PLATE 1: SAMPLE LOCATION MAP Of The Money Property

1. INTRODUCTION

Yukon Zinc Corporation has interest in the Money property which consists of 82 mineral claims that were acquired by an initial staking in 1995 (Figure 1 & 2) and additional staking of Money 42-87 claims in 2011.

This report describes the 2011 exploration program which was comprised of broad geological mapping, rock sampling, line cutting and soil sampling. Appendix A includes geochemical analysis certificates for soil and rock samples.

2. WORK PROGRAM

Yukon Zinc Corporation contracted Equity Exploration Ltd. to conduct a directed field program on the Money property comprised of geological work by T. Branson (Equity), J.Moore (YZC). Linecutting was completed by Coureur de Bois linecutters. Field organization, camp arrangements, planning and execution logistics, and program supervision was the large responsibility of T. Branson (Equity). Camp setup and logistics support was completed by the the staff at the Wolverine Minesite. Aviation support and transport was provided by Quantum Helicopters and Alkan air and vehicles by K&K Truck Rentals.

3. STATEMENT OF EXPENDITURES

I, J. A. Moore, as agent for Yukon Zinc Corporation located at 701-475 Howe St., Vancouver, B.C., do solemnly declare that an exploration program was conducted on the Money property in July, August and September, 2011 (Table 3).

I make this solemn declaration conscientiously believing it to be true and knowing that it is of the same force and effect as if made under oath and by virtue of the Canada Evidence Act. Declared before me at Vancouver in the Province of British Columbia this 28th day of Feb, 2011.

	Money Project	UNITS	RATE	SUBTOTAL	TOTAL
WAGES:	Project Geologist	1.00	$ 700.00	$ 700.00	
	Sr. Geologist	10.00	$ 750.00	$ 7,500.00	
	Prospector	12.00	$ 525.00	$ 6,300.00	
	Sampler	24.00	$ 275.00	$ 6,600.00	
	First Aid Attendant	19.50	$ 400.00	$ 7,800.00	
	Shared wages			$ 18,383.88	$ 47,283.88
RENTALS	ATV and Trailer Rental	0.00	$ 100.00	$ -	
	Camp (mandays)	237.50	$ 50.00	$ 11,875.00	
	Toughbook	1.00	$ 40.00	$ 40.00	
	Shared truck rentals			$ 11,449.39	$ 23,364.39
SUB CON	Fixed Wing(Prorated)			$ 4,615.01	
	Helicopter (pro-rated)			$ 6,066.22	
	Linecutting			$ 73,320.00	
	Staking			$ 6,120.00	
	Heli (A Star B2)			$ 97,606.42	$ 187,727.65
ANALYSES	Silts	0.00	$ 30.30	$ -

4. Analytical Procedures

Acme Analytical Laboratories Ltd. on 1020 Cordova St. East, Vancouver, BC was used for the Money Project 2011 exploration program. Acme is currently registered with ISO 9001:2000 accreditation. This is a global standardization of quality assurance for products and services. Mr. Clarence Leong, a BC Certified Assayer and Acme General Manager supervised the analytical process. Assay certificates from samples reported on in this report are WHI11000846, WHI11001023, WHI11001206, WHI11001447, WHI11001840.

4.1 Procedures and Methods

The project geologist supervised the sample shipment procedure. Samples were shipped in doubled rice bags on pallets, which were then plastic sealed, from the Wolverine Project and received in the loading bay at Acme. R & L Expediting, Twilight Expediting and Manitoulin Trucking Limited were used as shipping agents and shipments were tracked by the project geologist and office staff. A request for analysis is submitted with each sample shipment, which outlines the analytical method that has been requested and the samples that were shipped. Analytical packages that have been requested are Group IF06 and Group 7AR.

Methods and specifications for 1F06 1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis and the overlimits method of 7AR 1:1:1 Aqua Regia Digestion ICP-ES Finish are included in Appendix A with the assay certificates.

For all analytical methods standard reference materials are used, analysis are repeated and duplicate analysis of sample pulps are analyzed. The analytical resultant values are used to estimate analytical accuracy and precision.

