1.0 INTRODUCTION

1.1 Terms of Reference and Participating Personnel

This report presents the results of a 3,642.6 metre diamond drilling and reverse circulation exploration program conducted on the Clear Creek property during the summer of 2010. The program was funded and operated by Golden Predator Canada Corp. Peak Drilling of Courtenay, BC provided the diamond drilling services and Ensign (Encore Coring & Drilling) of Calgary, AB provided the reverse circulation drilling services. Geological and logistical services were provided by Golden Predator Canada Corp. staff. Expediting services were provided by Core Expediting and Hotshot, of Whitehorse, Yukon. ALS Chemex of Vancouver, BC performed the drill core and chip analysis.

The program consisted of both diamond and reverse circulation drilling. Forty-two (42) holes were drilled on the property for a total of 3,642.6 m. Holes CC10-01 to -04 were HQ diameter oriented core totaling 1,053.7 m. CC10-05 to -42 were reverse circulation holes totaling 2,588.9 m.

Based on the terms of underlying agreements with the registered claim owners, Golden Predator has the right to earn a 100% interest in 132 of the quartz mining claims subject to a 3% NSR and, through staking, has acquired a 100% interest in the remaining 168 claims comprising the Clear Creek property (the "Property"). Golden Predator Canada Corp. is listed on the TSX exchange (TSX: GPD) and based in Vancouver, British Columbia. Golden Predator has prepared this Assessment Report to provide a summary of the technical data on the Property including the 2010 work program and a summary of previous exploration activities.

1.2 Supporting Documents

The Report is based on exploration and property information and data supplied by StrataGold Corp., a review of public domain geological and exploration data for the Clear Creek property (primarily Yukon Assessment Reports), incorporation of relevant mining and geological literature, data generated by a 2010 drilling program, for which the author was the Project Geologist.

2.0 PROPERTY LOCATION AND DESCRIPTION

2.1 Location

The Clear Creek property comprises 300 contiguous quartz claims covering approximately 6000 hectares. The property is located 115 km east-southest of Dawson City, Yukon Territory, Canada, on National Topographic System [NTS] map sheet 115P/14 centred at 63° 51' 2" north and 137° 6' 27" west (NAD 83, Zone 8N: 398020 E, 7081990 N). The quartz claims cover the headwaters and upper drainage area to Left Clear Creek.

2.2 Description and Ownership

The property covers approximately 6,000 hectares and consists of 300 contiguous, unsurveyed two-post quartz claims (Table 2-1; Figure 2-2) staked according to the Yukon Quartz Mining Act. Expiration dates shown in Table 2.1 are subject to acceptance of assessment covered by this report.

3.0 ACCESSIBILITY, CLIMATE, PHYSIOGRAPHY, AND INFRASTRUCTURE

3.1 Location and Access

The property is located approximately 115 km east-southeast of Dawson City and 65 km northwest of Mayo, Yukon, (Fig. 3.1). The centre of the claims is 63° 51' 2" north and 137° 6' 27" west (NAD 83, Zone 8N: 398020 E, 7081990 N) on NTS map sheet 115P/14.

The Property is accessed from the Clear Creek road, located km 609 on Klondike Highway (#2). The camp was located approximately 41 km east of the turnoff and 500 m east of Nel's Harpers placer camp, via a gravel road. The trip from Dawson City takes approximately 2. 5 hours. Trails and 4x4 roads provide additional access to the property.

3.2 Physiography

The Property is located in the Ogilvie Mountains on the Yukon Plateau at elevations ranging from approximately 1,200 m above sea level (ASL) in the valleys, to over 1800 m ASL on peaks in the West Ridge range. The Clear Creek property covers mountainous terrain, mainly above tree-line. Vegetation in the alpine environment includes lichen, moss, dwarf willow and alder. The property is dissected by a series of mountain creeks that drain into Harper's Creek and Left Clear Creek to the west and Josephine Creek to the east. Forested areas contain black spruce with lesser amounts of hemlock, poplar and alder.

The Property climate is typical for high mountains in the Yukon. Temperatures of -40°C are common in the winter and the summers are cool to warm with daily highs of 10°C to 25°C. Precipitation rates are fairly low with an average of 30 cm annual fall. The property is typically snow-free from mid-June to mid-September. Discontinuous permafrost is present on north and east-facing slopes and in wetlands.

