal, a controller working on behalf of Yukon-Shaanxi Mining Company, Inc.

9) I helped manage most of the 2008 soil sampling project at the Tit Mountain target and was active at the project site from September 7-14, 2008. The 2008 soil grid was designed by other project geologists working with Yukon-Nevada Gold Corp.

10) I was paid a daily rate for geological consulting services performed at the Discovery Creek Project and do not have any other interests relating to the project or Yukon-Shaanxi Mining Company Inc. I do not have any interest in adjoining properties in the Mt. Nansen area (Yukon).

11) I consent to the filing of the Technical Report with any stock exchange and other regulatory authority and any publication by them, including electronic publication in the public files on their websites accessible by the public.

Finalized Date: 16-OCT-2008
This copy reported on 12-JAN-2009
Account: YUSHAA

CERTIFICATE VA08135020

Project: Mount Nansen

P.O. No.:

This report is for 188 Soil samples submitted to our lab in Vancouver, BC, Canada on 22-SEP-2008.

The following have access to data associated with this certificate:

BRAD FINNSON	TODD JOHNSON	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
SCR-41	Screen to -180um and save both
LOG-22	Sample login - Rcd w/o BarCode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS41	51 anal. aqua regia ICPMS	

To: **YUKON-SHAANXI PROJECT**
ATTN: TODD JOHNSON
105C PLATINUM RD.
WHITEHORSE YT Y1A 5M3

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA08135021

Project: MOUNT NANSEN

P.O. No.:

This report is for 187 Soil samples submitted to our lab in Vancouver, BC, Canada on 22-SEP-2008.

The following have access to data associated with this certificate:

BRAD FINNSON	TODD JOHNSON	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS41	51 anal. aqua regia ICPMS	

To: **YUKON-SHAANXI PROJECT**
ATTN: TODD JOHNSON
105C PLATINUM RD.
WHITEHORSE YT Y1A 5M3

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE VA08135022

Project: MOUNT NANSEN

P.O. No.:

This report is for 171 Soil samples submitted to our lab in Vancouver, BC, Canada on 22-SEP-2008.

The following have access to data associated with this certificate:

BRAD FINNSON	TODD JOHNSON	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
SCR-41	Screen to -180um and save both
LOG-22	Sample login - Rcd w/o BarCode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-MS41	51 anal. aqua regia ICPMS	

To: **YUKON-SHAANXI PROJECT**
ATTN: TODD JOHNSON
105C PLATINUM RD.
WHITEHORSE YT Y1A 5M3

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS VA08135022

Method	CERTIFICATE COMMENTS
ME-MS41	Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
