1. INTRODUCTION AND LOCATION

The Dublin Gulch dispositions are located in the Mayo Mining District, Yukon Territory, approximately 75 kilometres North of Mayo and 370 kilometres due north of Whitehorse. The property outlined for assessment comprises 1895 contiguous quartz mining claims covering approximately 84,842 acres of land.

The registered owner of the Len 1-32 and Jan 1-4 fractional claims is Janet Dickson, while the remaining claims are registered to StrataGold Corporation. The Len and Jan claims are subject to an option agreement wherein StrataGold may earn a 100% interest.

This report summarizes the Diamond Drilling activities and Regional Geochemical Sampling and Trenching Programs which were successfully completed in 2006.

A list of the Dublin Gulch Claims for Assessment is included in Appendix B of this report.

2. GENERAL INFORMATION

The Dublin Gulch Claims group for 2006 assessment consists of 1895 claims comprising a total of 84,842 acres. Planning of the program began January 1st, 2006. The drill program was managed from May 7th to July 21st, 2006, when a total of 10 diamond drill holes were drilled, cut and sampled for a total of 4277 core samples. Subsequent to the diamond drill program a re-logging and sampling program initiated on specific historical intact tungsten drill core to investigate for possible gold mineralization peripheral to and within the tungsten skarn sampled an additional 920 samples. During the extent of the field season a regional crew collected a total of 2177 soil samples and 162 grab samples. The field season concluded with a trenching program initiated on the Shamrock Zone collecting 394 samples. Following camp's seasonal demobilization on Oct 6th, 2006 assessment of the data continued through to December 31st, 2006, including a screen metallic study.

3. DESCRIPTION OF WORK – DIAMOND DRILLING

During the period May 7th to July 21st, 2006, 10 Diamond Drill holes were drilled on the Dublin Gulch claims. Two diamond drills and a D6 Cat, owned by DJ Drilling Ltd., were contracted by StrataGold Corporation to complete the drill program. The drill program was designed to determine the potential North of the Eagle Zone as well as depth extent of the Eagle Zone's mineralization. Where available, historical roads and drill pads or clearings were used, some new access roads and drill pads were required to accommodate drilling. All drill holes were drilled for HQ size core. The core was drilled primarily in 5 foot lengths however was increased to 10 foot lengths typically at the greater than 200 meter depths where ground conditions permitted. At shift change core was transported down to the Dublin Gulch camp, located near the confluence of Dublin Gulch creek and Haggart Creek. The core was logged and split in camp using two diamond bladed core saws, followed by being sealed in plastic poly ore sample bags along with individual sample tags. An extensive routine of Quality Assurance and Control (QA/QC) procedures were followed during sampling and subsequent assaying. These procedures are outlined in the following section.

4. METHODS OF ANALYSIS AND DATA PRESENTATION – DIAMOND DRILLING AND HISTORICAL CORE

Drill core was logged on site in the Dublin Gulch camp, with sample tags placed by the logging geologist at the beginning of each sample interval. The core was then split using a diamond bladed core saw, with one half of the core returned to the core box for on site storage. The other half was secured in plastic poly ore sample bags and prepared for shipment to ALS Chemex in North Vancouver. Core on site were cross-stacked, tarp covered and labeled in the core storage area located near the camps core shack. A total of 4144 core samples were submitted from the field, to be analyzed for Gold by Fire Assay, with 27 element ICP. The sample procedures are detailed below.

A map showing the highlighted locations of 2006 drill holes is contained in Appendix C, accompanied by 9 east-looking Gold assay and lithology cross sections contained within Appendix E.

Strict Quality Assurance and Control (QA/QC) protocols were maintained throughout the sampling process. The routine practice for a series of 20 samples is outlined in the following table.

QAQC Sampling Procedures

Sample		Sample	
1	Field Duplicate 1	11	
2	Field Duplicate 2	12	
3		13	
4		14	
5		15	
6		16	Blank
7		17	
8		18	
9	Preparation Duplicate/Check Assay	19	
10	Standard	20	

The Field Duplicate consisted of one quarter sample. In this case, “Sample 1” was split into two halves, and then one of these halves was quartered to create “Field Duplicate 1” & “Field Duplicate 2”, and the other half of “Sample 1” was placed back in the box.

