I	2010 Rock Sample Highlights	6
---	-----------------------------	---

INTRODUCTION

The Vault property covers a gold prospect situated within the Kluane Mafic-Ultramafic Belt in western Yukon. The property is 100% owned by Strategic Metals Ltd.

This report describes an exploration program that was conducted by Archer, Cathro & Associates (1981) Limited, under the supervision of H. Smith, B.Sc. P.Geo., in summer 2010 on behalf of Strategic Metals. The work was performed on seven days between June 27 and July 20, and comprised prospecting and geochemical sampling. The authors directed the program, and their Statements of Qualifications appear in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Vault property consists of 180 contiguous mineral claims, which are located on NTS map sheets 115G/5, 6, 11 and 12 at latitude 61°31' north and longitude 139°36' west (Figure 1). The property covers an area of approximately 3650 ha (36.50 sq. km). The claims are registered with the Whitehorse Mining Recorder in the name of Archer, Cathro, which holds them in trust for Strategic Metals. Specifics concerning claim registration are tabulated below, while the locations of individual claims are shown on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
Vault 1-180	YD56961-YD57140	April 15, 2011

* Expiry date does not include 2010 work that has not yet been filed for assessment credit.

The property lies approximately 5 km northwest of the Wellgreen mine access road, about 6 km to the east of its junction with the Alaska Highway. From that junction, it is 30 km to Burwash Landing, the closest community and airport, and 280 km to the city of Whitehorse. In 2010, access was provided by a Hughes 500D helicopter operated by Fireweed Helicopters Ltd. from a temporary base at the White River Lodge, which is located 65 km northwest of the property on the Alaska Highway.

PREVIOUS WORK

The Vault property lies within the Kluane Gold Fields. Placer gold operations have been recorded on the creeks in the area since the first discovery in 1903 on Fourth of July Creek. Official production records are not available prior to 1940, but extensive workings found on the creeks throughout the area suggested subsequent production occurred during two gold rushes: the first between 1903 and 1904 and the other between the 1920s and 1930s. Between the 1940s and 1970s, placer work in the area was aided by heavy equipment that was transported along the Alaska Highway. For example, an estimated 95,000 ounces of gold and 800 ounces of platinum were recovered between 1946 and 1978 from Burwash Creek. Increases in gold prices since the mid-1970s have caused continued interest in the Kluane Gold Fields. In total, creeks in this district are estimated to have produced more than 200,000 ounces of gold and 1000 ounces of platinum, between 1903 and 2000. Coarse gold is common with nuggets ranging from one to eight ounces. Platinum generally occur as small flakes, but nuggets up to one half ounce have been recovered (Tremblay, 2000).

DATE: MARCH 2011

Hard rock exploration in the area began in earnest after 1945 because construction of the Alaska Highway improved access.

The Wellgreen Mine was developed by the Hudson Bay Mining and Smelting Ltd. In 1952, nickel-copper-platinum group element mineralization was discovered at the Wellgreen property, which lies about 6 km south of the Vault property. Underground mining produced a total of 171,652 tons, averaging 2.23% nickel, 1.39% copper, 0.065 oz. platinum and 0.073% cobalt between 1972 and 1973 (McCracken, 2010). Mining was suspended because of ground stability problems. In the late 1980s, All-North Resources Ltd. acquired the property and conducted extensive programs of surface and underground exploration which culminated in 1990 with an open pit resource estimated at 49.9 million tonnes grading 0.36% nickel, 0.35% copper, 550 ppb platinum and 340 ppb palladium (Carne, 1987).

Exploration programs have been carried out in the area surrounding the Wellgreen property intermittently since 1952 by different operators. Numerous claims blocks have been staked over various parts of the current Vault property with much of the activity stimulated by the discovery of the Wellgreen Deposit (Figure 3). Various exploration related activities are described in the following paragraphs.

In late 1952 and early 1953, New Alger Mines Ltd. staked the Polaris and Ursus groups. Mapping and prospecting were carried out in 1953 but no results were reported (Anon., 1953).

In 1952, Teck Exploration Company Ltd. staked the Musketeer and Conwest showings as the Musketeer claim group, part of which underlies the centre of the Vault claims. A work program carried out in 1953, which included geological mapping and prospecting, but no results were reported (Vanwermeskerken, 2001).