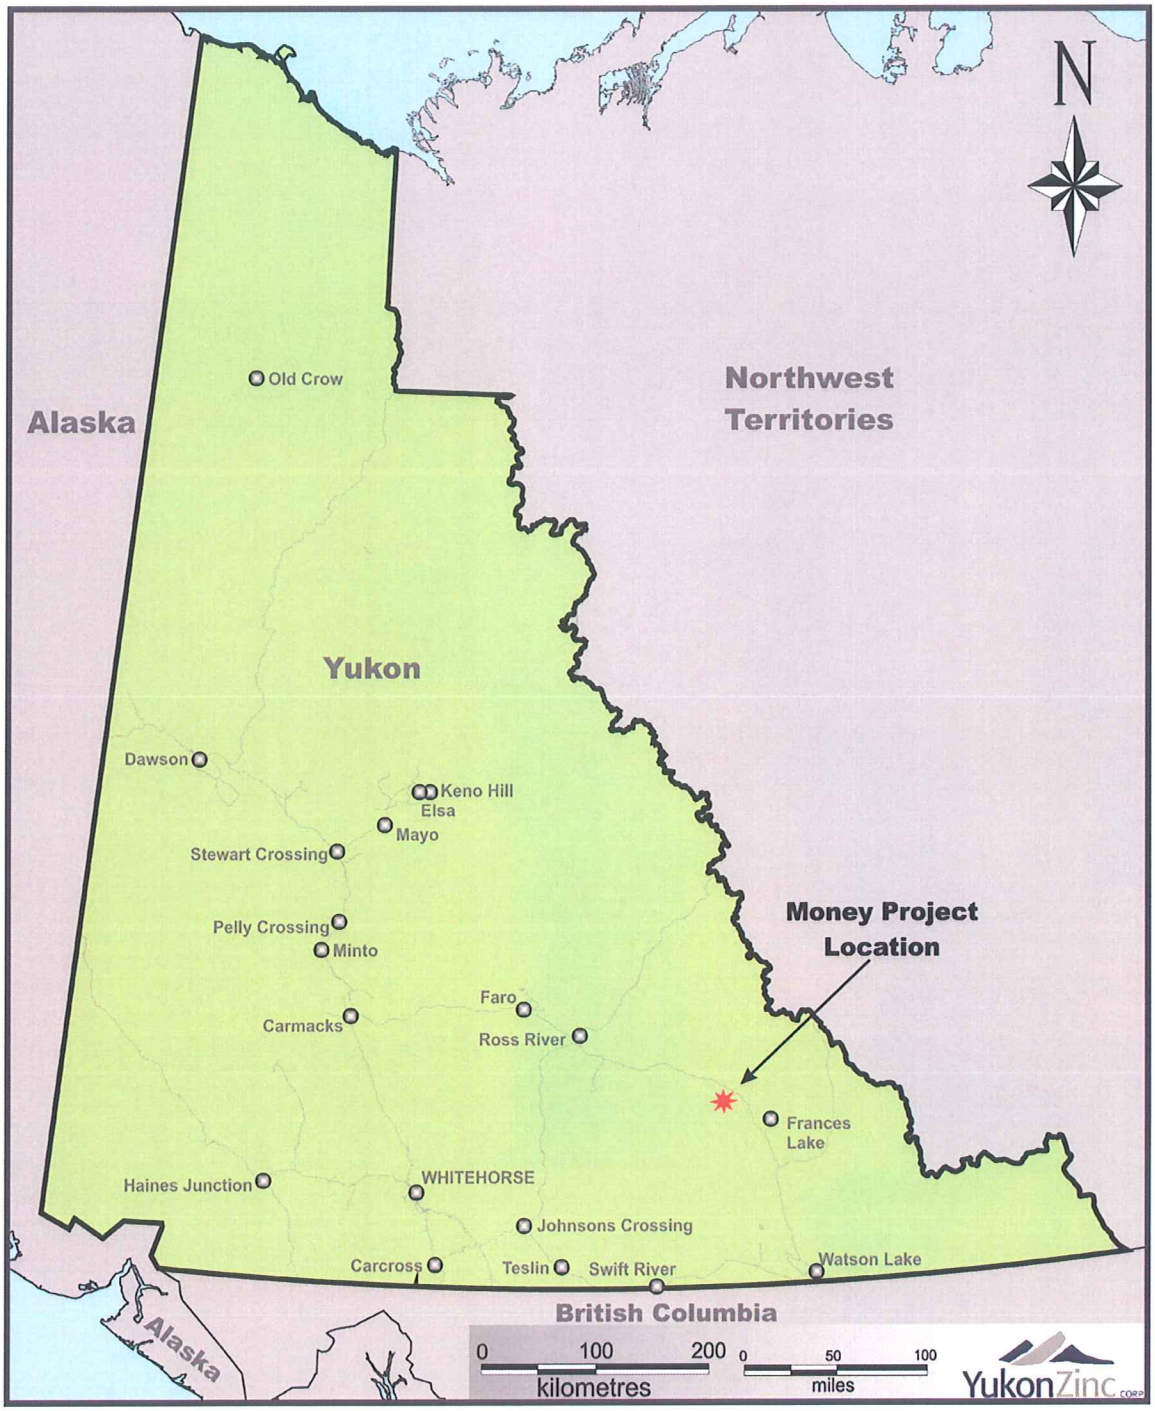

Figure 1: Money Project location.

5. PROPERTY, LOCATION AND ACCESS

The Money property is located in southeastern Yukon at latitude 61° 25' 2.53308" N and longitude -129° 59' 38.90832" W on NTS map sheet 105G/08, 105H/05 (Figure 1). It is comprised of 82 contiguous mineral claims registered with the Watson Lake Mining Recorder in the name of Yukon Zinc Corporation and YGC Resources Ltd. (Table 1, Figure 2).

Access points to the property can be gained from several locations. Predominantly, one can either drive or charter a small aircraft to the maintained Wolverine Mine airstrip located just off the Robert Campbell Hwy at km 190. This program utilized small aircraft chartered by Alkan and also a AStar BA helicopter and pilot was provided by Quantum Helicopters from Terrace, BC.

Camp was located at the Wolverine Mine Site where temporary facilities were constructed to host sample sorting and shipping efforts. The Wolverine Mine access road was used for pick-ups and drop off's to the lower portion of the grid and property. Helicopter transport was utilized for transport to the upper elevations of the property, it is a short flight from the mine site airstrip and heli pad facilities. Naturally cleared areas are on the westward portion of the property, linecutting crews brush cleared helipads in vegetated areas for safety purposes.