The Preparation Duplicate and Check Assays were prepared during milling in the ALS Chemex lab. The number 8 sample was crushed and sieved to 70 % passing 2mm mesh. From this sample, two 250 gram portions were measured out, with one of these being sent to ACME Analytical for processing as the Check Assay. The 250 gram sample remaining at ALS Chemex was then ring-milled to 85% passing 75 micron or better. From this sample, two 50 gram samples were measured out for testing. The first was tested for both Gold by Fire Assay as well as 27 element ICP by acid digestion, and the second only for Gold by Fire Assay.

Standards were also used by StrataGold to monitor analytical accuracy. A total of 7 different Standards were incorporated into the sampling protocol. Two of the Standards were obtained from the Canadian Certified Reference Materials Project (CANMET), and were measured out with an electric scale into 30.5 gram portions, double bagged in two plastic sample bags, and placed in the sample series to occur approximately once every 100 samples. The other five standards (OREAS Standards) were obtained as pre-measured 60 gram pouches from Analytical Solutions Ltd. One of these was chosen by the core logging geologist to occur in each of the remaining 4 out of 100 standard samples.

The Blank sample used consisted of barren Dolomite purchased in 30 lb bags. Approximately 1.5 to 2 kilograms of dolomite were placed in a plastic bag and submitted once every 20 samples. In 2005, 12

samples, including one standard sample, were sent to each of 3 labs to test the consistency as a blank sample and to verify that no gold was present. The same samples material was used for the 2006 program.

The samples, once received by ALS Chemex, underwent the following procedure:

- The received sample was weighed and dried if necessary
- The sample was then crushed to 70% of the sample passing <2mm
- The sample was split using a riffle splitter
- The sample was then pulverized to 85% passing <75 um, with the crushers and pulverizers being washed at the beginning and end of the sample batch, and at the beginning of the technicians shift
- Followed by 50 gram Fire Assay and AAS with trace Hg via cold vapor/AAS
- Finally 27 element four acid ICP-AES

The analytical results were placed in an Access database as they were received. The original assay certificates received from ALS Chemex for the Drill Core and QAQC samples as well as the certificates from ACME Analytical Ltd. for the Check Assay samples are presented in Appendix G for Drilling and Appendix H for Drilling QA/QC.

5. DESCRIPTION OF WORK – REGIONAL SOIL GEOCHEMICAL SAMPLING PROGRAM

During the field season soil sampling was conducted on various laid out grids named: Peso, North Dublin, South Eagle and Shamrock. Soil samples where collected to follow up on various interpreted geophysical anomalies and or historical anomalous soil and grab samples previously recorded. Samples were collected using either a soil auger or mattocks. Soil was collected at a 12 to 18 inch depth range sampling the B horizon specifically. Sample spacing varied from 25 meter to 50 meter spacings. Samples that were collected and reviewed early in the season were selectively re-sampled for quality control assurance purposes and are listed as re-sampled soils samples which are listed below. All sample locations were flagged with sample numbers for subsequent review. Additionally, all sample locations were recorded using a Garmin GPS unit with coordinates being based in Nad 83, Zone 8. Samples were then shipped to ALS Chemex in North Vancouver and were assayed for gold and 27 element ICP. The regional geochemical sampling program was ATV and helicopter supported over much of the claim block. Collected samples include 2418 soil samples and 534 Rock samples primarily taken of quartz veins and mineralization in outcrop or sub-crop units.

6. DESCRIPTION OF WORK – REGIONAL TRENCH AND GEOCHEMICAL SAMPLING PROGRAM

The trenching program was conducted exclusively on the Shamrock Zone of the Dublin Gulch Property. The program consisted of 11 trenches consisting of a total of 727 meters. Trenches were of typically 1.5 meters wide and 2 meters deep. The trenches were sampled from a GPS recorded start point marked by a named staked post with flagging and sampled on an average of two meter interval widths. Care was taken to channel sample as representatively as possible using trowels and rock hammers. A total of 347 samples were collected and sent to ALS Chemex in Vancouver to be analyzed for gold by Fire Assay, with 27 elements ICP, with some samples receiving additional full screen metallics assaying when deemed necessary after reviewing initial assay results.