Montane glaciation has occurred on the higher peaks on the property and an active rock glacier occurs east of the Saddle zone. Bedrock is exposed at higher elevations but most of the property is covered by felsenmeer with talus fines and soil.

4.0 EXPLORATION HISTORY

The prospecting history dates back to the early 1900s, with modern exploration efforts commencing in the late 1970s. Bema Industries, working on contract from Canada Tungsten Corporation, was the first company to recognize potentially significant gold mineralization in 1978. Since this initial effort, various companies have conducted limited campaigns including programs by Gold Rite Mining Corp., Noranda Exploration Ltd., Ivanhoe Goldfields Ltd./First Dynasty Mines Ltd., Kennecott Canada Inc., Newmont Exploration Limited, Redstar Resources Corporation, and most recently StrataGold Corporation (now Victoria Gold Corp.).

Following up on results by previous explorers, Noranda Exploration Ltd. conducted extensive soil and rock chip sampling, ground geophysical surveys, trenching, road building, and a six hole reverse circulation ("RC") drilling program in 1991 and 1992. Two holes drilled on each of the Eiger, Saddle, and Pukelman stocks for a total of 654 m.

In 1995, Kennecott Canada Inc. completed drilling, soil sampling and 320 m of bulldozer trenching. The 27 hole (1971 m) RC program on the Rhosgobel stock identified an east-west trending zone 1200 m long, 200 m wide and 65 m deep. The average grade of the Au mineralization in this 40 Mt zone is at least 300 ppb Au, with a higher grade core zone of approximately 1.5-2.0 Mt grading from 0.75-1.25 g/t Au (Coombes, 1995). The size and grade estimate is conceptual in nature, as there has been insufficient exploration to define a mineral resource.

In 1998, Newmont Exploration Limited conducted magnetic and radiometric airborne geophysical surveys. Interpretation of the data by Newmont suggests that the Eiger, Saddle, Josephine and Pukelman stocks may be part of a single larger intrusive body, and the Rhosgobel and Far stocks are themselves a separate body.

Historic drilling by Redstar Resources Corporation on the Bear Paw Breccia Zone included two diamond drill holes totaling 219 m in 1999; and nine HQ-diameter diamond drill holes totaling 1211 m in 2000. The best result of the Bear Paw Breccia zone was 2.3 g/t Au over 31.8 m in Hole BP00-10.

In 2006, StrataGold Corporation (now a subsidiary of Victoria Gold Corp.) conducted a detailed trenching and soil sampling program on the Bear Paw Breccia and Contact zone (and also the Barney zone which lies west of the current claim configuration). In addition, infill sampling was conducted to follow-up on geophysical and historical gold anomalies identified by previous explorers.

5.0 GEOLOGICAL SETTING

5.1 Regional Geology

The property is located on the western edge of the Selwyn Basin. The Selwyn Basin is bounded on the south by the Tintina Fault (and the Intermontane Superterrane) and bounded on the north by the Dawson Thrust Fault (and the North American Shelf; Figure 5-1, from Gordey and Makepeace, 2001). The Teslin Suture is the zone of deformation between the accreted terraine and the ancient shelf.

Rocks of the Selwyn Basin include Proterozoic basinal and platformal clastic and pelitic sediments to Jurassic clastic shelf sediments. Various aged volcanic piles are stratabound within the sediments. The basin was subjected to rifting during the Proterozoic and again in the late Devonian and contemporaneous volcanics were exhaled onto the sea floor and as thick sill sequences.

By late Jurassic, the rocks of the Intermontane Belt of the Cordillera collided with the passive margin of the North America Shelf, causing compressive tectonics. This resulted in crustal shortening, tight folding, and failure along hinges. Three regionally stacked thrust panels were formed: the Robert Service, Tombstone and Dawson thrust sheets (oldest to youngest).

The Selwyn Basin is intruded by granitoids ranging from Mississippian to Eocene age; the most extensive being the middle Cretaceous Tombstone Suite. The Tombstone rocks range in composition from intermediate to felsic.