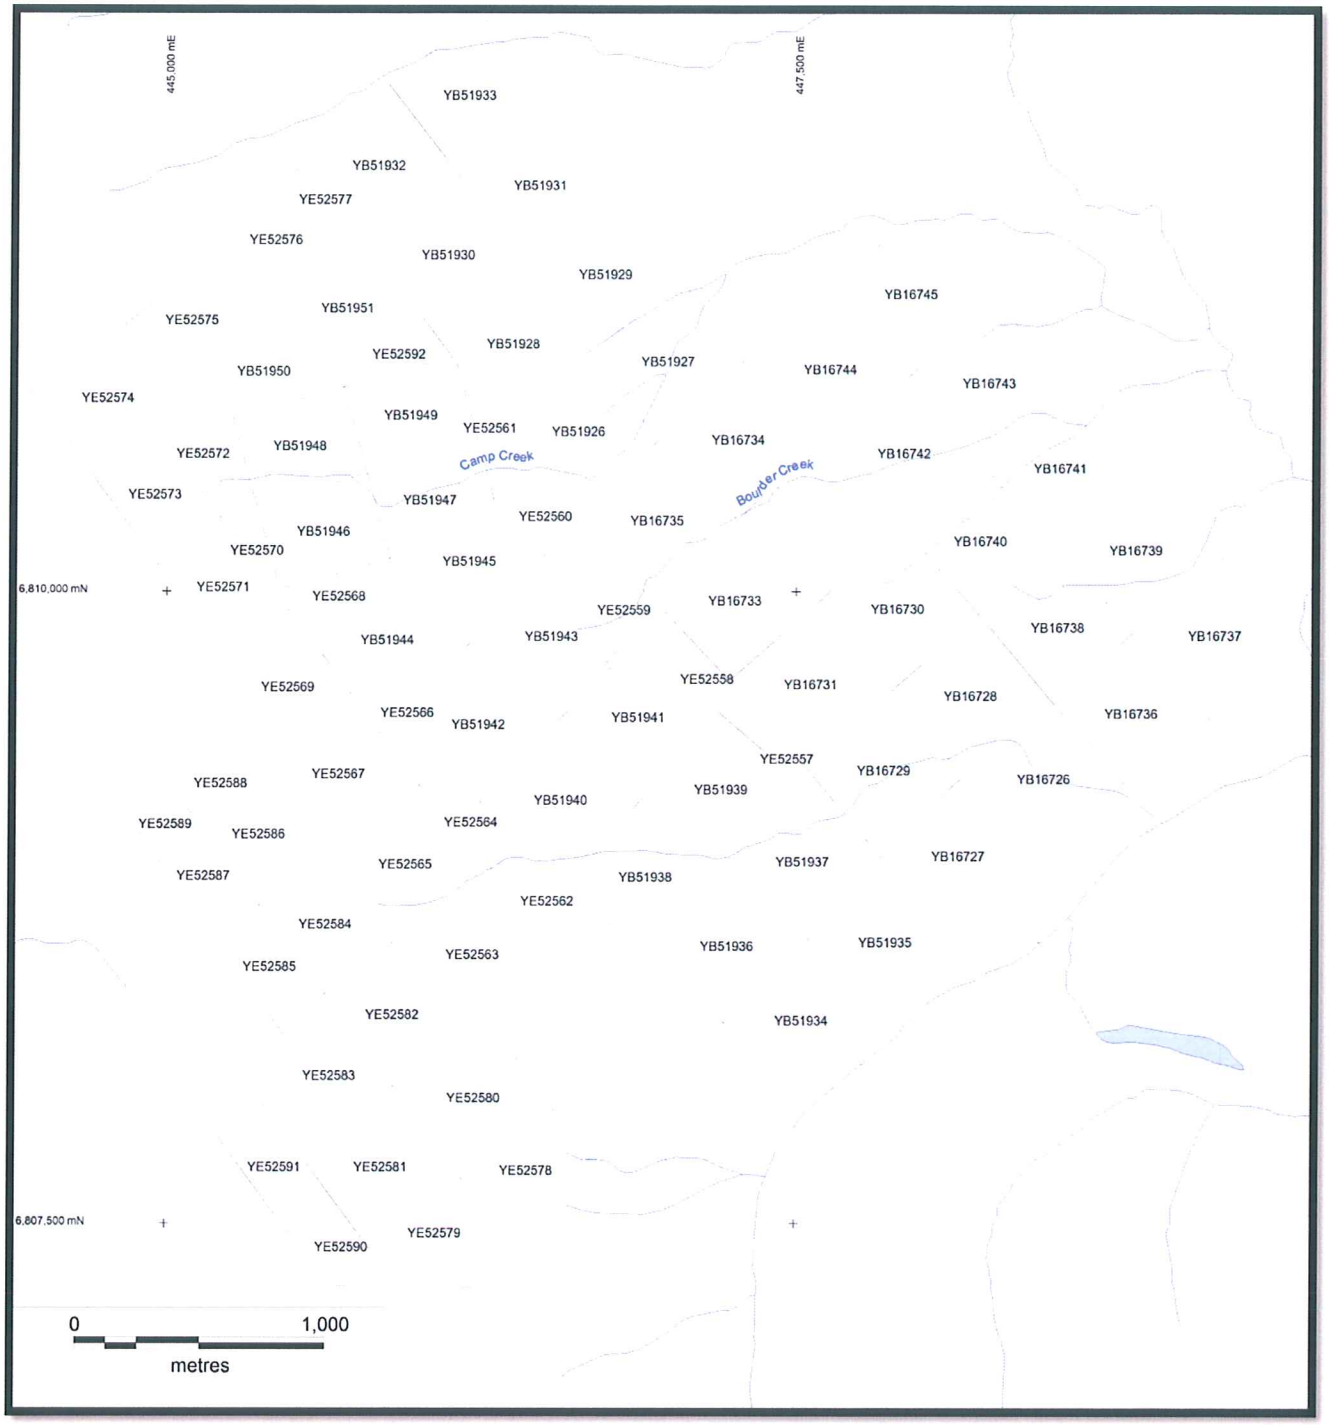

Figure 2: Money Property Claims Map

6. HISTORY

The original discovery and claim location (Julia 1-10) was made by Welcome North Mines Ltd. and Esperanza Exploration Ltd. in 1980. The property was immediately optioned to Arbor Resources Inc. which carried out electromagnetic and geochemical surveys in the same year. In 1981, electromagnetic, magnetic, and additional geochemical surveys were followed up with three diamond drill holes totalling 329m funded by a joint venture with Esso Resources Canada Limited. After the Property was allowed to lapse, YGC Resources Ltd. re-staked the property in 1990 (Money 1-20), and added additional claims in 1994 (Money 21-46). In 1994, the property was optioned to Atna Resources. In 1995 and 1996 Atna conducted several programs consisting of geological mapping, rock and soil sampling, hand trenching, horizontal loop EM geophysics, and diamond drilling. Seven diamond drill holes were drilled in 1996 for a total of 965.6m. All core from the 1996 drill program was stored a the Money creek camp site (UTM co-ordinates 446400E, 6810200N). In 1997, Atna Resources conducted a program consisting of GPS surveying, geological mapping, geo-electric and geophysical surveying, and diamond drilling. Four diamond drill holes were drilled in 1997 for a total of 827.8m. The best drill intersection in 1996 was 1.0 metre of massive sulphide grading 1.75 % copper, 21 g/t silver and 0.4 g/t gold.

7. GEOMORPHOLOGY

The Money property lies 50 km northeast of the Tintina Trench and covers mountainous terrain on the northern flank of the Pelly Mountains. Creeks draining the property flow into Money Creek, Finlayson River and eventually into the Finlayson Lake area.

Elevations range from 1100 m in the valley bottom to 1940 m along ridge crests in the western part of the claim block. Topographic relief is significant gentle over most of the property ranging from 10° at lower elevations and >15° above 1300 m. Steeper slopes (averaging 25°) and outcrops are restricted to the western half of the claim block.

Treeline is at 1600 m, vegetation consists of evergreens, alder and willow in the valley bottoms giving way to buckbrush and willow and eventually alpine grass, moss and lichen at higher elevations.

With the exception of the alpine zones, outcrop is minimum and the property is overlain by Pleistocene colluvial sediments, glacial till and minor talus. The entire area has been glaciated. Large boulders and glacial till mantle the eastern half of the claims. A large boulder terminal moraine covers the upper Camp Creek valley or cirque. Three eastern flowing creeks, Camp, Boulder and Welcome North Creeks cross the claims and empty onto a broad north-south valley, which is a tributory of Money Creek, along the eastern border of the property. Outcrops are restricted to the western part of the claims; rubble, boulders and talus also cover much of this area. Furthermore, abundant lichen masks the colour and texture of rocks making outcrop determination difficult.

8. GEOLOGY

8.1 REGIONAL GEOLOGY