7. DESCRIPTION OF WORK – REGIONAL GRAB AND CHIP CHANNEL SAMPLING PROGRAM

Regional grab samples were collected predominantly at historically noted anomalous locations to provide confirmation of reported Au grades. 534 Rock samples were taken of quartz veins and mineralization in outcrop or sub-crop. Sample locations were flagged, with samples placed in plastic poly-ore bags with sample tags, and shipped to ALS Chemex in Vancouver. No quality control measures were conducted for the grab samples collected.

8. DESCRIPTION OF WORK – RELOGGING AND CORE ASSAY SAMPLING OF HISTORICAL MAR TUNGSTEN ZONE CORE

Selected historical drill core demonstrating favourable lithogy and mineralization and in proximal location to known favourable occurrences was logged, cut and sampled using the same procedures and quality controls as our 2005 and 2006 drill core. Previously, all historical drill core had only minor sections split with assays sampled primarily for tungsten. Gold was rarely analysed for by previous operators. A total of 942.02 meters was sampled from five historical diamond drill holes as listed below.

9. METHOD OF ANALYSIS AND DATA PRESENTATION - REGIONAL GEOCHEMICAL SAMPLING PROGRAM

Regional Samples, once collected, were sorted and placed into rice bags. The Rock, Soil and Trench samples were processed the same as the Diamond Drilling core samples.

A map showing both the rock and soil sample locations is included in APPENDIX I. The list of Rock Samples is included in Appendix K with the ALS Assay Certificates included in Appendix L. The list of Soil Samples is included in Appendix O, with the ALS Assay Certificates included in Appendix P. A list of Trench Samples is included in Appendix M, with the ALS Assay Certificates included in Appendix N.

Weak to moderate foliation throughout. Qtz veins occur at very high frequency and average 4cm thickness. BQS occurs in small chunks @ 156.5m and 164.3m - black to dark brown interlayered with qtz veins and selvage, selvage is sericite with some biotite and scordite, also has trace py. Quartz/carbonate veinlets present, show no preferred orientation. QZZ has minor oxidation and trace aspy and py. High chlorite alteration beginning at 167.5m to contact, qtz vein has significantly more unaltered py closer to contact.	1	3	1	1			6	1	6.0	47.0	50		1.5	s/b	3	0	0.1			0.1						2.0				B366176				BLANK

Vein/veinlets of qtz, in random orientations occure throughout, some associated with chlorite alteration. Carbonate veins occure through out, bleaching is associated with them in most places. Two qtz veins occure near 196m, they cross cut each other, at 15° and 145° and 130° intersection angle, the first has 1-2% py and trace aspy, shows selvage of 0.4cm-sericite, the second has only trace, oxidized sulfides and has selvage of 1.5cm- chlorite alteration. A quartz vein extending along core from 198.33m to 198.95m contains 3-5% sulfides (py, aspy), it is at a low angle to core axis and is ~.8cm thick. A major qtz vein occurs at 200.8m, 3cm wide with a 4cm sericitic selvage, trace aspy and py. 10		87.78	112.55	GND. Medium grained, medium to light grey color, unit has moderate to high sericitization and silicification and moderate bleaching as well as limited clay alteration in some areas associated with sulfide/carbonate veins/veinlets. Core competency is moderate to high with some area's being very fractured, broken and competency losses usually associated with clay/carbonate alteration and/or veining. Qtz, carbonate and sulfide veins are also found in this unit, qtz veins being much more common. Carbonate veinlets/stringers are common. Fracture surfaces commonly have py and aspy on them, occasionally po. Po (and lesser py) can be found disseminated throughout matrix in less altered/bleach area's.	1	3		1	3		2	6	0.2	0.4	15						0.1			1.0							1.0	2.0			C081497	87.78	89.00	0.115