In 1955, Teck completed a program of geophysical exploration on the Musketeer claims, which included line-cutting, electromagnetic surveying, and some magnetic surveying. This program was designed to trace a peridotite unit that is related to nickel-copper showings in the area. Several anomalies were indicated by the electromagnetic survey, but they were not of great interest. As there was doubt to the reliability of the electromagnetic equipment, a resistivity survey was performed later that year. None of the resistivity anomalies coincided with the electromagnetic anomalies previously outlined. The results from these studies indicated that the bodies causing the anomalies were likely not massive in character (Walker, 1955 and 1956).

In 1980 and 1981, Archer, Cathro did work in the Dawson Range as part of the NAT Joint Venture (NAT JV), which comprised Chevron Canada Limited and Armco Mineral Exploration Ltd. Part of the NAT JV program involved reanalyses of over 5000 previously collected geochemical sample splits for gold, silver, arsenic and lead. Sixteen soil samples and 44 stream sediment samples were reanalyzed from the current Vault property and returned values up to 135 ppb gold in soils and up to 425 ppb gold in stream sediments. Despite the encouraging values and intense gold placer activity in the area, no claims were staked (Archer and Onasick, 1980).

In 1987, Reed Creek Joint Venture staked the Valley, Reed, Pump and Swede claims to cover an aeromagnetic anomaly that coincides with a regionally extensive ultramafic sill. This ultramafic sill is associated with the nickel-copper-platinum group element mineralization at the nearby Wellgreen property. The 1987 work program consisted of geological mapping, reconnaissance prospecting and geochemical sampling traverses oriented perpendicular to the regional tectonic fabric. A high grade nickel-copper showing, rumoured to be located on Reed Creek, was followed up, but it was assumed to be a glacially transported boulder because no bedrock source was found. A number of other specimens of glacially-transported ultramafic or gabbro float were also discovered. Soil and stream sediment geochemical sampling returned discontinuous moderate strength anomalies (60 to 350 ppb gold in soils) along the lower slopes. That sampling also outlined elevated copper-gold-platinum values in the south half of the Reed claims and the west part of the Swede claims. These anomalous samples were taken at approximately same stratigraphic level as the probable lode source for coarse angular gold in nearby creek placers (Carne, 1988).

In 1987, the Toby claims, most of which underlies the centre of the Vault claims, were staked by D.E. Makkonen to cover the headwaters of gold-bearing Reed Creek. Twenty-nine soil samples were collected at 60 m intervals along the ridge crest and another 33 contour soil samples were collected at 30 m intervals at approximately 1500 m elevation. The two best samples returned 130 ppb gold and 350 ppm arsenic and 125 ppb gold and 1000 ppm arsenic, respectively, while seven other samples returned moderately anomalous gold values between 50 and 95 ppb. Platinum and palladium analyses generally gave weak response (Makkonen, 1988).

In 1987, the Greg claims were staked by N. Zikos on the southeastern side of the current Vault property. A prospecting and reconnaissance sampling program was conducted later that year, but all samples collected were from outside the current property boundary (Davidson, 1988).

In 1987, exploration on the Arch property (which encompasses the Barny, Mus, Amp, and Eugene claims) was funded by Pak-Man Resources Inc. and Rockridge Mining Corp. Of these claims, only the Eugene claims overlap with the current Vault property. Claim staking, mapping, geochemical soil sampling and rock sampling were done on the Eugene claims. Strongly anomalous values (up to 10,000 ppb gold) were returned from three consecutive soils samples over a 75 m strike length below a quartz-carbonate alteration zone developed in pyroclastic volcanic rocks (Eaton, 1988).

In 1988, another work program was performed on the Arch property, which included few man-days spent prospecting the Eugene gold anomaly. One rock sample assayed 5000 ppb gold while seven chip samples taken from different parts of the quartz-carbonate altered zone returned 40 to 420 ppb gold. Representative specimens of other rock types found in the talus all returned near background values. Arsenic was the only metal other than gold that was present in anomalous levels, returning 30 to 479 ppm from the chip samples (Eaton, 1988).