The Money property is located within the Finlayson Terrane, a 380 by 60 km area comprised primarily of the Yukon-Tanana Terrane (YTT) as illustrated in Figure 3. This terrane represents the innermost of the accreted or "suspect" terranes in the Canadian Cordillera (Mortensen and Jilson, 1985). The northeastern margin of the block is the Finlayson Lake Fault Zone, a complex zone of steep and shallow faults related to transpressive suturing. The southwestern boundary of the block is the Tintina Fault Zone, a major strike-slip structure with at least 450 km of dextral displacement during Late Cretaceous and/or Early Tertiary time (Tempelman-Kluit et al, 1976).

Regional mapping of the Finlayson Lake area was completed by the Geological Survey of Canada (GSC) in the mid to late 1970's (Tempelman-Kluit, 1977, 1979). More recent regional studies have been published by Mortensen and Jilson (1985), Mortensen (1992), Murphy and Timmerman (1997) and Murphy and Piercey (1998, 1999). The following regional geological descriptions and property geology use the nomenclature and regional interpretations as presented by Murphy (1997), Murphy and Piercey (1998, 1999) and Murphy et al., (2001).

Figure 3: Yukon Tanana Terrane and locations of the major VHMS deposits in the Finlayson district (Piercey, 2001; Murphy and Piercey, 1998, 1999; Murphy et al., 2001).

YTT consists largely of Paleozoic continental margin and/or arc stratigraphy deposited on a continental basement of uncertain origin (Mortensen, 1992). In the vicinity of the Money property YTT contains Layered Rocks which are divided into four packages. These packages are Upper Devonian to older ages and are termed the Grass Lakes Succession, Kudz Ze Kayah Felsic Metavolcanic Unit, the Fyre Lake Metavolcanic Unit and an older unnamed group of rocks. Metamorphic grades within YTT range from lower greenschist to middle amphibolite facies.

Murphy et al., (2001) describes the Grass Lakes succession in the following terms. The lowest exposed unit of the Grass Lakes succession is composed of grit, psammite, meta-pelite, locally important muscovite-quartz phyllite, as well as augen phyllite of probable felsic meta-volcanic protolith, minor chloritic phyllite of mafic meta-igneous protolith, and marble and calcareous schist. It is overlain by the Fire Lake unit, a mafic meta-volcanic unit composed mainly of chloritic phyllite, but also including carbonaceous phyllite and rare muscovite-quartz phyllite of probable felsic meta-volcanic protolith. The Fyre Lake massive sulphide deposit is hosted in chloritic phyllite of the Fire Lake unit. Mafic and ultramafic meta-plutonic rocks are spatially associated with the Fire Lake unit and are inferred to be comagmatic sills and dykes. The Fire Lake unit is overlain by carbonaceous phyllite, lesser quartz-feldspar grit and pebble meta-conglomerate, and feldspar-muscovite quartz phyllite and augen phyllite of the Kudz Ze Kayah

unit (hosts ABM and GP4F VMS deposits). The upper unit of the Grass Lakes succession is composed of carbonaceous phyllite, chloritic phyllite (mafic metavolcanic rocks and dykes), quartzite and quartzofeldspathic meta-conglomerate. The latter conglomerate unit was deposited on all underlying units of the Grass Lakes succession, implying an angular unconformity following a phase of deformation.