		373.88	386.49	GND, medium to fine grained, medium to pale green color. High sericitic alteration throughout, moderate to high bleaching and etched in some area's. Occasional massive sulfide veins, situated toward middle of unit, associated with qtz veins . Qtz, sulfide and carbon (pink) present, with carbonate veinlets/stringers in some area and no preferred orientation and become pervasive toward end of unit. Sulfide's found with qtz veins less altered/oxidized than those found with carbonate or in bleached area's. 		451.04		GND, medium grained, medium grey to light green color. Moderate to strong sericitic alteration associated with qtz veins, some fractures and carbonate veins, moderate to high silicification throughout. Qtz, sulfide and carbonate veins present, qtz veins with ill-defined boundaries are common. Sheeted qtz veins are very common throughout section. Xenoliths present throughout unit. Aspy most commonly as well as po and py found disseminated in matrix associated with qtz veins and sericitic alteration. Fracture surfaces commonly at 30-40°, with aspy and py on surfaces that didn't have vein formation.		3		1	1		4	1	1.3	2.6	30		0.6	Q/S	3					1.0						7.0			C081931	451.04	452.24	0.040

GEOTECHNICAL SUMMARY SHEET

PROJECT: Dublin Gulch - 1735	
DRILL HOLE NO: DG06-313C	
Date Started: June 13, 2006	**Date Completed:** June 24, 2006
Geoteched By: Stacy Doyle, Jason Kindrat, Mike Giasson, Marc Mains	
Contractor: DJ Drilling	
Hole Size: HQ	**Core Size:** HQ
Total Depth: 504.44m	**Elevation:** 1095m
Average RQD: 51%	**Average Recovery Rate:** 91%

	Easting	**Northing**
DDH NAD27		
NAD27	459906	7099696
NAD83	459787	7099881

80	11.28 to 87.4 m	11.28	30.36	MSED. Dark to reddy brown color, highly oxidized, minor silicifiction. Very fractured and broken, with a pervasive foliation at 70° orientation. Qtz and carbonate veins throughout, qtz being more common. Carbonate veins are very oxidized - reddy/brown color. Qtz eyes and lenses (oriented along foliation) present throughout. Rocks appear banded where they can be observed over 20cm length.	3						3	1	1.0	1.8	35	20																	C081988	11.28	12.19	0.011

		263.36	289.36	GND. Medium grained, light grey to green in color. Unit is bleached w/ a yellow tinge throughout by silicified carbonate. Mineralized veins occur in darkened altered zones, consisting of fresh py, aspy, and po. Unit is highly fractured with major clay alteration in sections. Chloritic alteration throughout. Veins occur from 5-85 degrees.	1	2	1	1	2																					C082249	261.20	262.20		Check assay

80	MSED	1.52	33.62	Predominantly BQS, alternating to small zones of HFLS. All is quite oxidized (<10%) and broken up (no core pieces longer than 25cm). 8cm zone of light brown clay with small amounts of gravel and sand within, at 8.53-8.61m. Larger clay-rich zone from 12.05 to 15.16m. Fabric is rearranged into tight folds with an axis at 60° to CA, or is completely erased into clay (light grey-light brown). GEOTECHNICAL SUMMARY SHEET

PROJECT: Dublin Gulch - 1735		
DRILL HOLE NO: DG06-316C		
Date Started: July 6, 2006	**Date Completed:** July 11, 2006	
Geoteched By: Stacy Doyle, Jason Kindrat, Mike Giasson, Marc Mains		
Contractor: DJ Drilling		
Hole Size: HQ	**Core Size:** HQ	
Total Depth: 362.10m	**Elevation:** 931m	
Average RQD: 55.37%	**Average Recovery Rate:** 91.69%	
	Easting	**Northing**
DDH NAD27

COMMENTS: (Ground conditions, fracture zones, water flows, drilling problems)

July 16th, 2006. Drill #1's motpr has completely broken down so there will be a break in drilling this hole until either a replacement motor can be obtained or Drill #2 finishes 319C and can move to 317C.

A replacement motor was installed, then the hydraulic pump went down, in total 3 days of drilling lost, July 16, 17, 18, 2006.

The hole was terminated on July 19, 2006, in a fault zone when it became to difficult to drill, rods stuck repeatedly.