5.2 Property Geology

Highly deformed metasedimentary rocks of the Yusezyu Formation underlie the Clear Creek property. The metasedimentary strata are part of the Neoprotoerozoic to Early Cambrian Hyland Group. They are comprised of predominantly highly deformed and folded phyllite, schist, quartzite, sandstone, fine quartz-pebble conglomerate with rare limestone. The Hyland Group rocks have been intruded by Tombstone Plutonic Suite suite diorite, granodiorite, quartz monzonite and granitoid stocks, including, from south to north, the Rhosgobel, Big Creek, Pukelman, Josephine and Eiger stocks. The Bear Paw breccia is spatially and likely-temporally related to the intrusive rocks. The Tombstone strain zone, a broad zone of complex deformation exhibited as multi-episodic folding and prominent foliation and lineation development within the sedimentary sequence, extends roughly east-west to the north of the Josephine stock. Alteration is fairly localized to near the contacts with the intrusive bodies and include metasediments altered to quartz-biotite hornfels and rare calc-silicate skarn. Schistosity strikes west -northwesterly with gentle to moderate north-east dips (Weekes and Fall, 2001).

6.0 EXPLORATION

6.1 Exploration Program

The 2010 exploration program ran from June 30 to September 3, 2010 and included drilling of 42 holes for a total of 3,662.4 m. Holes CC10-01 to -04 were HQ diameter oriented core totaling 1,053.7 m. CC10-05 to -42 were reverse circulation holes totaling 2,588.91 m. Golden Predator staked a 168 'Zoe' quartz claims in May 2010 to supplement the property's holdings.

Prior to the commencement of field work, a GIS compilation of historical data and drill core information was completed by Golden Predator. Exploration activities for the program include: setting up a field camp for up to 15 people; construction drill pads; drilling and core logging, tear down and demob camp.

6.2 Drilling

The 2010 exploration program was designed to test numerous soil and talus-fine gold and arsenic geochemical anomalies on the property. Peak Drilling from Courtney, BC was engaged to complete the diamond drilling program, using HQ-diameter (63.5 mm) core. Ensign (Encore Coring & Drilling) of Calgary, AB provided the reverse circulation drilling services, using a 5.5" (139.7 mm) diameter borehole. Summary geological logs are presented in Appendix 2 and the sample intervals and associated sample numbers are presented in Appendix 3.

Bear Paw
Two diamond holes (545.61 m) and twelve RC holes (662.40 m) were completed at Bear Paw. Oriented core of diamond drill holes CC10-01 and -02 were used to get a better understanding of the structural controls on mineralization. RC holes CC1-05 to 16 were designed to test a 1 km long by 250 m wide NE-SW trending soil anomaly.

Contact
Two diamond holes CC10-03 and -04 (508.1 m) and eight RC holes (705.79 m) were completed on the Contact Zone near the Pukelman Intrusive. The diamond drilling program was designed to test the structural controls on mineralization indentified by previous workers. Auriferous sheeted veins have been measured at striking E-W and steeply dipping to the north. Results from the structural measurements completed by Golden Predator indicate a principle orientation of the veins of 279° and dipping at 68° to the north using oriented core. The RC holes CC10-17 to 24 were designed to test a large soil- talus fines geochemical anomaly.

Saddle
Eleven RC holes totaling 731.52 m were completed on the Saddle Zone. RC holes CC10-25 to -29 targeted some of the highest soil anomalies coinciding with limonitic-stained quartz monzonites exposed in historic trenches or in outcrop. RC holes CC10-30 to 35 targeted soil geochemical anomalies.

Josephine
Seven RC holes totaling 358.14 m were completed at Josephine. RC holes CC10-36 to -40 targeted soil geochemical anomalies and sheeted quartz veins observed in road cuts trending east-west. RC holes CC10-41 and -42 targeted soil geochemical anomalies and sheeted quartz veins observed in outcrop.

6.3 Collar Surveys

Collar locations were surveyed using a handheld Garmin GPS with accuracy on the order of ± 3 m. Table 6-1 presents the collar file for the 2010 program.

6.4 Sampling Methodology

A gas-powered diamond saw was used to sample core from the four diamond holes (CC10-01 to CC10-04). RC drill holes CC10-05 to CC10-42 were drilled by track mounted drills that produce a 5.5" (139.7 mm) diameter drill hole. Samples were collected from 1/8th of the material from a 5 ft (1.5 m) interval utilizing a splitter incorporated on the cyclone.

Samples were freighted to ALS Chemex's prep lab in Whitehorse, YT and then forwarded to their ISO 9001 certified preparation facility in Terrace, BC. The pulps were analyzed at ALS's ISO 9001 certified laboratory in Vancouver. Blanks, commercial standards and duplicate samples were included in each batch. For gold analysis, 30 g samples are fire assayed (Au-AA23 package) then digested in aqua regia solution and analyzed by atomic absorption with detection limits between 5-10,000 ppb Au. Values over 10 g/t gold are re-assayed by fire assay followed by a gravimetric finish (50 ppb lower detection limit).