Unit DF - Fire Lake Metavolcanic Unit: Massive to subtly layered, plagioclase-chlorite phyllite or schist, locally with biotite and actinolite porphyroblasts; lesser carbonaceous phyllite, tan muscovite-quartz phyllite (felsic metavolcanic rock), grey quartzite and marble. Rare orange-brown weathering carbonate clast pebble to cobble conglomerate. This unit is associated with volcanogenic massive sulphide (VMS) mineral occurrences.

Unit DKCS - Kudz Ze Kayah Felsic Metavolcanic Unit: Discontinuous bodies of calcareous muscovite-quartz-metasandstone and grit locally with graded bedding and shale chips.

Unit DKCP - Kudz Ze Kayah Felsic Metavolcanic Unit: Carbonaceous phyllite and grey quartzite.

Unit DK - Kudz Ze Kayah Felsic Metavolcanic Unit: Undifferentiated foliated feldspar-muscovite-quartz schist or phyllite, massive pale siliceous muscovite-quartz schist or phyllite, locally with quartz amygdules; feldspar- and rarely quartz-augen schist or phyllite (meta-porphyry), and thin calcite plagioclase-biotite schist. Interbeds of carbonaceous phyllite are common. Magnetite iron formation occurs locally near the top of the unit in the carbonaceous phyllite and thin felsic schist.

In addition to the stratigraphic units a number of intrusive rocks and other units occur within YTT. In the claim block two intrusive units have been recognized. In the southern portion of the claim block an earlier Cretaceous Jurassic Granite Unit Kg, which is a biotite-muscovite fine to medium-grained equigranular granite. In the very northeastern claims an older Jurassic granite Unit Jg comprised of medium grained equigranular hornblende biotite granite. Contact hornfels occur locally around plutonic units.

Small Mississippian or younger ultramafic bodies found within YTT of the Finlayson Block are also controversial. Some geologists consider them to be thrust bounded slices while others propose they were intruded as sills.

YTT strata are locally unconformably overlain by sedimentary and volcanic units which also overlie adjacent autochthonous strata belonging to the North American miogeocline. One of the successor units is comprised of Late Triassic immature sediments containing cobbles of Campbell Range Basalt. Late Cretaceous to Tertiary felsic volcanic flows and volcaniclastic deposits are also present and are usually found in close proximity to the Tintina Fault Zone.

Low angle extensional faults of various magnitudes occur throughout the Finlayson Terrane and in some cases are believed to juxtapose differing sequences. East and northeast trending,

steep normal faults are also present. These faults predate the Cretaceous intrusions. The presence of thrust faults in the Finlayson Terrane is somewhat uncertain as there is little surficial evidence to confirm this type of structure (Murphy, 2001).

8.2 Regional Mineralization

Approximately 145 mineral occurrences have been reported within the Finlayson Terrane. Primarily there are many occurrences known or suspected to be volcanogenic in origin while veins, skarns and asbestos occurrences comprise most of the remainder. Although the better known volcanogenic occurrences are Kuroko-type, some Besshi-type mineralization is also present (Morin, 1981; Johnston and Mortensen, 1994) and the Ice Deposit is Cyprus-type.

The Finlayson Lake District has been divided into 3 distinct successions separated by regional unconformities (Piercey, 2001; Murphy and Piercey, 1998, 1999; Murphy et al., 2001). The lower most unit, called the Grass Lakes Succession is comprised of mafic and felsic metavolcanic rocks, carbonaceous metaclastic rocks, marbles, and granitic orthogneiss. The Fyre Lake deposit is hosted in the lower portion of this succession (Figure 4). The ABM and GP4F deposits on the Kudz ze Kayah property are located within the upper portion of this succession. The middle unit, called the Wolverine Succession, consists of carbonaceous argillite, felsic volcanics and high level intrusions, and as well as exhalative carbonate and/or iron oxides. The Wolverine polymetallic VHMS deposit occurs near the base of Wolverine Succession. The upper most unit, called the Campbell Range Succession, is comprised of mafic metavolcanic rocks and wackes. The Campbell Range Succession hosts the Ice VMS deposit (Figure 4).

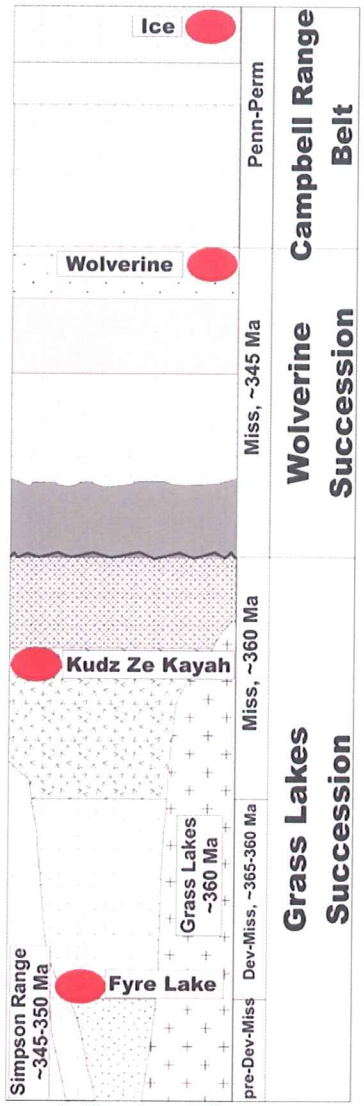

Figure 4: Regional Stratigraphy (after Piercey, 2001).