In 1997, Northern Platinum Ltd. carried out mapping, geochemical soil sampling, rock sampling, geophysical survey and road construction on the Arch property. All samples collected during this program were from outside the current Vault claim boundaries (McGoran, 1997).

In 2000, Auterra Ventures Inc. carried out a brief program of sampling, road rehabilitation, blast trenching and additional staking on the AR claims. All work was completed outside the Vault property boundary (Vanwermeskerken, 2001 and Brickner, 2002).

In 2002, two independent prospectors, R. McIntosh and F. Ellis, conducted a work program that included data compilation of all work done on the Ross property from the 1980s through to the 2000s, plus prospecting, geochemical sampling and mapping. Of the samples taken along Ellis/Glacier Creek, only one showed 6 ppb gold while the remainder were less than 5 ppb gold (McIntosh et al, 2002).

GEOMORPHOLOGY

The Vault property is located along the northeast edge of the Kluane Range immediately southwest of the broad, flat-bottomed Shikwak Valley. Elevations range from 1130 m on the edge of the valley to 2050 m on the ridge crests. Vegetation consists of stunted black spruce and thick moss near the valley floor, giving way to willow and black birch on lower slopes with moss, lichen and grass on upper slopes. Higher elevations are characterized by long, steep (about 30°) talus slopes. Outcrops occur near ridge crests and along actively eroding creek cuts.

REGIONAL GEOLOGY

The Vault property lies along the northeast edge of Wrangellia Terrane (Figure 4) within a steeply dipping package of Late Paleozoic and Early Mesozoic volcanic and sedimentary rocks that are bounded on the northeast by the Denali Fault and southwest by the Duke River Fault. The following lithological unit descriptions have been compiled most recently by Israel and Van Zeyl (2004).

Skolai Assemblage

The oldest rocks in the project area belong to the 1000 m thick Pennsylvanian to Permian Station Creek Formation (PSv), which forms the lower member of the Skolai Assemblage. The lower part of the formation consists of augite-phyric basalt and andesitic volcanic flows that are succeeded upwards by fine- to medium-grained tuff. Volcanic agglomerate and breccia are locally present and discontinuous beds of limestone occur throughout. The upper 400 m of the formation is transitional with overlying Hasen Creek Formation (PHp), with the contact informally put at the cessation of pyroclastic deposition.

The Hasen Creek Formation forms the upper part of the Skolai Assemblage, attaining a maximum thickness of approximately 800 m. Stratigraphy consists of a fine grained clastic lower member composed of grey to black phyllite, cherty argillite, and siltstone that gives way gradationally upward to shaly limestone and buff coloured massive bioclastic limestone and calcarenite with discontinuous beds of reddish brown conglomerate, massive greywacke and sandstone. Thin basaltic flows, breccia and tuff are locally present.

Nikolai Assemblage

The Middle to Late Triassic Nikolai Assemblage (uTrNv) is a kilometre or more thick sequence of basalt flows with minor interbedded limestone that unconformably overlies the Skolai

DATE: MARCH 2011

Assemblage rocks. Flows are thin (2 to 10 m), vesicular to amygdaloidal and locally hematitic, indicating shallow water to subaerial deposition.

Kluane Mafic-Ultramafic Suite

Mafic and ultramafic intrusions (uTru) are common within the northeast section of the Kluane Range. These sill-like bodies probably acted as subvolcanic feeders to the overlying oceanic plateau basalts of uTrNv. They are preferentially emplaced along the contact between PHp and PSv within a short stratigraphic distance above or below the contact. They vary from less than 10 to 1000 m in thickness and attain strike lengths up to 20 km. A significant number are ultramafic dominated and include thin or discontinuous marginal gabbro zones at the base of the sill or in areas of complex interdigitation with country rocks. The generally fine grained to phyrlic marginal gabbros can be overlain or flanked successively by melano-gabbro, clinopyroxenite, olivine clinopyroxenite, peridotite and dunite. Furthermore, gabbros are also locally present in wallrocks peripheral to the sills. Gabbro and pyroxenite phases often host magmatic sulphide concentrations as either massive sulphide lenses or heavy disseminations. These sulphide rich zones carry nickel, copper and PGE mineralization in a number of locations. Crosscutting relationships indicates an Upper Triassic age for the mafic-ultramafic intrusions.