Other elements are analyzed by a 35 elements package (ME-ICP41) whereby the sample is digested in an aqua regia acid solution and then analyzed by inductively coupled plasma (ICP) – atomic emission spectrometry. Assay certificates are presented in Appendix 4 and the detailed methodology and detection limits are in Appendix 5.

6.5 Drilling Sampling Protocol / Chain of Custody/Data Verification

All sampling is conducted under the supervision of the Company's project geologist and the chain of custody from the drill to the sample preparation and logging facility is continually monitored by the project geologist. Samples are shipped to the lab by qualified couriers or Company personnel under locked bags with independent identification lock numbers. Data verification of the analytical results includes a statistical analysis of the duplicates, standards and blanks that must pass certain set parameters for acceptance to ensure accurate and verifiable results. All assays are reported as drilled intervals and are not to be interpreted as true widths.

6.6 Results

The four diamond drill holes (CC10-01 to -04) reached their target depths however, the majority of the 38 reverse circulation holes were terminated before achieving their target depths. Issues encountered with during the RC program included encountering the saturated (groundwater) table at shallow depths (Bear Paw and Josephine) and encountering very hard rock (Contact and Saddle).

Bear Paw

The 2010 program was designed to test a 1 km long by 250 m wide NE-SW trending soil anomaly. Significant gold intercepts were encountered in eleven of the 14 holes. Not all of the proposed targets could be tested because significant amounts of permafrost on the pads leading to unstable ground or because the RC drill could not reach the planned target depths. Highlights from Bear Paw are presented in Table 7-3. In the highlight table, results where (g/t x m) is less than 2.5 are not reported as significant, unless the individual grade was ≥ 1 g/t gold over a minimum of 1.0 meters.

The most significant results were returned from RC Hole # CC10-07, with an intercept of 1.87 g/t Au over 42.68 m starting at 1.52 m depth, including higher grade intervals of 2.59 g/t Au over 25.91 m starting at 10.67 m depth and 5.64 g/t Au over 9.15 m starting at 16.76 m depth.

The drilling program on Contact was designed to test a large soil- talus fines geochemical anomaly. Significant gold intercepts were encountered in eight of the ten holes. Not all of the proposed targets could be tested because the RC drill could not reach the planned target depths due to very hard rock. Highlights from Contact are presented in Table 6-4. In the highlight table, results where (g/t x m) is less than 2.5 are not reported as significant, unless the individual grade was ≥ 1 g/t gold over a minimum of 1.0 meters.

Highlights from Contact include RC Hole CC10-22, which intercepted 137.50 g/t Au over 1.52 m from a depth of 3.05 m and RC Hole CC10-20 with 0.719 g/t Au over 30.48 m from a depth of 38.1 m. RC Hole CC10-20 is collared and ended in mineralization with an average grade of 0.44 g/t over its entire 136 m length.

Saddle

RC holes CC10-25 to -30 on Saddle were designed to test some of the higher soil anomalies in the area which coincide with limonitic-stained quartz monzonites exposed in historic trenches or in outcrop. RC holes CC10-30 to 35 targeted soil geochemical anomalies. Significant mineralization was encountered in each of the five holes testing both the geochemical and trench/bedrock targets but only one of the six holes testing geochemical anomalies had significant results. Not all of the proposed targets could be tested because the RC drill could not reach the planned target depths due to very hard rock. Highlights from Saddle are presented in Table 6-5. In the highlight table, results where (g/t x m) is less than 2.5 are not reported as significant, unless the individual grade was ≥ 1 g/t gold over a minimum of 1.0 meters.

The best results on the Saddle were from RC Hole CC10-25 which intercepted 1.24 g/t Au over 22.86 m from 10.67 m depth.

Josephine

RC holes CC10-36 to -42 were completed at Josephine. RC holes CC10-36 to -40 targeted soil geochemical anomalies and sheeted quartz veins observed in road cuts trending east-west. RC holes CC10-41 and -42 targeted soil geochemical anomalies and sheeted quartz veins observed in outcrop. No significant mineralization was encountered in the holes, but all of the holes were terminated before reaching target depth due to significant subsurface water.