The Kudz ze Kayah property includes both the ABM and Gp4F deposit. They lie within YTT near the centre of the Finlayson Terrane. The ABM deposit hosted by an overturned assemblage of felsic pyroclastics, aphanitic massive rhyolites and metasiliciclastic rocks belonging to Unit DK of Murphy's Layered Rocks. Although both the sulphides and wallrocks are highly strained and exhibit pervasive schistosity, compositional layering in the immediate vicinity of the deposit has a relatively consistent, shallow northerly dip. Sphalerite, chalcopyrite and galena are the main economic minerals while the gangue includes various mixtures of magnetite, barite, pyrrhotite, pyrite and carbonate. The deposit averages about 18 m thick and has been traced 700 m along strike and up to 400 m downdip. The mineralization responds well to magnetic and electromagnetic surveys but geochemical response is somewhat erratic because the entire deposit is covered by 2 to 10 m of glacial till. Drilling has identified 13,720,000 tonnes grading 6.0% Zn, 1.6% Pb, 0.90% Cu, 139.2 g/t Ag, and 1.38 g/t Au. The GP4F Deposit is located some 4.5 km southeast of the ABM deposit. It consists of a massive sulphide lens that has been partially defined by drilling and reportedly contains an inferred

resource of and 1,500,000 tonnes grading 6.4% Zn, 3.1% Pb, 0.1% Cu, 90.0 g/t Ag, and 2.0 g/t Au in the Gp4F Deposit (Schultz, 2001).

The Wolverine Deposit is located 25 km southeast of Kudz ze Kayah. It consists of the Wolverine, Lynx and Sable Zones which are hosted by rhyolitic metavolcanics and argillites lying within the footwall rocks of the Money Creek Thrust. The mineralization consists primarily of semi-massive to massive pyrite and sphalerite with varying amounts of galena, chalcopyrite, tetrahedrite and native gold. The surface expression of the Wolverine Zone is marked by a vegetation kill zone containing weakly malachite stained chlorite schist while the Lynx and Sable Zones are blanketed by glacial till. Based on continuous ore lenses, mineralization and thickness the deposit is divided into three geographical zones called the Wolverine, Saddle, and Lynx zones. Wolverine and Lynx zones are thick massive sulfide lenses generally ranging from 3 metres to 10 metres in true thickness. They are separated by the Saddle zone with thinner massive sulfide, generally ranging from 1 to 4 metres true thickness.

A resource inventory completed by Pearson and Giroux (2006), from the previous drilling program in 1995, 1996, 1997, 2000, 2004 and 2005 expanded the deposit to the current Measured and Indicated mineral resource of 4.51 million tonnes grading 12.05% zinc, 351.86 grams per tonne silver, 1.15% copper, 1.68 grams per tonne gold and 1.57% lead and an Inferred mineral resource 1.69 million tonnes containing 12.16% zinc, 385.1 grams per tonne silver, 1.23% copper, 1.71 grams per tonne gold and 1.74% lead.

Fyre Lake property, owned by Pacific Ridge Exploration is located in southeast Yukon, and is host to a "Besshi-type" copper-cobalt-gold VMS deposit. The Fyre Lake property covers over nine kilometres of favourable host rocks with geochemical and geophysical targets indicative of VMS mineralization. During 1996 and 1997, the company focused its attention to delineating one target, the Kona deposit, through completion of 23,200 m of drilling in 115 holes (Blanchflower et al., 1997). The Kona Deposit consists of two parallel northwest trending zones of copper-cobalt-gold massive sulphide mineralization found in horizons with mineralized thicknesses varying from 8 m to 40 m over a length of 1,500 m and a width of 250 m. A NI 43-101 compliant report prepared by Minorex Consulting Ltd. in August 2002, the Kona VMS deposit is calculated to contain 15.4 Mt within which deposit 8.2 Mt grades 2.1% Cu, 0.11% Co and 0.73 g/t Au, utilizing a 1.0% Cu cutoff. Metallurgical studies prepared by Lakefield Research Limited in June 1997 indicate metal recoveries of 90% for copper and 70% for gold and cobalt. Cobalt is associated with pyrite and can be efficiently recovered as a separate product from copper-gold concentrates. Using prices of US$1.00 for copper, US$365/oz of gold and US$10/lb copper, an independently prepared scoping study by Kilborn Engineering Pacific Ltd. in August 1997, suggests economic viability for a 20 Mt reserve, with an open pit grade of 2.0% Cu, 0.7 g/t Au and 0.12% Co, and an underground grade of 3.0% Cu, 1.0 g/t Au and 0.12% Co. With a presently defined deposit of eight million tonnes, exploration potential is well demonstrated for the discovery of additional mineralization through drilling within a 20 Mt envelope. Significant exploration potential remains, over and above determining the ultimate size of the Kona massive sulphide deposit. A four km long magnetic anomaly located northeast of Kona and a three kilometre-long magnetic anomaly lying west of Kona are larger and more

intense as compared to the magnetic feature reflecting the Kona mineralization. These anomalies represent priority drill targets for discovery of additional massive sulphide deposits.

9. PROPERTY GEOLOGY

9.1 DESCRIPTION

Most of the Money property is heavily vegetated and blanketed with glacial till. Outcrop and subcrop exposures are restricted to the alpine portions and bouldery outcrops below and around treeline.. Previous property scale mapping was limited to the west-central part of the claim block where diamond drilling was conducted to test soil geochemical and ground geophysical anomalies and is referenced herein (Kallock, 1995).

