1.0 SUMMARY

On behalf of Silver Quest Resources Ltd. ("Silver Quest"), Equity Exploration Consultants Ltd. ("Equity") completed geochemical sampling at the Ladue property on August 22 & 23 and September 17 – 19, 2010. This property is comprised of 147 claims located 20 km north of the confluence between the White and Ladue rivers, within the White Gold district of the Yukon Territory.

Work in 2010 comprised five days of surface geochemical sampling by crews of up to six people, which resulted in the collection of 795 soil samples.

Soil geochemistry data defines a previously unknown, very large (4.7 x 1.2 km) and coincident As-Au-Sb-Mo anomaly in the eastern half of the Ladue property. This anomaly overlies Permian metasediments and lies just east of a contact with granitoid orthogneiss. Both the geochemistry and geological setting are therefore consistent with that associated with bedrock mineralization elsewhere in the White Gold district, as at the Coffee property for example. Follow-up work is strongly recommended.

2.0 INTRODUCTION

During the 2010 field season, Equity was contracted by Silver Quest to carry out the sampling work on the Ladue property as part of a larger exploration program focused at the Boulevard property located 75 km to the south-southeast. This report describes the work completed and summarizes the results.

3.0 PROPERTY DESCRIPTION AND LOCATION

The Ladue property is located in the Dawson Range of the west-central Yukon Territory, about 20 km north of the confluence between the White and Ladue rivers (Figure 1). It comprises 147 contiguous quartz claims that are centered on 63.32° N latitude and 140.47° W longitude (Figure 2). The first batch of claims was optioned in March 2010 and then a second batch was staked around it in June 2010 (Table 1). The remainder of the property, as currently defined, was staked in September and October 2010. For those claims staked later in the year, transfer to Silver Quest is still pending as of April 15/2011.

4.0 ACCESSIBILITY, CLIMATE, LOCAL RESOURCES, INFRASTRUCTURE, PHYSIOGRAPHY

The Ladue property is located 95 km to south-southwest of Dawson City. The topography of the area is characterized by rolling hills typical of the Dawson Ranges. Vegetation is sparse, with lower elevations covered by spruce, birch, aspen, alder and willow, whereas higher elevations have thick moss, grasses and scrub birch. Creek valleys are filled with thick willow and alder thickets. North-facing slopes locally exhibit permafrost, which complicates soil sampling. South-facing slopes are more typically vegetated by deciduous trees such as aspen and birch. Drainage systems vary from well channelled, discrete streams to swamps in broader, flat-bottomed valleys.

The area has a sub-arctic continental climate, with cold winters and cool, wet summers. Exploration can be carried out on the property from June until October.

Direct access to the property is via helicopter and several helicopter bases are located in Dawson City. Alternatively, several boat operators in Dawson City and a barge operating out of Minto Landing are available for hire to transport supplies to points along the Yukon River where they can be subsequently mobilized by helicopter to the property. During the 2010 program, personnel were mobilized from the Boulevard camp via Hughes 500D helicopter. The nearest airstrips are Independence and Thistle, both of which are located about 65 km from the property to the east-southeast and south-southeast respectively. Fixed wing operators from Dawson City and Whitehorse run Otter, Beaver and Cessna 206 aircraft capable of servicing these airstrips.

5.0 HISTORY

5.1 Previous Work

The MINFILE database indicates that there are no historical mineral occurrences within the Ladue property.

In 1986 the GSC performed a regional stream sediment survey on NTS map sheets 115N and 115O (Friske et al., 1986). A sample was collected from a tributary of Ladue Creek, which drained the Ladue property. This sample yielded 100th percentile antimony (58 ppm), 95th percentile arsenic (17 ppm) and background mercury and gold.

On the basis of the anomalous Sb and As abundances, 71 augered soil samples were taken on the Ladue property in 2009 (Smith, 2010). These samples were taken at 50 m spacing along a single east – west trending line. Analysis of soils identified strongly anomalous As, as well as moderately anomalous Cu, Pb and Zn.

The core of the Ladue property (formerly LAD property) was optioned to Silver Quest in 2010 and subsequently expanded through staking in June, September and October of 2010.

The bedrock geology of the region was most recently compiled by Gordey and Ryan (2005); the section of this map that illustrates the geology surrounding the Ladue property is shown in Figure 3.

5.2 2010 Exploration Program

On August 22 and 23, and September 17 – 19, crews of up to six samplers were dispatched to the Ladue property. The August soil sampling program comprised four lines, each about 2 km in length, oriented parallel to the east – west line done in 2009. Two of the new lines were placed south of the 2009 line and the other two were placed to the north. Along these lines the soil samples were collected at 50 m intervals. Sampling in September was then done along ~1.5 km long lines trending north-northeast, and crossing the previously established east – west trending grid. These samples were also collected at 50 m intervals. “Ridge and spur” type traverse lines with 50 or 100 m sample spacings were also completed along all prominent features underlying the property. In total, 795 new soil samples were collected and added to the existing database of 71 samples from 2009.

Samples were submitted to the ALS Laboratory Group preparation facility in Whitehorse and were analysed for a 51-element high precision suite (ME-MS41) and gold by 30 g fire assay (Au-AA23). Assay certificates of analysis are presented in an Appendix at the end of this report. Soil sample sites are marked with blue and orange flagging and a Tyvek tag, and all sample locations were recorded by hand-held GPS.