7.0 CONCLUSIONS

The 2010 drilling program was carried out of four zones: Bear Paw, Contact, Saddle and Josephine. Significant gold mineralization was encountered all of the zones except for Josephine, but RC drilling was hampered due to subsurface ground conditions.

Oriented drill core was effective at measuring mineralized sheeted veins striking E-W (averaging 279°) and steeply dipping to the north (~68°) at Contact. High grade Bonanza-style mineralization encountered in CC10-22 coupled with consistent low grade mineralization (e.g. CC10-20 grading 0.44 g/t over 136 m) at Contact suggest multiple styles of mineralization and possibly mineralizing events. Historic drilling at Contact also identified structural controlled mineralization along a faulted granodiorite dyke. Additional subsurface work is required to link the various mineralization styles.

Oriented drill core was less effective at determining structural controls on mineralization at Bear Paw, probably because of the complex structural nature of the breccia. Historic soil geochemistry outlined a NE-SW trending Au-As anomaly. Tabulation of trench data from previous operators indicates the preferred orientation of mineralized veins is primarily northeast and southwest. The 2010 program tested this model but the RC rig was unable to reach target depths at Bear Paw. Permafrost in north-facing slopes also prohibited drilling of some of the northern drill targets. As such, several areas at Bear Paw remain untested.

Mineralization controls are less well understood at Saddle, however sheeted quartz veins striking approximately to the west and dipping steeply to north were observed. Well mineralized rock occurred mainly in Hyland formation schists and quartzites (e.g. CC10-25 grading 1.24 g/t over 22.86 m). Additional surface work and core drilling would be required to better understand controls on mineralization at Saddle.

8.0 RECOMMENDATIONS

Clear Creek is large property covering approximately 6,000 hectatres. Clear Creek hosts an intrusion-related gold system associated with Tombstone Suite plutonics in several zones kilometers apart. Gold mineralization occurs in broadly disseminated zones, sheeted veins and breccias.

Favourable drilling results from 2010 should be followed-up with a drill program to systematically assess the extent, depth and grade of mineralization occurring at Bear Paw, Contact and Saddle. The goal of this program would be to define a preliminary resource estimate of these three zones. Additional earthworks will be required facilitate drilling activities. A D8 cat (or larger) and an excavator will be required to complete the trail building. Trenching areas with high soil geochemical anomalies will also generate additional drill-ready targets.

Soil sampling including talus fines has been effective at identifying Au-As (-Bi) geochemical anomalies, some of which have were tested to find subsurface mineralization. Areas with permafrost may require different geochemical sampling techniques and should be categorized in their own subset of data when analyzing the results.

APPENDIX 5

DESCRIPTION OF ANALYTICAL METHODS AND DETECTION LIMITS

ALS Chemex

Fire Assay Procedure – Au-AA23 & Au-AA24
Fire Assay Fusion, AAS Finish

Sample Decomposition: Fire Assay Fusion (FA-FUS01 & FA-FUS02)
Analytical Method: Atomic Absorption Spectroscopy (AAS)

A prepared sample is fused with a mixture of lead oxide, sodium carbonate, borax, silica and other reagents as required, inquarted with 6 mg of gold-free silver and then cupelled to yield a precious metal bead.

The bead is digested in 0.5 mL dilute nitric acid in the microwave oven, 0.5 mL concentrated hydrochloric acid is then added and the bead is further digested in the microwave at a lower power setting. The digested solution is cooled, diluted to a total volume of 4 mL with de-mineralized water, and analyzed by atomic absorption spectroscopy against matrix-matched standards.

Method Code	Element	Symbol	Units	Sample Weight (g)	Lower Limit	Upper Limit	Default Overlimit Method
Au-AA23	Gold	Au	ppm	30	0.005	10.0	Au-GRA21
Au-AA24	Gold	Au	ppm	50	0.005	10.0	Au-GRA22

ALS Chemex

Geochemical Procedure - ME-ICP41
Trace Level Methods Using Conventional ICP-AES Analysis

Sample Decomposition: Nitric Aqua Regia Digestion (GEO-AR01)
Analytical Method: Inductively Coupled Plasma - Atomic Emission Spectroscopy (ICP - AES)

A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to 12.5 mL with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. The analytical results are corrected for inter-element spectral interferences.

NOTE: In the majority of geological matrices, data reported from an aqua regia leach should be considered as representing only the leachable portion of the particular analyte.