More than 90% of the outcrops at the Money claims are intermediate to mafic, volcanics previously referred to as basalt. The lithologies fit within the Campbell Range Group, although further lithochemistry testwork needs to be completed to confirm this. In outcrops, the volcanics are green, dark green or brownish green, suggesting more intermediate affinity, perhaps andesite. For the most part, the volcanics are fine grained. Feldspars and amphiboles are difficult to distinguish. Epidote, hematite and lesser calcite are common especially on pillow rinds. Pillow flows are particularly discernible where vertical cliffs afford clean, visible exposures. Volcanic breccia, tuffs and calcite or crystalline limestone are less commonly seen within the andesite. Jointing or sheeting is common but was not felt to be restricted to a distinct unit. Within the andesite and/or basalt flows, occasional outcrops of tuffaceous sediments, siltstone, slate, phyllite and/or chert can be found. These units are generally finely bedded or laminated. Maroon to green colors due to hematite, chlorite and epidote are most common. Hardness varies from soft, almost talcose to hard, cherty or siliceous. Continuity along strike of the sedimentary units appears to be strongest north of the Boulder Creek Showing where a sharp, straight, narrow gully extends 125 metres up to a plateau. Maroon slate and light green siltstone in this gully appear to strike towards the massive sulfide float boulders.

In Welcome North Creek, adjacent to the massive sulfide outcrop, a sedimentary unit has at least 35 m of thickness. Here, however, the visible strike length is limited to less than 50 m due to talus and overlying volcanic flows. There are at least two sedimentary horizons exposed in each of the three major creeks on the claims. However, rock exposures between creeks are sparse and possible folding makes correlation of sedimentary units speculative. Finally, it should be noted that the massive sulfides themselves, banding especially those of Welcome North Creek, appear to be stratiform. The crude banding and the east contact are both conformable with bedding in the adjacent sedimentary rock. Poorly layered massive sulfide float boulders in Boulder Creek are situated near a North-south sedimentary horizon within the volcanic flows.