Maple Creek Gabbro

Texturally varied hypabyssal stocks, sills and dykes of gabbroic composition are approximately coeval with the mafic-ultramafic intrusions. They are thought to have been feeders to the Nikolai Assemblage volcanic rocks and are reliably dated at 232 ± 1 Ma.

PROPERTY GEOLOGY

To date, no detailed geological mapping has been done on the Vault property. The following description of property geology is based on published data discussed in the previous section. Generalized property geology is shown on Figure 5.

The Station Creek Formation (PSv) occurs throughout much of the eastern part of the property. PSv is overlain to the southwest, with apparent conformity, by the Hasen Creek Formation (PHp), which underlies much of the central portion of the property. The Nikolai Formation (uTrN) is mostly found in the southeastern corner of the property and is dominantly comprising of uTrNv, which is a sequence of flood basalts. Bands of uTrNc, a sedimentary unit, are also present in the same area, while uTrNb, a volcanic breccia to agglomerate unit, occurs locally in the centre of the property.

Several gabbroic dykes and sills are present, mainly near the western boundary of the property. These have been mapped as part of the Maple Creek Gabbro, which is composed of coarse- to medium-grained pyroxene gabbro and fine-grained diabase.

Two thrust faults have been mapped within the property boundary. Both strike northwesterly and dip southwesterly. The most pervasive structures in the study area are northwest trending, and northeast verging overturned folds. Local secondary folding events likely resulted in southwest and southeast plunges of the older fold axes.

MINERALIZATION

Mineralization at the Vault property consists of localized, poorly developed stockwork of white quartz veinlets surrounded by tan carbonate altered volcanics. Fine-grained pyrite, chalcopyrite, and arsenopyrite are rarely noted (Eaton, 1988).

Gold mineralization in the Reed Creek placer operation has been described as unique for the district by Carne (1988). Nuggets greater than one-half ounce are common and about 40-50% of the placer gold is angular or crystalline with white quartz-calcite vein material adhering. Quartz-calcite vein float containing coarse visible gold has been recovered from the creek gravels along the entire 3 km length of the placer workings. The float is generally angular and pieces range from fist-sized to about a metre across. Minor chalcopyrite, pyrite and arsenopyrite occur in narrow bands within the vein material but assays of sulphide-rich sections generally return less than 7 g/t gold. The gold bearing float is likely derived from veins that occur further upstream in the headwaters, and the placer gold may have been derived from breakdown of vein material that was carried downstream and deposited with ice-rafted marginal or terminal morainal debris during the last glaciation.

A total of 14 rock samples were collected from the property in 2010. Six samples were collected near the centre of the property, while the others were taken further south. Rock sample locations and results for gold, arsenic, copper and silver are plotted on Figures 6 to 10, respectively. Sampling and Analytical Procedures for 2010 samples are provided in Appendix II. Rock sample descriptions are included in Appendix III and Certificates of Analysis are given in Appendix IV.

The samples returned weakly to strongly anomalous values for gold, arsenic, copper and silver. Table 1 highlights values from the five best samples.

Table I – 2010 Rock Sampling Highlights

Type	Gold (ppb)	Arsenic (ppm)	Copper (ppm)	Silver (ppm)
Rock – grab	23	62	4920	14
Rock – grab	51	74	318	2.5
Rock – grab	357	303	102	0.4
Rock – grab	868	2	494	0.1
Rock – grab	18	9	16950	1.6

SOIL GEOCHEMISTRY

A total of 679 soil samples were collected in summer 2010. The soil samples were taken using hand held soil augers along contour lines. The samples were spaced approximately 50 m apart along the lines. Sample locations are shown in Figure 11 while results for gold, arsenic, copper and silver are shown in Figures 12 to 15, respectively.

The contour samples yielded background to strongly anomalous values for all four metals but often in different areas. The most continuous gold-in-soil anomaly lies in the southeastern

portion of the property where a string of six samples all returned greater than 200 ppb gold. Strongly elevated silver (1 to 2.8 ppm), arsenic (269 to 5990 ppm) and copper (724 to 1505 ppm) values were returned from samples collected near the middle of the property. In general, there does not appear to be a direct correlation between gold and the other metals.