		158.77	186.80	MSED. Dark brown/black with pale beige (bleached) sections. Moderate to high silicification and sericitization, some bleached area's. Moderate to high core competancy throughout with a pervasive foliation at 70° orientation. Qtz and carbonate veins throughout, carbonate veining/veinlets/stringers common are common and when pervasive reduce core competancy. Qtz eyes and lenses (oriented along foliation) present. Carbonate veins cross cut foliation, 20 from CA and 90 between carb veins and foliation. Some aspy, scordite asociated with qtz and carbonate veins. Aspy and scordite found in qtz veins and eyes as well. Py found in bleached area's and along fracture/fault surfaces. Trace po found with qtz blobs in highly silicified argillite. Coridierite gives a bluish cast to unbleached, low qtz area's. Scordite is common as lenses in matrix and associted with qtz veins. COMMENTS: (Ground conditions, fracture zones, water flows, drilling problems)

The NAD 27 historical coordinates were shifted based upon the Sept 2005 Underhill survey +10.670 mE and -3.579mN to get the NAD 27 Real coordinates. Those coordinates were then converted with NTv2 to get the NAD83 coordinates.

10	148.96 to 164.40	148.96	164.40	GND. Medium grained, light grey. Moderate to strong bleaching, moderate to high silicification, and low sericitic alteration associated with qtz veins. Qtz veins common, carbonate veins very rare. Aspy appears as trace only, associated with qtz veins. Qtz veins are larger, usually 1cm+ thick and have a preferred orientation of 5° to 15°. The NAD 27 historical coordinates were shifted based upon the Sept 2005 Underhill survey +10.670 mE and -3.579mN to get the NAD 27 Real coordinates. Those coordinates were then converted with NTv2 to get the NAD83 coordinates.

The NAD 27 historical coordinates were shifted based upon the Sept 2005 Underhill survey +10.670 mE and -3.579mN to get the NAD 27 Real coordinates. Those coordinates were then converted with NTv2 to get the NAD83 coordinates.

10	173.15 to 196.30	173.15	196.30	GND. Medium grained, medium to dark grey colour. High biotite in section. Weak to moderate silicification, low carbonate alteration mostly associated with veins. Some chlorite alteration, associated with veins and weak bleaching associated with carbonate veins. Carbonate and qtz veins present, carbonate veins preferred orientation is between 20 and 30, qtz veins generally are low angle. Rare sullfide's found with in qtz veins (aspy). Qtz veins are usually pink, large veins show large euhadral crystal growth of qtz, carb and fspar crystals.			3		2		2	1	0.3	0.6	10																		C080443	173.15	173.80

COMMENTS: (Ground conditions, fracture zones, water flows, drilling problems)

The NAD 27 historical coordinates were shifted based upon the Sept 2005 Underhill survey +10.670 mE and -3.579mN to get the NAD 27 Real coordinates. Those coordinates were then converted with NTv2 to get the NAD83 coordinates.

The NAD 27 historical coordinates were shifted based upon the Sept 2005 Underhill survey +10.670 mE and -3.579mN to get the NAD 27 Real coordinates. Those coordinates were then converted with NTv2 to get the NAD83 coordinates.

85	33.60m to	33.60	101.94	BQS. Medium grained, medium to light grey to muddy green colour. Low po moderate silicification throughout, low carbonate alteration near veins. Carbonate veins are common with preferred orientation of ~20-30° and less common qtz veins have generally low angle orientation. Rare trace sulfides in section, some trace aspy and some py on fracture surfaces, single occurrence of holy on fracture surface. Banding in section occurs at 85° to core axis and low amounts fractures in section have a preferred orientation between 10° and 30°, carbonate veins seem to follow the fractures. Project: Dublin Gulch1735

P.O. No.:

This report is for 266 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 18-JUL-2006.

The following have access to data associated with this certificate:

WILLIAM HAY TERRY TUCKER	JEFF SCULLY KRISTIAN WHITEHEAD	JIM SPARLING

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
PUL-32d	Pulverize Split -Dup 85% <75um
LOG-22	Sample login - Rcd w/o BarCode
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
CRU-QC	Crushing QC Test
CRU-31	Fine crushing - 70% <2mm
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-32	Pulverize 1000g to 85% < 75 um
ROL-21	Rolling Charge
LOG-24	Pulp Login - Rcd w/o Barcode
SPL-21d	Split sample - duplicate

Au-GRA22	Au 50 g FA-GRAV finish	WST-SIM
ME-ICP61	27 element four acid ICP-AES	ICP-AES
Zn-AA62	Ore grade Zn - four acid / AAS	AAS

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geological materials collected by the prospective investor or by a qualified person selected by him/her and based on an evaluation of all engineering data which is available concerning any proposed project.