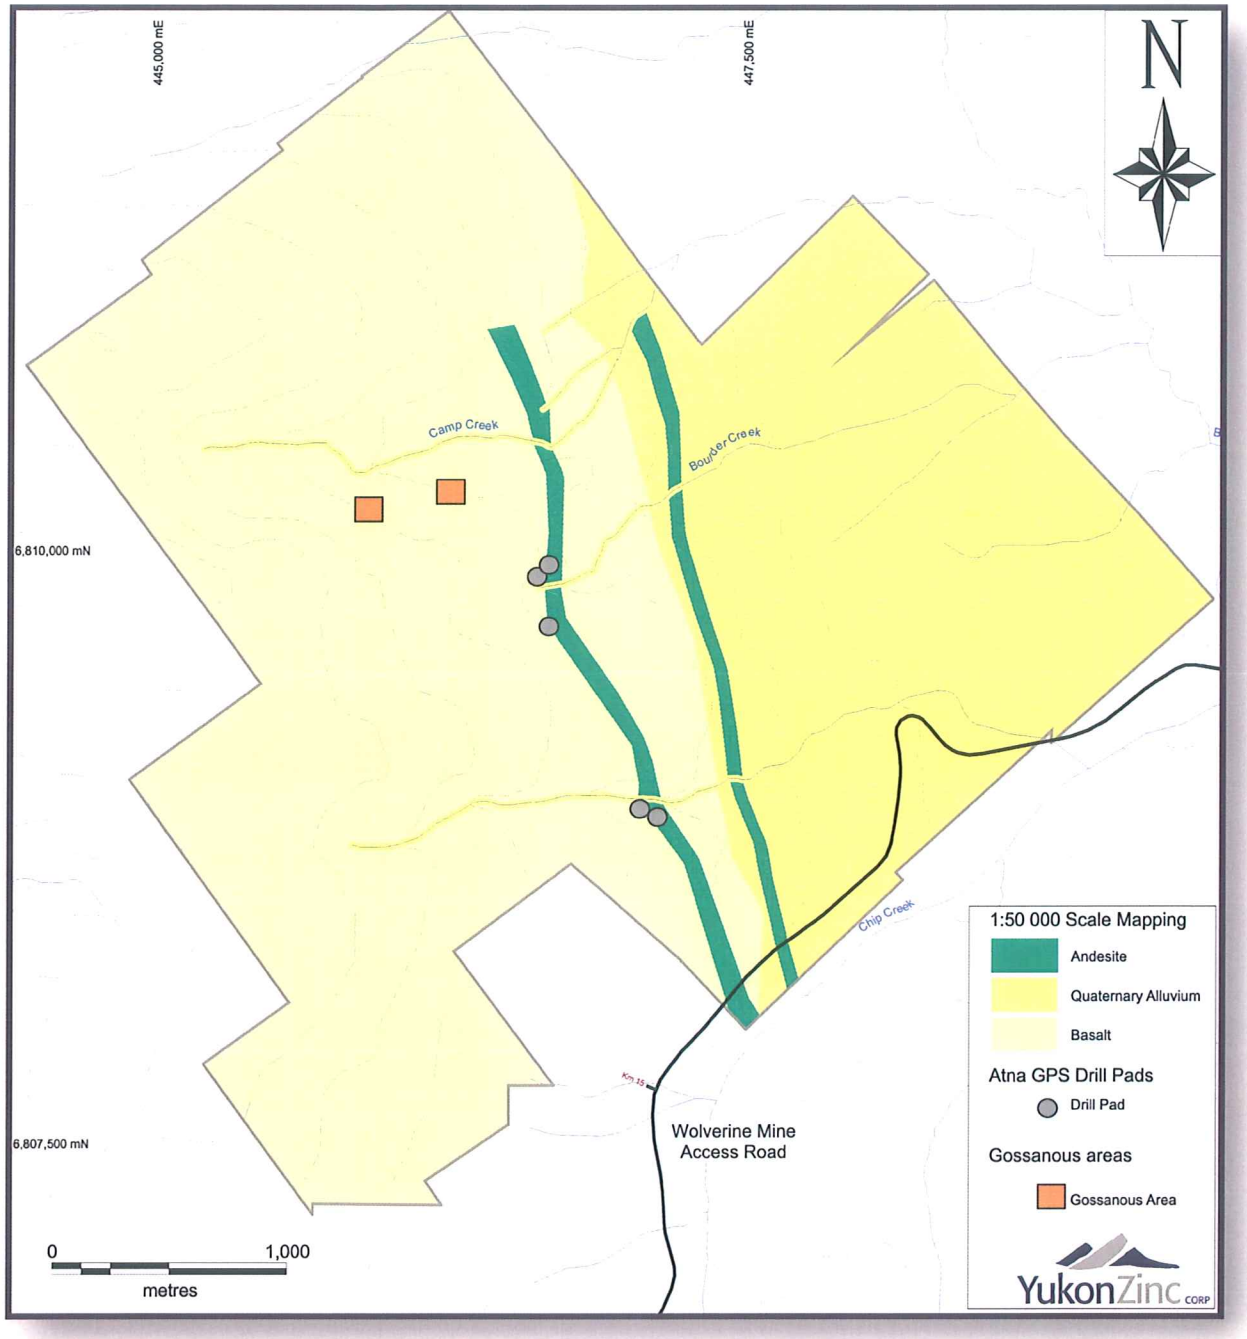

Figure 3: Money Property geology map

10. Soil Geochemistry

Soil chemistry from the 1990's was imported as a .tiff file in Mapinfo GIS format as original sample locations were not available in digital database forms. It was determined that the 1990's sample locations were indeterminate and general areas for chemical soil anomalies are used within several hundred metres discrepancies of actual locations. Therefore a new grid (Plate 1, 2) was set based on available data including airborne geophysics, government mapping and project area knowledge. Soil sample locations are on Plate 1 and assays provided in Appendix A.

11. Discussion and Recommendations

Additional analysis and integration of the 2011 data set is required and recommended before future explorative efforts are conducted on the property. These rocks demonstrate potential for mineralization where there are geophysical magnetic or electro magnetic anomalies and geochemistry indicative of mineralization; however, the geochemistry may be very subdued and/or erratic in the thick glacial till cover. Concentrated prospecting in areas of known mineralization and also geologic mapping helps expand and also constrain mineralization potential.

11.1 Property Wide Exploration

The stratigraphy is productive in preliminary exploration work. Additional detailed areas geologic mapping of the property at a 1:20,000 scale utilizing, airphotos, airborne geophysics, satellite imagery and fieldwork is recommended in areas of elevated soil and till geochemistry.

In addition, there are several areas of coincident soil anomalies and conductors that from previous 1990's reconnaissance sampling and the Atna geophysical MaxMin survey that warrant additional soil sampling and prospecting.

11.2 Focused Exploration

A 2012 or future program of cutline grid extension and geochemical sampling to the west and northwest is highly recommended. Well placed soil reconnaissance sampling at a 50 to 100 metre line spacing across the northwest zone of the property would enable faster delineation of best stratigraphy for exploration work. Follow up of previous 2011 soil sampling across the property with small 50m line spacing and 25m sample intervals is recommended. Completion of this work will expand potentially favourable stratigraphy. Additional mapping and prospecting the entire grid and expansions is necessary to delimit areas that have higher mineralization potential.

11.3 Follow Up Geophysics and Drilling

Deeper electromagnetic (EM) geophysical methods could be utilized where there are favourable surface anomalies, extended surveys to determine the discontinuity or non-correlation between surface massive sulfide horizons and associated gossans and previous drilling. Integration of geophysical data with drill data is recommended.

12. STATEMENT OF QUALIFICATIONS

I, J. A. Moore, of 39147-3695 W.10th Ave. Vancouver, V6R 4P1, in the Province of British Columbia, Canada, do hereby certify:

I am a graduate of Prescott College in Prescott, Arizona, U.S.A, with a degree in Environmental Geology (1996). I completed a postgraduate degree at Rhodes University in Grahamstown, South Africa. I was admitted to the degree of M.Sc. Geology Min. Ex. in 2002.

Since 1991, I have been involved in the exploration and exploitation of base metals, precious metals and diamonds in British Columbia, NWT, Nunavut, Central America, the eastern shields of South America, and West Africa.

The information, conclusions, and recommendation in this report are based on collaboration of other professional colleagues involved with various aspects of exploration on the property and in review of the literature stated in the bibliography. I have prepared this report on behalf of Yukon Zinc Corporation.

This report may be used for the development of the property, provided that, no portion will be used out of context in such a manner as to convey meanings different from that set out in the whole.

I am unaware of any material fact or material change with respect to the technical matter of this report that might cause the technical report to be inaccurate or misleading.

Consent is hereby given to the company for which this report was prepared to reproduce the report or any part of it for the purposes of development of the property, or facts relating to the raising of funds by way of a prospectus and/or statement of material facts.

J. A. Moore

Dated: February 28th, 2011 Signed_____

J.A. Moore, M.Sc. Geology
Project Geologist