DISCUSSION AND CONCLUSIONS

The Vault property is located within the Kluane Mafic-Ultramafic Belt in western Yukon. Previous and current work has identified numerous high gold (200 ppb to over 10,000 ppb) soil values, the distribution of which suggests that the source could be a stacked sequence of thrust faults cutting Permo-Triassic metasedimentary rocks over 12 km of strike length.

Soil sampling at the Vault property has also identified anomalies for arsenic, copper and silver. Main areas of interests for these metals lie near the centre of the property. Some high gold values occur with the other metals but most do not. Limited prospecting has discovered too little mineralization to adequately explain the relatively strong soil geochemical results. Thus, the sources of the metals are suspected to be recessive weathering zones buried beneath talus cover.

Detailed grid soil sampling and geological mapping, plus a few follow-up drill holes are suggested to better characterize the sources of the gold. Due to the rugged terrain, motorized trenching is not recommended.

Respectfully submitted,

STATEMENTS OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Crystal J. Chung, geologist, with business addresses in Vancouver, British Columbia and Whitehorse, Yukon Territory and residential address in Burnaby, British Columbia do hereby certify that:

1. I graduated from the University of British Columbia in 2005 with a B.Sc. majoring in Earth and Ocean Sciences (Geology).
2. From 2004 to present, I have been actively engaged in mineral exploration in British Columbia, Alaska and the Yukon Territory.
3. I am a Geoscientist in Training (GIT) with the Association of Professional Engineers and Geoscientists of British Columbia (Member Number 138321).
4. I have personally reviewed and interpreted all data resulting from this work.

Crystal J. Chung, B.Sc., GIT

STATEMENT OF QUALIFICATIONS

I, Heather Smith, geologist, with business addresses in Vancouver, British Columbia and Whitehorse, Yukon Territory and residential address at #604-175 West 1 Street, North Vancouver, British Columbia, V7M 3N9 do hereby certify that:

1. I graduated from the University of British Columbia in 2006 with a B. Sc in Geological Sciences.
2. From 2004 to present, I have been actively engaged in mineral exploration in the Yukon Territory, British Columbia and Northwest Territories.
3. I am a Professional Geoscientist (P.Geo.) with the Association of Professional Engineers and Geoscientists of British Columbia (Member Number 150000).
4. I have personally directed the fieldwork reported herein and have interpreted all data resulting from this work.

Heather Smith, B.Sc., P.Geo.

APPENDIX II

SAMPLING AND ANALYTICAL PROCEDURES

2010 Rock Geochemical Samples

Rock geochemical sample sites on the property were marked with orange flagging tape labelled with the sample number. The location of each sample was determined using a handheld GPS unit.

Multi-element analyses for rock samples were carried out at ALS Chemex in North Vancouver, B.C. Each sample was dried, fine crushed to better than 70% passing -2mm and then a 250 g split was pulverized to better than 85% passing 75 micron. The fine fraction was then analyzed for gold using fire assay followed by inductively coupled plasma-atomic emission spectroscopy analysis and for 35 other elements using an aqua regia digestion and inductively coupled plasma-atomic emission spectroscopy analysis (Au-AA24 and ME-ICP41).

2010 Soil Geochemical Samples

All 2010 soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Soil samples were collected from 10 to 30 cm deep holes dug by hand-held auger. They were placed into individually pre-numbered Kraft paper bags.

The soil samples were sent to ALS Chemex, where they were dried, screened to -180 microns, dissolved in aqua regia solution and then analyzed for 35 elements using the inductively coupled plasma with atomic emission spectroscopy technique (ME-ICP41). An additional 50 g charge was further analysed for gold by fire assay with inductively coupled plasma-atomic emissions spectroscopy finish (Au-AA24).