A magnetic declination of 22° E was used for all compass measurements. All maps and UTM coordinates are referenced to the 1983 North American Datum (NAD-83; Zone 7).

6.0 REGIONAL GEOLOGY AND MINERALIZATION

6.1 Geology

The Ladue property is located within the Yukon-Tanana Terrane in west-central Yukon, a pericratonic terrane of continental affinity that occupies a position between the ancestral continental margin of North America and outboard accreted terranes (Colpron, 2006). The pericratonic terranes were accreted in the Early Jurassic, while subsequent outboard exotic terranes began accreting in the Early to mid-Cretaceous. At this time, the pericratonic package was intruded by a voluminous, northwest-to southeast-trending plutonic suite, referred to as the Dawson Range plutonic belt by Hart et al. (2004) (Klotassin batholith of Templeman-Kluit, 1974), which lies south of the Ladue property.

Regional-scale geological compilation maps (Gordey and Makepeace, 1999) show that the Ladue property is underlain by the Devonian-Mississippian metasediments (DMps) as well as two units of Permian orthogneiss (Figure 3). The orthogneiss units comprise K-feldspar augen gneiss (Poga) and suspected tonalitic orthogneiss (Pogt?).

6.2 Mineralization

The nearest significant example of gold mineralization to the Ladue property is the Coffee property of Kaminak Gold, located just 15 km to the southeast, where significant gold discoveries were announced in spring 2010 (Carpenter, 2011). No resource has been calculated for the Coffee but early drill results include intercepts of 17.1 g/t Au over 15.5 m and 6.3 g/t Au over 35 m within a 15 km long Au in soil anomaly. At Coffee, gold is hosted in both N-S and E-W trending structures (Carpenter, 2011) that overprint regional gneissic and schistose deformation fabrics, indicating that gold is tectonically late. Gold-bearing zones at Coffee are characterised by silicification plus sericite-clay alteration with variable As-Ag-Sb-Ba-Mo enrichment, and the dominant sulphide phase is arsenic-rich pyrite. Gold mineralization at Coffee is hosted by many different rock-types including augen orthogneiss, hornblende-biotite granite, schist and dacite dykes.

The regional geological map suggests that the Ladue property is also underlain by metasedimentary schist and granitoid orthogneiss (Gordey and Ryan, 2005), which comprise one of the better host rocks for Au mineralization at Coffee. The contact zones between these rock types have proved particularly prospective on the Coffee property and are therefore obvious follow-up targets at Ladue.

7.0 GEOCHEMISTRY

7.1 Rock Geochemistry

No rock samples were taken from the Ladue property in 2010.

7.2 Soil Geochemistry

Soil results for the 795 samples collected during the 2010 Ladue program have been compared with the larger (14,000+) database of soil analyses from numerous Silver Quest properties across the Dawson Range. Based on this larger dataset the Ladue property contains an exceptionally large zone (4.7 x 1.2 km) of anomalous As-in-soil with less widespread, but coincident, anomalies of Au, Sb and Mo (Figures 5a – 5d). This anomaly appears to trend east-southeast and lies just east of the contact between Permian metasediments and granitoid orthogneiss. Smaller As-in-soil, as well as Au and Mo, anomalies occur just south of the large anomaly.

7.3 Silt Geochemistry

No silt samples were taken from the Ladue property in 2010.

8.0 PROPERTY GEOLOGY AND MINERALIZATION

No mapping was conducted on the Ladue property in 2010.

9.0 DISCUSSION AND CONCLUSIONS

Geochemical analysis of soils defines one of the largest coincident As-Au-Sb-Mo anomalies in all of Silver Quest's Dawson Range properties. The geochemistry of this anomaly is similar to that overlying bedrock mineralization in other parts of the White Gold district, like on the Coffee Property for example. Furthermore, the proximity of this in-soil anomaly to a contact between Permian metasediments and granitoid orthogneiss is favorable. Follow-up work is strongly recommended for this anomaly.

Respectfully submitted,

Darcy Baker Ph.D., P.Geo.

Vancouver, BC, Canada

I, Darcy Baker, P.Geo. do hereby certify that:

- I am a Geologist and President of Equity Exploration Consultants Ltd., with offices at Suite 200–900 West Hastings Street in the City of Vancouver, B.C., in the Province of British Columbia.
- I am a member in good standing (#33,448) of the Association of Professional Engineers and Geoscientists of British Columbia.
- I am a graduate of Dalhousie University (1997) with an Honours Bachelor of Science degree in Geology, and am a graduate of the University of Newcastle, Australia (2003) with a Doctor of Philosophy degree in Geology, and I have practiced my profession continuously since 1997.
- Since 1997 I have been involved in mineral exploration for gold, silver, copper, uranium, molybdenum, lead and zinc across Canada and in Alaska, Nevada and Australia.
- I am a Consulting Geologist and principal of Equity Exploration Consultants Ltd. (a geological consulting and contracting firm) and have been so since May 2003.
- I managed the Yukon field exploration campaigns for Silver Quest during 2010.
- I am independent of Silver Quest.

Dated at Vancouver, British Columbia, this 29th day of March, 2011.