Project: Dublin Gulch1735

P.O. No.:

This report is for 274 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 17-JUL-2006.

The following have access to data associated with this certificate:

WILLIAM HAY TERRY TUCKER	JEFF SCULLY KRISTIAN WHITEHEAD	JIM SPARLING

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
PUL-32d	Pulverize Split -Dup 85% <75um
LOG-22	Sample login - Rcd w/o BarCode
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
CRU-QC	Crushing QC Test
SPL-21	Split sample - riffle splitter
PUL-32	Pulverize 1000g to 85% < 75 um
BAG-01	Bulk Master for Storage
ROL-21	Rolling Charge
LOG-24	Pulp Login - Rcd w/o Barcode
SPL-21d	Split sample - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
Au-GRA22	Au 50 g FA-GRAV finish	WST-SIM
ME-ICP61	27 element four acid ICP-AES	ICP-AES

The results of this assay were based solely upon the content of the sample submitted. Any decision to invest should be made only after the potential investment value of the claim or deposit has been determined based on the results of assays of multiple samples of geological materials collected by the prospective investor or by a qualified person selected by him/her and based on an evaluation of all engineering data which is available concerning any proposed project.

P.O. No.:

This report is for 32 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 26-JUN-2006.

The following have access to data associated with this certificate:

WILLIAM HAY TERRY TUCKER	JEFF SCULLY KRISTIAN WHITEHEAD	JIM SPARLING

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
PUL-32d	Pulverize Split -Dup 85% <75um
LOG-22	Sample login - Rcd w/o BarCode
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
CRU-QC	Crushing QC Test
CRU-31	Fine crushing - 70% <2mm
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-32	Pulverize 1000g to 85% < 75 um
BAG-01	Bulk Master for Storage
ROL-21	Rolling Charge
LOG-24	Pulp Login - Rcd w/o Barcode
SPL-21d	Split sample - duplicate

P.O. No.:

This report is for 100 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 26-JUN-2006.

The following have access to data associated with this certificate:

WILLIAM HAY TERRY TUCKER	JEFF SCULLY KRISTIAN WHITEHEAD	JIM SPARLING

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
PUL-32d	Pulverize Split -Dup 85% <75um
LOG-22	Sample login - Rcd w/o BarCode
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
CRU-QC	Crushing QC Test
CRU-31	Fine crushing - 70% <2mm
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-32	Pulverize 1000g to 85% < 75 um
BAG-01	Bulk Master for Storage
ROL-21	Rolling Charge
LOG-24	Pulp Login - Rcd w/o Barcode
SPL-21d	Split sample - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP61	27 element four acid ICP-AES	ICP-AES

P.O. No.:

This report is for 100 Drill Core samples submitted to our lab in Vancouver, BC, Canada on 4-JUL-2006.

The following have access to data associated with this certificate:

WILLIAM HAY TERRY TUCKER	JEFF SCULLY KRISTIAN WHITEHEAD	JIM SPARLING

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
PUL-32d	Pulverize Split -Dup 85% <75um
LOG-22	Sample login - Rcd w/o BarCode
WSH-21	"Wash" crushers
WSH-22	"Wash" pulverizers
CRU-QC	Crushing QC Test
CRU-31	Fine crushing - 70% <2mm
PUL-QC	Pulverizing QC Test
SPL-21	Split sample - riffle splitter
PUL-32	Pulverize 1000g to 85% < 75 um
BAG-01	Bulk Master for Storage
ROL-21	Rolling Charge
LOG-24	Pulp Login - Rcd w/o Barcode
SPL-21d	Split sample - duplicate

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-AA24	Au 50g FA AA finish	AAS
ME-ICP61	27 element four acid ICP-AES	ICP-AES
Zn-AA62	Ore grade Zn - four acid / AAS	AAS