Comments:	Composite specimen sample of talus. 3 pc/2 m. Rock makes up approximatley 5% of talus. Calcite flooded mafic volcanic with trace chalcopyrite and azurite.					
Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension:
C386421	UTM:	577522 E	UTM:	6819533 N	Sample Width:	Abundance:
	Elevation:	m				
Comments:	Specimen from talus. 1 piece (6 cm by 4 cm). Chlorite altered intrusive. Ultramafic with calcite veins/flooding. Disseminated chalcopyrite, pyrite and a bronze-gold coloured mineral.					
Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension:
C386422	UTM:	577500 E	UTM:	6819495 N	Sample Width:	Abundance:
	Elevation:	m				
Comments:	Composite specimen- 10 pieces over two metres. Moderately abundant in float, but localized to this area. Quartz-calcite-ankerite vein material with weakly disseminated pyrite.					
Sample Number:	Grid East:	E	Grid North:	N	Type: Chip	Dimension:
C386423	UTM:	577419 E	UTM:	6819374 N	Sample Width: 0.75 m	Abundance:
	Elevation:	m				
Comments:	Chip sample across 0.75 m mafic volcanic dyke. Fine grained, diabase. Disseminated pyrite mineralization with < 1 cm "clots" of super fine grained, almost "powdery" pyrite. Stratigraphically sits below volcanic unit.					
Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension: 5 x 20 x 16 cm
C386424	UTM:	577381 E	UTM:	6819297 N	Sample Width:	Abundance: Rare
	Elevation:	m				
Comments:	Float specimen. Medium grained monzonite with < 5 mm altered feldspars (tan). Disseminated pyrite, arsenopyrite and chalcopyrite throughout. Hairline fractures coated with sulphides.					

Rock Sample Descriptions			Project: <u>Vault</u>		Property: <u>Vault</u>	
Sample Number:	Grid East:	E	Grid North:	N	Type: Composite	Dimension: 10 pieces over 2 m
C386425	UTM:	577310	UTM:	6819149	N Sample Width:	Abundance:
	Elevation:	m				
Comments:	Composite chip sample of 10 pieces over two metres. Orange-tan weathering surface. Quartz-carbonate-ankerite. Perfict 12 sided mineral-deep red to maroon. Trace pyrite. Abundant in float.					
Sample Number:	Grid East:	E	Grid North:	N	Type: Talus	Dimension: 15 x 15 x 10 cm
C386426	UTM:	577283	UTM:	6819152	N Sample Width:	Abundance:
	Elevation:	m				
Comments:	Talus sample of angular, fine grained, diabase dyke. Homogeneous except where flooded with calcite. Abundant malachite, disseminated chalcopyrite and blobs of fine grained pyrite.					
Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
	UTM:	E	UTM:	N	Sample Width:	Abundance:
	Elevation:	m				
Comments:						
Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:

Account: MTT

CERTIFICATE VA10089872

Project: VAULT

P.O. No.:

This report is for 299 Soil samples submitted to our lab in Vancouver, BC, Canada on 3-JUL-2010.

The following have access to data associated with this certificate:

JOAN MARIACHER

BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
EXTRA-01	Extra Sample received in Shipment
SCR-41	Screen to -180um and save both

CERTIFICATE VA10094044

Project: VAULT

P.O. No.:

This report is for 8 Rock samples submitted to our lab in Vancouver, BC, Canada on 12-JUL-2010.

The following have access to data associated with this certificate:

JOAN MARIACHER

BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Cu-OG46	Ore Grade Cu - Aqua Regia	VARIABLE
ME-OG46	Ore Grade Elements - AquaRegia	ICP-AES

To: STRATEGIC METALS LTD.
ATTN: JOAN MARIACHER

CERTIFICATE VA10100822

Project: VAULT

P.O. No.:

This report is for 193 Soil samples submitted to our lab in Vancouver, BC, Canada on 24-JUL-2010.

The following have access to data associated with this certificate:

JOAN MARIACHER

BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

CERTIFICATE VA10101961

Project: Vault

P.O. No.:

This report is for 97 Soil samples submitted to our lab in Vancouver, BC, Canada on 26-JUL-2010.

The following have access to data associated with this certificate:

JOAN MARIACHER

BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

To: STRATEGIC METALS LTD.

P.O. No.:

This report is for 6 Rock samples submitted to our lab in Vancouver, BC, Canada on 28-JUN-2010.

The following have access to data associated with this certificate:

JOAN MARIACHER

BILL WENGZYNOWSKI

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
